Corrosion-resisting alloy. CENTRAL ALLOY STEEL CORP. Fr. 649,679, Sept. 8, 1927. A rust- and corrosion-resisting Fe alloy contains Cu 0.2-0.5, Mo 0.1-0.2, and C 0.05-0.1%. The alloy may contain other ingredients such as Si, Mn, P and S, but the total of these including the C should not exceed 0.25%.

Magnetic alloy. BELL TELEPHONE MANUFACTURING CO. Swiss 12,601, Dec. 31, 1926. An alloy susceptible to small magnetic impulses comprises Ni 78, Fe 18-19, and Mo 4-3%.

Magnetic alloys. SIEMENS & HALSKE A.-G. Brit. 290,658, May 20, 1927. Alloys are formed of Ni 30-80, Fe 20-70 and Si 1-20% (suitably Ni 78.5, Fe 17.5 and Si 4%) and may be heated at about 900° for some time, then slowly cooled to about 625°, maintained at that temp. for some time, and finally cooled in air.

Aluminum alloys. ANDRÉ GEYER. Fr. 640,113, Feb. 4, 1927. Al alloys contg. C are protected against oxidation during fusion by a layer of carbides. Reducing gases are maintained over the bath. The C used is wetted with water. An example of an alloy contains Al 93.84, Cu 3.55, Mg 0.7, Mn 0.66, Si 0.6, Fe 0.54 and C 0.11%. Cf. C. A. 22, 4454.

Aluminum alloys. DEUTSCHE VERSUCHSANSTALT FÜR LUFTFAHRT E. V. Fr. 639,954, Aug. 24, 1927. See Brit. 282,701 (C. A. 22, 3877).

Aluminum-silicon alloy. ALFRED G. C. GROVER and HENRY W. L. PHILLIPS (to The British Aluminium Co., Ltd.). Can. 284,544, Nov. 6, 1928. The structure of Al-Si alloys is physically varied by introducing into the molten alloy at a temp. only slightly above the melting point of the alloy Na_2O_2 , preferably in small quantities at a time (as the reaction is strongly exothermic). After skimming off the dross and slag the molten alloy is cooled to the temp. desired for pouring and poured in the usual way, preferably into chill molds. In place of Na_2O may be used K_2O or other alkali metal peroxide or mixts. of these.

Nickel and its alloys, etc. P. D. MERICA and A. E. KAYES (to International Nickel Co.). Brit. 290,647, May 19, 1927. In order to produce metal free from C and from gas, Ni contg. metal is melted and, by the addn. of Ni oxide or in other suitable manner, C present is completely oxidized and the CO is boiled out of the metal. The Ni oxide is then reduced by a deoxidizer such as Si which does not form gaseous oxides, and Mn and Mg may be added before casting. Various details are given.

Steel alloys. FRIED. KRUPP AKT.-GES. (Franz P. Fischer, inventor). Ger. 468,752, Dec. 8, 1926. Steel alloys such as Ni-Mg steel and particularly austenitic steel alloys have their stretching point raised by rotating the article made from the alloy, such as a turbo rotor, at a sufficiently high speed.

Alloy steel. GREGORY J. COMSTOCK (to Firth-Sterling Steel Co.). U. S. 1,695,916, Dec. 18. An alloy steel contg. C 1.20-1.80, Cr 10-14, V 0.75-1.25, and Mo 0.50-1.25% may be air hardened even in fairly large sections and is capable of being annealed sufficiently soft for easy machining. It is suitable for making dies and punches.

Alloy steel for "high-speed" tools. REMY-STÄHLWERKE STAHL SCHMIDT & CO. GES. Brit. 280,900, Feb. 28, 1927. An alloy steel is specified contg. W 17, Cr 5, V 1.5, Ta 7, and C 0.9%, with or without Mo 2%.

Manufacture of tungsten-carbon alloys for tools. METALLABOR A.-G. Swiss 126,663, June 23, 1927. C in an amt. not exceeding 3% is supplied to the metal during its fusion at a temp. at which the metal is passing from the pasty to the liquid state. An addn. of an auxiliary metal, particularly Ta, may be made, and fusion may be effected in an atm. of N.

Tungsten carbide. STAHLWERKE RÖCHLING-BUDERUS A.-G. Swiss 126,729, Jan. 18, 1926. Hard tools and like objects are made from W carbide, by mixing a small quantity of Th carbide with W, fusing with C, and molding.

Electric testing apparatus for detecting flaws in metal bars, railway rails, etc. SPERRY DEVELOPMENT CO. Brit. 290,073, July 22, 1927.

Production of corrosion-resistant surfaces on metals. FREDERICK M. BECKET (to the Electro Metallurgical Co. of Can., Ltd.). Can. 284,705, Nov. 13, 1928. Corrodible metal (iron, steel, etc.) is treated by a cementation process with a powd. ternary alloy

of Fe, Cr and Si and a diluent consisting of an inert oxide (alumina). A binary alloy of Cr and Si may be used instead of the ternary alloy quoted.

Acid-proof linings for vessels. I. G. FARBERIND. A.-G. Brit. 290,189, May 9, 1927. Linings are formed of slabs of Si alloys having good thermal cond. such as alloys of Si with Cu, Cr, Mn or W. Cf. C. A. 22, 4016.

Apparatus for tinning metal plates. H. WILLIAMS. Brit. 290,337, Feb. 9, 1927.

Apparatus (with sheepskin rollers, etc.), for cleaning tin plates with bran, etc. L. B. FRY and B. A. THOMAS. Brit. 289,946, Feb. 3, 1927.

Tempering wires. ÉDOUARD DROUET. Fr. 639,877, Aug. 22, 1927. Wires are tempered by passing them simultaneously in opposite directions in 2 series so as to recover, by heating one series, the heat given out in tempering and cooling the other series.

Seamless metal tubes. W. KUNST. Brit. 290,334, Feb. 8, 1927. Mech. features of manuf. are specified.

Apparatus for pickling or other liquid treatments of long rods or tubes. CHARLES E. LEHR (to Bethlehem Steel Co.). U. S. 1,696,806, Dec. 25. Structural features.

Apparatus for forming pipe from lead or similar metals by extrusion through a water-cooled die. J. C. LABROSSE. Brit. 290,289, May 12, 1927.

Continuous-sheet mill and method of making finished metal sheets. FLORENCE C. BIGGERT, JR. (to United Engineering & Foundry Co.). U. S. 1,695,910, Dec. 18. Mech. features.

Apparatus for testing the effect of bending of metal strips. GEORGE B. COLLINS (to The Texas Co.). U. S. 1,695,367, Dec. 18.

Arc welding. COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 32,953, Jan. 12, 1926. Addn. to 523,169. The electrodes for arc welding contain a compd. of Ti, e. g., Na titanate, with Zn and finally Sn.

Arc-welding electrode. HARRY R. PENNINGTON and CHARLES H. HOLLUP (to C. H. Hollup Corp.). U. S. 1,696,011, Dec. 18. A coating for welding rods comprises BaCO_3 and powd. C in approx. equal vols. and a dil. Na silicate soln.

Solder. H. CHAPMAN. Brit. 290,891, Sept. 27, 1927. A method is specified for prepg. solder in the form of flakes coated with flux (which for lead soldering may comprise an emulsion of a mineral hydrocarbon oil with ZnCl_2 soln.).

Solder for aluminum. ERNEST STIRNEMANN and ADRIEN PERRET. Fr. 640,676, Sept. 8, 1927. Solder for Al and its alloys is made under the following conditions: (1) It must not contain over 40% Al; (2) if it contains over 30% Al it must not contain over 40% Zn; (3) it must not contain over 45% Cu; (4) if no Pb is present the quantities of Cu and Sn are obtained for the formula $y = 2 - 0.00047x^3 + 0.00667x^2 - 0.042x$, if Pb is present, from the formula $y = 1 + 0.001x^2 + 0.08x$, where x and y represent the amts. of Sn and Cu, resp.; (5) the fusion pt. should not exceed 480° .

10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

One hundred years of organic synthesis. JOCELYN F. THORPE. *J. Chem. Education* 5, 1591-602(1928). E. H.

Progress in the synthetic organic chemical industry in 1928. FRANK TALBOT AND W. N. WATSON. *Ind. Eng. Chem.* 21, 8-11(1928). E. H.

Contemporary reception of Wöhler's discovery of the synthesis of urea. W. H. WARREN. *J. Chem. Education* 5, 1539-53(1928); cf. C. A. 22, 2919. E. H.

The synthesis of methane from carbon dioxide and hydrogen. MERLE RANDALL AND FRANK W. GERARD. Univ. of Calif. *Ind. Eng. Chem.* 20, 1335-40(1928). The equil. for the reaction $\text{CO}_2 + 4\text{H}_2 \rightleftharpoons \text{CH}_4 + 2\text{H}_2\text{O}$ was detd. by the dynamic method at atm. pressure and at temps. between 322° and 392.5° . The catalysts used were supported Ni catalysts, both unpromoted and promoted by ceria. Space velocities from 6 to 12 were used. Equil. was approached from both sides. In studying the forward reaction ratios of H/CO_2 of 4 and 2.3 were used. The free energy equation that fits the data for this reaction is $\Delta F^\circ = -35,093 + 12.38T \ln T - 0.00415T^2 - 0.00000025T^3 - 39.91T$. This equation gives $\Delta H_{29.81}^\circ = -38,401$ cal. and $\Delta F_{29.81}^\circ = -26,339$ cal. An observed deposition of C during some of the expts. is accounted for by assuming reaction between CO_2 and CH_4 to form graphite and H_2O . Such a reaction is thermodynamically possible under the exptl. conditions prevailing. R. L. D.

Synthesis of higher hydrocarbons from water gas. II. DAVID F. SMITH, CHARLES O. HAWK AND D. A. REYNOLDS. U. S. Bur. of Mines, Pittsburgh, Pa. *Ind. Eng. Chem.* 20, 1341-8(1928); cf. C. A. 22, 1948.—A catalyst made from co-pptd. hydroxides

of Co, Mn and Cu was used to synthesize hydrocarbons from purified water gas at atm. pressure and at temps. about 250°. Space velocities between 120 and 360 were used. Extensive tabulation is made of the nature and quantities of hydrocarbons formed, the quantities of water gas converted, and their relation to the temp. and space velocity. The quantities of oxygenated products formed were comparatively small. The % of CH₄ in the hydrocarbon product was higher the higher the temp. and the more active the catalyst. The proportion of very heavy hydrocarbons was greater at the lower space velocities and the higher temps. At the higher space velocities and higher temps. relatively more unsatd. hydrocarbons were formed. At 260° and 260 space velocity the hydrocarbon product was 21% by wt. CH₄, 45% enriching hydrocarbons (German "Gasol"), 34% motor fuel. The yields of hydrocarbons, exclusive of CH₄, vary from 92 to 156 gm. per cu. m. of H₂ + CO converted. At 203° and 230 space velocity, about 18% of the water gas was converted in a single pass. R. L. DODGE

Oxidation of methane with nitrogen peroxide. PER K. FROLICH, P. J. HARRINGTON AND ALDEN H. WAITT. Mass. Inst. Tech. *J. Am. Chem. Soc.* 50, 3216-21 (1928).—The min. reaction temp. for the oxidation of CH₄ with NO₂ is about 430° in an open Pyrex tube. No MeOH could be detected. HCHO is formed, the yield being less than 25% of the CH₄ reacting. Conditions favoring lowering of the reaction temp. such as low NO₂ concn., slow rate of flow and absence of contact surfaces, also favor HCHO production. The losses of NO₂ by decompn. to free N₂ are small. Attention is called to the possible formation of AcOH by reaction in the cold, of liquid NO₂ with small quantities of higher hydrocarbons present in the CH₄. J. H. PERRY

Preparation of tetramethylethylene. J. C. EARL. *J. Proc. Roy. Soc. N. S. Wales* 61, 68-72 (1928) — EtC(OH)Me₂ was dehydrated by the method of D. R. P. 66,866, except that the vapors from the reaction flask were passed through a fractionat-

ing column, at the top of which the temp. did not exceed 45°. $\text{MeCH: CMe}_2 \xrightarrow{\text{Cl}} \text{MeC(OH)CClMe}_2 \xrightarrow{\text{MeMgI}}$

$\text{MeC(OH)CClMe}_2 \longrightarrow \text{Me}_2\text{CHC(OH)Me}_2$ which was dehydrated by adding in small portions to boiling 33% H₂C₂O₄ and distg. so that the top of the fractionating column was not above 80°. The distillate was nearly pure Me₂C: CMe₂ with a little water. L. W. RIGGS

Electron displacement in carbon compounds. V. The addition of hydrogen chloride to 3-ethyl-2-pentene. HOWARD J. LUCAS. Calif. Inst. Tech. *J. Am. Chem.*

$n_D^{20} 1.417$
70% of 3-ethyl-2-pentanol, b_{50} 82.0-2.5°, b_{743} 151-1.5°, and 8% of 4,5-dimethyl-3,6-dimethyl 4,5-octanediol, m 100.7-1.2°. 3-Ethyl-3-pentanol, b_{50} 72.5-3.5°, b_{710} 83.5-1.0°, b_{743} 140.5-1.5°, n_D^{20} 1.4305, n_D^{25} 1.4281. With HCl and ZnCl₂ the alcs. give the corresponding chlorides. 2-Chloro-3-ethylpentane, b_{50} 62-2.5°, b_{710} 77-7.5°, b_{743} 142.5-3.0°, d_4^{25} 0.8911, n_D^{20} 1.4318, n_D^{25} 1.4299. 3-Chloro-3-ethylpentane, b_{50} 78.5-0.0°, b_{710} 83.0-3.5°, b_{743} 143.0-4.0° (decompn.), d_4^{25} 0.8945, n_D^{20} 1.4334, n_D^{25} 1.4311. HCl in glacial AcOH reacting with 3-ethyl-2-pentene gives a heptyl chloride which is practically pure 3-Cl deriv. The product formed agrees with the prediction made on the assumption that the electron attractions of H, Me and Et are in the order H > Me > Et and not with the hypothesis of an alternately polarized C chain. C. J. WEST

Cadmium acetylide. KARL GEBAUER. *Z. anorg. allgem. Chem.* 176, 283-4 (1928).—When pure dry C₂H₂ is passed through CdI₂·C₆H₅NH₂ in Me₂CO, there is formed an orange ppt., the compn. of which corresponds to the formula CdC₂·C₂H₅·CdI₂. By washing with alc., or H₂O, the CdI₂ is removed and CdC₂·C₂H₅ is formed. Both compds. partially decomp. in hot H₂O with the evolution of C₂H₂, but may be heated in the air to 200° without decompn. H. F. JOHNSTONE

Action of sulfuric acid in the preparation of certain alkyl halides. ROGERS McCULLOUGH AND FRANK CORTESE. Mass. Inst. Tech. *J. Am. Chem. Soc.* 51, 225-8 (1929).—CH₃CHCH₂Cl is conveniently prepd. by mixing the alc. with 8 times its vol. concn. HCl (d. 1.19) in a well-corked bottle; after 10 days the upper layer is washed with 10% NaOH and twice with 15% NaCl; distn. gives 55-65% chloride, b. 45-7°; the bromide is obtained in 60-5% yields and the iodide in 75-80% yields. These halides do not develop objectionable odors and colors on standing; these colors are caused by the action of H₂SO₄ and halogen acid on the unsatd. materials, which are always formed, even by the Norris method. H₂SO₄ not only polymerizes these materials but attacks sensitive halides to form more unsatd. materials. H₂SO₄, therefore, is to be condemned in the prepn. of pure alkyl halides. The Norris procedure gives the purest products. C. J. WEST

Behavior of zinc oxide and zinc oxide-chromium oxide catalysts in the decomposition and synthesis of methanol. H. H. STORCH. Roessler & Hasslacher Company, Perth Amboy, N. J. *J. Phys. Chem.* 32, 1743-7(1928).—Details of prepn. of several pptd. and supported ZnO and ZnO-Cr₂O₃ catalysts are reported. Their activities for the synthesis of MeOH from 4H₂:1CO gas mixts. at 3000 l./sq. in. and about 350° are compared. The addn. of Cr₂O₃ to a ZnO catalyst in proportions of 200 g. ZnO to 22 g. Cr₂O₃ showed more activity than pure ZnO or pure Cr₂O₃. There was, however, no appreciable difference in activity between the catalysts when used to decomp. MeOH at atm. pressure. The mixed oxide catalyst was practically inactive for the synthesis of MeOH below 300°, and at 350° the yield was less than at 330°.

R. L. DODGE

Catalysts for the formation of alcohols from carbon monoxide and hydrogen. II. Synthesis of methanol with catalysts composed of copper and zinc. PER K. FROLICH, M. R. FENSKE, P. S. TAYLOR AND C. A. SOUTHWICK, JR. Mass. Inst. Tech. *Ind. Eng. Chem.* 20, 1327-30(1928); cf. *C. A.* 22, 3338.—Data on the decompn. of MeOH by CuO-ZnO catalysts at atm. pressure have been correlated with expts. on MeOH synthesis at 204 atm., the same catalysts being used. The curves for "% of decompd. MeOH appearing as CO" vs. "compn. of catalyst" are of the same shape as those representing "% of CO converted to MeOH" plotted against the same abscissas. Conclusion: The atm. pressure decompn. method of testing is eminently fitted for studies of the activity of catalysts for the MeOH synthesis from water gas at high pressure.

R. L. DODGE

History of ether. ERNST DARMSTAEDTER. *J. prakt. Chem.* 120, 74-88(1928).—Discussion of the claims of Cordus (1600) as the discoverer of Et₂O. Twenty-five references.

C. J. WEST

Relationship of the constitution of certain alkyl halides to the formation of nitro-paraffins and alkyl nitrites. ROBERT B. REYNOLDS AND HOMER ADKINS. Univ. of Wisconsin. *J. Am. Chem. Soc.* 51, 279-87(1929).—The reaction between AgNO₂ and the following alkyl halides gave the indicated total yield of mixed isomers (%) and % of NO₂ compd. in the mixt. (2nd figure): CH₃:CHCH₂Br, 74.0, 79.8; PrBr, 86.1, 77.4; *sec*-PrBr, 78.5, 40.3; BuBr, 88.2, 77.9; *iso*-BuBr, 77.2, 57.8; *sec*-BuBr, 68.3, 30.0; *tert*-BuBr 60.6, 48.3; *iso*-AmBr, 78.2, 67.5; C₇H₁₅Br, 94.3, 71.0; *sec*-C₈H₁₇Br, 82.1, 34.3; Pri 85.9, 66.9; *sec*-PriI, 71.7, 31.8; BuI, 85.1, 60.7; *iso*-BuI, 74.9, 40.0; *sec*-BuI, 70.0 31.9. A larger proportion of NO₂ compd. was produced from the bromides than from the iodides except in the case of *sec*-BuBr. *Iso*-AmBr gave over twice as large a % of NO₂ compd. as did the *iso*-AmCl. The yield of the isomers isolated was from 10-17% higher from the bromides than from the iodides, except in the case of *sec*-BuBr. Primary halides contg. a branched chain did not give as high a proportion of NO₂ compd. as did the straight chain compds. If the halogen in the alkyl halide is on a *sec.* C atom, the amt. of formation of the NO₂ compd. is materially less than it is for the corresponding primary or *tert.* alkyl halide. It cannot be said that there is in general either an increase or decrease in proportion of NO₂ compds. with increasing mol. wt. of the alkyl group. The results obtained with allyl bromide indicate that unsatn. has little or no effect on the ratio of isomers formed. The highest yields of the mixed isomers were isolated from the reaction of normal alkyl halides, the yield increasing with lengthening of the chain in the case of the bromides. The order of increasing activity of the alkyl halides is allyl, *tert*-Bu, *sec*-halides, isoalkyls and *n*-alkyls. The iodides are more reactive than the bromides. Attempts to prep. mixts. of the isomers sufficiently pure for analysis were unsuccessful with *tert*-BuI, cyclohexyl iodide, PhCH₂Br or PhCH₂-CH₂Br. The method of analysis of the reaction mixt. involved the addn. of EtOH-NaOH to a weighed sample, evapg. the soln. and analyzing the residue by a wet combustion method for C.

C. J. WEST

Chemistry of nitroso compounds. JOHN C. EARL, FRANK C. ELLSWORTH, EDWARD C. S. JONES AND JAMES KENNER. Univ. of Sydney and Coll. of Tech., Manchester. *J. Chem. Soc.* 1928, 2697-703.—*β*-Hydroxyethylnitrolic acid, m. 76-7° (decompn., cor.) results from the Na salt of HOCH₂CH₂NO₂ in EtOH and NaNO₂ and KOH in H₂O, the mixt. being acidified at -10° to 0°, then rendered alk. and again reacidified; the yield (33%) is due to the soly. of the acid in H₂O; it gradually decomp. with evolution of NO fumes. The same compd. is obtained from (HOCH₂)₂C:NO₂H, HCHO being formed. Ethylnitrolic acid is obtained in the same manner from MeCH(NO₂)CH₂OH. The original should be consulted for the discussion of the chemistry of these reactions.

C. J. WEST

Factors involved in the preparation of mercury diisobutyl by the reaction of Frankland and Duppa. HARRY F. LEWIS AND EUNICE CHAMBERLIN. Cornell College and

Univ. of Iowa. *J. Am. Chem. Soc.* 51, 291-4(1929).— $\text{Me}_2\text{CHCH}_2\text{I}$ (31 cc.) and 14.8 cc. AcOEt , cooled to 0° , are treated with 0.25% Na-Hg from 13.6 g. Na and 400 cc. Hg so that the temp. does not exceed 15° (45 min.); addn. of H_2O and distn. gives 56.6% of the Hg deriv. Between $15-20^\circ$, the yield drops to 49% and at the b. p. ($75-85^\circ$) to 45%. Using a 0.125% Na-Hg , the yield dropped to 38.3%. In the absence of AcOEt no Hg deriv. is formed; doubling the amt. of AcOEt gives a 48.7% yield. Aldehydes, ketones and anhydrides may be used as catalysts in the reaction. The principal by-product is diisobutyl. $\text{Me}_2\text{CHCH}_2\text{Br}$ cannot replace the iodide in the above expts.

C. J. WEST

Polymerides of aliphatic chloroaldehydes. FREDERICK D. CHATTAWAY AND EDWIN G. KELLET. Queen's College, Oxford. *J. Chem. Soc.* 1928, 2709-14.— $\text{Cl}_3\text{CCHO} \cdot \text{H}_2\text{O}$ (100 g.) in 1000 g. concd. H_2SO_4 , each portion of chloral being shaken until dissolved, on standing 3 days at room temp. gives a mixt. of 3 polymers with chloralide; the excess of chloral is removed with hot H_2O and the solid then extd. with boiling EtOH , from which the chloralide seps. on cooling; H_2O ppts. α - (I) and β -parachloral (II), which are sepd. by repeated crystn. from EtOH , in which II is the more sol. I, orthorhombic, m. 116° , b_{700} 223° (capillary tube); $a:b:c = 0.8801:1:1.4505$, c (001), o (111), m (110). II, m. 152° , b. 250° . The yield of I and II is not more than 1%; of chloralide, about 2%. Butylchloral hydrate (25 g.) and 150 g. concd. H_2SO_4 give about 80% of α - (III) and β -parabutylchloral (IV), sepd. by crystn. from AcOH or EtOH . III, m. 180° , b_{700} 255° , orthorhombic, $a:b:c = 0.8209:1:1.4460$, c (001), b (010), m (110), r (101) and o (111). IV, m. 157° , b_{700} 233° . Anhyd. butylchloral may be prepd. by distg. the hydrate with about half its wt. of Ac_2O ; it b. 165° ; HCl does not give the meta-polymer. $\text{C}_4\text{H}_9\text{N}$ gives a mixt. of III and IV. C. J. W.

Oxidation of lignoceric acid. F. A. TAYLOR AND P. A. LEVENE. W. H. Singer Memorial Research Lab., Pittsburgh, Pa., and The Rockefeller Inst., N. Y. *J. Biol. Chem.* 80, 609-13(1928).—Lignoceric acid was prepd. from peanut oil by recrystn. of the insol. fatty acids. It m. $80-1^\circ$ and solidifies 77° . With red P and Br, it was converted to α -bromolignoceric acid (m. $69.5-70.5^\circ$). This compd. in turn, by heating on the H_2O -bath with an excess of 10% NaOH , was converted to α -hydroxylignoceric acid (m. $94-5^\circ$) which was oxidized by KMnO_4 to isotricosanoic acid (m. $76.5-7.5^\circ$).

ARTHUR GROLLMAN

Oxidation of unsaturated compounds. I. Oxidation of crotonic and isocrotonic acids, of the lactone of 3-hydroxyisocrotonic acid and of maleic anhydride. GÉZA BRAUN. Univ. of Chicago. *J. Am. Chem. Soc.* 51, 228-48(1929).—The oxidation of crotonic acid with BzO_2H gives a *dl*-1,2-dihydroxybutyric acid (I), m. 81.5° , in 63.5% yields. isocrotonic acid gives the isomeric acid (II), m. $74-5^\circ$, in 62.5% yields. With AgClO_4 and OsO_4 crotonic acid gives 82.5% II, while isocrotonic gives 82.5% of I. Various chlorates were studied; in the chlorate oxidations, the reduction of chlorates proceeds through the lower oxides of Cl and the mechanism of these oxidations is discussed. I is considered the *erythro*-form, II the *threo*-form. Oxidation of the lactone of 3-hydroxyisocrotonic acid with AgClO_3 gives 75%, with $\text{Ba}(\text{ClO}_3)_2$ 64%, of erythronic lactone. Oxidation of maleic anhydride with $\text{Ba}(\text{ClO}_3)_2$ gave mesotartaric acid quant., while AgClO_3 gave only 70% yields.

C. J. WEST

New synthesis of 1,5-dihydropentane(pentamethyleneglycol) and 1,5-diiodopentane. ADOLF MÜLLER, ERICH RÖLZ AND ALEXANDER GERO. Univ. Wien. *Monatsh.* 50, 105-8(1928).—Glutaric acid is best prepd. by the oxidation of cyclopentanone. Reduction of the di-Et ester (b_{110} $108-10^\circ$, b_{700} $127-9^\circ$) with EtONa gives 46% of pentamethyleneglycol, b_{110} 134° (*bisphenylurethan*, m. $174-5^\circ$ (cor.)); on cooling and immediate remelting, the m. p. is $142-3^\circ$ (cor.). HBr with the glycol at $80-90^\circ$ gives 62.2% of the 1,5-di-Br deriv., b_{110} $95-8^\circ$. The glycol, I and red P give 76.3% of the 1,5-di-I-deriv., b_{110} $128-30^\circ$.

Acetylation of diethylene oxide. MORNA MACLEOD. Univ. Coll., London. *J. Chem. Soc.* 1928, 3092.—The reaction of Ac_2O with $\text{O}:(\text{CH}_2\text{CH}_2)_2:\text{O}$ gives some $(\text{CH}_3\text{OAc})_2$ and β,β' -diacetoxyethyl ether, $\text{O}(\text{CH}_2\text{CH}_2\text{OAc})_2$, sweet smelling oil, b_{16} 110–35°, d_{20}^{20} 1.123, n_D^{20} 1.4348, $(R_L)_D$ 44.12. C. J. WEST

Determination of the structure of carbohydrates. M. HAWORTH. *Bull. soc. ind. Mulhouse* 94, 662–6 (1928).—An address. A. PAPINEAU-COUTURE

Reactions relating to carbohydrates and polysaccharides. XX. Preparation, properties and identification of glycerol β -methyl ether. HAROLD HIBBERT, MYRON S. WHEELER AND NEAL M. CARTER. McGill Univ. *J. Am. Chem. Soc.* 51, 302–6 (1929); cf. *C. A.* 23, 596.—Glyceryl α -Me ether (I) gives a practically theoretical yield of a di-*p*-nitrobenzoate, yellow, m. 108°; the β -Me ether deriv., orange, m. 155° (yield, almost quant.). I gives a diphenylcarbamate, m. 118–9°; the β -Me ether deriv., m. 102°. The importance of the β -Me ether as a "type substance" in org. analyses and syntheses is indicated. C. J. WEST

The glycerides of lauric and myristic acids. A. BOMER AND K. FRACH. Münster. *Z. Untersuch. Lebensm.* 55, 501–28 (1928).—Lauric and myristic acids are found in laurel, nutmeg, coconut and palmkernel oils. The glycerides were recovered from these oils by vacuum distn. Nutmeg oil contd. about 40% trimyristin, m. 56.2°. Free stearic acid made up about 6% of the nutmeg oil. The synthesis of α -lauro- α,β -dimyristin, $\text{C}_3\text{H}_6(\text{C}_{12}\text{H}_{23}\text{O}_2)(\text{C}_{14}\text{H}_{27}\text{O}_2)_2$, m. 43.3°, and α -myristo- α,β -dilaurin, $\text{C}_3\text{H}_6(\text{C}_{14}\text{H}_{27}\text{O}_2)(\text{C}_{12}\text{H}_{23}\text{O}_2)_2$, m. 38.0°, is described. C. R. F.

Polysaccharides. II. Acetylation and methylation of starch. WALTER N. HAWORTH, EDMUND L. HIRST AND JOHN I. WEBB. Univ. of Birmingham. *J. Chem. Soc.* 1928, 2681–90.—In prepg. starch for the following expts. 20 g. prime starch was stirred into 600 cc. H_2O until it formed a paste; after 30 min. heating the starch was pptd. by the addn. of EtOH to the warm paste and the ppt. was ground in a mortar with EtOH, finally washed with EtOH and Et₂O and dried *in vacuo*. This powd. starch was treated with 6 times its wt. of glacial AcOH through which Cl had been bubbled for a few sec. and the mixt. stirred 30 min. at 20°; Ac_2O (20 parts by wt.), contg. an amt. of SO_2 equiv. to that of the Cl in the AcOH, was then added and the mixt. stirred at room temp. for 60 min. and then at 55° for about 4 hrs.; there results 96.5% of tri-Ac starch, identical with that obtained by Bergmann and Knehe (*C. A.* 21, 1448). Similar products were obtained from untreated starch, using Cl and SO_2 or $\text{C}_6\text{H}_5\text{N}$ as the catalyst but in 10–15% yields. Methylation of the triacetate with 30% NaOH and Me_2SO_4 at 50° for 1.25 hrs. and at 70° for 1.25 hrs., with final heating for 30 min. at 100°, gives 80% of a product analyzing for di-Me starch, α_D 143° (CHCl_3 , c 1.0) but giving a mixt. of mono-, di- and trimethyl methylglucosides on hydrolysis. Methylation of the triacetate (25 g.) in 250 cc. Me_2CO with 280 cc. 30% NaOH and 100 cc. Me_2SO_4 at 56° (6 methylations in all) gave 89.4% of trimethyl starch, identical with that obtained by Irvine and Macdonald, which gives 80% of trimethylmethylglucoside on hydrolysis. III. The molecular complexity of inulin. HARRY D. K. DREW AND W. N. HAWORTH. *Ibid* 2690–7.—It is considered probable that inulin consists of chains of fructose-furanose or γ -fructose rings, the mol. contg. at least 20 or 24 such rings. Degradation, by means of CO_2 or a trace of HCl, consists in the hydrolytic scission of the chains at junctions between the rings, polysaccharides of shorter chains being produced. Dehydration may in certain circumstances tend to regenerate the longer chain polysaccharides or inulin itself. Complete scission probably leads to the production of γ -fructose, which is then irreversibly changed to ordinary fructose. The migration of inulin in plant stems may possibly occur through the formation of H_2O -sol. polysaccharides which are subsequently dehydrated to inulin in the tubers. C. J. WEST

Preparation of the sodium salts of ω -hydroxybutyric, -valeric and -caproic acids. C. S. MARVEL AND E. R. BIRKHIMER. Univ. of Illinois. *J. Am. Chem. Soc.* 51, 260–2 (1929).— γ -Butyrolactone, b. 202.6°, d_4^{25} 1.1054, n_D^{25} 1.4343, and NaOH, heated 3 hrs., give 40% of Na γ -hydroxybutyrate. δ -Valerolactone, b. 215–20°, d_4^{20} 1.1130, n_D^{20} 1.4600 gives 47% of the corresponding Na salt. Na ϵ -hydroxycaproate was similarly prepd. C. J. WEST

Substituted butyrolactams. SARBHANI SAHAY GUHA SIRCAR. *J. Indian Chem. Soc.* 5, 549–54 (1928).—A no. of substituted butyrolactams (I) were prepd. by slight modification of the method used by Noyes (*Ber.* 27, 917) with camphorimide. Substituted glutaric anhydrides are treated with 2.2 equivs. of concd. aq. NH_3 (d. 0.88), giving the NH_4 salts of the amic acids which are converted to the Na salts with 10% NaOH. The resulting solns. are evapd. to half vol., treated with 1 equiv. of Br in 8 equivs. 10%

NaOH, and heated 2 hrs. at 70–5°. The cool solns. are neutralized with concd. HCl, excess NaOBr decompd. with NaHSO₃, and the solns. made strongly acid with HCl and evapd. to dryness. The residues are extd. with Et₂O to remove the glutaric acid, and then with acetone. The acetone exts. are evapd. to a pasty consistency to remove HCl, dissolved in H₂O and neutralized with NaOH. I are extd. from the resulting solns. with Et₂O. I are sol. in all usual org. solvents, neutral in reaction, and moderately stable toward dil. acids and alkalis. They are pptd. as white ppts. from H₂O by phosphotungstic and tannic acids, Hg(OAc)₂, Pb(OAc)₂, yellow with Meyer's reagent, brown with Dragendorff's reagent, and give violet color with 3,5-(NO₂)₂C₆H₃COCl. I form unstable cryst. addn. compds. with HgCl₂ in H₂O, yellow oily compds. with AuCl₃, yellow oily or cryst. nitrosamines when treated with dil. H₂SO₄ and KNO₂ in the cold which decomp. in warm H₂O. Treatment of the Na derivs. of I with alc. AgNO₃ gives unstable Ag derivs. I form oily or cryst. Bz derivs. according to the Schotten-Baumann reaction. The following compds. were prepd. *Cyclohexane-spiro-butyrolactam*, m. 98°, b₁₃ 180–1° (46% yield); *Bz deriv.*, m. 138°; *nitroso deriv.*, m. 82°; *HgCl₂ addn. compd.*, m. 158–60°. *Cyclopentane-spiro-butyrolactam*, m. 75°, b₁₀ 164° (yield, 38%); *Bz deriv.*, m. 70–1°; *nitroso deriv.*, m. 51–2°; *HgCl₂ addn. compd.*, m. 135°. *β,β-Dimethylbutyrolactam*, m. 65–6°, b₁₂ 146–7° (yield 35%); *Bz deriv.*, m. 69°; *nitroso deriv.*, m. 45°. *β,β-Methylethylbutyrolactam*, m. 74–5°, b₁₃ 150–2°; *nitroso deriv.* is an oil. *β,β-Diethylbutyrolactam*, m. 76–7°, b₁₂ 163° (yield 40%); *HgCl₂ addn. compd.* 130°. *β-Ethylbutyrolactam*, b₁₃ 117–8° (yield, 25%); *nitroso* and *Bz derivs.* are oil. *β-Methylbutyrolactam* b₁₃ 116° (yield, 15%). *Butyrolactam*, b₁₄ 114° (yield, 20%). Reaction with the foregoing lactams is difficult, 0.1 N alkali produces very little effect for 5 hrs. at 55°. Because of the stringent conditions required and the possible accompanying disturbing factors, a study of the influence of the various groups on the stability of the ring was abandoned.

FREDERICK C. HAHN

A molecular compound of glycine anhydride and silver nitrate. TEI-ICHI ASAHINA. Univ. Tokyo. *Z. physiol. Chem.* 179, 83–7(1928).—By dissolving glycine anhydride in hot concd. AgNO₃ and allowing the soln. to cool over night an 80% yield of scaly crystals with pearly luster is obtained. The substance contains 2 mols. each of AgNO₃ and glycine anhydride. It is stable to diffused light, insol. in org. solvents, and decomps. into its constituents by H₂O. At 195° it begins to decomp. and at 210° it puts with formation of NO and metallic Ag. It is probably an intermediate product in the formation of the well-known glycine anhydride Ag from which sarcosine anhydride is obtained by treatment with MeI.

A. W. DOX

Concentration of hydrazine hydrate solution. CHARLES D. HURD AND C. W. BENNETT. Northwestern Univ. *J. Am. Chem. Soc.* 51, 265–9(1929).—Dil. N₂H₄·H₂O solns. may be readily concd. to solns. of 65% strength by distg. them with an equal wt. of xylene until all the hydrocarbon is removed. By beginning with more xylene and distg. similarly, concns. up to 95–6% but apparently not higher, may be effected in a single operation. PhMe is considerably less efficient than xylene and C₆H₆ is quite unsatisfactory for this purpose. CaC₂ and Al₄C₃ do not react with N₂H₄ salts but NaNH₂ reacts violently if undild. Hydrocarbons are unsatisfactory diluents for the purpose of prep. anhyd. N₂H₄ by this method.

C. J. WEST

Photochemical decomposition of glyoxal. RONALD G. W. NORRISH AND JOHN G. A. GERRITHS. Cambridge Univ. *J. Chem. Soc.* 1928, 2829–40.—Glyoxal (I) gas decomps. in the light of the Hg vapor lamp, probably through the agency of the blue, violet and ultra-violet light at 3650 Å. U. The main reaction involves a bimol. change, 2 vol. of I giving 1 vol. of CO and a polymerized solid product. A 2nd reaction to the extent of about 1.5% of the total change probably occurs with the production of H₂ I → 2CO + H₂. The chem. properties, compn. and mol. wt. of the solid product are in accord with its representation as a polymeride of the hitherto unknown *glycerone* (II) to which it is hydrolyzed in H₂O and acids. The properties of II further suggest that in H₂O it exists in tautomeric equil. with an acidic HOCH₂ form: CHOCO-CH(OH)-CHOC(OH).CHOH, in analogy with other substances of this type. The kinetic of the photochem. reaction is discussed. The polymer decomps. 200° without melting. The mol. wt. gradually decreases from 342 (after 30 min.) to 89.5 at a. The *oxamoxaline deriv.*, yellow, m. 165°. PhNHNH₂ in cold 50% AcOH gives a bright yellow compd., C₂₁H₂₀N₄, m. 161°; heated on the H₂O bath, the reaction mixt. turns brownish red and then m. 132°.

C. J. WEST

Interaction of bromine with acetic anhydride. IV. Bromination and chlorination compared. HERBERT B. WATSON AND EMERY H. ROBERTS. Univ. Coll. of North Wales. *J. Chem. Soc.* 1928, 2779–86; cf. C. A. 22, 942.—The reactions of Cl with Ac₂O, AcCl and AcOH indicate that chlorination is in many respects similar to bromi-

nation but it nevertheless presents some striking contrasts. Chlorination of Ac_2O , like bromination, proceeds by 2 routes, involving in 1 the halogenation of the acid chloride and in the other the preliminary enolization of the anhydride. Cl, however, reacts far more slowly than Br; this difference is due entirely to a difference in the speeds of halogenation of the acyl halides, while the velocity of enolization of the anhydride is unaffected. Quinoline, pyridine and AcONa , which inhibit the bromination of Ac_2O , have no similar effect on chlorination; the 1st 2, indeed, accelerate the disappearance of Cl. AcCl reacts with Cl more slowly than with Br; the rate of disappearance of Cl has been found to increase as the reaction proceeds, which is due to side reactions. Addn. of a small quantity of I catalyzes the production of ClCH_2COCl so powerfully that the side reactions are now imperceptible and the velocity is proportional to the concn. of Cl. The reaction of AcOH with Cl is also slower than with Br. A powerful acceleration results from the introduction of a small quantity of AcCl ; the velocity is proportional to the quantity of AcCl added and different acid chlorides have identical effects. HCl also accelerates the chlorination of AcOH , probably due to the production of a trace of AcCl ; the powerful enolizing agents H_2SO_4 and FeCl_3 have very little effect, which indicates that reaction of the halogen with the enolic form of AcOH occurs only to a very small extent. These facts are supported by many exptl. measurements of reaction velocities. I does not attack Ac_2O at 25° nor does introduction of HI or of H_2SO_4 lead to reaction. On heating the Ac_2O with I at 100° for several hrs., there is little fall in I concn. No reaction takes place when AcOH is heated with I at 100° .

C. J. WEST

Influence of solvent on the rotation of optically active compounds. XXVI. The optical activity of malic acid in the presence of sodium molybdate. THOMAS S. PATTERSON AND CHARLES BUCHANAN. Univ. of Glasgow. *J. Chem. Soc.* 1928, 3006-19. The optical activity of malic acid in solns. of Na molybdate of varying concns. and with different wave lengths and temps. is recorded in tables and as curves. The original must be consulted for the discussion.

C. J. WEST

Alkylation of hexacyanochromic acid. FRANZ HÖLZL AND FRIEDRICH VIDITZ. Univ. Graz. *Monatsh.* 49, 241-64(1928). $\text{K}_2\text{Cr}(\text{CN})_6$ is treated with Me_2SO_4 in (or without) MeOH for 3 hrs. at $40-50^\circ$, the product cooled and filtered. From the filtrate KMeSO_4 is pptd. by Et_2O ; further addn. of Et_2O ppts. a red, tarry substance (I). The brown residue, the main product, is washed with H_2O and dried at 105° , yielding a grayish green product (II), $\text{Cr}_2(\text{CN})_4(\text{OH})_2 \cdot 6\text{H}_2\text{O} \cdot \text{MeNC}$, this on keeping over CaCl_2 yields a product (III), $\text{Cr}_2(\text{CN})_4(\text{OH})_3 \cdot 3\text{H}_2\text{O} \cdot 2\text{MeNC}$, which slowly absorbs H_2O from the air to give $\text{Cr}_2(\text{CN})_4(\text{OH})_3 \cdot 4\text{H}_2\text{O} \cdot \text{MeNC}$ (IV). MeI with the Ag salt yields unsatisfactory products, dry HCl with the K salt in abs. EtOH yields $\text{CrCl}_3 \cdot (\text{EtOH})_3$ and in MeCN a brown substance (V) contg. $\text{MeCN} \cdot \text{Cr}_2(\text{CN})_3(\text{OH})_3 \cdot 7\text{H}_2\text{O} \cdot \text{MeCN}$. Me_2SO_4 with the K salt in H_2O at $40-50^\circ$ yields a red liquid from which a Ag deriv. ($\text{Cr}:\text{Ag} = 1:2$) is obtained. Schemes are given for the gradual evolution of these products; thus the hypothetical $(\text{MeNC})_3\text{Cr}(\text{CN})_3$ (VI) by loss of MeNC from 2 mols. would yield the substance $(\text{MeNC})_4$; $(\text{CN})_3\text{Cr}(\text{CN})_3$ (VII); a product which probably has this constitution (contg. a triple bridge of coordinated CN ion) is obtained from Me_2SO_4 and the K salt in EtOH . VII is then considered to be hydrolyzed by H_2O , yielding ultimately the substance $(\text{H}_2\text{O})_7\text{Cr}(\text{CN})_3\text{Cr}(\text{OH})_3$ (VIII), which can be prepd. (+ $2\text{H}_2\text{O}$) with Me_2SO_4 in absence of solvent and treating the product with H_2O without removing the adhering Me_2SO_4 ; by adding AgNO_3 the substance $\text{Ag}_2[(\text{H}_2\text{O})_3\text{Cr}(\text{CN})_3\text{Cr}(\text{OH})_3]$ is obtained. From the decomposition schemes the substances II, III and IV are formulated $[(\text{MeNC})(\text{H}_2\text{O})_2\text{Cr}(\text{CN})_3\text{Cr}(\text{CN})(\text{OH})] \cdot 4\text{H}_2\text{O}$; $[(\text{MeNC})_2(\text{H}_2\text{O})\text{Cr}(\text{CN})_3\text{Cr}(\text{OH})_3] \cdot 2\text{H}_2\text{O}$ and $[(\text{MeNC})(\text{H}_2\text{O})_2\text{Cr}(\text{CN})\text{Cr}(\text{OH})_3] \cdot 2\text{H}_2\text{O}$; each of these has a triple bridge of coordinated CN ion. C. J. W.

Hydantoins. XLVII. Synthesis of polypeptide hydantoins from 2-thiohydantoin-3-acetic acid. ALICE G. RENFREW AND TREAT B. JOHNSON. Yale Univ. *J. Am. Chem. Soc.* 51, 254-9(1929).—2-Thiohydantoin-3-acetic acid (I) and $p\text{-MeOC}_6\text{H}_4\text{CHO}$ with Ac_2O , AcOH and AcONa give 80% of the 5- $p\text{-anisal deriv.}$, m. $280-2^\circ$; $\text{ClCH}_2\text{CO}_2\text{H}$ removes the S, giving 5- $p\text{-anisalhydantoin-3-acetic acid}$, m. $269-71^\circ$; this has also been obtained from hydantoin-3-acetic acid and $p\text{-MeOC}_6\text{H}_4\text{CHO}$. I and $o\text{-HOC}_6\text{H}_4\text{CHO}$ give the 5-salicylal deriv., m. $253-4^\circ$ (decompn.) in 96% yield; $\text{ClCH}_2\text{CO}_2\text{H}$ gives salicylalhydantoin-3-acetic acid, light yellow, m. $273-4^\circ$ (decompn.); *Et ester*, m. 164° (uncor.). Reduction with HI gives *o-hydroxybenzylhydantoin-3-acetic acid*, m. $189-90^\circ$ (75% yield). The 5-piperonal deriv. of I, yellow, m. 291° (decompn.). 5-Piperonalhydantoin-3-acetic acid, lemon-yellow, m. $275-6^\circ$; *Et ester*, m. $159-60^\circ$.

C. J. WEST

Aldehyde condensation with diphenylisothiohydantoin. STUART S. KINGSBURY

AND KLAIRE S. MARKLEY. George Washington Univ. and Johns Hopkins Univ. *J. Wash. Acad. Sci.* **18**, 558-61(1928); cf. *C. A.* **20**, 1980.—Diphenylisothiohydantoin (I) was prepd. by refluxing for 3 hrs. $\text{CS}(\text{NHPh})_2$ and $\text{CH}_2\text{ClCO}_2\text{H}$ in alc. The following 2,3-diphenylisothiohydantoins were prepd. by condensing I with aldehydes: 5-*o*-methoxybenzal (3.4 g. from 2.5 g. I and 1.6 g. *o*- $\text{MeOC}_6\text{H}_4\text{CHO}$), greenish yellow, m. 296-7°; 5-*anisal* (1.46 g. from 2 g. I and 1.15 g. *p*- $\text{MeOC}_6\text{H}_4\text{CHO}$), bright yellow, m. 199°; 5-*veratral* (2.34 g. from 2 g. I and 1.35 g. 3,4-(MeO) $_2\text{C}_6\text{H}_3\text{CHO}$), bright yellow, m. 177-8°; 5-*piperonal* (2.3 g. from 2 g. I and 1.2 g. piperonal), bright yellow, m. 232°; 5-*p*-tolual (from I and *p*- $\text{MeC}_6\text{H}_4\text{CHO}$), dark yellow, m. 197-8°; 5-*p*-hydroxybenzal (from I and *p*- $\text{HOC}_6\text{H}_4\text{CHO}$), greenish yellow, did not m. 300°; 5-*o*-chlorobenzal (from I and *o*- $\text{ClC}_6\text{H}_4\text{CHO}$), greenish yellow, m. 234-5°; 5-*m*-nitrobenzal (1.79 g. from 2 g. I and 1.2 g. *m*- $\text{O}_2\text{NC}_6\text{H}_4\text{CHO}$), deep orange, m. 219-20°; 5-*citral* (2 g. from 5.3 g. I and 3 g. citral), greenish yellow, m. 230°.

LOUISE KELLEY

Direct substitution on the nitrogen of 5,5-dialkylbarbituric acids. ARTHUR W. DOX AND EDWARD G. JONES. Parke, Davis and Co., Detroit. *J. Am. Chem. Soc.* **51**, 316-9(1929). The possibility of tautomeric forms of the 5,5-dialkylbarbituric acids is discussed, the question was definitely disposed of in the case of the 1-benzyl deriv. which was prepd. by 2 methods, the products being identical. Alkylation on the N apparently does not occur until both methylene H have been substituted. By reaction of PhCH_2Cl or $\text{CH}_2=\text{CHCH}_2\text{Br}$ with the Na salts there were prepd. the *N*-benzyl derivs. of the following 5,5-dialkylbarbituric acids: *di*-Et, m. 127°; *ethylisoamyl*, m. 90°; *ethylphenyl*, m. 113°; *diallyl*, m. 116°; *allyl sec butyl*, m. 90-1°, and the *N*-allyl derivs. of *di*-Et, m. 75°; *diallyl*, m. 68-9°; *di*-Pr, m. 73°. Some tetraalkyl deriv. is simultaneously formed. *Diallyldipropylbarbituric acid*, m. 62-3°. C. J. WEST

Identification of alkylbarbituric acids. EDWARD LYONS AND ARTHUR W. DOX. Parke, Davis and Co., Detroit. *J. Am. Chem. Soc.* **51**, 288-91(1929).— $p\text{-O}_2\text{NC}_6\text{H}_4\text{CHCl}$ is a useful reagent for the identification of alkylbarbituric acids. It reacts with these acids in the presence of Na_2CO_3 to form cryst. products with definite m. p.; both the imide and methylene H react to give completely substituted derivs. The following derivs. of barbituric acid were prepd. ($R = p$ nitrobenzyl). 1,3,5,5-tetra-*R*, lemon-yellow chars when heated, 1,3-*di*-*R*-5,5-diethyl, m. 192°, 1-*R*, m. 192°; 1,3-*di*-*R*-5-ethyl-5-isopropyl, m. 160°, 1,3-*di*-*R*-diallyl, m. 190°, 1,3-*di*-*R*-5-ethyl-5-butyl, m. 141°, 1,3-*di*-*R*-5-isoamyl-5-ethyl, m. 138°, 1,3-*di*-*R*-5-ethyl-5-phenyl, m. 169°, 1,3-*di*-*R*-5-ethyl-5-butyl, m. 182°, 1,3-*di*-*R*-5-ethyl-5-amyl, m. 131°, 3,5-*di*-*R*-1-methyl-5-ethyl, m. 139°, 1,3,5-tri-*R*-5-isopropyl, m. 187°, 1,3,5-tri-*R*-5-butyl, m. 180°, 5-*R*-5-phenyl-1,3-diphenyl, m. 218°, 1-*R*-3-methyl-5,5-diethyl, m. 104°, 1-*R*-3,5,5-triethyl, m. 90°, 1-*R*-3-phenyl-5,5-diethyl, m. 133°. C. J. WEST

Xylose from cottonseed bran. WARREN E. EMLEY. *Bur. Standards Ind. Eng. Chem., Anal. Ed.* **6**, No. 21, 3(1928). Brief account of exptl work on the hydrolysis of cottonseed bran or peanut shells for the production of xylose and its possible uses.

C. J. WEST

Rotation dispersion of sugars. THEODOR WAGNER-JAUREGG. *Helv. chim. Acta* **11**, No. 9(1928). Rotation dispersion data are given for α , β -glucose, α , β -galactose, α , β -fructose, α , β -arabinose, α methylglucoside, β -phenylglucoside, β -pentamethylglucose, and β -pentaacetylglucose. Dispersion coeffs. of the unsubstituted sugars are identical within exptl error. The substitution of H in position 1 by Me has no influence, while Ph increases the coeff. only slightly. Substitution of Me in all 5 OH groups causes significant increase of dispersion which is even greater with the penta Ac deriv.

FREDERICK G. HAHN

Hexose diphosphate. P. A. LEVENE AND ALBERT L. RAYMOND. Rockefeller Inst. New York. *J. Biol. Chem.* **80**, 633-8(1928). "On the basis of the rate of hydroly-

Me glucoside of the fructose diphosphate of fermentation, it is concluded that the substance has the <2,5> lactal structure." The stable phosphoric acid residue thus attached to C atom 6 and Neuberg's monophosphate is 6-fructose phosphate.

ARTHUR GROLLMAN

A new *h*-fructose anhydride. H. H. SCHLUBACH AND H. ELSNER. *Naturwissenschaften* **15**, 772(1928). The sirup prepd by Irvine and Garrett (*C. A.* **5**, 1077) from acetone and *h*-fructose contains besides a monoacetonefructose 2 acetone-free compds. in considerable amt. The first one is an anhydride of *h*-fructose, the second a di-*h*-fructose, easily to be converted into a di-*h*-fructose anhydride. The fructose anhydride was identified by methylation; it is a (1,2)(2,5) deriv., the tri-Me compd. being identical with Haworth's inulin deriv. (3,4,6-trimethylfructose). B. J. C. VAN DER HOEVEN

Review of recent papers on lignin. CLARENCE J. WEST. National Research Council, Washington, D. C. *Paper Trade J.* **87**, No. 24, 51-3(1928). A. P. C.

Genuine lignin. II. Action of bromine on acetylated pine wood. WALTER FUCHS AND OTTO HORN. Kaiser Wilhelm-Inst. f. Kohlen-Forschung in Mülheim-Ruhr. *Ber.* 61B, 2197-2202(1928); cf. *C. A.* 22, 2744.—When the dry acetylated wood prep'd. with $\text{Ac}_2\text{O-H}_2\text{SO}_4$ as described in the earlier paper is treated with Br in CCl_4 in the presence of I under the proper conditions a quite const. quantity of Br is absorbed and there is obtained, with slight loss of Ac groups and evolution of a little HBr, a 1st *perbromoacetylwood* (I) with about 6% Br, $\frac{2}{3}$ of which can be removed as HBr with alkali acetates, leaving a 1st *bromoacetylwood* (II) with unchanged wood structure which, after replacement of the AcOH split off, contains 2% Br, 38-9% Ac and 17% lignin. On acid hydrolysis both I and II yield a lignin with about 11% Br. These results indicate that acetylated wood contains a H atom replaceable by Br and a double bond capable of adding Br, and the II obtained by removing 2 mols HBr from I must contain 2 double bonds instead of the 1 present in the original acetylwood. And, in fact, on again treating II with Br there is obtained a 2nd *perbromoacetylwood* (III) with 9% Br, $\frac{2}{3}$ of which can be removed with alkali acetates, leaving a 2nd *bromoacetylwood* (IV) which, after replacement of the slight quantity of AcOH lost, contains 3.5% Br, 18% lignin and 37% Ac. When well dried and carefully acetylated wood is used, the prep'n. of these Br products offers no difficulty. I and III, however, have a tendency to decomp. by spontaneous loss of HBr and must be analyzed as rapidly as possible. The bromolignin obtained from III and IV contains about 18% Br. The firmly bound Br, at least, of all these compds. must be in the lignin part of the wood and the same is also probably true of the loosely held Br, for in all the stages of the reaction all the quantities of Br involved bear simple, whole no. relations to each other. Apparently the acetylated wood takes up one Br atom in firm union by substitution and 2 atoms in loose union by addn. The 2 new double bonds produced by the removal as HBr of the 2 loosely held Br atoms take up 4 more Br atoms, 3 of which can again be split off as HBr while the 4th remains in the lignin part. This process is analogous to that of the exhaustive bromination whereby hydrogenated C_6H_6 nuclei can be converted into purely aromatic derivs. and it may justifiably be assumed that genuine lignin acetate contains a tetrahydrobenzene ring converted by exhaustive bromination into a deriv. of PhBr. Other possibilities are that it contains a ring with more than six C atoms or a long open chain but these seem excluded by the fact that on a 3rd bromination IV takes up no more Br. The Br content of the above compds. gives for the min. mol. wt. of the lignin in acetylated wood an av. value of 690 (± 40), while recent direct detns. have given values around 800. Furthermore, in passing from wood to IV there is a loss of 12.5%, occurring chiefly in the acetylation, and as it is possible that this loss may consist in the splitting off of a building stone of the lignin mol., the concordance between the mol. wts. obtained in the 2 ways is even better. *C. A. R.*

Conversion of hydroaromatic into aromatic compounds. III. 3,5-Dichloro-1-phenyl- $\Delta^{2,4}$ -cyclohexadiene and its behavior with chlorine. LEONARD E. HINKEL AND DONALD H. HEY. Univ. Coll., Swansea. *J. Chem. Soc.* 1928, 2786-91; cf. *C. A.* 22, 2927.—Phenyldihydroresorcinol (94 g.) in 200 cc. dry CHCl_3 , gradually treated with 220 g. PCl_5 , gives 70 g. 3,5-dichloro-1-phenyl- $\Delta^{2,4}$ -cyclohexadiene (I), b_{10} 156°, and some 3,5- $\text{Cl}_2\text{C}_6\text{H}_3\text{Ph}$ (II), m. 36°. I and Cl (cooling) give mainly II; when Cl is passed into I in hot CHCl_3 there results a mixt. of II and 2,3,5- $\text{Cl}_3\text{C}_6\text{H}_2\text{Ph}$ (III). Nitration of II in AcOH gives the 4'- NO_2 deriv., pale yellow, m. 146°, and the 2'- NO_2 deriv., m. 75°. The 4'- NH_2 deriv., m. 124° (*Ac deriv.*, m. 188°); the 2'- NH_2 deriv., m. 74° (*Ac deriv.*, m. 163°). The 4'- NH_2 deriv., through the diazo reaction, gives 3,5,4'-trichlorodiphenyl, m. 88°; 3,5,2'-tri-Cl deriv., pale yellow, m. 58°. Nitration of III gives the 4'- NO_2 deriv., yellow, m. 155°. *C. J. WEST*

Use of chromium powder in organic syntheses. SACHINDRA NATH CHAKRABARTY AND SIKHIBHUSAN DUTT. *J. Indian Chem. Soc.* 5, 513-8(1928).—The use of metallic Cr in a no. of org. syntheses in which metals such as Na, Cu, Ag, Zn, Hg and Al are generally used has been studied. Cr behaves in a similar manner to Al (see *C. A.* 22, 4508) in most of the reactions studied, but its action is less vigorous and yields are lower. Cr does not react with org. Br or I compds. Successful results were obtained with org. Cl compds. in which the Cl is quite labile. Freshly powd. Cr is much more reactive than old powd. Cr. The activity of the latter however can be renewed by heating to red heat in a current of pure H. Successful reactions tried were: Zinc, Friedel-Crafts' and Ullmann's. Cr cannot be used in Reformatski's or Gattermann's synthesis, nor as a neutral reducing agent. *FREDERICK C. HAHN*

The constitution of high polymers. XIII. H. STAUDINGER. *Ber.* 61B, 2127-31 (1928).—The phys. properties of high polymers are det'd. by the length of the principal-valence chain in the mol., the chem. properties by the nature of the end-standing

groups. The length of the chain may be much greater than that deduced from the unit cell obtained by x-ray analysis.

DAVID DAVIDSON

Polymerization. I. Polymerization of styrene. NICHOLAS A. MILAS. Princeton Univ. *Proc. Natl. Acad. Sci.* **14**, 844-9(1928).—The rate of oxidation of styrene (I) at 110° falls off rapidly because of polymerization which is probably caused by the energy liberated in the oxidation. BzO_2H accelerates both oxidation and polymerization. Anthracene, while allowing the primary oxidation of I to proceed, inhibits the oxidation of the primary oxidation products (BzH and CH_2O) and also the polymerization of I. The anthracene itself suffers induced oxidation to anthraquinone. D. D.

The mobility of various halogen atoms. II. A. ANGELI AND R. POGGI. *Atti accad. Lincei* **7**, 966-9(1928).—The similarity in behavior of MeOCH_2Cl and $\text{MeO-C}_6\text{H}_4\text{CH}_2\text{Cl}$ is already known, both losing HCl readily, either in H_2O or EtOH , also neither reacts with Mg (Grignard reagent). This is probably due to the labile condition of the Cl atom; when there is a group in the *o*- or *p*-positions as in 3,4- or 3,6- $\text{O}_2\text{N}(\text{C}_6\text{H}_4)_2\text{C}_6\text{H}_3\text{CH}_2\text{Br}$, the halogen is stable. This also explains the resistance to heating of certain diazonium salts, as *o*- $\text{MeOC}_6\text{H}_4\text{N}_2\text{Cl}$. Chlorotrianiisylmethane, however, again has a labile Cl atom as its constitution, $\text{MeOC}_6\text{H}_4\text{C}(\text{C}_6\text{H}_4\text{OMe})_2\text{Cl}$, indicates. In a stoppered bottle the latter slowly changes to a red vitreous mass with liberation of HCl gas (pressure formation). The similar product $\text{MeOC}_6\text{H}_4\text{CH}_2\text{Cl}$ also resinifies, losing HCl . The analysis of the product agrees with the empirical formula $(\text{C}_{15}\text{H}_{14}\text{O}_2)_n$, i. e. $2\text{MeOC}_6\text{H}_4\text{CH}_2\text{Cl} = \text{C}_{15}\text{H}_{14}\text{O}_2 + \text{HCl} + \text{MeCl}$. The polyhydroxymethylenes and Balchite are formed similarly from HCHO and salicylic acid, HOCH_2OH and $\text{HO-C}_6\text{H}_4\text{CH}_2\text{OH}$, which have this "labile" constitution. A. W. CONTIERI

Pentanitroaniline. BERNHARD FLÜRSCHHEIM AND ERIC L. HOLMES. *J. Chem. Soc.* **1928**, 3041-6.—3,5-(O_2N) $_2\text{C}_6\text{H}_3\text{NH}_2$ (I) (1 vol.) in 20 vols. of oleum (5% SO_3) and 15 vols. of HNO_3 (d. 1.52) is heated at 70-5° for 3 hrs. without stirring and the product crystal from C_6H_6 , giving *pentanitroaniline* (II), crystg. with 1 C_6H_6 , golden yellow, m. 192°. 3 g. I gives 1.5 g. II; 4.5 g. of the Ac deriv. give only 0.6 g. II. II in Me_2CO , shaken with excess of aq. AcONa , or heated on the H_2O bath with satd. Na_2CO_3 , gives 2,4,6-trinitro-5-aminoresorcinol (III), deep yellow, m. 236.7°. II and 10% aq. KOH transform II into 2,4,6-trinitrophenol (IV), m. 167°. II, refluxed with dry MeOH for 24 hrs., gives the *di-Me ether* of III, lemon-yellow, m. 127.5°; the *di-Et ether*, yellow, m. 127.5°. II and 10% NH_4OH give 2,4,6,1,3,5- $\text{C}(\text{NO}_2)_6(\text{NH}_2)_2$, which has been reduced to a hexaminobenzene, m. 255° (decompn.), whose hexa-Ac deriv. does not m. 30°. It also forms a tripicrate and a tetra- HCl salt. II, boiled with Ac_2O and concd. H_2SO_4 gives a compd., m. 147-7.5°, which may be a tetranitrodiaacetaminophenol. Tetranitroacetanilide, yellow, m. 169° (decompn.). Approx. soly. data for II are given. C. J. WEST

Chlorination of anilides. V. The significance of velocity measurements in relation to the problem of benzene substitution. ALAN E. BRADFELD AND BRYNMOR JONES. Univ. Coll. of North Wales. *J. Chem. Soc.* **1928**, 3073-81; cf. *C. A.* **22**, 2371.—The original should be consulted for the math. discussion under the heads: critical energy measurements for the reactions of *p*-disubstituted benzenes; phase and steric factors; structure and reactivity. *p*-Isobutoxybenzoic acid, m. 136.5°. *p*-Chlorophenyl isobutyrate, b_p 95.7°, n_D^{25} 1.5000. The velocity coeff. for the chlorination of addnl. samples at 20° and for the 2 ethers are given. C. J. WEST

Nitration of *o*-bromoacetanilide. CHARLES S. GIBSON AND JOHN DOBNEY A. JONES. Univ. of London. *J. Chem. Soc.* **1928**, 3092-3. Nitration of 204 g. *o*- $\text{Br-C}_6\text{H}_4\text{NHAc}$ according to Frazer and Engel (*C. A.* **15**, 3633) gives 66 g. 2,4- $\text{Br}(\text{O}_2\text{N})_2\text{-C}_6\text{H}_3\text{NHAc}$ and 80 g. 2,6- $\text{Br}(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{NHAc}$. C. J. WEST

Some substitution products of azobenzene. JAMES BURNS, HAMILTON MCCOMBIE AND HENRY A. SCARBOROUGH. Univ. of Cambridge. *J. Chem. Soc.* **1928**, 2928-36.—Nitration of 5 g. of 4- $\text{MeC}_6\text{H}_4\text{N}:\text{NPh}$ with HNO_3 of d. 1.5 below 5° for 2 hrs. gives 55% of *nitro deriv.*, deep red, m. 183°, also obtained from *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{NH}_2$ and *p*- $\text{MeC}_6\text{H}_4\text{NO}$. *4'-Br deriv.*, orange, m. 152°. PhNO and 4,2- $\text{H}_2\text{N}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{Me}$ give 3-nitro-4-methylazobenzene, golden, m. 105°; 3-*Br deriv.*, yellow, m. 84°. 4- $\text{MeC}_6\text{H}_4\text{N}:\text{NPh}$ and 80 cc. 10% Br-AcOH contg. 4 g. AcONa , heated 8 hrs., gives 1 g. *α-Br deriv.*, red, m. 115°. Nitration of 3- $\text{MeC}_6\text{H}_4\text{N}:\text{NPh}$ with HNO_3 of d. 1.5° below 5° for 90 min. gives the 4,4'-*dinitro deriv.*, bright red, m. 183°. Br-AcOH gives the 4-*Br deriv.*, light yellow, m. 69°. 4,4'-*Dinitro-2-methylazobenzene*, dark red, m. 220°. 2- $\text{MeC}_6\text{H}_4\text{N}:\text{NPh}$ and 10% Br-AcOH give a compd. $\text{C}_{15}\text{H}_{12}\text{N}_2\text{Br}_2$, m. 210°. 4- $\text{ClC}_6\text{H}_4\text{N}:\text{NPh}$, Br and FeCl_3 give the 4'-*Br deriv.*, bright yellow, m. 195°; 4,4'-*di-Cl deriv.*, light yellow, m. 188°; oxidation with hyperol gives 4,4'-*dichloroazoxybenzene*, light straw-colored, m. 157°. 4-*Chloro-4'-nitroazobenzene*, red, m. 169°; 3-*Cl deriv.*, red,

m. 129°. 3-Chloro-4'-bromoazobenzene, deep yellow, m. 128°. 3-Bromo-4-methoxyazobenzene, yellow, m. 78°. 2-Bromo-4-nitroaniline, m. 108°. 3,4'-Dibromo-4-methoxyazobenzene, light yellow, m. 123°, from $p\text{-BrC}_6\text{H}_4\text{NO}$ and $2,4\text{-Br}(\text{H}_2\text{N})\text{C}_6\text{H}_3\text{OMe}$. $4\text{-MeOC}_6\text{H}_4\text{N:NPh}$, 30% Br-AcOH and AcONa give the 3,4',5-tri-Br deriv., yellow, m. 130°. 3,5-Di-Cl deriv., yellow, m. 98°. HBr splits off the Me group, giving 3,5-dichloro-4-hydroxyazobenzene, brown, m. 116°. 3,4'-Dinitro-4-methoxyazobenzene, bright red, m. 190°, from $4\text{-MeOC}_6\text{H}_4\text{N:NPh}$ and KNO_3 in H_2SO_4 . 3-Chloro-4-acetaminobenzene, orange, m. 134°; the 4-amino deriv., deep yellow, m. 99.5°. Reduction of 3 $\text{ClC}_6\text{H}_4\text{N:NPh}$ gives 2-chlorobenzidine, m. 113°. $4\text{-H}_2\text{NC}_6\text{H}_4\text{N:NPh}$, 10% Br in AcOH and AcONa give 3,5-dibromo-4-aminoazobenzene, light yellow, m. 168°; through the diazo reaction there results 3,5-dibromoazobenzene, dark red, m. 104°; reduction with SnCl_2 and NaOH in EtOH gives 3,5-dibromohydrazobenzene, m. 114°, while reduction in EtOH-HCl gives 2,6-dibromobenzidine, m. 185°. C. J. WEST

Interaction of chloral and 2,4,6-trihalogen-substituted phenylhydrazines. FREDERICK D. CHATTAWAY AND FRANCIS G. DALDY. Queen's College, Oxford. *J. Chem. Soc.* **1928**, 2756-62.— $\text{Cl}_3\text{CCHO} \cdot \text{H}_2\text{O}$ (9 g.) and 13.5 g. $2,4,6\text{-Cl}_3\text{C}_6\text{H}_2\text{NHNH}_2 \cdot \text{HCl}$ in 1000 cc. H_2O contg. 20 cc. HCl, heated nearly to boiling, give α, α -dichloro- β -2,4,6-trichlorobenzeneazoethylene (I), deep crimson, m. 54°; the normal hydrazone is an intermediate product but is very unstable and loses HCl rapidly at room temp., giving I; this elimination of HCl is a reversible reaction, for when I in Ac_2O is satd. with HCl at 80°, there results chloral- α -2,4,6-trichlorophenylhydrazone (II), m. 144°. I is also formed from the components in AcOH and AcONa, but if the AcONa is omitted there results glyoxylic acid 2,4,6-trichlorophenylhydrazone (III), pale yellow, m. 167°, also obtained from glyoxylic acid and $2,4,6\text{-Cl}_3\text{C}_6\text{H}_2\text{NHNH}_2 \cdot \text{HCl}$ in boiling H_2O ; the formation of III is due to the hydrolysis of the CCl_3 group, which is a much slower reaction than the elimination of HCl. The initial reaction in EtOH gives I but on further heating there results the Et ester (IV) of III, pale yellow, m. 97.5°, also obtained by the esterification of III and by boiling I with EtOH for 8 hrs. or with EtOH-HCl for 1 hr. Cl and I in AcOH (cooling) give chloral- ω -chloro-2,4,6-trichlorophenylhydrazone, yellow, m. 104°; if the soln. is boiled, HCl is evolved, giving α, α, β -trichloro- β -2,4,6-trichlorobenzeneazoethylene (V), bright red, m. 75°. Br gives the corresponding α, α -dichloro- β -bromo deriv., brick-red, m. 108.5°. IV in Ac_2O contg. a drop of H_2SO_4 gives the α -Cl deriv., m. 112.5°. Cl and IV in AcOH give the ω -Cl deriv. (VI), m. 73.5°, also obtained by boiling V in EtOH for 8 hrs. The corresponding α -Br deriv. (VII), m. 75°. III and Cl in AcOH give the ω -Cl deriv., yellow, m. 151.5°. $2,4,6\text{-Cl}_3\text{C}_6\text{H}_2\text{N}_2\text{Cl}$ and $\text{AcCH}_2\text{CO}_2\text{Et}$ in EtOH-AcONa give Et 2,4,6-trichlorobenzeneacetate, yellow, m. 94.5°, with Cl and Br this yields VI and VII, resp. With $2,4,6\text{-Br}_3\text{C}_6\text{H}_2\text{NHNH}_2$ the following compds. were prepd.: α, α -dichloro- β -2,4,6-tribromobenzeneazoethylene, crimson, m. 92°; α, α, β -tri-Cl deriv., deep red, m. 105°; α, α -dichloro- β -bromo deriv., deep red, m. 115°; glyoxylic acid 2,4,6-tribromophenylhydrazone, pale yellow, m. 170.5° (decomposes); Et ester, pale yellow, m. 126° (α -Cl deriv., m. 133.5°; ω -Cl deriv., m. 108.5°; β -Br deriv., m. 102.5°); Et 2,4,6-tribromobenzeneacetate, yellow, m. 96.5°. C. J. WEST

Dependence of rotatory power on chemical constitution. XXXIII. The resolution of *dl*-*m*-carboxyphenyl ethyl sulfoxide and of *dl*-*m*-carboxyphenylethylsulfine-*p*-toluenesulfonylimine. JOSEPH HOLLOWAY, JOSEPH KENYON AND HENRY PHILLIPS. Battersea Polytechnic. *J. Chem. Soc.* **1928**, 3000-6. *m*-Ethylmercaptobenzoic acid (I), m. 99-100°, on oxidation with HNO_3 gives *dl*-*m*-carboxyphenyl Et sulfoxide, m. 104-6°. The *d*-isomer, m. 71°, $[\alpha]_{546}^{25}$ 236° (CHCl_3 , c 2), is obtained by crystn. of the brucine salt, m. 125-6°, $[\alpha]_{546}^{25}$ 69° (CHCl_3 , c 2.145). The *l*-isomer was obtained through the quinidine salt, m. 198-9°, $[\alpha]_{546}^{25}$ 102° (CHCl_3 , c 1.25). *m*-Carboxyphenyl Et sulfone, m. 162-4°. *m*-Carboxyphenyl Et sulfide dibromide, yellowish red, m. 102°. The action of chloramine-T on I gives *dl*-*m*-carboxyphenylethylsulfine-*p*-toluenesulfonylimine, m. 149°; through the brucine salt, m. 161°, $[\alpha]_{546}^{25}$ -157°, $[\alpha]_{4359}^{25}$ -287°, there results the *l*-isomer, m. 149-50°, $[\alpha]_{546}^{25}$ 368° (EtOH, c 2.543); through the strychnine salt, m. 174°, $[\alpha]_{546}^{25}$ 152° (EtOH, c 0.9566) there results the *d*-isomer: cinchonidine salt, m. 198-9°, $[\alpha]_{546}^{25}$ 50° (CHCl_3 , c 1.050). The rotation of these 2 optically active compds. is given for several solvents and various wave lengths. C. J. WEST

Influence of sulfonic acid groups and other substituents on the color of trisazo dyes. HANS DINNER. *Z. angew. Chem.* **41**, 1078-83(1928).—The introduction of a SO_3H group in all cases gives a positive color change, the change becoming smaller the more SO_3H groups are present. Introduction of a 2nd SO_3H into the diazo component gives a very small positive change. SO_3H in the *p*-position to the azo group is more effective than in *o* or *m*, except in some cases where *m* is just as effective. The light

absorption max. of *o*-sulfanilic (I), metanilic (II) and sulfanilic acid dyes (III) lie near one another, but that for III is shoved more toward the red. The influence of the position of the SO_3H is greater than that of the no. thereof. The fastness to light increases with the introduction of SO_3H groups, I being more effective than II. Dyes from 2,4-anilinedisulfonic acid are faster than those from the 2,5-acid. Dyes contg. benzene derivs. as one component and C_{10}H_8 derivs. as the other are faster to light than dyes contg. benzene derivs. as both components. Substitution of Ph in the NH_2 of J-acid gives a positive color change, increase in light fastness and affinity for cotton, and a decrease in soly. of the dye. Introduction of Me gives a positive or negative color change depending on its position and an increase in light fastness. Alkoxy gives a positive color change, and improvements or very slight decreases in light fastness.

FREDERICK C. HAHN

Organic acids and bases in non-aqueous solutions. IV. Phenols and amines. F. HÖLZL. *Monatsh.* 50, 291-309 (1928); cf. *C. A.* 21, 3188. Compd. formation between phenols and amines was studied by elec. cond. in abs. alc. The phenols studied were PhOH , *o*-, *m*- and *p*- $\text{C}_6\text{H}_4(\text{OH})_2$; the amines were NH_3 , NH_2Et , NHEt_2 , NEt_3 , $(\text{CH}_3\text{NH}_2)_2$, PhCH_2NH_2 , PhNH_2 , *p*- $\text{MeC}_6\text{H}_4\text{NH}_2$, *o*-, *m*- and *p*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$. Compds. are indicated in nearly all cases except with *o*- and *m*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$. G. B. TAYLOR

Phenols from anthracite tar. HORST BRÜCKNER. *Z. angew. Chem.* 41, 1043-6 (1928). B isolates the homologs of PhOH from a 20 kg. sample of crude industrial anthracite tar by the following process. The phenols are first sulfonated, then treated with superheated steam, fractions being taken while the temp. is gradually increasing. By taking advantage of the different solubilities of the homologous phenolates in 25% NaOH , and of the Na salt of the acylglycolic acids of the phenols ($\text{RO}-\text{CH}_2\text{COONa}$) in water, the fractions obtained by steaming are reduced into their constituents.

A. L. HENNE

Hydroxythiophenols. I. JAKOB POLLAK AND EUGEN RIESZ. *Monatsh.* 50, 251-62 (1928). Hydroxythiophenols are of interest as intermediate products in the prepn. of S contg. dyestuffs; they can be readily obtained by the reduction of the hydro-sulfochlorides from chlorosulfonic acids. (With RUDOLF FEIKS.) Reduction of 20 g. of *o*-cresoldisulfonyl chloride in Me_2CO with Zn and H_2SO_4 gives 8 g. of *dimercapto-o-cresol*, m. 51°. FeCl_3 gives a red-violet color; $\text{Ph}(\text{OAc})_2$ ppts. a yellowish red Pb salt, *tri-Bz deriv.*, m. 96°; *dipicryl deriv.*, orange-red, decmps. explosively on heating, and with KOH in EtOH yields a phenoxthin deriv. Reduction of the sulfonyl chloride with Zn and Ac_2O in AcOH AcONa gives a pale yellow oil, probably the tri-Ac deriv. *Dimercapto m-cresol*, m. 69° (9 g. from 20 g. sulfonyl chloride); *tri-Bz deriv.*, m. 120°; *dipicryl deriv.*, orange-yellow, which yields with KOH the compd. $\text{C}_{24}\text{H}_{14}\text{O}_{10}\text{N}_4\text{S}_4$, dark red, which may be a *disulfide* of 2,4-dinitro-7-methyldibenzophenoxthin-6-mercaptan. Reduction with Zn and Ac_2O in AcOH - AcONa gives the *tri-Ac deriv.*, m. 56°. *Tri-mercapto m-cresol*, yellow, m. 35-6°; *tetra Ac deriv.*, m. 76°. (With FRANZ PILPEL.) *Dimercapto p-cresol*, m. 48°; *tri-Mc deriv.*, m. 77°; *tri-Ac deriv.*, m. 98°; *tri-Bz deriv.*,

m. 138°; *dicarboxymethyl deriv.*, m. 139°; *dipicryl deriv.*, yellow, decomp. 109°. *Dimercaptosorcinol* is oily and was analyzed as the *Pb salt*; the *tetra-Me deriv.*, m. 83-6°; the *dicarboxymethyl deriv.*, m. 174°; the *tetracarbethoxy deriv.*, m. 81°; the *dipicryl deriv.*, yellow, decomp. on heating, and with KOH gives the *tetranitrodiphenoxthin deriv.*, dark red, decomp. above 280°; *tetra-Ac deriv.*, m. 136-8°. The *trimercaptosorcinol* is also oily and was analyzed as the *Pb salt*; *penta-Ac deriv.*, m. 105-10°.

C. J. WEST

The directive action of the carbethoxy group in phenols. ERICH GEBAUER-FÜLNEGG AND JOHN SMITH-REESE. Univ. Wien. *Monatsh.* 50, 231-4(1928).—When the CO_2Et group is used to protect the phenolic group in nitrations, substitution in the *o*-position is decreased and that in the *p*-position is increased. PhOCO_2Et (9.5 g.) and AcNO_3 (5 cc.), cooled with ice-salt, and the product sapond. with NaOH , gives 0.5 g. *o*- and 1.6 g. *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{OH}$. The use of BzNO_2 likewise gives a greater amt. of the *p*- than the *o*- NO_2 isomer, while with PhOMe , there results 85% of the *o*- NO_2 deriv. and PhOH gives an excess of the *o*- NO_2 deriv. Nitration with H_2SO_4 and KNO_3 is not suitable for PhOMe ; PhOCO_2Et gives only 20% of NO_2 derivs., but here, also, the *p*-isomer predominates.

C. J. WEST

Chemical examination of salyrgan. GEORGE W. COLLINS. Chem. Lab. Am. Med. Assoc. *J. Am. Med. Assoc.* 91, 1994-5(1928).—Salyrgan appears to be a $\text{Na}\{o\text{-}[\gamma\text{-(hydroxymethyl)-}\beta\text{-methoxypropylcarbamyl}]\text{phenoxy}\}\text{acetate}$, a definite chem. compd. $\text{NaO}_2\text{CCH}_2\text{OC}_6\text{H}_4\text{CONHCH}_2\text{CH}(\text{OMe})\text{CH}_2\text{HgOH}$. The presence of the MeO group and the radical HgOH , as claimed by the H. A. Metz labs., was sustained. The formula generally given in German literature contg. the acetoxymercuri group appears incorrect. While the product contains moisture, there is no evidence that the H_2O is combined as water of crystn.

L. W. RIGGS

Sulfur-containing derivatives of *p*-dichlorobenzene. ERICH GEBAUER-FÜLNEGG AND ERIKA NEUMANN. Univ. Wien. *Monatsh.* 50, 235-6(1928).—The dichloronitrobenzenesulfonyl chloride, m. 59-60°, prepd. by G.-F. and Figdor (*C. A.* 22, 1148), on heating with KOH, gives the *di-K salt* of 1-chloro-3-nitro-4-phenol-5-sulfonic acid, orange leaflets with 1 mol. H_2O (dil. H_2SO_4 in EtOH gives a *mono-K salt*, anhyd. needles) and the *K salt* of 1,4-dichloro-3-nitrobenzene-5-sulfonic acid, less deeply colored leaflets.

C. J. WEST

Acylation of diazomethane. Effects of variations in the conditions on the extent of formation of chloroacetophenone from benzoyl chloride. WM. BRADLEY AND GEROLD SCHWARZENBACH. Univ. of Manchester. *J. Chem. Soc.* 1928, 2904-12.—The reactions involved in the addn. of 1 mol. RCOCl to 2 mols. CH_2N_2 in Et_2O are: $\text{RCOCl} + \text{CH}_2\text{N}_2 = \text{RCOCHN}_2 + \text{HCl}$ (I); $\text{CH}_2\text{N}_2 + \text{HCl} = \text{MeCl} + \text{N}_2$ (II); $\text{RCOCHN}_2 + \text{HCl} = \text{RCOCH}_2\text{Cl} + \text{N}_2$ (III); reactions I and II occur almost to the exclusion of side reactions such as III. Nierenstein (*C. A.* 22, 3389) believes that RCOCH_2Cl may be obtained in high yield by adding the CH_2N_2 to the RCOCl . This suggestion cannot be confirmed and under all conditions PhCOCHN_2 is found to be the principal product of the reaction of CH_2N_2 and BzCl . Of the 3 reactions given above, II is far more rapid than III, which, however, is a facile reaction. II is also more rapid than I, but not to such an extent that BzCl in excess is unable to compete effectively with HCl for the CH_2N_2 that enters the system. When CH_2N_2 is in excess reactions I and II greatly predominate; when BzCl is in excess, I is still the primary reaction but the relatively diminished concn. of CH_2N_2 permits reaction III to occur to a small extent. Under ordinary conditions of rapid addn. or gradual addn. during a period of 25 min., the action of 1 mol. CH_2N_2 on 1 mol. BzCl gives only 10-13% of PhCOCH_2Cl , while the yield of PhCOCHN_2 is approx. 50%. This yield is maintained whether the solvent is dried by P_2O_5 or CaCl_2 and whether the product is isolated after a few min. or several hrs. Heating the product previous to isolation entails the loss of cryst. BzCH_2Cl without increasing the proportion of chloroacetophenone. PhCH_2COCl and CH_2N_2 in Et_2O at -10° give a viscous oil, which decomp. at 90-100° with evolution of N and reacts with *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{CO}_2\text{H}$ to give *p*-nitrobenzoyloxymethyl benzyl ketone, m. 120°. *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{COCl}$ and CH_2N_2 give *o*-diazo-*p*-nitroacetophenone, m. 116-7°; rapid loss of N occurs at 120-5°; warming in AcOH gives *p*-nitro-*o*-acetoxyacetophenone, yellow, m. 121-2°. *o*-Diazo-3,4-diacetoxyacetophenone, lemon-yellow, m. 76-7°; HCl in dry Et_2O gives *o*-chloro-3,4-diacetoxyacetophenone, m. 107.5-8°.

C. J. WEST

Some aromatic hydroxymethylene ketones and their derivatives. ERICH BENARY. *Ber.* 61B, 2252-5(1928).—In connection with the synthesis of pyridine ketones from hydroxymethylene ketones with AcONH_4 and AcOH (*C. A.* 21, 2130) some other aromatic hydroxymethylene ketones were also studied in this respect. Whereas $\text{PhCOCH}_2\text{CHOH}$ gave a mixt. of pyridine ketone and imino compd. its nucleus-substituted de-

rivs. gave only imino compds. with but traces, at most, of basic substances. The new ketones are cryst. and quite stable; the *p*-Br and *p*-Cl derivs. can be titrated as enols by the Meyer Br method. *Hydroxymethylene-p-bromoacetophenone*, from $\text{BrC}_6\text{H}_4\text{COME}$ and HCO_2Et slowly added to Na in cold abs. Et_2O , yellow, m. $71-2^\circ$, gives a red color in alc. with FeCl_3 ; *Cu salt*, green, decomp. about 268° ; *anilide*, yellow, m. 178° . *1-Phenyl-5(3)-p-bromophenylpyrazole*, from the ketone and PhNHNH_2 on the H_2O bath, silvery leaflets, m. 127° . *Iminobisformyl-p-bromoacetophenone*, from the ketone in Et_2O allowed to stand several days with a satd. soln. of AcONH_4 in glacial AcOH , yellow, m. 217° . *Hydroxymethylene-p-chloroacetophenone*, light yellow, m. $48-9^\circ$ gives an intense red color with FeCl_3 in alc.; *anilide*, greenish yellow, m. $163-4^\circ$. *Iminobisformyl-p-chloroacetophenone*, yellow, m. 204° . *1-Phenyl-5(3)-p-chlorophenylpyrazole*, m. 118° . *Hydroxymethylene-m-nitroacetophenone*, light yellow, m. 85° (yield, very small), gives a red color with FeCl_3 in alc.; *anilide*, light yellow, m. 151° ; *imino deriv.*, yellowish, m. $215-6^\circ$. *Hydroxymethylene-m-cyanoacetophenone*, light yellow, m. $103-4^\circ$, gives a deep red color with FeCl_3 in alc.; *imino deriv.*, light yellow, m. 165° . *Iminobisformylmethyl p-tolyl ketone* (with KURT CHARISIUS), m. $155-6^\circ$, shows yellow-green fluorescence in concd. H_2SO_4 ; *iminobisformyl-p-methoxyacetophenone*, m. $188-9^\circ$.

C. A. R.

"Oxidizing" actions of the alkalis. I. GUNTHER LOCK. Techn. Hochschule Wien. *Ber.* 61B, 2234-40 (1928).—Unlike BzH itself, its HO derivs. are so difficultly oxidized that often HO groups are introduced into the nucleus before the CHO group is oxidized to CO_2H , while fusion with alkalis affords a practicable method of converting aromatic HO aldehydes into the acids. This, however, is true only of the free HO aldehydes; their alkyl ethers, like BzH , undergo the Cannizzaro reaction. Earlier investigators have reported that *o*- $\text{HOC}_6\text{H}_4\text{CHO}$ can be converted into the acid only by fusion with KOH and that H is evolved in the process but they do not describe the exptl. conditions. I. has found that the KOH reacts quite rapidly even at $105-10^\circ$ (bath temp.) with $\text{KOC}_6\text{H}_4\text{CHO}$, converting it quant. into $\text{KOC}_6\text{H}_4\text{CO}_2\text{K}$ with evolution of 1 mol. H_2 (detd. as H_2O). That there is not first a Cannizzaro reaction, the $\text{KOC}_6\text{H}_4\text{CH}_2\text{OH}$ then reacting according to the equation $\text{KOC}_6\text{H}_4\text{CH}_2\text{OH} + \text{KOH} = \text{KOC}_6\text{H}_4\text{CO}_2\text{K} + 2\text{H}_2$, was indicated by the results of a control expt. under the same conditions with a mixt. of $\text{KOC}_6\text{H}_4\text{CH}_2\text{OH} + \text{KOH}$. H_2O in the KOH facilitates the reaction by making possible intimate mixing by lowering the m. p., but its presence is not essential; the oxidation also takes place when H_2O is excluded with the utmost care. NaOH and LiOH react in the same way but higher temps. are required (130° and 150° , resp.). Even Ba(OH)_2 dehydrated at 120° can effect the oxidation. NaNH_2 could not be made to react with $\text{KOC}_6\text{H}_4\text{CHO}$. Dissociation of H_2O into H_2 and O at 110° cannot explain the reaction, which is not a true oxidation but a dehydrogenation replacement of the H of the CHO group by the KO residue.

C. A. R.

The degradation of acid azides by the Curtius method. HANS LINDEMANN. *Helv. Chim. Acta* 11, 1027-8 (1928).—The expression "a modified Curtius degradation" employed by Naegeli and Stefanovitch (cf. *C. A.* 23, 113) is not justified since their modification is nothing more than the employment of a different method for the prepn. of the starting product (*viz.* the azide); N. and S. are also in error in the statement that azides prepd. from the chlorides "have never before been employed for the purpose of a Curtius degradation" (cf. *C. A.* 19, 2824; Abderhalden, *Handb. d. Biol. Arbeitsmethoden*, I, pt. 2, 1273 (1927)). The usual method (concd. HCl in sealed tubes or distn. with alk. earth oxides) of converting azides to amines with urethans and ureas as intermediates is often impossible but in some cases it is possible to accomplish the desired result by heating on the water bath with dil. acids, especially AcOH . Thus, 2,4,3,5- $\text{ClMe}(\text{ONa})\text{C}_6\text{HCON}_3$ (5 g.) (prepd. from the corresponding acid chloride and NaN_3 in aq. Me_2CO) when heated on the water bath with 100 cc. 50% AcOH until N_2 evolution ceases, then filtered and cooled, yields 3,5-dinitro-2-chloro-4-methylaniline, yellow, m. 173° ; similarly indoxazene-3-carboxylic azide yields the acetate of 3-aminoindoxazene from which the free base, $\text{C}_7\text{H}_5\text{ON}_2$, is obtained by neutralization with Na_2CO_3 ; the base crystals from H_2O in needles, m. 110° .

N. A. LANGE

o-Sulfinobenzoic acid. WM. B. PRICE AND SAMUEL SMILES. King's Coll., London. *J. Chem. Soc.* 1928, 2858-63.—*o*-Sulfinobenzoic acid (I) yields a dichloride, $\text{C}_6\text{H}_4\text{SCl}_2\text{O.CO}$, cream, m. 62° ; with *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{OH}$ there results the *p*-nitro-

benzyl *o*-carboxybenzenesulfonate, m. 121° ; hydrolysis gives I and the alc. The K salt of I and *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{Br}$ give *o*-carboxyphenyl *p*-nitrobenzyl sulfone, m. 226° , whose *p*-nitrobenzyl ester (II), m. 190° . *m*-Carboxyphenyl *p*-nitrobenzyl sulfone gives a *p*-nitrobenzyl ester, m. 203° . Boiling II with EtONa gives 3-keto-2-*p*-nitrophenyl-2,3-di-

hydrothionaphthene 1,1-dioxide, m. 186°. The K salt of I and $\text{ClCH}_2\text{CO}_2\text{Et}$ give the corresponding 2-carbethoxy deriv. 2-Carboxy-4'-hydroxydiphenyl sulfide, from the dichloride and PhOH , m. 193°; 2',4'-di-HO deriv., m. 190°. $m\text{-C}_6\text{H}_4(\text{OH})_2$ gives bis-2'-carboxyphenyl-2,4-dihydroxybenzene, m. 272°. $\beta\text{-C}_{10}\text{H}_7\text{OH}$ gives *o*-carboxyphenyl 2-hydroxy- α -naphthyl sulfide, m. 237°. The reactions of the dichloride confirm the structure assigned to it.

C. J. WEST

4-Chloro-2-aminobenzoic acid. GUSTAV HELLER AND LUDWIG HESSEL. Univ. Leipzig. *J. prakt. Chem.* 120, 64-73(1928).—Et 4-chloro-2-aminobenzoate, m. 41° (50% yield); Me ester, m. 68.5°; with $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$ the latter gives the hydrazide, m. 151° (95% yield) (*di-Ac* deriv., m. 214°). Heating 5 hrs. at 200° splits off N_2H_4 , giving, *di*-4-chloro-2-aminobenzoic acid]hydrazide, m. 272°. Chloroanthranilic acid (I) and BzCl in $\text{C}_6\text{H}_5\text{N}$ give 4-chloro-2,1-benzoylanthranil (II), m. 198°, and 4-chloro-2-benzoylaminobenzoic acid, m. 219°, changed into II by warming with concd. H_2SO_4 . II and $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$ in EtOH give 6-chloro-3-phenyl-3-hydrazino-2,4-dihydrobenzoxazone, m. 214°, changed by warming in AcOH to 7-chloro-2-phenyl-3-amino-4-quinazolone, m. 198°. I and Ac_2O give 4-chloro-2-acetantranilic acid, yellow, m. 145°; acidification of the alk. soln. gives 4-chloro-2-acetantranilic acid, m. 213°. $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$ gives 7-chloro-2-methyl-3-amino-4-quinazolone. I and KCN in AcOH give 4-chlorophenyl-2-glycinenitrile-1-carboxylic acid, yellow, m. 215° (decompn.); warming with 50% KOH gives the glycine 4,2-Cl($\text{HO}_2\text{CCH}_2\text{NH}$) $\text{C}_6\text{H}_4\text{CO}_2\text{H}$, red, m. 228° (Me ester, m. 189°); Ac_2O and AcONa give 2,2-dichloroindigo.

C. J. WEST

Salts of aromatic nitriles. II. Potassium phenylacetoneitrile. MARY M. RISING, IRVING E. MUSKAT AND EDMUND W. LOWE. Univ. of Chicago. *J. Am. Chem. Soc.* 51, 262-5(1929); cf. *C. A.* 22, 2377.—Details are given of conditions for the prepn. of *K* phenylacetoneitrile from PhCH_2CN and K in dry Et₂O in a N atm. The salt is yellow, is exceedingly sensitive to traces of H_2O and acids, which form HCN; EtI gives $\text{Ph}(\text{CN})\text{CH}_2\text{Et}$. These 2 reactions indicate a nitride structure, $[\text{PhHC}:\text{C}:\text{N}]\text{K}$ and also a carbide form, $[\text{Ph}(\text{CN})\text{HC}]\text{K}$.

C. J. WEST

The mechanism of the Perkin synthesis. PAUL KALNIN. *Helv. Chim. Acta* 11, 977-1003(1928).—The generally accepted mechanism of the Perkin synthesis as proposed by Fittig is erroneous since the condensation as a rule does not occur between the salt and the aldehyde but rather between the acid anhydride and the aldehyde, the salt acts only as a catalyst since it can be replaced entirely by other catalysts such as tertiary bases (quinoline, pyridine, $\text{Et}_3\text{NCH}_2\text{Ph}$, Et_3N , etc.). The catalytic action (a) causes enolization of the acid anhydride, making possible the addn. of the aldehyde to the enolic acid anhydride; (b) enolizes this addn. product which is formed; and (c) splits off a mol. of acid from the enolized addn. product. The effectiveness of the catalyst is directly proportional to the basicity of the catalyst and consequently the yields are adversely affected by the addn. of free acid and the yield of cinnamic acid (I) can be reduced to zero by adding sufficient free acid. Since the effectiveness of the tertiary bases is directly proportional to their basicity the yield of I can be used to det. the relative basicity of a series of bases; the yield also depends upon the quantity of basic catalyst, the quantity of base necessary decreasing with increasing basicity, increasing quantities of base decrease the yields. The mechanism of the reaction is

$\text{AcOH} + \text{OHCCH}_2\text{Bz} \longrightarrow \text{tar and resins}$. The yield of cinnamic acid depends upon the reactivity of the aldehyde H atom and for this reason aldehydes can be replaced by aldehyde-anilines, RCH NPh . Various alkali salts of weak org. acids can replace the usual AcONa and act even more advantageously as catalysts; thus when 20 g. BzH , 30 g. Ac_2O were heated to 180° for 8 hrs. the yields of I based on BzH were: with 11.95 g. AcOK , 72.5%; 8.41 g. K_2CO_3 , 58.9%; 6.46 g. Na_2CO_3 , 40.2%; 10 g. AcONa , 39.3%; 20.1 g. Na_3PO_4 , 36.4%; 10.44 g. K_2SO_3 , 32%; 26 g. K_3PO_4 , 20.4%; 6.72 g. K_2S , 8.4%; 8 g. KCN, 0%; 20.24 g. KI, 0%. The time of reaction can be decreased by a substitution of Na_2CO_3 for AcONa and when K_2CO_3 was substituted for AcONa the time of heating was decreased from 8 hrs. to 15 min.

N. A. LANGE

Addition of halogens to unsaturated acids and esters. II. The addition of "bromine chloride" to phenylpropionic acid. NORMAN WM. HANSON AND THOMAS C. JAMES. Univ. Coll. of Wales. *J. Chem. Soc.* 1928, 2979-85; cf. *C. A.* 22, 3647.

PhC : CCO₂H and a mixt. of BrCl in CCl₄ at 0° in the dark give a mixt. of *trans-chloro- α -bromocinnamic acid*, m. 129°, and the *cis-isomer*, m. 112°; the ratio is approx. 1:4. The lower-melting acid with H₂SO₄ gives *3-chloro-2-bromo-1-ketoindene*, golden yellow, m. 150°; with PhNH₂ the latter gives *2-bromo-3-anilinoindene*, m. 170° (Roser and Haselhoff, *Ann.* 247, 148(1888)); NH₂OH gives the *oxime*, yellow, m. 194° (decompn.); 2-chloro-3-bromo-1-ketoindene gives an *oxime*, m. 184° (decompn.). The *trans-acid* is not changed by H₂SO₄ and from a mixt. of the 2 acids may be recovered after H₂SO₄ treatment and removal of the indene. BrCl reacts with PhC : CCO₂H at a much more rapid rate than either Br or Cl alone, the reaction being of the bimol. type, without an inhibition period. *cis*-PhCCl:CClCO₂H and Cl in CCl₄ give $\alpha,\alpha,\beta,\beta$ -tetrachloro- β -phenylpropionic acid, m. 130°. *cis*-PhCCl:CBBrCO₂H and Cl yield α,β,β -trichloro- α -bromo- β -phenylpropionic acid, m. 127°, and some tetra-Cl deriv. C. J. WEST

Metallic derivatives of hydroxy esters. I. Copper and nickel derivatives of methyl salicylate. BRIAN W. DOAK AND JOHN PACKER. Univ. of New Zealand. *J. Chem. Soc.* 1928, 2763-9.—Cu(AcO)₂·2H₂O (36 g.) in H₂O and 16 g. concd. NH₄OH, added to 50 g. *o*-HOC₆H₄CO₂Me in 5 vols. of 94% EtOH give 67% of *Me cuprisalicylate dihydrate* (I), Cu(OC₆H₄CO₂Me)₂·2H₂O, green, begins to decomp. 115° and may be recrystd from Me₂CO. *In vacuo*, I loses H₂O and *o*-HOC₆H₄CO₂Me, slowly at room temp., more rapidly at 100°, but the hydrolysis is incomplete; when I is heated in the air at 100°, the hydrolysis is also incomplete, owing to the escape of some of the H₂O of crystn. A stream of air, satd. with H₂O, passed over I at 100-5° for 10 days, gives *Me hydroxycuprisalicylate* (II), MeO₂CC₆H₄OCuOH; when dry air is passed over this compd. for 6 days, there results the basic compd. (III), MeO₂CC₆H₄OCuOCu(OH)₂CO₂Me. I, treated with MeOH in a Soxhlet app. until the ext. is colorless, gives *Me methoxycuprisalicylate* (IV), blue, decomp. on heating, decompd. by mineral acids, completely hydrolyzed by boiling H₂O. Treated with wet air at 100° for 4 days and then with dry air for 4 days, there result successively II and III. I and EtOH give a small quantity of HOC₆H₄CO₂Me and Cu(OEt)₂. IV in anhyd. AcOMe contg. the theoretical quantity of *o*-HOC₆H₄CO₂Me gives the anhyd. *Me cuprisalicylate*, green, giving IV with MeOH. *o*-HOC₆H₄CO₂Me, NiCl₂ and NH₄OH give a smaller yield of *Me nickelosalicylate dihydrate* (V), light green. Boiling V with H₂O gives *Me hydroxynickelosalicylate* (VI), dark green. Boiling MeOH or EtOH gives the corresponding *Me methoxy(or ethoxy)nickelosalicylate*. Excess NH₄OH added to the theoretical quantities of NiCl₂ and *o*-HOC₆H₄CO₂Me gives *Me diamminenickelosalicylate*, C₁₆H₂₀O₆N₂Ni, bright purple, hydrolyzed by boiling H₂O to NH₃, HOC₆H₄CO₂Me and VI. C. J. WEST

The glucoside of methyl salicylate of Gaultheria procumbens is the monotropitoside. M. BRIDEL AND S. GRILLON. *Compt. rend.* 187, 609-11(1928).—Me salicylate (I) exists in *Gaultheria procumbens* as a glucoside (II) which is isolated by extn. with alc. in cryst. form, m. 179.5°, α_D^{20} -57.91°. It shows properties identical with monotropitoside. II with concd. H₂SO₄ gives the odor of I; with orcinol and HCl, a violet color characteristic of pentoses; with rhamnodiastase, I and glucose (reducing sugar).

FREDERICK C. HAHN

New synthesis of coumarin derivatives. RICHARD WEISS AND EMERICH MERKSAMMER. Univ. Wien. *Monatsh.* 50, 115-22(1928).—W. and Woidich (*C. A.* 21, 1265) prepd from resacetophenone and AcC(CHOEt)CO₂Et (I) a compd. to which they ascribed the formula 3-acetyl-5-resorcylyl- γ -pyrone and which is now shown to be 3,6-diacetyl-7-hydroxycoumarin (II), m. 166-8°. *Me methoxymethyleneacetate*, b. 150°, m. 56-8°, may also be used. Orcacetophenone and I give 3,6-diacetyl-5-methyl-7-hydroxycoumarin, yellow, m. 211-2°; FeCl₃ gives a wine-red color. I and 2,4-(HO)₂C₆H₃Bz give 60% of 3-acetyl-6-benzoyl-7-hydroxycoumarin, yellow, m. 215-7°; FeCl₃ gives a red color. *o*-C₆H₄(OH)₂ and I give 3-acetyl-7-hydroxycoumarin, yellow, m. 236°. The dil. EtOH soln. shows a strong fluorescence; *bromobenzoyl deriv.*, m. 212-4°. NH₄ gives resorcyldiazine, yellow, does not m. 300°, which crystals with H₂O. 1,2,3-C₆H₃(OH)₃ and I give 3-acetyl-7,8-dihydroxycoumarin, brown needles, m. 251-5°. A by-product from the prepn. of II is a compd., C₁₆H₁₄O₆, m. 192-7°. The previously described 5-Bz deriv., m. 180°, is now to be termed 3-benzoyl-6-acetyl-7-hydroxycoumarin. C. J. WEST

Ozonide of nopinene. GEORGES BRUS AND G. PEYRESBLAQUES. *Compt. rend.* 187, 984-6(1928).—The nopinene (I) used b. 162-3°, d_4^{20} 0.8712, n_D^{20} 1.4861. Ozonized O₃ was bubbled through 5 g. I in 30 cc. pure CHCl₃ at 0°. During each 30 min. 2 cc. CHCl₃ was added to keep the concn. const., since the absorption of O₃ decreased in proportion to the evapn. of the solvent. When absorption of O₃ had ceased, the CHCl₃ was evapd. *in vacuo*. The ozonide (II), C₁₆H₁₆O₈, of I was obtained as a colorless, viscous oil which crystd. partially when kept for a long time at 0°. When heated

with 5% KOH or with AcOH, or distd. with steam, II gave H_2O_2 , CH_2O , nopinone (>50% yield) and a small quantity of an unidentified cryst. substance, m. $125-6^\circ$. This is a good method for the prepn. of nopinone.

LOUISE KELLEY

New compounds of camphor with amines. F. ROMAGNOLI. *Ann. chim. applicata* 18, 465-8(1928).—Camphor-2-aminodimethylphenylisopyrazolone, prepd. by heating together pernitrosocamphor and aminoantipyrine, and recrystg. from EtOH, m. 194° . It is very sol. in org. solvents, as well as in mineral acids, insol. in H_2O and alkalis. Its formation with elimination of H_2O and N_2O indicates the formula

A. W. CONTIERI

Diphenyl series. VIII. Derivatives of 2-amino- and 4-aminodiphenyl. FRANK BELL. Wellcome Chem. Res. Labs, London. *J. Chem. Soc.* 1928, 2770-9; cf. *C. A.* 22, 70.—The attempted prepn. of *o*-diphenylene from diazotized $2\text{-H}_2\text{NC}_6\text{H}_4\text{Ph}$ gave only the 2-Cl and 2-azo derivs. $2\text{-AcNHC}_6\text{H}_4\text{Ph}$, AcOH and HNO_3 (d. 1.5) give, if the temp is kept below 30° , the 5- NO_2 deriv., orange, m. 133° ; at higher temps., more highly nitrated products are formed. Hydrolysis gives 5-nitro-2-aminodiphenyl, yellow, m. 125° , whose *p*-toluenesulfonyl deriv. (I), pale yellow, m. 169° . 2-*p*-Toluenesulfonamidodiphenyl, m. 99° (*Me* deriv. (II), m. 136°); nitration with dil. HNO_3 gives the 5- NO_2 deriv.; nitration in AcOH gives the 3,5-di- NO_2 deriv., m. 186° , hydrolyzed to 3,5-dinitro-2-aminodiphenyl, yellow, m. 182° ; an Ac deriv. could not be prepd. Nitration of II gives the 5- NO_2 deriv., m. 152° , also obtained by methylation of I. 4'-Nitro-2-*p*-toluenesulfonamidodiphenyl, very pale yellow, m. 163° ; nitration gives the 3,5,4'-tri- NO_2 deriv., m. 190° , hydrolyzed to 3,5,4'-trinitro-2-aminodiphenyl, bright yellow, m. 229° . Nitration of $5,2\text{-O}_2\text{N}(\text{AcNH})\text{C}_6\text{H}_3\text{Ph}$ gives the 5,4'-di- NO_2 deriv.; this does not react with *p*- $\text{MeC}_6\text{H}_4\text{SO}_2\text{Cl}$ under the ordinary conditions. 3,5-Dinitro-4-*p*-toluenesulfonamidodiphenyl (III), m. 189° ; hydrolysis gives 3,5-dinitro-4-aminodiphenyl, orange-red, m. 177° , whose Ac deriv., pale yellow, m. 146° . The *Me* deriv. of III, m. 144° , on hydrolysis and acetylation gives 3,5-dinitro-4-acetomethylaminodiphenyl, yellow, m. 149° . Directions are given for the prepn. of $p\text{-O}_2\text{NC}_6\text{H}_4\text{SO}_2\text{Cl}$, from which the following compds. were prepd.: Et *p*-nitrobenzenesulfonate, m. 91° ; menthyl ester, m. 72° ; Ph ester, m. 114° ; *m*-nitrophenyl ester, m. 133° ; *p*-nitrophenyl ester, m. 156° ; *p*-tolyl ester, m. 106° ; 3-nitro-*p*-tolyl ester, m. 136° ; 2-nitro-*p*-tolyl ester, m. 116° . *p*-Nitrobenzenesulfon-*p*-tolylamide, m. $179-80^\circ$; nitration gives the 3,5-dinitro-*p*-tolylamide, m. 185° . $2\text{-H}_2\text{NC}_6\text{H}_4\text{Ph}$ and $\text{Hg}(\text{OAc})_2$ in EtOH- H_2O -AcOH give an oil, which, treated with Ac_2O , yields 5-acetoxymercuri-2-acetamidodiphenyl, m. 200° ; Br gives the corresponding 5-Br deriv. $4\text{-H}_2\text{NC}_6\text{H}_4\text{Ph}$ and $\text{Hg}(\text{OAc})_2$ gives a compd., m. 167° , apparently $\text{PhC}_6\text{H}_3\text{NH.Hg}$, which crysts. from AcOH to give

3-acetoxymercuri-4-acetamidodiphenyl, m. 205° ; repeated crystn. from AcOH raises the m. p. and Hg content; excess of Br gives a compd., m. 196° , probably 3,4-Br-(AcNH) $\text{C}_6\text{H}_3\text{C}_6\text{H}_4\text{Br-4'}$. 3-Bromo-4-*p*-toluenesulfonaminodiphenyl, m. 119° . 3,4-Br-(HO) $\text{C}_6\text{H}_3\text{Ph}$ yields a mono-Hg deriv., m. 235° , but 4-HOC $\text{C}_6\text{H}_4\text{Ph}$ gives a mixt. of more highly mercurated derivs. 3-Acetoxymercuriaceto-*p*-toluide, m. 178° . C. J. W.

Hydroxycarbonyl compounds. Constitution of cotoin, isocotoin and isohydrocotoin. P. KARRER AND N. LICHTENSTEIN. *Helv. Chim. Acta* 11, 789-95(1928). The constitution of cotoin (I), $2,6,4\text{-(HO)}_2(\text{MeO})\text{C}_6\text{H}_2\text{COPh}$ and isocotoin (II), $2,4,6\text{-(HO)}_2(\text{MeO})\text{C}_6\text{H}_2\text{COPh}$, have been established in the following way. I with PhSO_2Cl (III) in pyridine gives a mono-(IV), m. 138° , and a ditoluenesulfonate (V), m. 144° . Partial sapon. of V gives IV. Methylation of IV gives the corresponding ester of hydrocotoin, m. 112° , that is also obtained by the action of III on hydrocotoin (VI). II with III in pyridine gives a mono-(VII), m. 109° , and a ditoluenesulfonate (VIII), m. 137° . VII shows a strong brown color with FeCl_3 , and therefore contains the CO group near the OH group. Partial sapon. of VIII gives a 2nd mono ester, m. 140° , that shows only a weak color with FeCl_3 . Isohydrocotoin, $2,6,4\text{-(MeO)}_2(\text{HO})\text{C}_6\text{H}_2\text{COPh}$, m. 177° , gives no color with FeCl_3 and is formed with VI (see J. Pollak, *Monatsh.* 18, 739) when $3,5\text{-(MeO)}_2\text{C}_6\text{H}_3\text{OH}$ is treated with BzCl and ZnCl_2 . F. C. HAHN

Interaction of ethyl acetoacetate with distyryl ketones. IV. Selective addition

to unsymmetrical chlorodistyryl ketones. ISIDOR M. HEILBRON AND ROWLAND HILL. Univ. of Liverpool. *J. Chem. Soc.* 1928, 2863-70; cf. *C. A.* 21, 2258.—Styryl Me ketone (20 g.) and 19 g. *o*-ClC₆H₄CHO in 150 cc. EtOH and 100 cc. H₂O, treated with 5.5 cc. 1% aq. NaOH (0.01 mol.) at 0° for several days, gives 11 g. (increased to 31 g. by liberal seeding) of 2-chloro- β -hydroxy- β -phenylethyl styryl ketone (I), m. 79-80°; by increasing the alkali concn. to 0.03 mol. or by refluxing the aldol with Ac₂O there is obtained 2-chlorodistyryl ketone (II), yellow, m. 82-3°. The 3-Cl isomer (III), m. 108-9°. The 4-Cl analog of I, from *p*-ClC₆H₄CHO, m. 108-9°; Ac₂O gives the 4-Cl analog (IV) of II, yellow, m. 134°. 2-Chlorostyryl Me ketone and *m*-ClC₆H₄CHO in Et₂O, satd. with Et₂O, give 2,3'-dichlorodistyryl ketone (V), yellow, m. 67-8°; the 2,3'-di-Cl deriv. (VI), yellow, m. 109°. *m*-ClC₆H₄CHO (20 g.) in 100 cc. Me₂CO, dild. to 2000 cc. with H₂O and treated with 100 cc. 10% NaOH, gives 17 g. 3-chlorostyryl Me ketone, yellow, m. 28-9°; *p*-ClC₆H₄CHO gives 3,4'-dichlorodistyryl ketone (VII), pale yellow, m. 134°. II (2.5 g.), 8 cc. AcCH₂CO₂Et and 12 drops piperidine, heated for 48 hrs., give Et [γ -keto- α -phenyl- ϵ -2-chlorophenyl- Δ^5 -pentenyl]acetoacetate, m. 112°; concd. H₂SO₄ gives an orange soln.; warming with EtONa or heating II, AcCH₂CO₂Et and EtONa in EtOH 15 min. gives Et 3-phenyl-5-*o*-chlorostyryl- Δ^5 -cyclohexen-1-one-2-carboxylate, m. 137°. The structure was established by oxidation with KMnO₄, giving *o*-ClC₆H₄CO₂H. Refluxing the ester with H₂SO₄-AcOH gives 3-phenyl-5-*o*-chlorostyryl- Δ^5 -cyclohexen-1-one, yellow, m. 142°. The filtrate from the above ester gives an isomer, Et 3-phenyl-5-*o*-chlorostyryl- Δ^4 -cyclohexen-1-one-2-carboxylate (?), m. 107°; H₂SO₄-AcOH gives 3-phenyl-5-*o*-chlorostyryl- Δ^4 -cyclohexen-1-one (?), golden yellow, m. 136-7°. III and AcCH₂CO₂Et give Et 3-phenyl-5-*m*-chlorostyryl- Δ^5 -cyclohexen-1-one-2-carboxylate, yellow, m. 105-6°; IV gives the corresponding 5-*p*-chlorostyryl deriv., m. 121-5°; V gives the 3-*o*-chlorophenyl-5-*m*-chlorostyryl deriv., pale yellow, m. 108-9°; VI gives the corresponding 5-*p*-chlorostyryl deriv., yellow, m. 143°; VII gives the 3-*m*-chlorophenyl-5-*p*-chlorostyryl deriv., yellow, m. 122°. A possible mechanism of the addn. is discussed.

C. J. WEST

Dehydration of *o*-benzoylbenzoic acid. A. H. GLEASON AND GREGG DOUGHERTY. Princeton Univ. *J. Am. Chem. Soc.* 51, 310-5 (1929).—A series of kinetic studies of the reaction BzC₆H₄CO₂H (I) \longrightarrow C₆H₄(CO)₂C₆H₄ (II) has been undertaken to throw light on the mechanism of such processes in general. I, heated alone, yields small quantities of II; the reaction temp. is high (220°) and numerous by-products are formed. Catalysts, such as AlCl₃, the sulfates of Hg, Cu, Sn, Mg and Ag and other anhyd. salts had little or no effect. TiCl₄ had a marked influence on the reaction temp. and in the presence of traces of this salt a strong positive test for II was obtained at 180°. P₂O₅ does not give good yields of II. Solns. contg. 10 parts concd. H₂SO₄ to 1 of pure I gave II quantitatively when heated 2 hrs. at 100°; at room temp. the yield is approx. 1% in 100 hrs. At 65°, using 1 part I and 10 parts 96% H₂SO₄, the value of *K* is fairly constant at 0.076; at 75°, the values vary from 0.242 to 0.272; at 85°, *K* is 0.838; at higher temps. the reaction was so rapid that *K* could not be accurately measured. The condensing power of the H₂SO₄ is directly proportional to the concn. of the acid. The 1 mol. of H₂O produced during the reaction has little or no effect on the value of *K* and does not cause deviation from the monomol. order as the reaction proceeds; H₂O added to the H₂SO₄ does have a retarding effect but the effect is not as great as in reaction of the (CO₂H)₂ type. The esters and acyl derivs. of I form II under the same conditions as the free I. An explanation of this type of reaction is offered. C. J. W.

The so-called fluorene-oxalic ester. RICHARD KUHN AND ERNST LEVY. Eidgenöss. Tech. Hochschule Zürich. *Ber.* 61B, 2240-8 (1928).—In prepg. Wislicenus' "fluorene oxalic ester," (C₆H₄)₂CHCOCO₂R, K. and L. were struck by the similarity of its color to the yellow diphenylene-acrylic acid, (C₆H₄)₂C:CHCO₂H, which is obtained from it by reduction, sapon. and elimination of H₂O, and were led to believe that it might have the enolic structure of α -hydroxy- β -diphenylene-acrylic ester (C₆H₄)₂C(OH)C(O₂R) (I). Thorough investigation has confirmed this view and shown that I is an enol tautomer completely enolized in the cryst. state. When the finely powd. I (the Me ester was used exclusively in this work) is dissolved as quickly as possible in glacial AcOH at room temp. the yellow color greatly diminishes in intensity (about 1/10 in a few sec.), the change being too rapid to be followed colorimetrically; titrations with Br₂ show that an equil. with the ketonic form is established. If alkali is added to the equil. soln. in alc., the yellow color deepens appreciably. The enolic HO group imparts a strongly acid character to the I, which dissolves in hot NaHCO₃ and can be titrated, with sapon., as a monobasic acid with naphtholphthalein and alkalis. When it is heated with concd. aq. NaOH its originally clear yellow soln. gradually becomes completely colorless and deposits fluorene nearly quant.; from the mother liquors

(CO₂H)₂ can be isolated as the Ca salt after exhaustive sapon. Similarly, 9-iodo-fluorene is obtained with exactly 2 atoms I (as HIO). With O₃ are obtained fluorenone and (CO₂H)₂. I is readily hydrogenated catalytically to (C₆H₄)₂CHCH(OH)CO₂H. It couples with diazonium salts, with elimination of the side chain; with *p*-O₂NC₆H₄N₂-OH it gives a compd. (II) identical with that obtained from fluorenone and *p*-O₂NC₆H₄-NHNH₂ and which with alc. alkalis gives a deep blue color, evidently peculiar to the *aci*-nitro salt; this salt formation is most simply explained by assigning to II the structure of a true hydrazone rather than an azo compd. Of enol derivs. of I were obtained the *p*-nitrobenzoate (III) (with O₂NC₆H₄COCl) and the *Me* ether (IV) (with CH₂N₂); of keto derivs. the *oxime* (V) and the Br deriv. (VI). The Meyer Br titration method gives widely varying results (75-95% enol) with I because of the unusually small reaction velocity between the Br ketone and HI; after the addn. of the β -naphthol and KI the mixt. must be allowed to stand 1-2 hrs., when the enol content is 100% if the crystd. ester is covered with the Br-AcOH soln.: if, however, solns. in glacial AcOH which have stood about 20 hrs. are used, the titration gives only 58.8% enol, which is the equil. value. I (*Me* ester) (65% from 12 g. (CO₂Me)₂ and KOMe in MeOH and 13 g. fluorene in Et₂O), m. 117.5°. Fluorenone *p*-nitrophenylhydrazone (II), yellow, m. 269°. IV, m. 60°, insol. in alkalis, colorless in the solid state but yellow when fused or in soln. III, yellow, m. 255°, gives no color with concd. H₂SO₄ and with FeCl₃. *Me* β -bromo- β -diphenylenepyrivate (VI), m. 94.5°, insol. in alkalis, almost colorless in org. solvents, very slowly forms AgBr with alc. AgNO₃ at room temp. *Me* α -hydroximino- β -diphenylenepropionate (V), m. 190°. C. A. R.

The constitution of a new hydroxybenzofluorenone. HANS E. FIERZ-DAVID AND GASTON JACCARD. *Helv. Chim. Acta* 11, 1042-7 (1928).—The condensation of 2-hydroxyanthraquinone and glycerol (cf. C. A. 16, 1948) as previously reported gives a compd. which is most likely 2-hydroxybenzanthrone (I); but the condensation product of 1-ethoxy- or 1-methoxynaphthalene with BzCl and AlCl₃ when heated to 180-200° gives 6-hydroxy-7,8-benzofluorenone (II) and not I as previously reported by Scholl and Seer (cf. C. A. 7, 790); the mechanism of the reaction is as follows: 1-C₁₀H₇OEt +

naphthyl *Ph* ketone (III), yellow, m. 82.3°, was obtained when a mixt. of 48 g. α -MeO-C₁₀H₇, 200 g. CS₂ and 43 g. BzCl was treated with 60 g. AlCl₃ during the course of 0.5 hr., boiled for 2 hrs., 300 cc. of 10% HCl added, steam distd., and the residue recrystd from 95% EtOH. III (20 g.) and 120 g. AlCl₃ heated 1 hr. at 100-45°, then boiled with HCl, filtered, dissolved in hot, dil. NaOH, and acidified gave about 0.5% I and 85% of 2-hydroxychrysofluorenone (II), red, m. 305°, and gives a non-fluorescing, green soln. in concd. H₂SO₄ (benzanthrone gives fluorescent, yellow or orange solns.); distn. of II with 10 parts of Zn dust in H₂ gave chrysofluorene (IV); oxidation of IV with KMnO₄ and NaOH (cf. Graebe and Honigshberger, *Ann.* 311, 268 (1900)) gave diphthalic acid. The small quantity of I which was formed was isolated by extn. with EtOH from the residue of the Zn distn.; it is yellow and gives a fluorescent orange soln. with H₂SO₄. In a similar manner, condensation of 1,5-C₁₀H₆(OMe)₂, BzCl and AlCl₃ gave 90% of 1,5-dimethoxy-4,8-dibenzoylnaphthalene, m. 356-68°. Condensation of 2,6-C₁₀H₆(OMe)₂ with BzCl and AlCl₃ in CS₂ gave 50% of 2,6-dihydroxy-1,5-dibenzoylnaphthalene, m. 275° (cf. D. R. P. 453,280). N. A. LANGE

Optically active carbonium salts. P. KARRER AND A. HELFENSTEIN. *Helv. Chim. Acta* 11, 842-7 (1928).—Attempts are made to isolate optically active carbonium salts to throw light on the constitution of anthocyanidins (I) from natural anthogen (II) that may be viewed either as oxonium or carbonium salts. II after fission of the sugar group gives I in optically inactive form. This inactivity may be attributed to the strong tendency of the carbonium salt to racemize. Ethers are prepd. by treating Ph(*o*-MeC₆H₄)(PhC₆H₄)CCl (III) with *d*-camphylcarbinol or α -*d*-methylglucoside in the presence of pyridine. A study of the rotation of these ethers in CHCl₃ shows that the carbonium radical must exist in optically active form. Regeneration of the carbinol from the ether by treatment with HCl gas at 0° gives III which is optically inactive, from which it is concluded that the carbonium salt shows such a great tendency to racemize that it is difficult to obtain in optically active form. F. C. H.

Demethylation of 2,4'-dimethoxybenzilic acid. S. YUKAWA. *J. Pharm. Soc. Japan* 48, 816-9 (1928).—Demethylation of 2,4'-dimethoxybenzilic acid (Asahina and Terasaka, C. A. 17, 3028) with HI gave 2,4'-dihydroxydiphenylacetic lactone, m. 158°. Bz deriv. (II), m. 161. Oxidation of II in Me₂CO with KMnO₄ gave a compd., m. 207°, which is probably the mono-Bz deriv. of 2,4'-dihydroxybenzilic acid. NAO UYEI

Preparation of 2,4-dihydroxybenzil. M. URUSHIBARA. *J. Pharm. Soc. Japan* **48**, 819-25(1928).—Condensation of PhCH_2CN and $m\text{-(HO)}_2\text{C}_6\text{H}_4$ by Hoesch's reaction, using ZnCl_2 and HCl as the condensing agents, gave 2,4-dihydroxydesoxybenzoin ketimine *HCl* salt, $(\text{C}_{14}\text{H}_{13}\text{NO}_2)\text{HCl} \cdot \text{H}_2\text{O}$, m. 243° , which on decompn. with H_2O gave the free benzoin (I), m. 117° . I and Ac_2O gave the *di-Ac* deriv. (II) which m. 137° instead of 109° as given by Finzi (*Monatsh.* **26**, 1128). I and $\text{NH}_2\text{OH} \cdot \text{HCl}$ gave the *oxime*, m. 230° (decompn.) instead of 170° . By satg. the soln. of II and AmNO_2 or EtNO_2 in abs. Et_2O with dry HCl , 2,4-dihydroxybenzil monoxime (III), $\text{PhC(}:\text{NOH)-COC}_6\text{H}_3(\text{OH})_2$, m. 187° , was obtained. *Tri-Ac* deriv., m. 189° . PhNHNH_2 with the PhH -sol. portion of the mother liquor from III gave 2,4-dihydroxybenzil osazone, yellow, m. 175° .

NAO UYER

Benzoin-anil-anilide and benzoin-*p*-tolyl-*p*-toluide as ammonobenzoin acetals. HAROLD H. STRAIN. Stanford Univ. *J. Am. Chem. Soc.* **51**, 269-73(1929); cf. *C. A.* **22**, 1149.—Benzoin-anil anilide and *p*-tolyl-*p*-toluide are ammonobenzoin acetals; as ammono acetals they can be ammonolyzed and hydrolyzed; as ammonobenzoin they can be nitrified to ammonobenzils. HCl converts the ammonobenzoin into indole derivs.

C. J. WEST

The chemistry of naphthalene and its derivatives. MARK SALONT. *Dyer, Calico Printer* **60**, 208-9, 229(1928).—A general review is given of their formation and sources, properties and constitution.

RUBY K. WORNER

Catalytic production of polynuclear compounds. I. GEORGE R. CLEMO AND ROBERT SPENCE. Univ. of Durham *J. Chem. Soc.* **1928**, 2811-9.—Heating $1,2\text{-C}_{10}\text{H}_7\text{BrOH}$ with Cu bronze and I, 3 hrs. at 280° gives a mixt. of β -dinaphthol (I), 1,1'-dinaphthylene 2,2'-oxide (II), pale yellow, m. 156° , and 1,1'-dinaphthylene-2,8',2',8'-tetroxide (III), yellow, m. 236° . Boiling I (25 g.) and V_2O_5 (1 g.) for 7 hrs. gives almost pure II; the oxide gives a purple color in concd. H_2SO_4 , changing to red and then to dark brown on warming, the picrate, m. 164° . $\beta\text{-C}_{10}\text{H}_7\text{OH}$ (20 g.) and 0.5 g. WO_3 , heated at 270° and then at 300° , give 12.5 g. ($\beta\text{-C}_{10}\text{H}_7$) $_2\text{O}$, m. 105° . V_2O_5 (0.5 g.) at 300° gives 8 g. I, while 100 g. $\beta\text{-C}_{10}\text{H}_7\text{OH}$ and 1 g. V_2O_5 , heated at 340° , give 43 g. II. $\beta\text{-C}_{10}\text{H}_7\text{OH}$ and 1 g. CaO , heated 10 hrs. between $270\text{--}340^\circ$, give 30 g. isodinaphthylene-oxide (IV), m. $158\text{--}9^\circ$. H_2SO_4 gives an orange-red soln., changing through scarlet, purple and blue to light brown on warming, Br in CS_2 gives a di-Br deriv., m. 193° . Oxidation of II with H_2SO_4 gives $\text{C}_{10}\text{H}_4(\text{CO}_2\text{H})_2$, while CrO_3 and IV give a quinone (V), $\text{C}_{10}\text{H}_6\text{O}_2$, bronze leaflets, m. 268° , which sublimes unchanged and gives a bluish green soln. with H_2SO_4 , becoming brown on heating. Reduction of V with Zn in Ac_2O gives diacetoxyisodinaphthylene oxide, m. $245\text{--}6^\circ$; hydrolysis of V with EtOH-NaOH gives dihydroxydinaphthaquinone (VI), light red, m. 222° ; this crystals with CHCl_3 and C_6H_6 ; *di-Ac* deriv., golden yellow, m. 167° ; H_2SO_4 gives a reddish brown color, or KOH gives a red color (hydrolysis). VI, heated at 250° , loses H_2O , giving *o*-naphthaquinone oxide (VII), deep red, m. $255\text{--}6^\circ$, which condenses with *o*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$ to a phenazine, $\text{C}_{26}\text{H}_{14}\text{ON}_2$, yellow, m. 240° . 2,3 $\text{C}_{10}\text{H}_6\text{ClCO}_2\text{H}$ and Cu bronze in PhNO_2 give only $\beta\text{-C}_{10}\text{H}_7\text{CO}_2\text{H}$. 2-Methoxy-3-naphthylamine, m. 109.5° (*Ac* deriv., m. $124\text{--}5^\circ$), through the diazo reaction, yields 3-bromo-2-methoxynaphthalene, m. 76° ; the 3-*I* deriv., m. 65° ; 2-bromo- β -naphthol, m. $80\text{--}1^\circ$. 2,3- $\text{C}_{10}\text{H}_6(\text{OH})\text{CO}_2\text{H}$ (6 g.) with 0.05 VO_3 or V_2O_5 give dinaphthaxanthone, yellow, m. $134\text{--}5^\circ$. $\alpha\text{-C}_{10}\text{H}_7\text{OH}$ and V_2O_5 at 40° give 2,2'-dinaphthylene-1,1'-oxide, yellow, m. 179° .

Reduction of phenyl naphthyl ketones by the binary system magnesium + magnesium iodide. W. E. BACHMANN AND R. V. SHANKLAND. Univ. of Michigan. *J. Am. Chem. Soc.* **51**, 306-9(1929).—Reduction of $\alpha\text{-C}_{10}\text{H}_7\text{Bz}$ with $\text{Mg} + \text{MgI}_2$ (cf. S. M. S. and B., *C. A.* **21**, 579) gives 46% of diphenyldi- α -naphthylpinacol (I), m. 20° (decompn.), the crude reaction product was shown to be mostly I by rearranging

it ($\text{AcOH} + \text{I}$ or AcCl) to *benzoyldi- α -naphthylphenylmethane*, m. 216–7°. Reduction of the ketone by Zn and AcOH gives a pinacol (II), m. 158° (Cohen, C. A. 13, 2504); rearrangement with AcCl or $\text{AcOH} + \text{I}$ gives a *compd.*, $\text{C}_{24}\text{H}_{24}\text{O}$, m. 232°, which is very resistant to hot EtOH-KOH . II is transformed into I by treating with EtMgI and decomp. the product with ice and NH_4Cl . Reduction of $\beta\text{-C}_{10}\text{H}_7\text{Bz}$ by $\text{Mg} + \text{MgI}$ or by Zn and AcOH gives *diphenyldi- β -naphthylpinacol*, m. 175°; dehydration gives quant. *benzoyldi- β -naphthylphenylmethane*, m. 181–2°. C. J. WEST

Production of thiophene by the interaction of acetylene and carbon disulfide. HENRY V. A. BRISCOE, JOHN B. PEEL AND PERCY L. ROBINSON. Univ. of Durham. J. Chem. Soc. 1928, 2857–8; cf. C. A. 22, 4460.—The small proportion of thiophene that is formed from C_2H_2 and S vapor is produced probably by a direct reaction of C_2H_2 and S and not by a secondary reaction between the gas and CS_2 . C_2H_2 satd. with CS_2 was passed through tubes heated to any desired temp. up to 800°; at 200° the liquid contained only unchanged CS_2 ; at 350° a trace of thiophene appeared; at 700° there was present approx. 10% by vol. of thiophene. The yield could not be increased by the use of bauxite or granular CuS as the furnace packing. C. J. WEST

Synthesis of indole derivatives. II. Synthesis of a few indolecarboxylic acids. S. KEIMATSU AND S. SUGASAWA. Tokyo Imp. Univ. J. Pharm. Soc. (Japan) 48, 755–61(1928); cf. C. A. 22, 3163.—In order to improve the method for the prepn. of 3-[β -aminoethyl indole (I) the following reactions were tried. Action of 1 mol. $\text{AcCH}_2\text{CO}_2\text{Et}$ and 1 atom Na on 1 mol. $\text{ClCH}_2\text{CH}_2\text{CN}$ gave, as a main product, *bis*-[β -cyanoethyl]acetoacetic ester, m. 83°. On the other hand, the action of 3 mols. $\text{AcCH}_2\text{CO}_2\text{Et}$ and 3 atoms Na on 1 mol. $\text{ClCH}_2\text{CH}_2\text{CN}$ gave *cyanomethylacetoacetic ester* (II), b. 156° (yield 70%). II and PhN_2Cl gave *β -cyanomethylpyrrolacetic ester phenylhydrazone* (III), $\text{C}_6\text{H}_5\text{NHN}:\text{C}(\text{CO}_2\text{Et})\text{CH}_2\text{CH}_2\text{CN}$, bright yellow, m. 155°. In an attempt to convert III into the indole deriv. by a ring closure, various condensing agents were used but without success. When EtOH-HCl or $\text{EtOH-H}_2\text{SO}_4$ were used the indole ring formation took place, but sapon. of CN group took place simultaneously and instead of the desired nitrile, *Et indole-3-acetic acid-2-carboxylate* (IV), m. 85.6°, was obtained. The free acid m. 228° (decompn.). Although the synthesis of I from III has not been accomplished, IV has been easily obtained. Therefore in order to study whether the above reaction is a general method for the prepn. of indole- α,β -carboxylic acids the synthesis of Kalb's (C. A. 21, 90) *indole-3-propionic acid* (V) was tried. The action of KCN on $\text{ClCH}_2\text{CH}_2\text{CH}_2\text{Br}$ gave $\text{ClCH}_2\text{CH}_2\text{CH}_2\text{CN}$ (V). Condensation of V with $\text{AcCH}_2\text{CO}_2\text{Et}$ and Na gave *γ -cyanopropylacetoacetic ester* (VI), b. 138–9° (yield, 48%). VI and PhN_2Cl in EtOH-NaOH gave *Et α -keto- δ -cyanovalerate phenylhydrazone* (VII), yellowish brown, m. 93°. Dry HCl on VII in abs. alc. gave an intermediate product, probably the *HCl salt of the imido ester*, which with cold H_2O gave *di-Et indole-3-propionate-2-carboxylate*, m. 95°. The free dicarboxylic acid (VIII) m. 195° (decompn.). Heating of VIII at 220–30° gave V, m. 134°. Synthesis of 2,3-dimethylindole: Heating of *o*- $\text{AcNHC}_6\text{H}_4\text{Et}$ with NaNH_2 gave 2,3-dimethylindole. It is to be noted that the reaction gave an indole instead of a quinoline deriv. III. New method for the synthesis of 3-keto-3,4,5,6-tetrahydro-4-carboline. S. KEIMATSU, S. SUGASAWA AND G. KASUYA. Ibid 762–6.—Manske, Perkin and Robinson (C. A. 21, 1269) have recently obtained harmalan and harmaline by a clever application of the Japp-Klingemann reaction. Since K., S. and K. are interested in the synthesis of 3-[β -phthalimidomethyl]indole-2-carboxylic acid (IV) and 3-keto-3,4,5,6-tetrahydro-4-carboline (V) which are the raw materials for the synthesis of rutecarpine, R., M. and P.'s method was slightly modified to obtain these compds. $\text{AcCHNaCO}_2\text{Et}$ with $\text{C}_6\text{H}_4(\text{CO})_2\text{NCH}_2\text{CH}_2\text{CH}_2\text{Br}$ gave *Et α -acetyl- δ -phthalimidovalerate* (I). The free acid, obtained by sapon. of I, was condensed with PhN_2Cl in EtOH-NaOH to *Et- α -keto δ -phthalimidovalerate phenylhydrazone* (II), yellowish brown, m. 146°. In this reaction, if aq. NaOH were used instead of EtOH-NaOH as a condensing agent, CO_2H should have been decompd. instead of Ac group, to give ζ -phthalimidohexane- β,γ -dione γ -phenylhydrazone as in the case of R., M. and P.'s synthesis of harmaline. Heating of II in abs. alc. with dry HCl gave *Et 3-[β -phthalimidomethyl]indole-2-carboxylate* (III), m. 195°. Boiling of III with EtOH and $\text{H}_2\text{NNH}_2\cdot\text{H}_2\text{O}$ and then heating again with 10% HCl gave R., M. and P.'s compd. V, which m. 188–9° instead of 173–4°. In this reaction IV has probably been formed as an intermediate product. Decompn. of V with dil. EtOH-KOH and then neutralization with AcOH gave IV, m. 257° (decompn.). Further heating of IV with 5–10% HCl gave the *HCl salt of 3-[β -aminoethyl]indole Acetate*, m. 136°. NAO UYEI

Azo dyes from acetoacetanilides. HANS E. FIERZ-DAVID AND EDWIN ZIEGLER. Tech. Hochschule, Zürich. Helv. Chim. Acta 11, 776–86(1928).—A no. of dyes from

acetoacetanilides (I) are prepd. and then reduced. In every case the intermediate unstable aminoacetoacetanilide could not be isolated, the corresponding dihydropyrazine being formed. The general method for the prepn. of I consists in heating $\text{AcCH}_2\text{CO}_2\text{Et}$ (1.2 mols.) in xylene contg. pyridine to 135° and adding thereto during 5 hrs. the aniline (1 mol.) in xylene contg. pyridine, the resulting mixt. being boiled 2 hrs. I sep. from the cool reaction mixt. and are washed with xylene. Prepd. according to this method, *acetoacetanilide*, m. 85° ; *o*-toluide, m. 104° ; *p*-toluide, m. 95° ; *m*-xylide, 89° ; *o*-aniside, 87° ; *o*-chloroanilide, 105° ; *2,5*-dichloroanilide, 96° ; *p*-nitroanilide, 119° ; *diacetoacetbenzidide*, 234° (decompn.). Coupling of the foregoing acetoacetanilides with diazosulfanilic acid and reduction of the resulting azo dyes gave the following dihydropyrazines: *2,5-dimethyldihydropyrazine-3,6-dicarboxanilide* (II), m. 218° ; *o*-toluide, m. $236-7^\circ$; *p*-toluide, m. $227-8^\circ$; *m*-xylide, m. 190° ; *o*-aniside (III), m. 231° ; *o*-chloroanilide, m. 197° ; *2,5*-dichloroanilide, m. 215° . On the basis of the foregoing information the structures of the following I. G. dyes were detd. by reduction to some of the foregoing anilides and corresponding *o*-diamines which gave the known phenanthrazines. In this way it is shown that Hansagelb R is manufd. by coupling $2,5\text{-Cl}_2\text{C}_6\text{H}_3\text{NH}_2$ with phenylmethylpyrazolone; Hansagelb G obtained by coupling *m*-nitro-*p*-toluidine with I is identical with Hansagelb GA, Monolithgelb G and Pigmentgelb HGL; Hansagelb 3G obtained from $4,2\text{-Cl(O}_2\text{N)}_2\text{C}_6\text{H}_3\text{NH}_2$ and I is identical with Pigmentgelb 3GL; Hansagelb 5G from *o*-nitroaniline and I is identical with Monolithgelb 5G, Pigment 5G, extra H 5 GL, Litholechtgelb 5G and Hansagelb 10G from $4,2\text{-Cl(O}_2\text{N)}_2\text{C}_6\text{H}_3\text{NH}_2$ and III.

FREDERICK C. HAHN

Aminobenzothiazoles. X. Mobility of the 1-amino-3-methylbenzothiazole system. ROBERT F. HUNTER AND ERIC R. STYLES. Imperial Coll. Sci. Tech. *J. Chem. Soc.*, 1928, 3019-27. —Because of certain possible criticisms, it is necessary to establish the mobility of a typical substituted 1-aminobenzothiazole (the 3-Me deriv. was chosen) by means of evidence of the symmetry type and of the substitution type, about which there can be no question. The labile acetyl-*o*-tolylthiocarbamide (I) (m. 140°) in CHCl_3 with Br at 0° gives the *tribromide*, $\text{C}_{10}\text{H}_9\text{ON}_2\text{Br}_3\text{S.HBr}$, yellow, m. 173° (decompn.); treatment with SO_2 and then NH_4OH (d. 0.880) gives *1-imino-2-acetyl-3-methyl-1,2-dihydrobenzothiazole*, pale yellow, m. 170° ; refluxing with 25% HCl for 24 hrs. gives *1-amino-3-methylbenzothiazole* (II), m. 136° . The stable form of I yields a *tetrabromide*, orange, m. 140° (decompn.); reduction gives *1-acetamido-3-methylbenzothiazole* (III), m. 285° ; this is identical with the Ac deriv. obtained from II and Ac_2O and on hydrolysis gives II. Bromination of III gives a *hexabromide*, orange, m. $255-8^\circ$ (decompn.). *o*-Tolylthiocarbamide and Br in CHCl_3 give I *tribromide-HBr* (IV), orange-yellow, m. 129° (decompn.); crystn. from 80% EtOH gives *5-bromo-1-amino-3-methylbenzothiazole-HBr*, m. $280-90^\circ$ (decompn.), which is reduced by SO_2 to II. Certain preps. of the IV are unstable in the air and give the HBr salt of II, m. $220-2^\circ$. Bromination of II gives a *tetrabromide*, yellowish brown, m. 302° . Methylation of II (MeI at 100° for 24 hrs.) gives a mixt. of *1-methylamino-3-methylbenzothiazole* (V), m. 130° , and *1-imino-2,3-dimethyl-1,2-dihydrobenzothiazole* (VI), m. 86° ; the resp. Ac derivs. m. 133° and 147° . *o*-Tolylthiocarbamide and MeNH_2 in EtOH give *s-o-tolylmethylthiocarbamide*, m. 161° ; bromination with vigorous refluxing gives a *tetrabromide*, d. m. 75° (decompn.), readily decompd. by atm. moisture; if the bromination is carried out on the steam-bath, there results a *tribromide*, yellow, m. 113° ; reduction with SO_2 gives V. *as-o-Tolylmethylthiocarbamide*, m. $107-8^\circ$, yields a Br deriv. which is reduced to VI. *5-Bromo-o-tolylthiocarbamide*, m. 194° , and Br give a *dibromide-HBr*, orange, turns white at $130-40^\circ$ but is unmelted at 250° ; SO_2 gives the 5-Br deriv. of II. *s-o-Tolylpropylthiocarbamide*, m. 66° ; *tetrabromide*, red, m. 71° (decompn. 130°); reduction gives *1-propylamino-3-methylbenzothiazole*, m. 62° ; HBr salt, m. 179° (decompn.); Ac deriv., m. 61° . The tetra-Br deriv. with EtOH gives a *bromide-HBr*, m. 259° . *s-5-Bromo-o-tolylpropylthiocarbamide*, m. 79° ; reduction of the ill-defined Br compd. gives *5-bromo-1-propylamino-3-methylbenzothiazole*, m. 82° , identical with the base liberated from the last mentioned HBr salt. *s-o-Tolylheptylthiocarbamide*, m. 98° ; *hexabromide*, orange-red, m. 53° ; *1-heptylamino-3-methylbenzothiazole*, m. 57° ; Ac deriv., m. 73° ; the hexa-Br deriv. with EtOH gives a *bromide-HBr*, m. 220° . *s-5-Bromo-o-tolylheptylthiocarbamide*, m. 71° ; *5-bromo-1-heptylamino-3-methylbenzothiazole*, m. 75° .

C. J. WEST

Transformation of quinazolones into triazole derivatives. GUSTAV HELLER, WILLI KÖNIGER, SIEGFRIED GOTTFRIED, HERBERT ARNOLD AND HELMUT HERRMANN. Univ. Leipzig. *J. prakt. Chem.* 120, 49-63 (1928). —Dibenzoyl-*o*-aminobenzohydrazide (7 g.) and 150 cc. dil. NaOH, heated 2 hrs., give 21% of *1-[carboxyphenyl]-2,5-diphenyl-3,4-triazole*, m. 310° ; it is more easily prepd. from 2-phenyl-3-benzoylamino-4-quinazoline;

the triazole is not attacked by concd. H_2SO_4 at 200° , boiling Ac_2O , KMnO_4 , or Zn dust in alk. soln., or CrO_3 in AcOH . 2-Phenyl-3-diacetyl-amino-4-quinazolone, m. 153° ; this or the mono-Ac deriv., heated with dil. alkali, gives 1-[*o*-carboxyphenyl]-2-phenyl-5-methyl-3,4-triazole (I), m. 241° (76% yield); Me ester, m. 156° ; Et ester, m. 165° ; 2-methyl-3-benzoylamino-4-quinazolone and alkali give only a trace of this triazole. Benzoyl-*o*-aminobenzoic acid *p*-chlorobenzoylhydrazide, m. 175° , yields 1-[*o*-carboxyphenyl]-2-phenyl-5-*p*-chlorophenyl-3,4-triazole, m. 204° . *p*-Chlorobenzoyl-*o*-aminobenzoic acid hydrazide, m. 225° ; the benzoylhydrazide, m. 213° ; with dil. alkali the latter yields 1-[*o*-carboxyphenyl]-2-*p*-chlorophenyl-5-phenyl-3,4-triazole, m. 212° . *p*-Chlorobenzoyl-aminobenzoic acid *p*-chlorobenzoylhydrazide, m. 227° (decompn.); alkali gives 1-*o*-carboxyphenyl-2,5-di-*p*-chlorophenyl-3,4-triazole, m. 345° . I, treated with PCl_5 in PCl_3 and then with PhNH_2 , gives the 1-*o*-benzanilide deriv., m. 253° . Attempted nitration of I gave a compd., $\text{C}_{16}\text{H}_{11}\text{O}_6\text{N}_5$, m. 273° . Oxidation of I with KMnO_4 in acid soln. gives a compd., $\text{C}_{16}\text{H}_9\text{O}_2\text{N}_5$, m. 259° . Diacetylbenzohydrazide, m. 152° ; acetylformylhydrazide, m. 96° (70% yield). BzNHNHAc , PhNH_2 and P_2O_5 , heated 45 min., give 1,5-diphenyl-2-methyl-1,3,4-triazole, m. 161° ; picrate, m. 182° ; *p*- $\text{MeC}_6\text{H}_4\text{NH}_2$ gives the 1-*p*-tolyl deriv., m. 162.5° (HCl salt, m. 205.10° ; picrate, m. $160-2^\circ$); 1-*o*-tolyl deriv., m. 177.5° (HCl salt, m. 210° ; picrate, m. 186°). 2-Phenyl-5-methyl-1,3,4-triazole, m. 164.5° , from BzNHNH_2 and AcONH_2 ; picrate, m. 158° ; HCl salt, m. 230° . 1-Phenyl-2,5-dimethyl-1,2,4-triazole, m. 236° . 1-Phenyl-1,3,4-triazole, m. 122° picrate, m. 172° . Dichloroacetylbenzohydrazide chloride, m. 143° . C. J. WEST

Synthesis of derivatives of benzotriazole. SACHINDRA NATH CHAKRABARTY AND SIKHIBHUSAN DUTT. *J. Indian Chem. Soc.* 5, 555 9(1928).—Although *o*-nitroazobenzene (I) is readily reduced to *o*-aminoazobenzene with alc. $(\text{NH}_4)_2\text{S}$, it was found that when I contained other substituents, derivs. of benzotriazole (II) were obtained. C. and D. postulate the theory that the introduction of substituents into the 2 benzene nuclei brings the latter two closer together in space with the result that the reduction takes a different course and derivs. of II are formed. The following benzotriazoles were prepd. by coupling diazotized *o*-nitroaniline with the suitable phenol or amine, and reduction of the resulting substituted *o*-nitroazobenzene with aq. or alc. $(\text{NH}_4)_2\text{S}$. 2-[4'-hydroxy] (III), m. 231° ; 2-[4'-methoxyphenyl], m. 138° , prepd. from *o*-nitrobenzeneazobenzene which was prepd. by methylating *o*-nitrobenzeneazophenol with Me_2SO_4 and NaOH ; 2-[2',4'-dihydroxyphenyl], pale brown, m. 191° ; 2-[4'-hydroxynaphthyl]; yellow, m. 201° ; 2-[2'-hydroxynaphthyl], light brown, m. 119° ; 2-[3'-carboxy-4'-hydroxyphenyl], m. 300° ; 2-[3'-carboxy-4'-hydroxynaphthyl], light gray, m. 189° ; 2-[4'-carboxy-3'-hydroxyphenyl], m. 109° ; 2-[2',3',4'-trihydroxy-6'-carboxyphenyl], yellow powder, m. 191° ; 2-[4'-hydroxy-3'-aldehydophenyl], m. 132° ; 2-[4'-aminophenyl], yellow, m. 135° , which when diazotized and boiled with water gave III; 2-[4'-dimethylaminophenyl], yellow, m. 187° ; 5-amino-2-phenyl, yellow, m. 182° ; 5-amino-2-[4'-sulfo]phenyl, yellow, 5-amino-2-naphthyl, yellow, m. 169° ; 5-amino-2-[2'-naphthyl], brown powder, m. 114° . The structure of III was detd. by oxidation with 5% KMnO_4 to triazoledicarboxylic acid. FREDERICK C. HAHN

Synthesis of polyhydroxychalcones and flavanones. I. Synthesis of 2', 4'-dihydroxychalcone; 2', 4'-dihydroxy-4-methoxyhydrochalcone and isosakuranetin. J. SHINODA AND S. SATO. Tokushima Higher Tech. School. *J. Pharm. Soc. (Japan)* 48, 791-801(1928).—The method of prepn. of polyhydroxychalcones by Kostanecki and his coworkers which consists in the condensation of methoxyacetophenone with methoxybenzaldehyde is beset with difficulty when applied to compds. with free OH groups. S. and S. have now succeeded in the synthesis of polyhydroxychalcones or polyhydroxyhydrochalcones by using Behn's reaction (D. R. P. 95901; *Chem. Zentr.* 1898, I, 1223), i. e., by condensing polyhydroxyphenols with PhCH:CHCOCl (I) or $\text{PhCH}_2\text{CH}_2\text{COCl}$ (II) in PhNO_2 , using AlCl_3 as the condensing agent. When *m*-(HO) $_2\text{C}_6\text{H}_4$ (III) is used the main products are chalcone derivs., while with 1,3,5-(HO) $_3\text{C}_6\text{H}_3$ (IV), the main products are flavanone derivs. Condensation of I and III with AlCl_3 in PhNO_2 gave 2',4'-dihydroxychalcone, m. 151° instead of $133-4^\circ$ as previously reported by Ellison (C. A. 21, 3193). By using II in place of I in the above reaction, 2',4'-dihydroxyhydrochalcone, m. 84° , was obtained, while with *p*- $\text{MeOC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{COCl}$, 2',4'-dihydroxy-4-methoxyhydrochalcone, m. 83° , was obtained. Condensation of IV and I in similar way gave as a main product 5,7-dihydroxyflavanone (V), m. $203-4^\circ$ (oxime, m. 263°), and the isomeric 2',4',6'-trihydroxychalcone (VI), orange needles, m. $189-90^\circ$, together with small amts. of 3 compds., one m. 147.5° (tricinnamoylphloroglucinate), another m. 243° and still another m. 205° . The compd. VI is unstable and by heating with glacial AcOH or heating above its m. p., it changes over to V, whereas heating of V with dil. KOH gives VI. Di-Ac deriv. of V m. $141-2^\circ$. Tri-Ac deriv. (VII) m. $115-$

6.5°. Catalytic reduction of VII gave 2',4',6'-triacetoxhydrochalcone (VIII), m. 76°. CH_3N_2 with V gave the mono-Me deriv., m. 101°. II and IV gave 2',4',6'-trihydroxyhydrochalcone, m. 120–1°, which with Ac_2O gave VIII. *p*-MeOC₆H₄CH:CHCOCl and IV gave 4'-methoxy-5,7-dihydroxyflavanone (or isosakuranetin), m. 193–4°, and a small amt. of a red compd., m. 176°. Condensation of 3',4'-methylenedioxy-cinnamyl chloride and IV gave 3',4'-methylenedioxy-5,7-dihydroxyflavanone, m. 220°, and a red compd., m. 213°. *p*-MeOC₆H₄CH₂CH₂COCl and IV gave 2',4',6'-trihydroxy-4-methoxyhydrochalcone, m. 201–2°. The reason why III gives chalcone derivs., while IV gives flavanone derivs. in the above reaction is probably that the presence of OH at position 6 makes OH at 2 so reactive that the intermediate chalcone compd. formed undergoes a ring closure and changes over to the flavanone deriv. This assumption also explains why substances exist in nature as flavanones rather than trihydroxychalcones. N. U.

Chemistry of grape pigments. V. The anthocyanins in Ives grapes. R. L. SHRINER AND R. J. ANDERSON. New York Agr. Expt. Sta., Geneva. *J. Biol. Chem.* **80**, 743–52 (1928). The anthocyanin pigment in Ives grapes was isolated and found to consist of anthocyanidin, the monoglucoside of dimethoxydelphinidin (enidin), the monoglucoside of a monomethoxydelphinidin, and some deriv. of *p*-hydroxycinnamic acid. The only product obtained by oxidation of the anthocyanidin acetates was syringic acid.

ARTHUR GROLLMAN

Reactions and derivatives of iron carbonyl. III. Pyridine-containing iron carbonyls. W. HIEBER AND F. SONNEKALB. Univ. Heidelberg. *Ber.* **61B**, 2421–7 (1928); cf. *C. A.* **23**, 353. $\text{NH}_2\text{CH}_2\text{CH}_2\text{NH}_2$ (I) combines with $\text{Fe}(\text{CO})_5$ (II) at 70° to form $\text{Fe}(\text{CO})_4\text{NH}(\text{CH}_2\text{CH}_2\text{NH}_2)_2$, reddish yellow prisms, which is notably unstable toward acids, $\text{Fe}(\text{CO})_4$, Fe salts, H_2 and CO being formed. Substitution of CO by I occurs in the presence of $\text{C}_6\text{H}_5\text{N}$. At 80°, 5 mols. of $\text{C}_6\text{H}_5\text{N}$ cause the liberation of 3 mols. of CO, 2 mols. appearing in 10 hrs. and the 3rd very slowly thereafter. At 25° 2 mols. of CO are liberated in 78 hrs., when the reaction comes to a standstill. Two g. II + 4 cc. $\text{C}_6\text{H}_5\text{N}$ were allowed to stand in a loosely stoppered flask at 20–25°. The products were isolated in the absence of H_2O in a N_2 atm. In 12 hrs. the above-mentioned addn. product was obtained. After 3–4 days, monoclinic leaflets of $\text{Fe}(\text{CO})_4\text{C}_6\text{H}_5\text{N}$ separated, while at the end of 10–14 days, deep red pyramids of $\text{Fe}(\text{CO})_2\text{C}_6\text{H}_5\text{N}$ were isolated. Substitution of CO by $\text{C}_6\text{H}_5\text{N}$ occurs only when the liberated CO can escape; it does not take place in sealed tubes. The products are pyrophoric and yield Fe_2O_3 in pseudomorphs of the original crystals. D. D.

α -Methylaminopyridine and some of its derivatives. A. E. CHICHIBABIN AND I. I. KUNJANZ. *Ber.* **61B**, 2215–7 (1928); cf. *C. A.* **22**, 1975. In the earlier paper was described a method of prep. α - $\text{C}_6\text{H}_4\text{NNMe}_2$ by methylating the Na deriv. of α - $\text{C}_6\text{H}_4\text{NNH}_2$ with Me_2SO_4 , sepn. from the α - $\text{C}_6\text{H}_4\text{NNHMe}$ (I) and unchanged $\text{C}_6\text{H}_4\text{NNH}_2$ being effected by acetylating the mixt. and fractionating the acetylation product. If the methylation is carried out under conditions which give much I, the sepn. can be conveniently effected by exhaustive benzoylation, the $\text{C}_6\text{H}_4\text{NNH}_2$ yielding the di-Bz deriv. insol. in dil. acids while the $\text{C}_6\text{H}_4\text{NNMe}_2$ and $\text{C}_6\text{H}_4\text{NNMeBz}$ (II) dissolve readily and after pptn. with Na_2CO_3 or alkalis, can easily be sepd. by fractionation *in vacuo*. Sepn. of II gives I in entirely pure form, b_p 90°, m. 15°. With HNO_2 I readily forms the *nitrosamine* (III) which, unlike PhNMeNO , is not isomerized by hot H_2SO_4 with migration of the NO group to the nucleus. III is reduced to *asym.- α -pyridylmethylhydrazine* (IV). *Benzoyl- α -methylaminopyridine* (II) (50 g. from 94 g. I), b₁₁ 200°, m. 61–2°. III (yield, 93%), greenish yellowish, b₁₀ 123–4°; *picrate*, m. 186–7°. IV, from III in 80% AcOH and Zn powder in H_2O suspension at room temp., b₁₀ 105°; *picrate*, m. 153–5°, forms with BzH a *hydrazone*, m. 67–8°. C. A. R.

Action of thionyl chloride on the pyridinemonocarboxylic acids. HANS MEYER AND RODERICH GRAF. *Ber.* **61B**, 2202–15 (1928). M and others had obtained by the action of SOCl_2 on pyridinecarboxylic acids substances having the properties of acid chlorides, but which, because of their abnormally high m. ps., were thought to be polymers, while Späth and Spitzer (*C. A.* **20**, 3294) later obtained products with normally low m. ps. A renewed study of the reaction has now revealed the cause of the discrepancy. If the treatment of picolinic acid (I) with SOCl_2 is not too prolonged there is obtained almost exclusively the normal low-melting chloride (II) but if it is continued longer nucleus chlorination also takes place, especially at high temps. Nicotinic (III) and isonicotinic acids (IV) are not appreciably halogenated in the nucleus at the b. p. of SOCl_2 but do yield chlorinated derivs. when heated in sealed tubes. If the crude II, still contg. SOCl_2 , is kept *in vacuo* over KOH the originally liquid mass gradually changes into the high-melting product previously thought to be the polymer but which is really II.HCl and finally changes into I.HCl. This change into II.HCl occurs

only in the presence of traces of H_2O . The conversion of II.HCl into I.HCl is at first very rapid but gradually becomes slower and slower so that the resulting mixt. shows for many hrs. an almost const. Cl content, the presence of I.HCl being thereby masked. As in the earlier expts. fresh products were used for the prepn. of the amide and esters while the analyses were made only after they no longer gave off penetrating vapors it is easy to understand why the error as to their true nature was made. The admixed SOCl_2 can readily be removed completely *in vacuo* but the now completely S-free products still evolve for a long time penetrating vapors which, however, do not originate in an excess of SOCl_2 still present but represent the HCl set free in the change of II.HCl into I.HCl . **III** and **IV** behave in the same way but the change of the chloride HCl salts into the acid HCl salts is materially slower. Sublimed **II**, prepd. according to Späth and Spitzer, m. 46° , gives 80% of the amide with NH_3 , is stable in C_6H_6 even in the light or in sealed tubes at 100° but in the cryst. form changes in a few hrs. into a green-black mass even if protected from light and air. II.HCl , readily obtained from **II** in C_6H_6 with HCl, is a powdery ppt. which, when heated under the supernatant fluid in a sealed vessel until dissolved and allowed to cool slowly, seps. in leaflets, whereas on heating in an open dish it loses HCl and changes into I.HCl ; it is extraordinarily hygroscopic and rapidly decomp. in the air into I.HCl and HCl, but when protected from the air it can be kept for months without appreciable change; in a sealed capillary it m. $118-22^\circ$ (decompn.). Chloride of **III**, best prepd. by refluxing its HCl salt 3 days in SOCl_2 , b.₁₂ 85° , m. $15-6^\circ$. Chloride of **IV**, b. 100° in the vacuum of a H_2O pump, m. $15-6^\circ$. 4-Chloropicolinic acid (**V**) (30-40% from 10 g. I.HCl boiled in 30 cc. SOCl_2 until dissolved, and then heated 20 hrs. at 100° , the resulting HCl salt being decompd. with boiling H_2O) m. 182° (decompn.); its NH_4 salt with concd. NH_4OH at 180° gives aminopicolinic acid, m. 260° (decompn.) (isolated through the light violet Cu salt), which above its m. p. loses CO_2 and yields quant. $4\text{-C}_6\text{H}_4\text{NNH}_2$, m. $157-8^\circ$, while on diazotization it yields 4-hydroxypicolinic acid, m. $254-5^\circ$ with evolution of CO_2 and formation of $4\text{-C}_6\text{H}_4\text{NOH}$, m. $65-6^\circ$. Chloride of **V**, m. 46° , can be distd. *in vacuo* without decompn. Me ester, m. $57-8^\circ$. Ph ester, m. 68° . Amide, m. 158° . 4,6-Dichloropicolinic acid (**VI**) (35% from 5 g. **V** and 15 cc. SOCl_2 heated 50 hrs. at 180°), needles (from dil. soln.) or leaflets (from concd. soln.) with $1\text{H}_2\text{O}$, m. $96-7^\circ$, sublimes in anhyd. spears, m. $111-2^\circ$, loses HCl at $160-70^\circ$ and changes into a solid which melts very much higher with decompn. **V** refluxed in **III** (b. 127°) with red P gives a basic 4-iodopicolinic acid-**HI** (**VII**), $\text{C}_{12}\text{H}_9\text{O}_4\text{N}_2\text{I}_3$, m. $185-90^\circ$, converted in hot H_2O by an excess of freshly pptd. AgCl into the free acid (18 g. from 12 g. **V**), m. 169° (decompn.); Me ester, m. $75-6^\circ$. **VI** boiled with **HI** (d. 1.7) and red P gives **VII**. Me ester of **VI**, m. $73-4^\circ$. Amide, m. $172-4^\circ$. 3(5),4,6-Trichloropicolinic acid is obtained as a by-product in the prepn. of **VI**; its Me ester m. $122-3^\circ$. 5-Chloronicotinic acid, m. 171° , is obtained in very small yield from III.HCl with SOCl_2 at 180° , followed by sapon. with boiling H_2O ; chloride, b.₁₂ 120° , m. 53° ; Me ester, m. $88-9^\circ$; Ph ester, m. 79° ; amide, m. $205-6^\circ$. The NH_4 salt with NH_4OH and CuO at 180° yields 5-aminonicotinic acid (Me ester, m. 137°) which above its m. p. forms $3\text{-C}_6\text{H}_4\text{NNH}_2$. 5,6-Dichloronicotinic acid (30% from III.HCl heated 50 hrs. with SOCl_2 at 150°), needles with $1\text{H}_2\text{O}$, m. (anhyd.) $161-2^\circ$, resolidifies a few degrees higher and m. again about 300° (decompn.); boiled a long time in excess of KOH or with moderately concd. H_2SO_4 it gives the 5-chloro-6-hydroxy acid, m. 305° (incipient decompn.). From **IV** and SOCl_2 at $180-220^\circ$ are obtained 3-chloroisonicotinic acid (**VII**), m. 235° (sealed capillary) (Me ester, m. 32°), and 3,5-dichloroisonicotinic acid (**VIII**), m. $218-20^\circ$, sublimes without decompn. *in vacuo*. 3-Hydroxyisonicotinic acid, from **VII** in boiling 50% KOH, yellowish, m. 312° . **VIII** heated 20 hrs. at 230° yields 3,5-dichloropyridine (**IX**), m. $64-5^\circ$, has an intense odor and is extraordinarily volatile; it was also synthesized from 5-chloronicotinic acid through the Me ester, hydrazide (m. 178°), urethan and $3,5\text{-C}_6\text{H}_3\text{N}(\text{NH}_2)\text{Cl}$. 2,5-Dichloropyridine, from Me isocinchomerone through $2,5\text{-C}_6\text{H}_3\text{N}(\text{NH}_2)_2$ treated in concd. HCl with NaNO_2 and Cu_2Cl_2 , extremely volatile, m. 60° , depresses the m. p. of **IX** more than 20° . C. A. R.

A new type of arsenical derivatives of quinoline. S. BERLINGOZZI. Reale Univ. Roma. *Ann. chim. applicata* 18, 333-6(1928) — Earlier investigations (cf. C. A. 22, (1976) have shown that it is possible to couple diazo salts with quinoline derivs., of which the As derivs. are of particular interest because of their pharmacol. value. In the present paper, aminoquinolines were chosen for coupling, both because of their relation to naphthylamines and because they offered the opportunity of obtaining for pharmacol. tests more basic compds. than those of the earlier expts. In conjunction with the latter, the expts. described in the present paper show a new type of arsenical and N deriv. of quinoline. They are particularly adapted to a study of the influence of the

position of substituents in the mol. on the physiol. properties of the resulting compds., and at the same time are of special pharmacol. interest because of the characteristics of the nucleus. Aq. Na arsanilate (2.8 g. in 100 cc. of water and 18 cc. of N HCl) diazotized with 0.1 N $NaNO_2$ (90 cc.), let stand 15 min., 2-methyl-3-aminoquinoline (1.7 g. in slight excess dil. AcOH) added, gradually warmed to 30–5°, let stand several hrs., filtered, washed with water, dried *in vacuo* over H_2SO_4 , yields 2-methyl-3-amino-4-azoquinoline- p -phenylarsonic acid, p -

$(HO)_2OAsC_6H_4N:NC:C(NH_2).CMe:N.C:C.CH:CH.CH:CH$, brown, m. 150–2°

(decompn.), gives intense brown-red solns. in alk. hydroxides and carbonates, from which it is reprecipitated by dil. AcOH, gives an intense brown soln. in concd. H_2SO_4 . Na salt. Following the same procedure, 2-phenyl-3-aminoquinoline (2.2 g.) yields 2-phenyl-3-amino-4-azoquinoline- p -phenylarsonic acid, orange-red, decomps. around 100°, is a weak acid, gives a brown-green soln. in concd. H_2SO_4 . Na salt. In the same way Na arsanilate (2.8 g.) and 2- p -methoxyphenyl-3-aminoquinoline (2.5 g.) yield 2- p -methoxyphenyl-3-amino-4-azoquinoline- p -phenylarsonic acid, brilliant red, decompd. around 145°, gives brown-yellow solns. in concd. H_2SO_4 . Likewise Na arsanilate (2.8 g.) and 8-aminoquinoline (1.4 g.) yield 5-azo-8-aminoquinoline- p -phenylarsonic acid,

$p-(HO)_2OAsC_6H_4N:NC:CH.CH:C(NH_2).C:C.CH:CH.CH.N$, chocolate-colored, is

not altered by heating up to 250°, gives an intense violet-red soln. in concd. H_2SO_4 . In the same way was prepd. 5-amino-8-azoquinoline- p -phenylarsonic acid $p-(HO)_2-$

$OAsC_6H_4N:NC:CH.CH:C(NH_2).C:C.N:CH.CH:CH$, dark wine-red, is not altered

by heating to 250°, gives a brilliant red soln. in concd. H_2SO_4 .

Mercury compounds of quinoline. II. T. UKAI. Kumamoto Pharm. Coll. Japan. *J. Pharm. Soc. (Japan)* 48, 812 (1928); cf. *C. A.* 22, 785.—By the action of $Hg(OAc)_2$ on several Me derivs. of quinoline, products of 3 types were obtained, i. e., (a) $C_8H_7MeN(HgCl)$, (b) $C_8H_7MeN(HgOAc)_2$ and (c) $C_8H_7MeN(HgOAc)$ (?). In the following are given resp. the kinds of derivs. used, the types of products obtained and their m. p.: 2-Me, (a) 154°, (b) 158–60°; 6-Me, (a) 210–3°, (b) does not m. 300°, (c) 229–32°; 7-Me, (a) 190–2°, (b) does not m. 300°, (c) 233–5°; 8-Me, (a) 212–4°, (b) does not m. 300°, (c) 209°.

NAO UYEI

Synthesis of methyl 2,4-dihydroxy-6,7-benzo-1,8-naphthyridin-3-carboxylate.

GLOE KOLLER AND ELSE STRANG. Univ. Wien. *Monatsh.* 50, 144–8 (1928).—Acridonic acid (1 g.) and 8 cc. AcOH, heated 1 hr. at 100°, 2 hrs. at 120° and 1 hr. at 130° give the anhydride, m. 223°; with NH_3 the C_6H_6 soln. ppts. an NH_4 salt, which with SO_2 yields the half amide of acridinic acid, sinters 175°, m. 189–90°; NaOBr transforms this into 2-aminoquinoline-3-carboxylic acid, m. 290–2° (decompn.) (the position of the NH_2 group was established by heating *in vacuo*, 2-aminoquinoline being formed); Me ester, yellow, m. 140–1°; condensation with $CH_2(CO_2Et)$ by heating with NaOEt at 145–50° gives Me 2,4-dihydroxy-6,7-benzo-1,8-naphthyridine-3-carboxylate, m. 240°.

C. J. WEST

Preparation of acridone derivatives. RICHARD WEISS AND J. LUDWIG KATZ. Univ. Wien. *Monatsh.* 50, 109–14 (1928).—The following compds. were prepd. with the idea of transforming them into heterocyclic analogs of trimethylenetriphenylmethane tricarboxylic acid; as yet this has not been accomplished. 4,3-Me(O_2N) C_6H_4COCl and C_6H_5MgCl in CS_2 with $AlCl_3$ give 90% of p -methyl- m -nitrodiphenyl ketone, m. 130–2°; reduction with $SnCl_2$ in concd. HCl gives the m - NH_2 deriv., m. 108–10°; condensed with o - $ClCH_2COH$ (KOH and Cu bronze), there results 2-tolyl-5'-benzoylanthranilic acid, m. 190–2°, crystg. with 0.5 H_2O (Me ester, m. 95–100°, crystg. with 1 H_2O). 2-Methyl-5'-benzoylanthranilic acid, m. 257° (decompn.), results from 4,3-Me(H_2N) C_6H_4COCl and o - $ClCH_2CO_2H$ with K_2CO_3 and Cu. (With WALTER HANDEL AND JACOB MELZER). o - IC_6H_4Me (7 g.) and 4.7 g. of o -tolylanthranilic acid give 3.8 g. of o -tolylanthranilic acid, m. 206–9°. Heating with concd. H_2SO_4 gives N - o -tolylanthranilic acid, m. 197–9°; the EtOH soln. shows a blue fluorescence. Phenyl- o -tolylanthranilic acid, m. 166–8° (86% yield); with concd. H_2SO_4 this gives a mixt. of N - o -tolylacridone and N -phenyl-4-methylacridone, m. 180–95°.

C. J. WEST

The alkylation of 2,5-diketopiperazine and peptides. CH. GRÄNACHER, G. WOLF AND A. WEIDINGER. *Helv. Chim. Acta* 11, 1228–41 (1928).—Of the many alkylation

methods, one in particular is suited to the prepn. of *N*-alkylated acid amides and consists in evapg. to dryness at low temps. the soln. or suspension of the acid amide and MeONa in abs. MeOH and then allowing the alkyl halide to react with the residue. When 5 g. glycine anhydride (I) suspended in a soln. of 2.5 g. Na in 50 cc. MeOH was heated to boiling for 1 min., the MeOH removed *in vacuo* below 40° until the residue was completely dry, 50 cc. PhCH₂Cl previously dried over K₂CO₃ added, heated on the water bath until test portions no longer gave an alk. reaction with moist litmus paper, filtered, washed with Et₂O, the excess I and NaCl removed from the cryst. residue with hot H₂O and then recrystd. from EtOH, 6-7 g. of *N,N'*-dibenzyl-2,5-diketopiperazine (II), PhCH₂N·CH₂·CO·N(CH₂Ph)·CH₂·CO, m. 176°, was obtained. *N*-Benzyl-

glycine-HCl, m. 226°, was obtained when 1.5 g. II was boiled 3-4 hrs. with 70 cc. concd. HCl. *N,N'*-Di-*p*-methoxybenzyl-2,5-diketopiperazine, prepd. like II from I and *p*-MeO C₆H₄CH₂Cl, m. 206°. Alanine anhydride (10 g.) prepd. from *dl*-alanine was treated with MeONa, dried and treated with PhCH₂Cl (70 g.) as above until neutral, the excess PhCH₂Cl removed by distn. *in vacuo*, the residue shaken with 150 cc. Et₂O, allowed to stand 3 hrs., the sepd. NaCl filtered off, the Et₂O removed by distn., the residue heated to 100° to remove traces of PhCH₂Cl and allowed to stand several days in the cold; the *N,N'*-dibenzylalanine anhydride (III) (2 g.) which sepd. m. 144.5°; when boiled with concd. HCl for 12 hrs., the soln. decanted from the impurities, evapd. to dryness *in vacuo*, the residue treated in H₂O with NH₄OH, filtered, the filtrate evapd. to dryness and recrystd. from a very little hot H₂O, *N*-benzyl-alanine (IV), softens 265°, m. 269-70° (decompn.), was obtained. The oily mother liquors from which III sepd. were steam distd., the residue dissolved in Et₂O, the Et₂O soln. washed successively with dil. HCl, H₂O, Na₂CO₃, H₂O, dried over K₂CO₃, the Et₂O evapd., giving the isomeric *N,N'*-dibenzylalanine anhydride (V), softens 85°, m. 89°; III and V are *trans*- and *cis*-stereoisomers, resp.; V is more sol. than III in EtOH or Et₂O; hydrolysis of V with HCl gives IV. *N*-Benzylhippuric acid ethylamide (VI), BzN(CH₂Ph)CH₂CO·NH₂Et, softens 117°, m. 119°, was prepd. by treating 10 g. BzNHCH₂CONH₂Et (VII) with 4 g. Na in 60 cc. abs. MeOH, evapg. to dryness at 60°, treating the residue with excess PhCH₂Cl, heating until neutral, adding Et₂O, removing the sepd. NaCl and cooling; hydrolysis with concd. HCl gave BzOH, benzylglycine-HCl, m. 226°, and PhCH₂NH₂Et. *p*-Bromobenzyl-*N*-hippuric acid ethylamide, prepd. like VI from VII and *p*-BrC₆H₄CH₂Br, m. 134-6°. *N*-Benzyl-hippuric acid benzylethylamide (VIII) BzN(CH₂Ph)CH₂CON(CH₂Ph)Et, obtained from the oily mother liquors in the prepn. of VI by fractional distn. *in vacuo*, b₁₋₂ 230-40°, forming an oil which does not cryst., was identified by the hydrolytic products in HCl soln. (BzOH, benzylglycine and EtNHCH₂Ph).
N. A. LANGE

β-Alanine derivatives. II. Metathiazine ring formation from acyl-β-alanine ester. E. MIYAMICHI. Toyama Pharm. Coll. Japan. *J. Pharm. Soc. (Japan)* **48**, 802-7 (1928) cf. *C. A.* **21**, 2663. - P₂S₅ and PhCONHCH₂CH₂CO₂Et in C₆H₆ gave *Et*-thiobenzoyl-β-alanate (I), yellowish brown, b₁ 175-82°. Heating of I with P₂S₅ at 120-40° gave 2-phenyl-6-ethoxymetathiazine, red, b₅ 85-95°. Picrate, m. 145°. Ac₂O and NH₂CH₂CH₂CO₂Et gave *Et* acetyl-β-alanate, b₆ 142°. III. Pyrimidine ring formation from acylalanine derivatives. *Ibid* 807-11. Action of 33% EtNH₂ in EtOH on PhCONHCH₂CH₂CO₂Et gave benzoyl-β-alanine ethylamide (I), PhCONHCH₂CH₂CONH₂Et, m. 138°. I and P₂O₅ in CHCl₃ gave 1-ethyl-2-phenyl-6-ketotetrahydropyrimidine (II), PhC·N·CH₂CH₂CO·NEt, brown, b_{0.6} 143-5°, which with PCl₅ gave 1-ethyl-2-

phenyl-6-chlorodihydropyrimidine-HCl, PhC·N·CH₂CH₂CCl·NEt·HCl, bright yel-

low, m. 171.3°. The above reactions are of interest because many pyrimidine derivs. are found in the decompn. products of nucleoproteins. NAO UYEI

Synthesis of four amino-3-hydroxy-1,4-benzisoxazines. GEO. NEWBERY AND MONTAGUE A. PHILLIPS. May and Baker, Ltd., Wandsworth. *J. Chem. Soc.* 1928, 3046-50.—These derivs. were prepd. for the orientation of certain of their As derivs. An improved method is given for the prepn. of 3,2-O₂N(H₂N)C₆H₃OH, whose chloroacetyl deriv., yellow, m. 153-4°; heating the latter with NaOH for 30 min. gives 5-nitro-3-hydroxy-1,4-benzisoxazine, orange, m. 115.6°; reduction with Fe and dil. AcOH gives the 5-NH₂ deriv., m. 236°; HCl salt, rhombs; Ac deriv., m. 255°; the triazole, by the action of NaNO₂, m. 204°. 4-Nitro-2-chloroacetamidophenol, m. 245° (decompn.); 6-nitro-3-hydroxy-1,4-benzisoxazine, m. 133.4°; reduction gives the 6-NH₂ deriv., m. 255°, also obtained by reduction of 2,4-(O₂N)₂C₆H₃OCH₂CO₂H with Fe and HCl; HCl salt, m. 300° (decompn.); Ac deriv., m. 298-9°. 2-Nitro-4-acet-

amidophenoxyacetic acid, yellow, m. 205–6°; reduction gives the 6-NH₂ deriv., m. 255°. *5-Nitro-2-chloroacetamidophenol*, light yellow, m. 233°; *7-nitro-3-hydroxy-1,4-benzisoxazine*, yellow, m. 232°; *7-NH₂ deriv.*, m. 220°; *HCl salt*, m. 275–8° (decompn.); *Ac deriv.*, m. 250°. *6-Nitro-2-chloroacetamidophenol*, yellow, m. 126°; *8-nitro-3-hydroxy-1,4-benzisoxazine*, light yellow, m. 255°; *8-NH₂ deriv.*, m. 180°; *HCl salt*, m. 272° (decompn.); *Ac deriv.*, m. 257°.

C. J. WEST

Heterocyclic compounds containing arsenic. II. Derivatives of 1,4-benzisoxazine. GEO NEWBERRY, MONTAGUE A. PHILLIPS AND RALPH WM. F. STICKINGS. May and Baker, Ltd., Wandsworth. *J. Chem. Soc.* 1928, 3051–66.—2,3-H₂N(HO)-C₆H₃AsO₃H₂ (20 g.) in 50 cc. 2 N NaOH, treated alternately with ClCH₂COCl (15 cc.) and 25% NaOH at 50°, gives 60% of *3-hydroxy-1,4-benzisoxazine-5-arsonic acid*, m. 245–8° (decompn.); the Ca, Ba and Mg salts are amorphous. 3,4-AcNH(HO)-C₆H₃AsO₃H₂ (45.5 g.) in 100 cc. H₂O, treated with 20 g. NaOH in 20 cc. H₂O and 16 g. ClCH₂CO₂H, refluxed until the mixt. is acid and again treated with 7 g. NaOH and 8 g. ClCH₂CO₂H, gives 66% of *2-acetamidophenoxyacetic acid-4-arsonic acid*, does not m. 280°. Using ClCH₂CONH₂ gives the corresponding *amide*, m. 236° (decompn.). With 5 N NaOH or 4 N HCl either the acid or amide gives 3-hydroxy-1,4-benzisoxazine 6 arsonic acid (I); I also results from 6-amino-3-hydroxy-1,4-benzisoxazine-HCl through the diazo reaction, from 3,4-ClCH₂CONH(HO)C₆H₃AsO₃H₂ and NaOH or from 3,4-H₂N(HO)C₆H₃AsO₃H₂. *2-Nitrophenoxyacetic acid 4-dichloroarsine*, plates, results from the 4-arsonic acid and HCl with KI satd. with SO₂; it is very resistant to aq. hydrolysis and is not reduced by SnCl₂ or NaHSO₂ but Fe(OH)₂ gives a small yield of *3-hydroxy 1,4-benzisoxazine 6-arsenoxide*, obtained in a 60% yield by reducing the arsenic acid. I (2.7 g.) in 20 cc. H₂O and 5 cc. satd. Na₂CO₃ soln., added to 2 g. MgCl₂·6H₂O and 10 g. NaHSO₂ in 200 cc. H₂O, gives *3,3'-dihydroxy-6,6'-arseno-1,4-benzisoxazine*, light yellow, amorphous. Nitration of I gives about 75% of total NO₂ derivs.; the proportion of 7- and 5-NO₂ compds. varies with the temp.: 0°, 29, 39%; 10°, 35, 35%; 30°, 41, 28%; there is also 1.3% of the 8-NO₂ deriv. The *5-NO₂ deriv.*, yellow, forms sol. cryst. Ca, Ba and Mg salts and a sparingly sol. mono-NH₄ salt; reduction with Fe(OH)₂ gives 70% of the *NH₂ deriv.*, plates, does not m. 300°; HNO₃ gives a *triazole*, C₈H₆O₆N₃As H₂O, m. 247° (decompn.). Refluxing with 5 N HCl for 4 hr. splits off the As, giving *5-amino-3-hydroxy-1,4-benzisoxazine-HCl*. The *7-NO₂ deriv.* of I is yellow and sparingly sol.; the Ca, Ba and Mg salts are sol. yellow solids; reduction gives 70% of the *7-NH₂ deriv.*, m. 258–60° (decompn.); *Ac deriv.*, decomp. 255°, *urethan*, needles. The *7-NO₂ deriv.* may be freed from As by boiling with Na₂SO₃. *3,7-Dihydroxy-1,4-benzisoxazine-6-arsonic acid*, plates, does not m. 300°. Ba salt, prisms; Ca and Mg salts, amorphous. *5-Acetamido-2,4-dihydroxyphenylarsonic acid*, prisms. Ca and Mg salts, amorphous. *3-Nitro-5-chloroacetamido-4-hydroxyphenylarsonic acid*, yellow, m. 200° (decompn.); NaOH gives 60% of *8-nitro-3-hydroxy 1,4-benzisoxazine-6 arsonic acid*, decomp. 320°; Ca and Mg salts, yellow needles. *2,6-Diacetamidophenoxyacetic-4-arsonic acid*, m. 212° (decompn.); Mg salt, amorphous. Boiling 5 N NaOH or 5 N HCl gives *8-amino-3-hydroxy-1,4-benzisoxazine 6 arsonic acid* (II), plates, does not m. 300°, sulfate, rhombs; Ba salt, prisms; Ca salt, needles; Mg salt, amorphous. Reduction of this in 5 N HCl by SO₂ and KI gives the *6-hydroxychloroarsine-HCl*, needles, which, with H₂O, gives the *6-arsenoxide-HCl*, plates, sol. in excess of H₂O. *8,8'-Diamino-3,3'-dihydroxy-6,6'-arseno-1,4-benzisoxazine*, pale yellow, amorphous. The *Ac deriv.* of II, m. 275–80°; reduction with SO₂ and KI gives *8-acetamido 3-hydroxy 1,4-benzisoxazine-6-dichloroarsine*, needles; H₂O gives the *arsenoxide*, needles. *8,8'-Diacetamido-3,3'-dihydroxy-6,6'-arseno-1,4-benzisoxazine*, yellow, amorphous. *3-Hydroxy-1,4-benzisoxazine-6-arsonic acid 8-glycinamide*, plates (60% yield). II and ClCH₂COCl and NaOH, followed by NH₄OH, give the *8-glycylamino deriv.*, needles. Through the diazo reaction, II gives the *8-Cl deriv.*, yellow, does not m. 280°. *3,3'-Diacetamido-4,4'-dihydroxy-5,5'-dimethylarsenobenzenamine*, yellow, amorphous. *3-Hydroxy-8-methyl-1,4-benzisoxazine-6-arsonic acid*, prism. *3,3'-Dihydroxy-8,8'-dimethyl-6,6'-arseno-1,4-benzisoxazine*, yellow, amorphous. II and ClCH₂CH₂CO₂Cl in 10 N NaOH give the *3-α-chlorocarbethoxyamino deriv.*, refluxing with 5 N NaOH gives the *8-β-hydroxyethylamino deriv.*, prisms. *3-Nitro 1-hydroxy-5-carboxyphenylarsonic acid*, rich yellow, forming a monohydrate, m. 282–4° (decompn.); Mg, Ba and Ca salts, amorphous; reduction with glucose and alkali gives the *3-NH₂ deriv.*, rhombs, not melted at 300°; Ca, Ba and Mg salts are amorphous. *Ac deriv.*, m. 250–4° (decompn.); Mg and Ca salts, amorphous. *3-Hydroxy-5-carboxy-1,4-benzisoxazine-6-arsonic acid*, m. 300–5° (decompn.). *3-Hydroxy 2-methyl 1,4-benzisoxazine-6-arsonic acid*, needles, does not m. 300°; Ca salt, needles; Mg salt, amorphous. The corresponding *2-Et deriv.*, needles, does not m.

280°. 8-Acetamido-3-hydroxy-2-methyl-1,4-benzisoxazine-6-arsonic acid, decomp. 265°, Mg salt, amorphous; the 2-Et deriv. forms needles. 3- ω -Chlorocarbethoxyamino-4-hydroxyphenylarsonic acid, m. 209° (decompn.) (63% yield); Mg salt, amorphous. With 4 N NaOH this yields 2,3-dihydro-1,4-benzisoxazine-6-arsonic acid, buff prisms, does not m. 300°. Reduction in HCl with SO₂ and HI gives the 6-arsenoxide, amorphous. 6,6'-Arseno-[2,3-dihydro-1,4-benzisoxazine], yellow, amorphous. 3- ω -Chlorocarbethoxyamido-5-acetamido-4-hydroxyphenylarsonic acid, m. 189° (decompn.); Mg salt, amorphous. Reduction gives 3,3'-di-[β -hydroxyethylamino]-5,5'-diacetamido-4,4'-dihydroxyarsenobenzene, pale yellow, amorphous. 3-Hydroxy-1,4-benzisoxazine-8-arsonic acid, m. 298° (decompn.); 6-NH₂ deriv., prisms, does not m. 300°; Ba and Ca salts, cryst.; Mg salt, amorphous; Ac deriv., needles, does not m. 300°. 6,6'-Diacetamido-3,3'-dihydroxy-8,8'-arsen-1,4-benzisoxazine, pale yellow, amorphous. III. Some derivatives of 4-amino-3-hydroxyphenylarsonic acid. ISIDORE E. BALBABAN. *Ibid* 3066-73.—3-Hydroxy-1,4-benzisoxazine-7-arsonic acid, crvsts. with 1H₂O; Mg and Ba salts, amorphous; Ca salt, spikes. Nitration gives 72.4% of a mixt. of the 8-NO₂ and the 6(?)·NO₂ derivs., both decomp. at 280°. 8-NH₂ deriv., needles with 0.75 mol. H₂O (66.6% yield); Ba and Ca salts, cryst.; Mg salt, amorphous; Ac deriv., needles. 2-Nitro-4- α -hydroxyacetamido-3-hydroxyphenylarsonic acid, golden brown, decomp. 210°. 2-NH₂ acid, prisms; Mg, Ca and Ba salts, amorphous; Ac deriv., needles. 8-Acetamido-3-hydroxy-1,4-benzisoxazine-5-arsonic acid, needles. Hydrolysis gives 8-amino-3-hydroxy-1,4-benzisoxazine, m. 180°; HCl salt, chars 270°, decomp. about 300°; it diazotizes normally; Ac deriv., m. 257°. 8-Amino-3-hydroxy-1,4-benzisoxazine-5-arsonic acid, prisms with 0.5 mol. H₂O not lost at 100°. 4,3-H₂N(HO)-C₆H₃AsO₃H₂ and COCl₂ in 2 N NaOH give benzoxazolone-5-arsonic acid, plates; nitration gives the 3-NO₂ deriv. 5-Nitro-4-amino-3-hydroxyphenylarsonic acid, bright yellow spikes with 1 mol. H₂O not lost at 100°. 6-Nitrobenzoxazolone-5-arsonic acid, pale brown plates; 6-NH₂ deriv., crystg. with 1H₂O, lost at 100°; Ac deriv., leaflets. 6-Acetamidobenzoxazolone-3-arsonic acid, leaflets. C. J. WEST

Synthesis of ketodehydrocorydaline. JOSEPH B. KOEPLI AND W. M. H. PERKIN, JR. Dyson Lab., Oxford. *J. Chem. Soc.* 1928, 2989-3000.—A brief sketch is given of the evidence which indicates that the constitution of corydaline must be I and not the II of Dobbie and Lauder; in order to establish this the synthesis of the highly characteristic deriv., ketodehydrocorydaline, was undertaken. Acetoveratrone (45 g.)

and 50 g. BrCH₂CO₂Et in 280 cc. C₆H₆ were heated with 20 g. Zn for 0.75 hr. and the resulting crude Et β -veratryl- β -hydroxybutyrate (III) distd. *in vacuo*, giving 50 g. Et β -veratrylcrotonate (IV), b₁₀ 195-6°, m. 51-2°; if the III is dehydrated with P₂O₅ there results a compd. C₂₄H₂₈O₈, m. 225-6°, which is not reduced by Na-Hg. Hydrolysis of the ester (IV) gives the free acid, m. 138-40°, which is reduced by Na-Hg to β -veratrylbutyric acid (V), m. 84-5°; the acid crvsts. with 1H₂O, m. 60-1° and loses H₂O at 100°. With concd. H₂SO₄ at 60-73°, V gives 5,6-dimethoxy-3-methyl-1-hydrindone, m. 90-1°, characterized as the oxime, m. 128-9°, and iso-NO deriv., lemon, m. 225-6° (decompn.). In order to cause the condensation to take place in position 2, the 6-position was protected by treating V with Br in AcOH-Ac₂O, giving the 6-Br deriv., m. 106-7°, which, with concd. H₂SO₄, gives the 4-bromo-6,7-dimethoxy-3-methyl-1-hydrindone, lemon, m. 82-3° (oxime, m. 187-8°). The 2-iso-NO deriv., pale yellow, m. 217° (decompn.), in NaOH undergoes a Beckmann transformation with *p*-Me-C₆H₄SO₂Cl, giving 6,3,4,2-Br(MeO)₂(HO₂C)C₆HCHMeCN, which was hydrolyzed to the corresponding acid and since this did not cryst., it was transformed into 6-bromo-3,4-dimethoxy- α -homophthalic anhydride m. 128-9°; this anhydride was hydrolyzed in alk. soln. and debrominated with Na-Hg, and the crude acid again transformed into

3,4-dimethoxy- α -methoxyhomophthalic anhydride, m. 131–3°. Boiled with β -veratrylethylamine in C_6H_6 , the acid transformed into the Me ester and the latter treated with $POCl_3$, there results **6,7,3',4'-tetramethoxy-9-methyl-2'-carbomethoxy-3,4-dihydro-protopapaverine**, m. 136–7°, which, heated at 150–70° for 10 min., gives ketodehydro-corydaline, identical with a specimen from corydaline. Preliminary expts. indicate that this is not readily reduced electrolytically to *dl*-corydaline. C. J. WEST

Constitution of laurotetanine. GEORGE BARGER AND ROBERT SILBERSCHMIDT. Edinburgh Univ. *J. Chem. Soc.* 1928, 2919–27.—Laurotetanine (I) is an alkaloid in various *Lauraceae*; Gorter (*C. A.* 22, 2470) assumed the same C skeleton in I and glaucine and termed the *N*-Me Me ether isoglaucine. The present work indicates that glaucine and isoglaucine are identical; complete methylation gives dimethyl-laurotetanine-MeI, m. 210° (G. gives 226°); with 10% EtOH-KOH this gives dimethyl-laurotetaninemethine, whose HI salt m. 265° and MeI salt m. 276°. Heating the MeI with 10% MeOH-KOH splits off Me_2N and gives **2,3,5,6-tetramethoxy-8-vinyl-phenanthrene (II)**, pale pink, m. 142°, oxidized by $KMnO_4$ in Me_2CO to **2,3,5,6-tetramethoxyphenanthrene-8-carboxylic acid**, yellow, m. 215°; CO_2 could not be removed from this acid. Similar compds. were prepd. from glaucine and found to be identical with those from the so-called isoglaucine. Reduction of II gives the *SA* deriv. (III), m. 120°. In the attempted synthesis of III, the following reactions were carried out. **3,4-(MeO) $_2$ C $_6$ H $_2$ Et**, through the Gattermann reaction, was transformed into **3,4-dimethoxy-6-ethylbenzaldehyde (?) (IV)**, b. 150–9°, m. 28–30° (*semicarbazone*, m. 197–9°); oxidation gives the corresponding *benzoic acid*, m. 138°. IV, hippuric acid, Ac_2O and $AcONa$ give 66% of the *azlactone* of **3,4-dimethoxy-6-ethylbenzylidenhippuric acid**, yellow, m. 155°; the acid, m. 212°. KOH transforms it into **3,4-dimethoxy-6-ethylphenylpyruvic acid**, pale yellow, m. 181°; oxidation with alk. H_2O_2 gives **3,4-dimethoxy-6-ethylphenylacetic acid**, pale pink, m. 67 (78% yield); condensation of the acid with **6,3,4-O $_2$ N(MeO) $_2$ C $_6$ H $_2$ CHO** by Ac_2O and $ZnCl_2$ gives 52% of **α , β -1-dimethoxy-6-ethylphenyl- β -6-nitro-3,4-dimethoxyphenylacrylic acid**, yellow, m. 203°; reduction with $FeSO_4$ and NH_4OH at 80° gives an amorphous *NH $_2$ acid*, deep yellow, m. 192°, which is transformed through the diazo reaction to **2,3,5,6-tetramethoxy-8-ethylphenanthrene-9-carboxylic acid**, which did not cryst. but was decarboxylated by heating at 230–50° and 9 mm., giving a compd. m. 118°, but the mixt. with III, m. 106°. The reason for this is as yet unexplained. **6-Nitro-3-methoxy-4-ethoxybenzaldehyde**, m. 159–60°. C. J. WEST

Strychnine and brucine. VII. The constitution of the alkaloids discussed in relation to the hypothesis that dinitrostrychnol is an isoquinoline derivative. REGINALD C. LAWCEY, WM. H. PERKIN, JR., AND ROBERT ROBINSON. Univ. of Oxford and Manchester and Univ. Coll., London. *J. Chem. Soc.* 1928, 3082–92; cf. *C. A.* 21, 3065. It is suggested that dinitrostrychnol is a dinitrodihydroxyisoquinoline and this suggestion is used as a starting point for the elaboration of new structural formulas for strychnine and brucine. The original must be consulted for the discussion. C. J. W.

Method for the technical preparation of scopolamine. F. CHEMNITZ. *J. prakt. Chem.* 120, 221–4 (1928).—Details are given for the extn. and purification of scopolamine.

C. J. WEST

Constitution of delphinin. KAORU KONDO. *Helv. Chim. Acta* 11, 919–21 (1928).—The constitution of the *p*- $HOC_6H_4CO_2H$ (I) in delphinin (II) was detd. as follows. This (from *Delphinium consolida* L.) was methylated with Me_2SO_4 and NaOH, keeping reaction as nearly neutral as possible, until a product (III) insol. in dil. alkali was obtained, showing that no free OH groups were present. Alk. hydrolysis of III gives an acid and an anthocyan (IV). Acid hydrolysis of IV gives an alkali-sol. aglucon the CO_2 content of which is nearly the same as that of the tri-Me ether of delphinidin, 3 OH groups being free (2 phenolic, apparently the same as those in the pyrylium nucle). The position of the sugar and I groups must be the same in III and II. I in II before is not combined with the sugar radical but in the aglucon of the dye mol.

FREDERICK C. HARN

Formula of the digitalis glucosides. II. *Digitalium verum*. ADOLF WINDAUS. *Nachr. Ges. Wiss. Göttingen Math.-Physik. Klasse* 1927, 422–6; cf. *C. A.* 22, 88.—Numerous analyses of very pure digitaligenin and 8 of its derivs. indicate that digitaligenin has a formula, $C_{25}H_{30}O_7$. By oxidation it never gives digitoxigenone, but a compd. m. 197°. *Digitalinum verum* has the formula, $C_{25}H_{34}O_{11}$ and contains 1 mol. of genu. $C_{25}H_{34}O_6$, 1 mol. glucose and 1 mol. digitalose. Hot HCl is required to split *digitalinum verum*. This reagent eliminates 2 mols. H_2O from the compd., $C_{25}H_{34}O_{11}$ primarily formed, so that digitaligenin, $C_{25}H_{30}O_7$, is obtained. Digitaligenin is a monohydroketone with 3 double bonds, giving cryst. formyl and Ac derivs., adding 6 H to

form satd. hexahydrodigitaligenin, $C_{23}H_{36}O_3$. A tetrahydro deriv. can be isolated as intermediary product. CrO_3 oxidizes the hexahydro deriv. to a ketone, $C_{23}H_{34}O_3$, then to a di- CO_2H acid, $C_{23}H_{34}O_6$. The secondary alc. groups of digitaligenin are located in a hydro ring. When reduced by Clemmensen's method, the ketone, $C_{23}H_{34}O_3$, gives a satd. lactone, $C_{23}H_{36}O_2$, which, like bile acid, contains 4 carbocyclic systems in its mol. This lactone differs from the one obtained from anhydrodigitoxigenin by the same method, they may be stereoisomers.

ALBERT L. HENNE

The addition of bromine to protoporphyrin dimethyl ester and to its complex zinc salt. WM. KÜSTER AND ARNO GROSSE. Tech. Hochschule Stuttgart. *Z. physiol. Chem.* 179, 117-38(1928).—The behavior of hemin toward Br or Cl and $AcOH-HBr$, whereby 2 atoms of halogen and 2 mols of HBr are added, leaves a choice of 2 structures for the unsatd. side chains, viz.

The addn. products would be the same in either case provided both side chains are attached to the same pyrrole ring. Fischer's synthesis of mesohemin, however, would indicate that the acetylene and vinyl groupings are not adjacent. But this complication disappears when hemin is regarded as a double mol. contg. a radical with a coordination position on the Fe as long as the latter is Fe^{++} , as in hemoglobin and hemochromogen, but an actual bond when the Fe becomes Fe^{+++} . There would be a distinction in this respect between the porphyrins, whose formation from hemin involves a reduction, and their complex salts, on the one hand, and the hemins on the other hand. It was therefore of interest to exam. the behavior of protoporphyrin ester and its complex Zn salt with respect to their halogen-adding capacity. In contrast to hemin ester which adds only 2 Br, the protoporphyrin ester adds 4 Br. Since the hemin ester is thought to be identical with the complex $ClFe^{+++}$ salt of protoporphyrin ester, the difference between this and the complex Zn salt as well as the porphyrin itself appeared to be established, especially since the mol. wt. of the Zn salt of tetramethyl-hematoporphyrin indicates the presence of 38 C atoms. However, a prepn. of the complex $ClFe^{+++}$ salt of protoporphyrin ester likewise had the capacity of adding 4 Br, so that it appears that in the transition from hemin to protoporphyrin a rearrangement may occur which accounts for the difference between the 2 hemin esters. The contrast between the complex $ClFe^{+++}$ and Zn salts of protoporphyrin ester would indicate that in some hemin esters, depending on their method of prepn., the $ClFe^{+++}$ group may or may not exert an influence on the acetylene and perhaps also on the vinyl grouping. Two of the 4 Br add to the acetylene group of protoporphyrin ester and the other 2 to the vinyl, a further evidence of structure I. To yield a substance of the hematoporphyrin type 2 Br should add to a secondary and 1 each to a primary and a tertiary C. The first 2 Br should then be replaceable by MeO, which is actually the case with tetrabromoporphyrin ester, while its Zn salt merely splits off 1 HBr . In the latter case the resulting side chains are $-C(OMe):CHBr$ and $-CHBrCH_2OMe$ as shown by oxidation to hemateric acid and the imide, $C_8H_{10}O_3NBr$, m. 75° . $Zn(OAc)_2$ in MeOH sapon. 1 MeO with formation of a Zn salt of the Zn complex. In tetrabromoporphyrin 2 Br are replaceable by 2 CN, viz. those on secondary carbons. Sapon. of the 2 CN to 2 CO_2H followed by esterification yields a dibromotetracarboxylic ester. Reduction by HI and P and treatment with MeOH removes a 3rd Br, leaving 5 MeO in all, showing that the tertiary Br on the unsatd. side chain had become secondary and therefore replaceable by MeO. The product is cryst. and represents an $A-\alpha$ -methoxy- $A-\beta$ -, $V-\alpha$ -dicarboxymethyl- $V-\beta$ -bromomesoporphyrin di-Me ester, where A designates the acetylene and V the vinyl side chain.

A. W. DOX

The rhodin-like compounds. HANS FISCHER, A. TREIBS AND J. HELBERGER. Tech. Hochschule, München. *Sitzb. math. naturw. Abl. bayer. Akad. Wiss. München*, 1928, No. 2, 141-2. Porphyrin is changed by treatment with H_2SO_4 and H_2O_2 , H_2SO_4 alone, or $AlCl_3$ to a cryst. compd. with the properties similar to rhodin. With compds. of the ethereal porphyrin type, methylethylmaleic acid imide is formed. When mesoporphyrin is treated with H_2SO_4 and H_2O_2 indifferent acid compds. originate which are probably lactones.

H. J. DEUEL, JR

Cerebronic acid. VI. P. A. LEVENE AND F. A. TAYLOR. Rockefeller Inst. and Allegheny General Hosp., Pittsburgh. *J. Biol. Chem.* 80, 227-9(1928).—In view of the recent emphatic refutation by Klenk (*C. A.* 22, 1782) of the accepted view of the

structure of cerebronic acid as $C_{25}H_{50}O_3$, the oxidation of cerebronic acid has been repeated under more rigorous conditions than in the expts. of Levene and Taylor (C. A. 16, 2305). The results confirm the older view of the compn. of the acid. L. and T. "have some reason to believe that the acid $C_{23}H_{46}O_2$ of Klenk was a mixt. of 2 acids, one of C_{24} and the other of C_{22} ." A. P. LOTHROP

Some derivatives of cholesterol. R. L. SHRINER AND LUTHER KO Univ. of Ill. *J. Biol. Chem.* 80, 1-8(1928) --Cholesteryl *p*-aminobenzoate was prepd. in the hope that its salts would be sol. in H_2O and because of the possibility that this deriv. might have a local anesthetic action. Neither hope was realized. The compd. was prepd. from the *p*-nitrobenzoate by catalytic reduction in $AcOEt$; the reduction requires only 25 min. and the double bond is not affected. Cholesteryl *p*-aminobenzoate, m. 237.4-8.5°, $[\alpha]_D^{25}$ 3.61° in $CHCl_3$; *HCl* salt, m. 210 1° Cholesterol can be completely reduced in $AcOEt$ catalytically to dihydrocholesterol in 4 hrs. but requires a large amt. of catalyst. The product is absolutely neg. to the Liebermann-Burchard reaction and its $[\alpha]_D^{25}$ is 26.35°, which is considerably higher than that usually given and is probably the correct value for the rotation of the completely reduced sterol. Dihydrocholesteryl benzoate, m. 135.8-6.8°, $[\alpha]_D^{25}$ 21.40°. Dihydrocholesteryl *p*-nitrobenzoate, m. 156.5-7.7°, $[\alpha]_D^{25}$ 20.05°. Dihydrocholesteryl *p*-aminobenzoate, m. 191 2°, $[\alpha]_D^{25}$ 26.55°; *HCl* salt, m. 182.5-4.5°. The values for $[\alpha]_D$ of the previously described benzoate and *p*-nitrobenzoate were found to be 13.70° and 6.48°, resp. A. P. LOTHROP

Catalytic oxidation of organic compounds. JOHANNES BRODE and ADOLF JOHANNSEN (to Grasselli Dyestuff Corpn.) U. S. 1,693,915, Dec. 4. In effecting catalytic oxidations such as that of $C_{10}H_8$ to produce phthalic anhydride the gaseous mixt. which has undergone reaction, prior to sepn. of the reaction products and at a temp. at which no deposition of the desired reaction product occurs, is brought into contact with a solid substance such as granulated pumice or bauxite the shape of which is not altered at the temp. of use and which does not cause further conversion or contamination of the product but which is capable of removing impurities such as H_2SO_4 .

Dissolving various organic compounds. I. G. FARBENIND A.-G. Brit. 290,554, Oct. 26, 1926. Ingredients of the prepn. described in Brit. 261,720 (C. A. 21, 3433), suitable for production of aq. solns. of org. compds. such as hydrocarbons, higher alcs., and ketones insol. or difficultly sol. in water, and comprising sulfonic acids having soap-like properties such as alkylated aromatic sulfonic acids or their salts and water-sol. salts, may be mixed in the solid state or the mixt. may be produced when prepg. the sulfonic acids and subsequently rendered solid. An example is given of the sulfonation of naphthalene followed by butylation, neutralizing the upper layer formed with an alkali, evapng. and mixing the salt of butylated naphthalenesulfonic acid obtained with Na_2SO_4 .

Purifying aromatic hydrocarbons. SELDON CO. Brit. 290,840, June 7, 1927. Aromatic hydrocarbons, particularly those of the benzene series, are purified by treatment with a halogen or halogen-yielding substance under conditions such that the impurities are converted into readily separable or harmless substances. Catalysts, ultra-violet rays, heat, pressure or a silent elec. discharge may in certain instances be used to facilitate the treatment. Many details and examples are given. Cf. C. A. 23, 274.

Alcohols and aldehydes from hydrocarbons. J. C. WALKER (to Empire Gas & Fuel Co). Brit. 290,613, May 17, 1927. Hydrocarbon gases such as natural gas or gases from coal, petroleum or shale distn. are treated (to produce oxidation products such as MeOH and other alcs., CH_2O , AcH and propionaldehyde) by adding to the gas a relatively small proportion of O and treating the mixt. with a catalyst under conditions favoring the production of the particular products desired. Among the catalysts which may be used are Pt, Pd, Cr, Mn, Fe, Cu, Ni, Au, Ag, oxides of Cu, Mn, Fe, Ni, V, Cr, Mo, Ce and other metals forming higher and lower oxides and their mixts. Various details and modifications are given.

Acetylene and other unsaturated hydrocarbons. I. G. FARBENIND. A.-G. Brit. 290,322, Jan. 10, 1927. Liquid hydrocarbons are sprayed into, or in admixt. with a combustible gas such as CH_4 , C_2H_6 or H and rapidly heated to a high temp. by burning part of the mixt. with O or gases rich in O, to produce C_2H_2 and other unsatd. hydrocarbons. An app. is described. Cf. C. A. 22, 243.

Polymerization of hydrocarbons. VIKTOR SZIDON. Fr. 640,534, Feb. 18, 1927. Thick, pasty polymerization products of hydrocarbons of the aliphatic series are prepd. by oxidation with a catalyst at a suitable temp. and pressure. Catalysts such as metals, oxides, oleates and stearates of metals, org. and inorg. acids may be used. In an example air under pressure is injected into American spindle oil at 180° in which finely divided Cu oxide is dispersed. A white paraffin, m. 45° , is obtained.

Depolymerization. I. G. FARBENIND. A.-G. Swiss 126,817, Jan. 28, 1927. High mol. carbohydrates are depolymerized by heating with a bivalent alc. The examples given are glycol and glycol chlorohydrin.

Amines. I. G. FARBENIND. A.-G. (Rudolf Wietzel and Otto Köhler, inventors). Ger. 468,895, July 8, 1925. In the prepn. of mono- and dimethylamine or their salts by the action of CH_2O , or substances yielding it, on NH_4 salts, alc. in the proportion of 1 mol. alc. to 2 mol. CH_2O is added to the reaction mixt. or to one of the components used.

Cyclic amines. I. G. FARBENIND. A.-G. Brit. 290,175, May 7, 1927. Homologs of PhNH_2 are hydrogenated by treatment under pressure with H, suitably at temps. of 170 – 350° and under pressures of 50–200 atm. in the presence of a catalyst such as Cu, a metal of the Pt or Fe group or oxides or salts of these metals (among which are particularly mentioned Pt, Ni, Co, oxides of Co and Ni, Co formate and Ni oxalate). Examples are given of the hydrogenation of *o*-, *m*- and *p*-toluidines and *p*-xylylidine to the corresponding hexahydro-compds. and of β -naphthylamine to a mixt. of *ar*- and *ac*-tetrahydro- β -naphthylamines.

Primary amines of the benzene series. I. G. FARBENIND. A.-G. (Paul Herold, inventor). Ger. 467,638. Jan. 1, 1927. Nitro compds. of the benzene series are reduced to the corresponding amines by treatment under pressure with solns. of water-sol. sulfides, polysulfides, or thiosulfates in the presence of a reducing gas, such as H, and in the presence or absence of a catalyst, the amt. of sulfide, etc., being so adjusted that at the end of the reaction all the S is present as sulfate only. Cf. Brit. 295,824.

Separating mono- and dialkyl derivatives of aromatic amines. WALTER FLEMING and HANS KLEIN (to Silesia Verein chemischer Fabriken Ida- und Marienhuetten). U. S. 1,695,372, Dec. 18. Mixts. such as those comprising monomethyl- and dimethylaniline are dissolved with a neutral solvent such as C_6H_6 and phthalic anhydride is added to convert the monoalkylated amine into the corresponding phthalimidic acid and the latter is then sepd. by shaking with an aq. alkali soln. such as a dil. NaOH soln.

Esters. WM. J. BANNISTER (to Commercial Solvents Corp.). U. S. 1,695,449, Dec. 18. In forming esters such as ethyl lactate an alc. and an acid such as EtOH and lactic acid are heated in the presence of a liquid, *e. g.*, C_6H_6 , which forms a const-boiling mixt. of minimum b. p. with water and the alc., and in the presence of a solid dehydrating agent, *e. g.*, anhyd. $\text{Al}_2(\text{SO}_4)_3$.

Mixtures of esters. WALTHER CLAASEN. Fr. 32,991, Feb. 4, 1927. Addn to 611,824. Crude phenols or cresols are hydrogenated and oxidized to the corresponding acids, which mixt. of acids is esterified. Before esterification individual acids, such as adipic, glutaric or succinic may be sepd. Cf. C. A. 22, 966.

Ethers of carbohydrates. I. G. FARBENIND. A.-G. Fr. 640,174, July 30, 1927. Ethers of carbohydrates of high mol. wt., $(\text{C}_6\text{H}_{10}\text{O}_5)_x$, such as cellulose or starch, are made by causing the alkylating agent to act on the semi-moist hydrates in the form of a gas or vapor under pressure or not and in the presence of an alkali. The mass is kept in motion during the reaction. Examples are given of the ethylation and methylation of starch and cellulose in various forms.

Ethylene glycol monoalkyl ethers. CHARLES O. YOUNG (to Carbide & Carbon Chemical Corp.). U. S. 1,696,874, Dec. 25. A reaction is effected between ethylene

oxide and EtOH by employment of heat and pressure, in the presence of a large excess of EtOH.

Aromatic aldehydes. J. D. RIEDEL A.-G. Brit. 290,649, May 20, 1927. *o*- and *p*-Propenylhydroxybenzenes are oxidized to the corresponding aldehydes by use of aromatic nitro compds. such as PhNO₂ or nitrotoluene in excess; e. g., a mixt. of isomeric propenylmonomethylpyrocatechol ethers can be decompd. directly by oxidation of the alkali salts into a mixt. of vanillin and isochavibetol and the vanillin subsequently extd. or after sepn. of the main quantity of isochavibetol the filtrate may be oxidized. By use of nitro compds for effecting the oxidation of the mixt. of alkali salts of the 2 propenylmonoalkyloxymethylpyrocatechol ethers produced in the decompn. of isosafrole or camphor oils, followed by methylation and heating with dil. acids, there is obtained an easily separable mixt. of isovanillin and isoeugenol.

Anhydrides. HENRY DREYFUS. Swiss 126,820, May 18, 1927. The anhydrides of monobasic fatty acids are obtained by the decompn. of the acids by heat. The hot gases resulting are led through app. which condenses the anhydride only. Alternatively the gases may be passed over a solvent for the anhydride having a higher b. p. than water.

Heterocyclic bases. MARCEL DE MONTMOLLIN. Swiss 126,821, May 9, 1927. Alk. dinitriles are reduced and the diamines so formed cyclized simultaneously in the presence of a catalyzer.

Benzanthrone derivatives. I. G. FARBENIND. A. G. (Richard K. Müller and Karl Wilke, inventors). Ger. 468,896, Oct. 27, 1925. Condensation products of the benzanthrone series are prepd. by heating *Bz*-halogenbenzanthrone or their derivs. with primary or secondary aliphatic or aromatic bases with or without diluents and acid-binding agents as well as a small quantity of Cu or a Cu salt. Examples are given of the condensation of *Bz*-1-bromobenzanthrone with MeNH₂, Me₂NH, carbazole and the Et ester of anthranilic acid, of amino-*Bz*-1-bromobenzanthrone with Me₂NH, and of pyrazoleanthrone with *Bz*-1-bromobenzanthrone giving benzanthrionylpyrazoleanthrone m. 398-400°.

7-Meso-Benzanthrenone derivatives. I. G. FARBENIND. A.-G. Fr. 640,410, Sept. 3, 1927. New condensation products are obtained by heating to a high temp. a compd. of the benzanthrenone series, having the 4-position free, with an aromatic OH compd. having an *o*- or *p*-position free, in the presence of NaOH or KOH only sufficient to form the phenolate. 7-*meso*-Benzanthrenone, β -naphthol and KOH are heated to 200°; a compd. is formed that is 4-(2-hydroxy-1-naphthyl)-7-*meso*-benzanthrenone, turns red at 200° and m. below 300°. Similar products are obtained if β -naphthol is replaced by chloro 2 naphthol or α -naphthol or if benzanthrenone is replaced by its 6-chloro deriv. only the benzobenzanthrenonecarboxylic acid described in Fr. 628,120. If β -naphthol is replaced by 2,6-xenol, the product, probably 4-(4-hydroxy-3,5-dimethylphenyl)-7-*meso*-benzanthrenone, crystallizes in yellow prisms from PhNO₂.

Monohydroxy- ω -aminoacetophenone derivatives. HELMUT LEGERLOTZ. Can. 287,650, Dec. 11, 1928. To 10 g. *p*-HOC₆H₄COCH₂Br (10 g.) in 25 cc. 96% alc. is added in small portions 40 cc. of 40% aq. MeNH₂ with cooling. After 24 hrs. at ordinary temp. the excess of MeNH₂ is partially evapd. and the cryst. deposit filtered out by suction and washed with alc. The HOC₆H₄COCH₂NHMe, purified by redissolving once or twice with alc., forms brilliant colorless leaflets, m. 147-8°. These leaflets can also be obtained by pptn. with NH₃ from the aq. soln. of the hydrochloride of the base. The hydrochloride, cryst. from alc., m. 239-240°.

Substituted guanidines. I. G. FARBENIND. A.-G. Fr. 640,017, Aug. 25, 1927. Substituted guanidines are prepd. by treating substituted thioureas with a Zn compd. and H₂ or an NH₃ deriv. in the presence of NaOH or an oxide or hydrate of an alk. earth metal. *Diphenylbenzylguanidine*, probably (Ph.NH)₂.C:N.CH₂.Ph, is prepd. from thiocarbanilide and benzylamine, m. 102-3°. *Diphenylmethylguanidine* is prepd. from thiocarbanilide and methylamine, m. 108-9°. *Diphenyldimethylguanidine* is prepd. from thiocarbanilide and dimethylamine, as an oil, the nitrate of which m. 199°.

Alkyl isoketyl cyclohexanols. WALTER SCHÖLLER and HANS JORDAN (to Chem. Fabrik auf Actien, vorm. E. Schering). U. S. 1,696,782, Dec. 25. Condensation product obtainable from alkylated phenols and ketones such as *p*-cresol and acetone are decompd. by heating and the mixt. of decompn. products thus obtained is then hydrogenated until 8 H atoms have entered into the mol. combination, and the hydrogenated alkyl isoketyl phenols are sepd. from the product by fractional distn. *in vacuo*.

Halogen derivatives of hydrocarbons. M. POLANYI and S. VON BOGDANDY. Brit. 289,795, April 29, 1927. Halogen in gas or vapor form is brought into contact with hydrocarbon mixed with a substance such as an alkali metal or As and P which readily

combines with the halogen and serves to facilitate the desired reaction. The process may be applied to the production of halogen derivs. from CH_4 and its homologs such as C_6H_{12} . The hydrocarbon, $\text{C}_{18}\text{H}_{38}$, gives chlorination products which after splitting off the Cl and oxidizing yield acids which can be used for *manuf. of soap*. Aromatic hydrocarbons can be similarly chlorinated. An app. is described in which MeCl may be made by use of CH_4 , Cl and Na vapor.

Halogen-substituted sulfonic acids. CHEMISCHE FABRIK MILCH A.-G. (to Oranienburger chemische Fabrik A.-G.). Brit 289,841, May 3, 1927. Halogen carriers are used in making halogen-substituted sulfonic acids by treating aliphatic, aromatic or hydroaromatic compds. of mixts. with sulfuric acid halohydrins. Examples are given of the treatment of castor oil, and a mixt. of ground nut fatty acid, wool fat and C_6H_6 with chlorosulfonic acid with addn. of pulverized pyrolusite.

Aromatic sulfonic acids. FRITZ GÜNTHER and ADOLF CANTZLER (to I. G. Farbenind. A.-G.). U. S. 1,696,199, Dec. 25. Sulfonic acids of high emulsifying, cleansing and wetting power and which are not dyes are derived from aromatic compds. (such as condensation products of C_{10}H_8 with alcs and aldehydes) contg. at least 2 aromatic nuclei linked together by a bridge and in which at least 1 aromatic nucleus contains at least 1 H atom substituted by a hydrocarbon residue with at least 2 C atoms.

Amino sulfonic acids. I. G. FARBENIND. A.-G. (Walther Duisberg, Winfrid Hentrich, Johann Huismann and Ludwig Zeh, inventors). Ger. 467,626, Mar. 5, 1924. ω -Aminoalkylaminonaphthalenesulfonic acids are obtained by treating hydroxy-, dihydroxy-, amino-, aminohydroxy-, or diaminonaphthalenesulfonic acids with a sulfite and an alkylendiamine, simultaneously or in the order named. In the examples (1) $1,4\text{-H}_2\text{NCH}_2\text{CH}_2\text{NHC}_{10}\text{H}_6\text{SO}_3\text{H}$ is obtained from $1,4\text{-HOC}_{10}\text{H}_6\text{SO}_3\text{H}$, NaHSO_3 and $\text{C}_2\text{H}_4(\text{NH}_2)_2$; (2) $2,7\text{-H}_2\text{NCH}_2\text{CH}_2\text{NHC}_{10}\text{H}_6\text{SO}_3\text{H}$ is obtained from $2\text{-H}_2\text{NC}_{10}\text{H}_6\text{SO}_3\text{H}$, NaHSO_3 and $\text{C}_2\text{H}_4(\text{NH}_2)_2$; (3) $2,8,6\text{-H}_2\text{NCH}_2\text{CH}_2\text{NH}(\text{OH})\text{C}_{10}\text{H}_6\text{SO}_3\text{H}$ is obtained from $2,8,6\text{-H}_2\text{N}(\text{HO})\text{C}_{10}\text{H}_6\text{SO}_3\text{H}$, NaHSO_3 and $\text{C}_2\text{H}_4(\text{NH}_2)_2$; (4) $2,8,3,6\text{-H}_2\text{NCH}_2\text{CH}_2\text{NH}(\text{OH})\text{C}_{10}\text{H}_6(\text{SO}_3\text{H})_2$ is obtained from $2,8,3,6\text{-(HO)}_2\text{C}_{10}\text{H}_6(\text{SO}_3\text{H})_2$, NaHSO_3 , and $\text{C}_2\text{H}_4(\text{NH}_2)_2$; (5) $2,7\text{-H}_2\text{N}(\text{CH}_2)_4\text{NHC}_{10}\text{H}_6\text{SO}_3\text{H}$ is obtained from $2,7\text{-H}_2\text{NC}_{10}\text{H}_6\text{SO}_3\text{H}$, NaHSO_3 and $\text{C}_4\text{H}_8(\text{NH}_2)_2 \cdot 2\text{HCl}$; (6) $5,1,3\text{-H}_2\text{NCH}_2\text{CH}_2\text{NH}(\text{H}_2\text{N})\text{C}_{10}\text{H}_6\text{SO}_3\text{H}$ is obtained from $1,5,3\text{-(H}_2\text{N)}_2\text{C}_{10}\text{H}_6\text{SO}_3\text{H}$, NaHSO_3 and $\text{C}_2\text{H}_4(\text{NH}_2)_2$. Cf. Brit. 230,457 (C. A. 19, 3272).

Cyclohexyl-substituted aliphatic acids. ROGER ADAMS and GLEN S. HIERs (to Abbott Laboratories). U. S. 1,693,801, Dec. 4. The *manuf.* of various of these acids is described, among which are: cyclohexylnonanoic acid, m. $45.5\text{--}46.5^\circ$, cyclohexyl butyric acid, m. $29\text{--}30^\circ$, δ -cyclohexylpentanoic acid, m. $6\text{--}8^\circ$, ϵ -cyclohexylhexanoic acid, ζ -cyclohexylheptanoic acid, m. $25\text{--}26^\circ$, θ -cyclohexyloctanoic acid, m. $27\text{--}28^\circ$, and the four acids of formula $\text{C}_6\text{H}_{11}(\text{CH}_2)_n\text{COOH}$ in which n is 9, 10, 11 and 12, resp., m. $52.5\text{--}53.5^\circ$, $58\text{--}59^\circ$, $61.5\text{--}62^\circ$ and $63\text{--}64^\circ$, resp. These compds. may be used as *therapeutic agents* and are effective against acid-fast bacteria such as *B. leprae* and *B. tuberculosis*. The acids with side chains larger than 8 C are prepd. by the condensation of the proper Grignard reagent with the aldehyde esters obtained by the ozonization of methyl oleate, methyl undecylenate or methyl erucate. The 9-C-side-chain acid is obtained from cyclohexyl bromide and methyl μ -aldehydooctanoate, the 10-C-side-chain acid from cyclohexyl bromide and methyl θ -aldehydononanoate, the 11-C-side-chain acid from β -cyclohexylethyl bromide and methyl μ -aldehydoctanoate, the 12-C-side-chain acid from β -cyclohexylethyl bromide and methyl θ -aldehydononanoate and the 13-C-side-chain acid from cyclohexyl bromide and methyl λ -aldehydododecanoate. Numerous details of procedure are given. Cf. C. A. 22, 3491.

Aminobenzenearsonic acids. ÉTABLISSEMENTS POULENC, FRÈRES (Robert Meyer and Gaston Sauvage, inventors) Fr. 636,660, Oct. 21, 1926. Aminobenzenearsonic acids and their derivs. are prepd. by reducing nitrobenzenearsonic acids with Fe and HCl. Examples are given of the prepn. of *p*-hydroxy-*m*-amino-, *o*-hydroxy-*p*-amino-, and *p*-aminobenzenearsonic acid.

Abietic acid esters of polyglycerol. ERNEST M. SYMMES (to Hercules Powder Co.) U. S. 1,696,337, Dec. 25. Esters are prepd. by refluxing a polyglycerol such as diglycerol with rosin and Zn dust. They are harder than "ester gum" and may be used in *varnishes*.

An indophenol. I. G. FARBENIND. A.-G. Swiss 126,120, Oct. 29, 1926. An indophenol is made by joint oxidation of propyl-2-monophenyldihydroindole and *p*-aminophenol.

Lead and tin alkyl compounds. STANDARD DEVELOPMENT CO. Brit. 290,444, May 21, 1927. The metal to be alkylated is alloyed with an alkali metal and the subdivided alloy is treated in a closed reaction vessel with EtCl or other suitable alkylating agent dissolved in a liquid hydrocarbon material such as naphtha, "white oil" or kero-

sene or benzenoid hydrocarbons The resulting products are sepd. by distn. or extrn. with suitable solvents.

Gold compound of the thiobenzimidazole series. I. G. FARBENIND. A.-G. Swiss 126,127. Feb. 4, 1927. 3,4-Thiobenzimidazolesulfonic acid or its salts is treated with Au salts. The initial material may be obtained as Na salt by treating the Na salt of 3,4-diaminobenzenesulfonic acid with CS_2 in alc. alkali.

Benzobenzanthronecarboxylic acid. I. G. FARBENIND. A.-G. Swiss 126,194, Jan. 13, 1927. 1,1-Dinaphthyl-8,8-dicarboxylic acid is treated with acid condensing agents until the product is sol. in glacial AcOH. The product, probably having the appended formula, m. 278° and is sol. in alkalies and in cold concd. H_2SO_4 .

1-Diazo-5-nitroanthraquinone-2-carboxylic acid. I. G. FARBENIND. A.-G. Swiss 126,965, Nov. 26, 1926. Addn. to Swiss 124,351. The N-contg. anthraquinone deriv. obtained by the action of fuming H_2SO_4 on 1,5 dinitro-2-methylantraquinone is heated with HNO_3 .

Separating benzoic and phthalic acids. ALPHONS O. JAEGER (to Selden Co.). U. S. 1,694,124, Dec. 4. The mixt. is brought into contact with vapors of C_6H_6 , ether or CCl_4 or other suitable org. solvents for benzoic acid at temps. (suitably about 125 – 150°) not substantially above the temp. at which the phthalic acids are transformed into the anhydrides, in order to sublime the benzoic acids. Cf. C. A. 22, 4539.

Condensation products of phthalic acid. FRANZ WEBEL (to I. G. Farbenind. A.-G.). Can. 284,968, Nov. 20, 1928. Water-sol. derivs. of phthalic acid are produced by action on 1 mol. proportion of phthalic acid at from 60° to 70° with at least 2 mol. proportions of ethylene oxide in the presence of a solvent and a catalyst comprising Na-late.

Lactic acid and derivatives. I. G. FARBENIND. A.-G. Brit. 290,464, July 2, 1927. Acid neutralized mash in which lactic acid has been produced by fermentation is treated with MeOH which dissolves out the lactate and the latter may be sepd. by distn. of MeOH or by pptg. as with acetone or Me formate. The free acid may be obtained by treating the lactate with inorg. acid or Me lactate may be produced by adding H_2SO_4 to the MeOH soln. of lactate and other esters of lactic acid may be similarly formed from different alcs.

Sulfonic acids. I. G. FARBENIND. A.-G. Brit. 290,229, May 10, 1927. 6-Chloro-2-amino-1-methylbenzene-3-sulfonic acid, 6-chloro-2-amino-1-methylbenzene-5-sulfonic acid and 6-chloro-2-amino-1-methylbenzene-3,5-disulfonic acid are made by sulfonating 6-chloro-2-amino-1-methylbenzene with suitably different regulation of the conditions of the process. Details are given of each of the processes.

Sulfonic acids. CHEMISCHE FABRIK MILCH A.-G. Fr. 640,617, Aug. 1, 1927. Sulfonic acids or sulfonates which are used for fat splitting and in the textile, paper and leather industries as washing, wetting, penetrating and dispersing agents and for the preservation of fibers, are obtained by treating org. substances of high mol. wt. with strong sulfonating agents. Examples are given of the treatment of castor oil, olein, waste wool fat, mineral oils of high b. p., a mixt. of oleic acid and benzene, a mixt. of mineral oils of high b. p., a mixt. of oleic acid and benzene, a mixt. of mineral oil and Freon, a mixt. of castor oil and Ac_2O , and a mixt. of lanolin and lactic acid with ClSO_3H . As sulfonating agents oleum or a mixt. of H_2SO_4 with either P_2O_5 , metaphosphoric acid, POCl_3 or anhydrous K_2SO_4 may also be used.

Aminoarylarsonic acids. LES ÉTABLISSEMENTS POULENC FRÈRES. Ger. 468,757, Oct. 22. Aminoarylarsonic acids and their derivs. are prepd. by reduction of the corresponding nitroarylarsonic acids with Fe in HCl soln. Examples are given of the prepn. of 3-amino-4-phenol-1-arsonic acid, *p*-aminophenylarsonic acid, 3,4-diaminobenzenearsonic acid, and 4-amino-2-phenol-1-arsonic acid. See Fr. 636,600.

1-Methyl-2,5,6-trichloro-3-aminobenzene-4-sulfonic acid. I. G. FARBENIND. A. G. Fr. 640,748, Sept. 10, 1927. 1-Methyl-2,5,6-trichlorobenzene-4-sulfonic acid is

treated with a nitrating agent, *e. g.*, HNO_3 , and reduced. In an example 1-methyl-2,5,6-trichlorobenzene is dissolved in H_2SO_4 and HNO_3 is run in with heating. The product is reduced in the usual manner.

1,5-Diaminoanthraquinone-2,6-dicarboxylic acid. I. G. FARBENIND. A.-G. Swiss 126,726. Mar. 7, 1927. Addn. to Swiss 125,478. Anthraquinone-1,2,5,6-diisoxazole is sapon.

1,8-Diaminoanthraquinone-2,7-dicarboxylic acid. I. G. FARBENIND. A.-G. Swiss 126,727. Mar. 7, 1927. Addn. to Swiss 125,478. The substance is prepd. by the sapon. of anthraquinone-1,2,8,7-diisoxazole.

5-Nitro-1-aminoanthraquinone-2-carboxylic acid. I. G. FARBENIND. A.-G. Swiss 126,725. Mar. 7, 1927. Addn. to Swiss 125,478. The substance is prepd. by the sapon. of 5-nitroanthraquinone-1,2-isoxazole, it m. 325° .

Concentrating lower aliphatic acids such as acetic acid. HENRY DREYFUS and CLIFFORD I. HANEY (to Celanese Corp. of America). U. S. 1,696,432, Dec. 25. Extn of aq. solns. of acids such as dil. HOAc is effected with a solvent for the acid, *e. g.*, ether or CHCl_3 , and a normally liquid hydrocarbon, *e. g.*, gasoline, both of lower b. p. than the acid, and subsequent fractional distn.

Concentrating acetic acid. HENRY DREYFUS and CLIFFORD I. HANEY (to Henry Dreyfus). Can. 285,052, Nov. 20, 1928. Aq. solns. of AcOH are concd. by extg. with a medium comprising about 70 parts by vol. of Et_2O and about 30 parts by vol. of petroleum ether b. about 40° . The aq. soln. and extg. medium are caused to pass counter-current through a column. The extracting medium is sepd. from the ext. and returned to the process.

Acetic acid. I. G. FARBENIND. A.-G. Swiss 126,819, April 29, 1927. Concd. AcOH is prepd. from dil. AcOH by extn. with an org. base, such as quinoline, which is not affected by the concd. acid.

Acetic anhydride. WM. P. SKERTCHLY (to Celanese Corp. of America). U. S. 1,696,363, Dec. 25. See Can. 283,817 (C. A. 22, 4539).

Acetic anhydride. I. G. FARBENIND. A.-G. Fr. 640,721, Sept. 9, 1927. AcOH is dissoed. into water and Ac_2O with catalyst at temps. above 500° , and the vapors formed are sepd. by diffusion in a series of porous plates and cylinders.

Acetic anhydride, etc. I. G. FARBENIND. A.-G. Brit. 289,959, Feb. 4, 1927. Ac_2O is made by mixing glacial HOAc with dry NaOAc in a closed vessel and adding SiCl_4 while stirring. SnCl_4 and TiCl_4 as well as SiCl_4 may also be used in various similar reactions for prepg. various anhydrides such as those of homologs and halogen derivs. of HOAc.

Acetic anhydride and other anhydrides. H. DREYFUS. Brit. 289,972, Feb. 8, 1927. In forming Ac_2O or similar anhydride from the corresponding acid, the vapor of the acid (which may be dil.) is treated at a high temp., with or without catalysts, and the product is then treated with water-binding substances such as a bisulfate or pyrosulfate of an alkali or alk. earth metal, ZnCl_2 , CaCl_2 or ortho-, pyro- or meta-phosphoric acid (but not using H_2SO_4). In the first stage, decompn. of the acid may be effected by passing the vapor through a Cu or fireclay tube, preferably at $700\text{--}1000^\circ$, and the second stage for water removal may be effected at a lower temp., suitably $150\text{--}350^\circ$.

Aldehydes. I. G. FARBENIND. A.-G. Brit. 290,319, Jan. 7, 1927. Carboxylic acids or their anhydrides are reacted on by reducing gases such as H, coal gas, producer gas or water gas at elevated temp. in the presence of hydrogenation catalysts such as Cr, Fe, Cu, Mn and Co and their oxides. Activating substances which also may be used include Pb, Be, Ce, U and Zn and their oxides. Examples are given of the production of benzaldehyde from phthalic anhydride and of propionaldehyde from succinic anhydride.

Acetaldehyde. CARL N. HAND (to Rubber Service Laboratories Co.). U. S. 1,696,479, Dec. 25. In order to sep. AcH from a mixt. also contg. C_2H_2 , the mixt. is passed through an aromatic org. compd. (such as aniline at $70\text{--}90^\circ$) which will chemically combine with the AcH.

Acetaldehyde and acetic acid. S. GOLDSCHMIDT. Brit. 290,523, Nov. 30, 1927. EtOH vapor and air or O are used with Ag as acatalyst at temps. of $380\text{--}440^\circ$ (preferably $400\text{--}420^\circ$). Various details are given.

Benzaldehyde and benzoic acid from toluene. ALPHONS O. JAEGER (to Selden Co.). U. S. 1,694,122, Dec. 4. Vapors of toluene mixed with O-contg. gas at an elevated temp. (suitably about $340\text{--}380^\circ$) are passed over a catalyst contg. a zeolite such as one contg. V, W and Mo which preferentially catalyzes the reaction and which has assocd. with it sulfate or other suitable non-alk. salt of an alkali-forming metal. Numerous other uses of various similar zeolitic catalysts are also described.

Crotonaldehyde. EMIL LÜSCHER (to Elektrizitätswerk Louza). U. S. 1,693,907,

Dec. 4. In forming crotonaldehyde from AcH and aldol, AcH is combined, in an atm. of N, with only such a quantity of a dil. aq. caustic alkali soln. as not to cause any pptn. on subsequent neutralization, and an inorg. acid such as H_3PO_4 or H_2SO_4 is then added to the reaction product to obtain a reaction mixt. contg. aldol, AcH and a little salt; this reaction mixt. is finally distd. fractionally without previous purification or sepn., in a circulating atm. of N. Cf. *C. A.* 22, 3670.

Synthesis of methanol, etc. SYNTHETIC AMMONIA & NITRATES, LTD. and R. G. FRANKLIN. Brit. 290,399, Nov. 15, 1926. Catalysts for the production of MeOH and other oxygenated org. compds. from CO and H are prepd. by heating a mixt. comprising $ZnCO_3$ or basic Zn carbonate and a Cr compd. such as Zn chromate or basic Zn chromate.

Synthetic methanol. JOHN C. WOODRUFF, GROVER BLOOMFIELD and WM. BANISTER (to Commercial Solvents Corp.). U. S. 1,695,447, Dec. 18. See Brit. 279,377 (*C. A.* 22, 2756).

Benzene. I. G. FARBENIND. A.-G. Swiss 126,818. Mar. 21, 1927. Naphthalene vapor is treated with acid in the presence of an acid-carrying catalyzer and the product subjected to the action of an energetic H_2CO_3 -liberating catalyzer.

Purifying crude anthracene. ALPHONS O. JAEGER (to Selden Research & Engineering Corp.). U. S. 1,693,713, Dec. 4. Impure anthracene is subjected to the action of furfural and methylfurfural or other suitable selective solvent contg. at least one liquid compd. with a furan nucleus and which serves to dissolve out phenanthrene and carbazole. Numerous details and examples are given.

Acetylene. FIRMA C. H. BOEHRINGER SOHN. Swiss 126,764, Nov. 22, 1926. C_2H_2 is purified by drying and treating with absorptive agents such as H_2CrO_4 . Cf. *C. A.* 22, 304.

6-Isopropoxy-8-aminoquinoline. I. G. FARBENIND. A.-G. Swiss 126,723. April 13, 1926. Addn. to Swiss 125,476. The substance is prepd. by isopropylating 6-hydroxy-8-aminoquinoline.

2-Styryl-4-amino-6-ethoxyquinoline. I. G. FARBENIND. A.-G. Swiss 126,074, Sept. 7, 1926. 2-Styryl-6-ethoxyquinoline-4-carboxylic acid amide is treated with hypohalogenites. The product m. 212° and forms water-sol. salts with lactic and glycolic acids. The initial material is obtained by treating 6-methoxyquinoline-4-carboxylic acid with excess of benzaldehyde in presence of $ZnCl_2$, esterifying the 2-styryl-6-ethoxyquinoline-4-carboxylic acid so obtained, and converting the ester to the amide with alc. NH_3 .

2-Styryl-4-amino-6-ethoxyquinoline. I. G. FARBENIND. A.-G. Swiss 126,075, Sept. 7, 1926. 4-Amino-6-ethoxyquinoline is condensed with benzaldehyde. The initial material (m. 195°) is made from 4-chloro-6-ethoxyquinoline by treatment with alc. NH_3 . Cf. Swiss 126,074 (above).

6-Ethoxy-8-aminoquinoline. I. G. FARBENIND. A.-G. Swiss, 126,722, April 13, 1926. Addn. to Swiss 125,476. The 6-hydroxy-8-aminoquinoline is ethylated. The product is a yellow oil which congeals at 60° .

1-Amino-2-bromoanthraquinone-4-nitrile. I. G. FARBENIND. A.-G. Swiss 126,724, Nov. 7, 1926. Addn. to Swiss 125,469. CuCN is heated with 1-amino-2-bromo-1-haloanthraquinone in the presence of a compd. in which a nitrile group is linked with an aliphatic residue, and the product treated with dil. HNO_3 . The substance m. 275° .

Diphenylaminechloroarsine. DONALD B. BRADNER. U. S. 1,696,539, Dec. 25. Crude molten diphenylaminechloroarsine is introduced into water and the mass is agitated until the diphenylaminechloroarsine has solidified, to effect purification.

Phenolphthalein. EARL B. PUTT. U. S. 1,693,666, Dec. 4. Phenolphthalein in unground particles less than 10 microns in diam. is obtained by dissolving in an aq. NaOH soln., mixing an aq. soln. of gum acacia, agar-agar or the like and adding an acid such as HCl or H_2SO_4 .

Crotonyl bromide. I. G. FARBENIND. A.-G. Brit. 289,777, April 30, 1927. An addn. reaction is effected between HBr and 1,3-butadiene (suitably by introducing butadiene into a soln. of HBr in glacial HOAc). The reaction mixt. is poured into ice water and the bromide which seps. as a heavy oil is dried and distd.

Sodium glutamate. K. OKA. Brit. 290,657, May 19, 1927. Na glutamate soln. is purified to free it from Fe by boiling with Na sulfide. When the glutamic acid is contaminated with other amino acids, such as leucine or tyrosine, the crude hydrochlorides are dissolved in water, neutralized with $Ca(OH)_2$ and the Ca salts of the other amino acids are filtered off, Na_2CO_3 is added to the filtrate to form Na glutamate and the latter is then freed from Fe.

Tribromoethanol from

I. G. FARBENIND. A.-G. Swiss 126,962,

Jan. 21, 1927. Addn. to Swiss 122,060. A soln. of bromal in secondary alc. is allowed to react with an Al alcoholate or an Al halogen alcoholate.

Trichloroethanol from chloral. I. G. FARBENIND. A.-G. Swiss 126,963, Jan. 21, 1927. Addn. to Swiss 122,061. A soln. of chloral in a secondary alc. is allowed to react with an Al alcoholate or an Al halogen alcoholate.

2,3-Hydroxynaphthoyl-2',3'-aminonaphthol methyl ether. I. G. FARBENIND. A.-G. Swiss 126,822. Mar. 25, 1927. The prepn. is carried out by heating 2,3-hydroxynaphthoic acid with 2,3-aminonaphthol methyl ether and a dehydrating agent in an indifferent medium, and crystg. from benzene. The m. p. (uncorrected) is 203-4°.

Iodobenzonitriles with a linkage of the phenol ether type. SCHERING-KAHLBAUM A.-G. (Walter Schoeller and Kurt Schmidt, inventors). Ger. 467,639, Aug. 3, 1926. Products of the type ROR'CN, in which R and R' are iodine-substituted aryl residues, are prepd. by condensing an iodophenol ether with a metal salt of a hydroxyiodobenzonitrile, or a metal salt of an iodophenol ether with an iodobenzonitrile, in either case in presence of a catalyst such as Cu. The iodobenzonitrile or iodohydroxybenzonitrile may be replaced by an idonitrobenzene or an idonitrophenol and the condensation product then reduced, diazotized and treated with Cu(CN)₂. Examples are given describing the prepn. of 4-cyano-4'-methoxy-2,6,3'-triiododiphenyl ether in 4 different ways. Cf. Brit. 275, 213 (C. A. 22, 2244).

Synthetic camphor. GABRIEL ROZIER. Fr. 640,846, Feb. 22, 1927. In the prepn. of borneols and synthetic camphor, pinene, mixed or not with secondary compds. of oil or turpentine is treated with dry HCl dild. either in a neutral solvent or dehydrating catalyst such as CCl₄, EtOH or in the mother liquors from crystn. from a preceding operation. Dehydrating catalysts such as CaCl₂, EtOH or BaCl₂ may be added to the pinene. Etherification of the pinene-HCl by an org. acid is facilitated by dildn. in a solvent such as Et formate, the losses of which are compensated by introduction of abs. alc. and recovered as alc. in the subsequent sapon. Transformation to camphene may be carried out at the same time as etherification by a metallic oxide such as ZnO.

Condensation products from crude cresol and acetone. HANS JORDAN (to Chem. Fabrik auf Actien, vorm. E. Schering). U. S. 1,696,769, Dec. 25. In order to recover separately the constituents of a mixt. produced by the condensation of crude cresol and acetone, the product is dissolved in ether and the *m*-cresol acetone condensation product which crystallizes out is sepd. from the liquid. Cf. C. A. 22, 2952.

Condensation products of alcohols and ketones with urea, etc. I. G. FARBENIND A.-G. Brit. 290,192, May 9, 1927. Examples are given of the production of condensation products from: (a) glycol, urea and *p*-toluenesulfonamide, heated together and treated with Na amalgam; (b) butylene glycol, urea, *p*-toluenesulfonamide, acetanilide and Zn dust; (c) diacetin, acetylurea, acetanilide and Ca shavings; and (d) butylene glycol, urea and *p*-toluenesulfonamide heated with Mg powder. The products may be used for keeping in soft condition casein, gelatin or artificial products which swell in water, being viscous or resinous in character and sol. in water. Cf. C. A. 23, 533.

PAUL E. HOWE

A—GENERAL

FRANK P. UNDERHILL

The composition of dental enamel. A. BERNARDI. *Ann. chim. applicata* 18, 454-60(1928).—The enamel from the teeth of bulls 2-5 yrs. old, as well as those 7-10 yrs., has been analyzed as follows: (I) 2-5 yrs., sol. ash 99.87, CaO 45.83, MgO 4.05, P as PO₄ 52.44, Cl 0.33%; (II) 7-10 yrs., sol. ash 99.63, CaO 57.25, MgO 1.49, P as PO₄ 52.05, Cl 0.25%. Change in compn. indicates that this is living matter. A. W. C.

Influence of amino acids on the action of salivary amylase. J. TEMMINCK GROLL. Univ. Amsterdam. *Pharm. Weekblad* 65, 1315-9(1928).—In contrast to the activating effect of amino acids on the cleavage of starch by salivary amylase reported by Sherman and coworkers, glycine, alanine, leucine, glutamine, asparagine and tyrosine were found by G. to have no influence whatever. With a sol. starch soln. buffered to pH 6.15-20 and dild. saliva, the time required for conversion to erythroextrin was the same with and without the addn. of various quantities of the above amino acids. Proline gave variable results, indicating possibly a slight activating effect. A. W. Dox

The dissociation constants of

acid and of inosid acid from

muscle. H. WASSERMEYER. Univ. Frankfurt. *Z. physiol. Chem.* 179, 238-42(1928).—Detns. by electrometric titration gave the values $pK_1 = 3.8$ and $pK_2 = 6.2$ for adenosine-phosphoric acid (I), and $pK_1 = 2.4$ and $pK_2 = 6.3-5$ for inosic acid (II). In the region of the 1st dissocn. stage II is more acid than I, whereas in the 2nd dissocn. stage both are about equally strong acids. During muscle contraction I is converted into II with liberation of NH_3 and the reaction is thus displaced toward the alk. side. A. W. DOX

Enzymic deamination in muscle. GERHARD SCHMIDT. Univ. Frankfurt. *Z. physiol. Chem.* 179, 243-82(1928).—Adenine in the form of adenylic acid or adenosine undergoes deamination when treated with the pulp or press juice from rabbit muscle. The free purine, on the other hand, remains practically unaltered when subjected to this treatment. Guanine, guanosine and guanosinephosphoric acid are not attacked by the enzymes present. The formation of NH_3 from adenylic acid and from adenosine is brought about by 2 distinct enzymes, each of which is sp. for the 1 substrate. The enzyme which liberates NH_3 from adenylic acid may be extd. from muscle by $NaHCO_3$ after a preliminary extn. with $NaCl$, and is adsorbed from faintly acid or alk. soln. by $Al(OH)_3$ and can then be recovered from the adsorbate by elution with $N Na_2HPO_4$. The other enzyme, which splits adenosine, is not adsorbed by $Al(OH)_3$ and the sepn. of the 2 can thus be effected. The pH optimum of the adenylic acid deaminase is at 5.9. This enzyme is inert toward a no. of amino acids, dipeptides, amides and purines. Although it readily attacks adenylic acid from muscle it has no action on that from yeast, showing that the adenylic acids from these 2 sources, despite their similarity in properties, are not identical but are isomers. Inosic acid (hypoxanthinephosphoric acid) was isolated and identified as the cleavage product of adenylic acid from muscle.

A. W. DOX

The role of the membrane in the measurement of the osmotic pressure of plasma proteins. A. NITSCHKE. Univ. Freiburg. *Z. ges. expth. Med.* 59, 298-302(1928).—The height of the osmometer when a collodion sack is used does not depend only on the proteins, but the Donnan effect between serum and collodion must be considered. For 7% protein at 20° and pH of 7.9 the rise was 20 cm. serum with a parchment membrane. With the collodion membrane the rise was 35 cm.

F. L. DUNN

Some aspects of the vibration theory of odor. G. MALCOLM DYSON. *Perfumery Essential Oil Record* 19, 456-9(1928).—Since odor perceptions take place through direct contact between the mols. of the odorous substance and the nasal perceptory app., a substance to be odorous must have a vapor pressure above a certain critical value. The odor of trichlorophenol can be detected in a diln. at which its partial pressure is 10^{-10} mm. of Hg, and for each particle of odorous substance there will be 10^{12} mols. of air. To produce the sensation of odor a succession of vibrations must be set up by the presence of a succession of mols. entering the nasal processes and impinging upon the sense organs (cf. *C. A.* 22, 1436). The wave motion is of such a nature that the mols. suffer no permanent change during its genesis. The odor mol. forms a loose absorption system with the protein mols. of the olfactory cells, and absorbs radiant heat energy. This causes displacement of one or more electrons from their normal orbit. When electrons revert to their normal positions the energy released as wave motion of a definite frequency is absorbed by the sensory app. and leaves the system as a nervous impulse. The above interpretation is in harmony with Grips's failure to find any relation between the intensity of odor and the absorptive capacity of the vapor in regard to radiant heat. Furthermore, it explains the variety of odors which exist. Any relation between gross chem. constitution and odor must be superficial, since the olfactory frequencies will not necessarily be related to the group present. Substances like vanilla, citral, aubepine, rhodinal and benzaldehyde all contain the CHO group and have a pleasant odor. The ester grouping as in Me salicylate, the ether group as in safrole, the ketone group as in Me heptenone are the seat of olfactory activity, but other groups modify or influence the odor associated with these special groups. Probably the electron pairs of the CHO group form the mechanical system for conversion of absorbed radiant heat energy into olfactory vibrations; when this system is altered, as it undoubtedly is, by attachment to a different group, then the frequency of the vibrations is altered accordingly. Respecting the fact that in extreme diln. certain unpleasant substances are found to have a pleasant odor, it seems probable that the "critical threshold concn.," or the limiting concn. at which olfactory frequency can be physiologically detected may differ with the frequency, and that the "pleasant" frequency is still observable at a diln. where the "unpleasant" frequency has ceased to be detectable.

W. O. E.

Physicochemical researches on sucrose. E. CANALS AND MELLE P. GOMBERT. Univ. de Montpellier. *Bull. soc. chim.* 43, 1137-44(1928).—By pptn. with EtOH,

sucrase loses a certain quantity of Mg; the diastasic activity is lessened, no matter whether it is detd. in neutral or acid soln. The addition of Mg ions (usually MgSO_4) causes a partial recovery of the diastase activity, at least in acid soln. Mg probably plays an important role in sucrase fermentation. A soln. of sucrase is freed of its electropositive Mg by dialysis; after electrolysis of such a soln., it is possible to detect electronegative, non-dialyzable colloidal Mg. This Mg has the same elec. sign as sucrase itself; it migrates with it by elec. transference. Mg is a constituent of the sucrase micelle.

A. L. HENNE

Russell Henry Chittenden. GRAHAM LUSK. *Ind. Eng. Chem.* 21, 91-2(1929).—Biography with portrait.

E. H.

Twenty-five years of biochemistry. HANS PRINGSHEIM. *Science* 68, 603-8(1928).

E. H.

The physical basis of electrobiology. R. FÜRTH. *Naturwissenschaften* 16, 777-81(1928).—A review on elec. phenomena in biological systems.

B. J. C. VAN DER HOEVEN

Studies on proteins. VIII. The influence of salts on the isoelectric behavior of the protein. KINSUKE KONDO AND TSUNETOMO HAYASHI. *Mem. College Agr., Kyoto Imp. Univ.* No. 5, 1-29(1928); cf. *C. A.* 22, 3420.—Expts. with solns. of the difficultly sol. proteins, rice-glutenin and casein, show that the isoelec. point of the protein is not at the point of max. flocculation, as the salt content plays a very important role. Many salts were added to protein solns. contg. about 40 mg. in 25 cc. together with calcd. amts. of 0.5 N AcOH and AcONa; and the quantities of protein pptd. and the H-ion of the solns. carefully followed. The paper contains a great many tables and graphs and a lengthy discussion of the results. IX. The isoelectric point of glutenin. *Ibid* 30-47.—The isoelec. point of glutenin from wheat flour varies according to the investigators. A glutenin carefully prepd. in this lab. showed 17.17% N. Its apparent isoelec. point was detd. at p_H 5.15 to 5.39 and was independent of the glutenin concn. in the exptl. soln. The glutenin does not denaturate after dehydration with alc. and ether. Addn. of RbCl to the buffer soln. shifts the isoelec. point of the glutenin to the acid side. Seven tables and 4 graphs are given.

G. H. W. LUCAS

The chemical composition of follicular liquid. III. G. B. TAFURI. *Boll. soc. ital. biol. sper.* 3, 641-44(1928).—The yellow substance in follicular liquid was studied spectroscopically. It showed a strong absorption band in the blue and indigo beginning at F at a wave length of 500μ and ending at G at about 430μ . Spectrophotometric measurements were also made. Two absorption bands were noted, one between $\lambda = 499.6$ and 460μ with a max. at $\lambda = 472.5$, the other between $\lambda = 459$ and 430μ with a maximum at $\lambda = 443\mu$. Probably the lipochrome in follicular liquid is identical with Escher's lutein.

PETER MASUCCI

The distribution of phosphagen in the various parts of the muscle fibers. G. MARTINO AND G. ZANGHI. *Boll. soc. ital. biol. sper.* 3, 720-3(1928).—Phosphagen was detd. in the middle portion and in the end portions of striated muscles. The animals used were the pigeon, dog and cat; the muscles tested were the sartorius of the dog and cat, the pectoral of the pigeon, and occasionally the sterno-cleidomastoideus or the abdominal muscles. The muscle fibers were cut into 3 parts; the detn. of phosphagen was made on the middle and on each of the end portions. The results are given in tabular form. The phosphagen content was greater in the middle portions. In some cases this was very marked, being 14% mg. in the middle and none in the ends, 46% mg. in the middle against 6% in the end portion, etc. These findings support the hypothesis that phosphagen is found largely in that part of the fiber next to the motor plexus.

PETER MASUCCI

The thermal effect of death. V. V. LEFESHKIN. *Ber. deut. botan. Ges.* 46, 591-3(1928).—If one considers the decompn. of unstable protein and lipid compds. as an essential feature of death, one should expect the process of death to be exothermic. Using a Dewar bottle as a calorimeter L. found that when yeast is killed by satd. sublimate or chloroform it gives off 2 g. cal. and 1.5 g. cal., resp., per g. of dry yeast. This is a preliminary report.

LAWRENCE P. MILLER

The biological significance of the radioactivity of potassium and other conclusions from a general disintegration scheme for potassium. JOSEF PENKAVA. *Radiol. Inst., Prag. Ernähr. Pflanze* 24, 429-35(1928).—A review with discussion.

L. P. M.

The adsorption ability of erythrocytes. I. Adsorption of alanine. A. KULTJUGIN AND N. IVANOVSKII. State Univ., Saratow. *Biochem. Z.* 200, 236-43(1928).—Cat, dog and cow erythrocytes thoroughly washed with physiol. salt soln. have the ability to remove alanine from soln. The removal of alanine by the erythrocytes is completed in 30 min. when no further increase in the alanine in the corpuscles is

observed. The quantity of alanine taken up by the erythrocytes depends upon the concn. of the amino acid in the soln.; absolutely less but relatively more alanine is adsorbed from dil. than from concd. solns. The removal of the alanine is an adsorption.

S. MORGULIS

Studies on the colloidal chemistry of hemoglobin. II. BR. JIRGENSONS. Lettland Univ., Riga. *Biochem. Z.* 200, 331-8(1928); cf. *C. A.* 22, 2582.—The flocculating influence of org. compds. on hemoglobin is directly related to their capillary activity. The spectral changes are similarly affected. Salts by themselves have no effect on the stability or the spectrum of the oxyhemoglobin, but when these are present together with the capillary active org. substances, the latter exert their influence generally more easily. If the concns. of both the salt and the org. substance are very high the hemoglobin may become stabilized against flocculation (e. g., isopropyl alc.), but the stabilization was only found in the cathemoglobin. In the presence of salts oxyhemoglobin is not flocculated by org. capillary active substances, and spectroscopically only the formation of methemoglobin is observed. Through heating flocculation occurs more easily; also the spectroscopic alterations proceed better in the following order: oxyhemoglobin, methemoglobin, cathemoglobin, hematin.

S. MORGULIS

The optical activity of cerebrospinal fluids. CHR. N. J. GRAM, O. JUL NIELSEN AND E. RUD. Med Universitetsklinik A, Copenhagen. *Biochem. Z.* 201, 353-68(1928).—The reducing power and the optical activity were detd. on the cerebrospinal fluid of 21 patients without disturbance of carbohydrate metabolism. The cerebrospinal fluid is dextrorotatory, corresponding to 0.026% glucose, which is invariably much lower than the value corresponding to the reduction. Administration of glucose by mouth just previous to taking the cerebrospinal fluid has no effect. In a few instances when the fluid remained for 24 hrs. its polarimetric glucose content was found to correspond to that detd. by reduction. But where the protein is pptd. with Pb acetate the rotation capacity is at once of a magnitude corresponding to the reducing capacity. It seems probable that the optical activity is the summation of the dextrorotation of the glucose and the levorotation of the protein, and is not the result of condensation of protein and glucose.

S. MORGULIS

Catalase number and catalase index of the blood of newborn kittens. F. v. KRÜGER. Univ. Rostock. *Biochem. Z.* 202, 18-20(1928).—The red-blood-cell count of kittens 6-8 weeks old is much lower than that of adult cats. Corresponding to the lower red cell count they show a smaller blood catalase no. but the catalase index is not different from that found in adult cats, the values falling within the same range of variation.

S. MORGULIS

Influence of abstention from food and water on the catalase number and catalase index of the blood. F. v. KRÜGER. Univ. Rostock. *Biochem. Z.* 202, 21-8(1928).—Abstention from food and water causes a marked rise in the no. of red cells. The catalase activity of the blood is likewise considerably increased, but since the catalase index remains still within the normal limits of variation, the increase is due to a parallel rise in the no. of red blood cells.

S. MORGULIS

Conditions for the formation of urea in the isolated liver. III. P. P. ASTANIN AND V. M. RUBEL. State Inst. of exptl. Med., Leningrad. *Biochem. Z.* 202, 70-4(1928); cf. *C. A.* 22, 2778.—In accordance with Werner's formulation of the chemistry of urea formation HNCO is the most important intermediate step. Expts. on perfused livers show that there is no formation of urea in the absence of serum; while the absence of the erythrocytes interferes with the oxidation processes also essential for the urea formation. Each is supposed to take part in one of the phases of the reaction. When serum and red cells are recombined the urea formation proceeds normally. Stimulation of the vagus nerve, which is regarded by some as favoring oxidation, also promotes the formation of urea. The addn. of NH_4 salts had no definite quant. effect on the urea formation. Conclusion: The urea formation must be dominated by the oxidation process which det. the amt. of HNCO produced, while the NH_4 salts simply favor the transformation of the HNCO to urea in alk. medium.

S. MORGULIS

The normal lipid content of some organs. II. Lipoids. BRUNO REWALD. *Biochem. Z.* 202, 99-105(1928).—The sex glands have the highest lipid content. On the basis of the dry substance, the ovaries, without the corpus luteum, contain 6.43% and the corpus luteum 21.63%, the testes 11.1% lipid material. The adrenal glands are likewise rich in lipid but the other organs contain about 6%.

S. MORGULIS

The "mitogenetic radiation" of working muscles and some other tissues. WERNER W. SIEBER. Univ. Berlin. *Biochem. Z.* 202, 115-22(1928).—It was found that pulp from muscles electrically stimulated promotes the growth of tad poles and that this effect cannot be obtained with pulp from resting muscles. Since Gurwitsch has shown

previously that germinating tissue from plants or animals can stimulate nuclear division in rootlets without any direct contact the action at a distance of the muscle pulp was likewise tested. The expts. were carried out in accordance with Gurwitsch's technic. Either 2 onion roots are employed, of which one is the "inductor" and the other the "detector" in which mitoses are induced by distant action. On the "inductor" is a culture of yeast grown on beer wort agar and the "detector" is a culture of yeast on peptone-dextrose-agar. Gurwitsch's results were corroborated, and the budding of the yeast exposed to the action of the "inductor" was found to be about 45% greater than in the control. A repetition of this expt. using the muscle pulp as "inductor" showed the same distant effect when a previously faradized muscle but not when a resting muscle was used. That the effect is really due to a radiation is sustained by the observation that it could be directed from the "inductor" tube by means of a metal mirror placed at 45° to a selected spot in the "detector" yeast culture which was marked off. Increased budding was invariably noted in the marked off spots. Other proliferating tissues were tested for their distant action; spleen and lymph nodes gave neg. results, but bone marrow was quite effective. Testes, ovary, skin and liver all gave neg. results, but fairly young Jensen sarcoma tissue was very active in inducing budding. Apparently the growth activity cannot account for the radiation which exerts its effect at a distance, because it is displayed strongly by muscle, and on the other hand, the lymph tissue was found inactive. The idea that the radiation may be assocd. with the production of special metabolic products is rejected and an hypothesis is proposed that oxidation is really the releasing cause. It is pointed out that the bone marrow and lymph tissue so unlike in their distant effects are also sharply differentiated from each other by the presence in the former and absence in the latter of oxidases. S. M.

Sugar oxidation and decomposition. I. Influence of chloramine on glucose. K. BERNHAUER AND K. SCHÖN. Chem. Lab., deut. Univ. Prague. *Biochem. Z.* 202, 159-63(1928).—Only under exceptional conditions are 8 equivs. of O_2 used up in the reaction of chloramine and glucose. The claim of Bleyer and Braun that under these conditions the glucose mol. is quantitatively changed to CO_2 and $C_2H_4O_2$ is denied. Not a trace of AcOH was found but on the contrary HCOOH which was recognized by its reaction with $HgCl_2$ and as its Pb salt. The oxidation of glucose by chloramine is thus not a simple process. The formation of methylglyoxal seems probable; on the contrary, gluconic acid is apparently not formed. S. MORGULIS

The photochemical dissociation under intermittent illumination and the absolute absorption spectrum of the respiratory enzyme. OTTO WARBURG AND ERWIN NEGELEIN. Kaiser Wilhelm-Inst. für Biologie, Berlin-Dahlem. *Biochem. Z.* 202, 202-28(1928).—The relative absorption spectrum of the respiration enzyme, i. e., the alteration of the absorption coeff. according to the wave length, can be calcd. from the stationary condition established when cells are illuminated in $CO-O_2$ mixts. The theory is developed in great detail to show that the abs. absorption spectrum of the respiration enzyme can be calcd. from the data on the velocity with which the stationary condition is established in light or dark. From the exptl. results the conclusion is drawn that the spectrum of the enzyme is not that of iron carbonyl but of iron carbonyl bound to an org. mol. as in hemin-CO, where the FeCO is carried by the tetra-pyrrole nucleus. The N of the latter forms complex salts with heavy metals and with Fe it forms hemin. Judging by its spectrum the respiration enzyme is a similar complex Fe compd. S. M.

The effect of proteins on ferric oxide sol. H. FREUNDLICH AND G. LINDAU. Kaiser Wilhelm-Inst. physik. Chem. u. Elektrochem., Berlin-Dahlem. *Biochem. Z.* 202, 236(1928). S. MORGULIS

Further studies on plant oxidoreductase. D. MICHLIN. *Biochem. Z.* 202, 329-36(1928).—A highly purified prepn. of oxidoreductase was made from potatoes. 500 g. of a finely ground potato pulp is quickly introduced into 500 cc. H_2O which prevents the formation of a brown color. After shaking for 2 hrs. it is poured through a cloth and pptd. with 3 vols. of acetone. The ppt. is collected and washed with small quantities of acetone and dried in the air. The gray powder thus obtained is rubbed up with 100 cc. 0.0025 N HCl and kept for 12 hrs. under toluene. After centrifuging, the soln. is decolorized with 2 g. charcoal and filtered, the treatment with charcoal being repeated until a colorless filtrate is obtained, which reduces nitrates to nitrites in the presence of aldehyde. Upon the addn. of 2 vols. of acetone to this soln. a fine colorless powder is formed easily sol. in H_2O , which preserved under petroleum ether retains its oxidoreductase activity. A prepn. of still greater purity is obtained when the enzyme soln. is dild. with 2 vols. of H_2O , then treated with 1 vol. of a 30% suspension of bolus alba. After thorough mixing this is centrifuged and the residue is washed twice with H_2O . The residue is now shaken for 2 hrs. with 0.05% NH_4OH equal to the original vol. of the

enzyme soln. The leached-out enzyme is then purified by the procedure previously described for the milk oxidoreductase. The activity of the enzyme is expressed per g of dry residue. The relative reaction velocity of both plant and animal oxidoreductase enzyme systems is studied and the relationship between the two enzymes discussed.

S. MORGULIS

Studies on electrolyte-free aqueous solutions of proteins. VII. Hydration and charge of protein ions. WOLFGANG PAULI. Univ. Wien. *Biochem. Z.* 202, 337-64 (1928).—The following table summarizes the results of numerous measurements which were made with highly purified proteins. The max. binding capacity of one g. protein in g. equivs. was:

	Pos. groups	Neg. group
A { Ovalbumin	110 $\times 10^{-5}$	134 $\times 10^{-5}$
{ Seralbumin	147 $\times 10^{-5}$	160 $\times 10^{-5}$
B Hemoglobin	68.5 $\times 10^{-5}$	68.5 $\times 10^{-5}$
C { Glutin	68 $\times 10^{-5}$	57 $\times 10^{-5}$
{ Pseudoglobulin	143 $\times 10^{-5}$	126 $\times 10^{-5}$

According to the highest pos. (+ mE) and neg. (− $m'E$) charge of their ions the proteins may be placed in 3 classes: (A) − $m'E$ > + mE ; (B) + mE = − $m'E$; and (C) + mE > − $m'E$. The first are predominantly acid, the third is predominantly alk. Hemoglobin with the equal no. of acid and basic groups is practically the ideally symmetrical ampholyte. The viscosity is greatest at the point of greatest elec. charge which corroborates the 2 principles, namely, that hydration increases with the charge and that under similar conditions cations become more hydrated than anions. S. M.

The sulfur content of hemoglobin in blood of pure-bred dogs and of some rarely studied animal species. ELIZABETH TIMÁR. Univ. Budapest. *Biochem. Z.* 202, 5-79 (1928). The previous reports that cat hemoglobin contains 0.97% S and beef blood hemoglobin 0.58% S are confirmed. In dogs of the usual lab. run the value of 58% in the hemoglobin is rarely found, so that a simple ratio as that of Fe:S₂ or Fe: calculated from the previous data cannot be derived. On the other hand, the hemoglobin of pure-bred dogs, as well as that of donkeys and foxes, yields very generally the due 0.57% S corresponding to a Fe:S₂ ratio. The hemoglobin of geese contains 71% S. In hemoglobin with a 0.58 or 0.97% S this must be entirely in the form of cysteine.

S. MORGULIS

The effect of age on the composition of the lipid fraction in the animal organism. S. SADIKOV AND E. S. GOLOVCHINSKII. Univ. Leningrad. *Biochem. Z.* 202, 421-54 (1928). The ether ext. of cats at different ages varies considerably, reaching a max. of 13.34% on the 21st day of age. The glycerol content of the ether ext. also varies with age, being only 0.7% of the dry residue of the ether ext. at birth but rising to 7.2% on the 7th day and again diminishing to 2.7% on the 14th day after birth. At the end of the lactating period this becomes 4.6%, and this value is retained throughout adult life. Referred to the total body wt. the glycerol content is only 0.04% in the new born cats, ranging between 0.10 and 0.55% in later stages, and in the well-nourished adult it is about 0.36%. In the state of senile exhaustion it falls to 0.08%. From these data on glycerol it follows that glycerides constitute only a small fraction of the ether ext. In the ext. of the new-born 56.86% is unsaponifiable matter, which increases gradually to 61.83% at the end of 5 days, with but a small quantity of fatty acid present. The unsaponifiable matter together with the glycerol and fatty acids accounts only for 69.52% of the total ext., but this is not thought to be due to the presence of volatile acids which are lost in the preliminary process. But from the 5th day after birth the unsaponifiable fraction falls to only 4.1-2.7%, to accumulate once more about the 30th day; the undetd. fraction so large in the newborn almost completely disappears by the 7th day. Subsequently this fraction again reappears and shows considerable variations in the course of growth. The degree of unsatn. diminishes gradually. At birth 100 parts of the ether ext. requires 80.2 parts of I₂ but this drops to 56.7 in the adult. The high I₂ value may be accounted for because the unsaponifiable lipid alcs. in the ether ext. of the new born are very greatly unsatd. This is not regarded as being of the cyclic sterols especially as it fails to give the usual cholesterol tests. It is supposed that these alcs. are oleyl alc., linolic alc., linolenic alc. and terpene alc. The ether ext. of kittens in the first postembryonic stage of development is rich in unsatd. aliphatic alc., corresponding to the unsatd. fatty acids, but the quantity of fatty acids is so small that these alcs. must be thought to be in an unesterified condition. In the second stage of postembryonal development, beginning on the 7th day, the unsaponifiable substances disappear and there is simultaneously a sudden appearance of an ex-

cess of fatty acids. This is believed to be due to a conversion of unsatd. aliphatic alcs. into the corresponding unsatd. acids which now esterify with the glycerol.

S. MORGULIS

Studies on enzymic proteolysis. III. P. RONA AND E. MISLOWITZER. Univ. Berlin. *Biochem. Z.* 202, 453-65(1928); cf. *C. A.* 23, 618.—Under the influence of trypsin on albumin solns. there is no diminution in the particle size. During peptic digestion of albumins a diminution in size of the particles can be observed corresponding more or less to the diminution observed in casein soln. The increase in amino groups during hydrolysis depends upon the cleavage of hydrolytic products of the non-protein N. In the colloidal part there is no or practically no increase in the NH_2 groups but a marked increase in the carboxyl groups.

S. MORGULIS

The occurrence and the transformation of pyrophosphate in cells. I. Demonstration and isolation of pyrophosphate. K. LOHMANN. Kaiser Wilhelm-Inst. für Biologie, Berlin-Dahlem. *Biochem. Z.* 202, 466-93(1928); cf. *C. A.* 22, 2176.—Fresh muscle contains an acid-sol. P compd. which is hydrolyzed in 7 min. by boiling at 100° in *N* HCl and which was isolated as a pyrophosphate. This substance is present in amts. of 0.0-0.9 mg. P_2O_5 per g. fresh or frog rabbit musculature, thus corresponding to 20% of the total acid-sol. P of muscle. The isolation from frog, rabbit, or crab muscle, as well as baker's yeast, is made generally by neutralizing with baryta a trichloroacetic ext. of the cells, the Ba ppt. being repptd. from an acetic acid soln. and transformed into the cryst. Na pyrophosphate from Pb and Cu salts. The identification of the compd. was by direct analysis as well as by comparison of its electrotitration curve with that of a synthetic product. The const. of the hydrolysis velocity of the pyrophosphate in 0.1 *N* HCl at 100° is 26×10^{-3} .

S. MORGULIS

Effect of irradiation on the blood chemistry in tuberculosis. KATHERINE C. SPENCE. *British J. Actinotherapy* 3, 148-9(1928).—It is known that blood Ca and P play an important part in the pathology of tuberculosis, and it is probable that cholesterol does also. For a study of the effect of ultra-violet irradiation on these constituents, 12 adults with undoubted tuberculous lesions were irradiated daily. After a month of this treatment the cholesterol had risen considerably in every case, the greatest rise occurring in patients who clinically showed the most improvement. The Ca and P figures, however, showed no significant changes. It is suggested that, although the total amt. of Ca is unchanged, the action of the radiation is to increase the percentage of the element in the ionized or active state.

E. H. QUIMBY

Influence of carbon dioxide tension on the oxygen dissociation curve. VALY MENKIN AND MIRIAM F. MENKIN. Harvard Univ. *Science* 68, 518-9(1928).—A double dissocn. process of oxyhemoglobin is assumed, thus: (1) $\text{HHbO}_2 \rightleftharpoons \text{HHb} + \text{O}_2$ and (2) $\text{HHbO}_2 \rightleftharpoons \text{H}^+ + \text{HbO}_2^-$. Equation (1) represents the absorption of O by the tissues and the production of reduced hemoglobin. Equation (2) represents the dissocn. of oxyhemoglobin, therefore $[\text{H}^+][\text{HbO}_2^-]/[\text{HHbO}_2] = K$. With the formation of CO_2 in the tissues the concn. of H is increased and hence in equation (2) the reaction would be driven back and thus tend to increase the concn. of undissocd. HHbO_2 . An increase in the concn. of HHbO_2 would involve a shift in the equil. of equation (1) to the right with an increase in the production of O. This double dissocn. of HHbO_2 offers a chem. mechanism to account for the lowering of the O dissocn. curve by an increase in the CO_2 tension.

The histochemical detection of urea. W. LAVES. Universitäts-inst. gericht. Med. in Graz. *Wiener klin. Wochschr.* **41**, 1403-4(1928).—In urea retention its presence in tissues can be demonstrated as follows: The material, secured at autopsy, is allowed to stand 6 hrs. in a 6% soln. of xanthydrol (Kahlbaum) in AcOH. Thin sections are dehydrated during a 24-hr. period in successive portions of abs. alc., embedded and cut. Characteristic dixanthyl urea crystals are formed. Illustrations are given of brain preps. D. B. DILL

Method for determining minimal quantities of lactic acid. E. LEHNARTZ. Univ. Frankfurt. *Z. physiol. Chem.* **179**, 1-8(1928).—Certain modifications in the Hirsch-Kauffmann and Embden procedures make it possible to det. lactic acid in quantities as small as 0.02 mg. with an av. yield of 100% and a max. error of $\pm 2.7\%$. For detn. of lactic acid in muscle a 0.1 g. sample is powdered in liquid air and transferred to a centrifuge tube contg. 5 cc. of 4% HCl. Add 2-3 cc. of 5% HgCl₂ to ppt. the proteins and let stand several hrs. Add 17 cc. H₂O and let stand overnight in the icebox. Centrifuge, pass H₂S through the decanted liquid to remove Hg and expel the H₂S by a current of air. Transfer the filtrate (about 23 cc.) to a 35-cc. volumetric flask, add 2 cc. of 10% CuSO₄, neutralize with 33% NaOH and ppt. with 5 cc. milk of lime. Dil. to 1 mark, transfer to a centrifuge tube, shake repeatedly during 0.5 hr. and centrifuge 5 min. Decant, filter and transfer a large aliquot (32-3 cc.) to a 100-cc. short-neck Erlenmeyer flask. This represents 80-90% of the lactic acid originally present. Neutralize with 25% H₂SO₄, add an excess to bring the H₂SO₄ concn. to 0.5%, add 2 cc. of 1% MnSO₄ and a little talc. In case considerable lactic acid is present a smaller aliquot is taken so that the detn. does not exceed 0.5 mg. Larger amts. require a longer time for oxidation without enhancing the accuracy. Oxidation is performed by dropping in 0.002 N KMnO₄ at the rate of 40-50 or 20-30 drops per min. according to the amt. of lactic acid to be detd., until the contents of the flask become dark brown, then heating on an asbestos plate provided with a hemispherical depression to fit the bottom of the flask so as to distil the AcH formed. The latter is collected in a receiver contg. 10 cc. of 0.02 N or 0.1 N KHSO₅ cooled in ice. The distg. head should fit the flask by means of a ground-glass joint instead of a rubber stopper. The main excess of KHSO₅ is removed with 0.04 or 0.02 N I and the exact end point reached by adding 0.002 N or 0.001 N I from a micro-buret graduated in 0.01 cc. Toward the end point only fractional drops are added. Now add a few g. NaHCO₃ or better Na₂HPO₄ to decompose the aldehyde-bisulfite compd., shake thoroughly and titrate as before with I. Recognition of the end point is facilitated by addn. of a trace of talc. If, instead of the Schenck reagent for removal of protein in the 1st step of the above procedure, CCl₄-CO₂H is used the results are less satisfactory. A. W. DOX

Preparation of histidine. F. CHEMNITZ. Jena. *Pharm. Zentralhalle* **69**, 741-2(1928). The prepn. of this compd. from dried beef blood is described. W. O. E.

Estimation of sugar in urine. FELIX JÖSTEN. *Pharm. Ztg.* **73**, 1436(1928).—A criticism of a recent article by E. Meyer on this subject (direct titration of dextrose with boiling Fehling's soln.), and recommendation that the indirect iodometric method as developed by Rupp be used instead. W. O. E.

Colorimetric determination of inorganic sulfate in small amounts of urine. BEN-NARD S. KAHN AND S. L. LEIBOFF. Lebanon Hospital, New York. *J. Biol. Chem.* **80**, 623-31(1928).—A colorimetric method is described for the detn. of inorg. SO₄— in

small quantities of urine. The SO_4^{--} is pptd. as benzidine sulfate; this is diazotized and coupled with PhOH , in alk. soln., to produce a yellow color, the intensity of which is proportional to the amt. of benzidine.

ARTHUR GROLLMAN

Stalagmometric determination of lipases. B. J. KRIJGSMAN. *Natuurw. Tijdschrift* 10, 137-44(1928).—The stalagmometer consisted of a rather wide-mouth calibrated pipet of 10 mm. diam., the flow from which was regulated by the air supply through a narrow dust-protected capillary. For 6 cc. of distd. water 160 drops were found, for 6 cc. of satd. tributyrin soln. 220 drops. Lipase was prepd. from intestinal glands of *Helix pomata*, dried to const. wt. and pulverized. To 25 mg. powder 3 cc. glycerol (80%) was added, mixed and kept at 30° for 17 hrs., 7 cc. distd. water was then added, mixed and centrifuged, the liquid layer being the test soln. used. For the sapon. expts. satd. tributyrin soln. was used from 500 cc. H_2O + 7 drops com. tributyrin, shaken for 20 min. and filtered after 16 hrs.' standing. Buffer solns. of 7 cc. $M/15 \text{Na}_2\text{HPO}_4 \cdot 2\text{H}_2\text{O}$ + 3 cc. $M/15 \text{KH}_2\text{PO}_4$ were added (1 cc.) to the exptl. solns. of gland ext. (0.25 cc.) and tributyrin solns. of varying concns. (25 cc.) to neutralize the surface action of free butyric acid (p_{H} of mixts. 7.17). The ester content of the mixts. was detd. from a standard tributyrin stalagmometer curve (drop no. vs. percentage). The accuracy was about 2%. By using $1/16$ to 1 cc. of gland ext. in the mixt. the cleavage appeared to be linear up to $1/8$ cc. (24% in 3 hrs.) with time. From there on it slows down with time in consequence of the accumulation of cleavage products. Below 40% cleavage the tributyrin decomposed is directly proportional to time and the amt. of enzyme is indirectly proportional to the time necessary for a certain percentage decompn. MgCl_2 was without effect on the reaction.

B. J. C. VAN DER HOEVEN

The action of magnesium on the coagulation of the blood. A new coagulometer. E. MENEGHETTI. *Boll. soc. ital. biol. sper.* 3, 782-9(1928).—This work deals with the modifications produced in the blood following the subcutaneous injection of MgCl_2 , and the technic used to det. these. The time of coagulation was measured by means of an app. which utilizes the same principle as the Heubner-Rona coagulometer, but

which has certain advantages over the latter. The coagulometer consists of 3 parts (1, 2, 3), supported on a wooden base. (1) Is a glass stopper through which passes a narrow opening widening at the top so that it can be packed with cotton. The stopper fits the inverted ampoule (2), which has an overflow tube the diam. of which may be regulated so that water, blood or any liquid may flow freely through it. The lower end of this tube fits the neck of a bottle (3). This has a side tube fitted with a stopcock by means of which the interior of the bottle is connected to the exterior through this side tube. A liquid introduced into the ampoule cannot flow freely into the bottle if the stopcock is closed, but if opened then the liquid flows continuously into the bottle. However, if before opening the stopcock, the upper end of the ampoule is closed with the glass stopper (1) the liquid falls from the ampoule into the bottle drop by drop. The app. is cleaned, dried and placed in an

incubator at 38° at least $1/2$ hr. before using. By means of a syringe a sample of blood is taken from a vein and rapidly introduced into the ampoule. For very accurate detns a cannula is inserted into the vein and the blood allowed to flow directly into the ampoule. The glass stopper is then inserted and the whole app. placed in the incubator again. Before shutting the door of the incubator, the stopcock on the side tube of the receiving bottle is opened. The blood can then be seen through the glass door to fall drop by drop into the bottle until coagulation takes place. The interval between the taking of the sample of blood from the vein and the fall of the last drop, is the time of coagulation of that particular sample of blood. By this method the coagulation time of normal rabbit blood is about 10 min. A drop falls every 10 sec. so that it takes about 3 cc. of blood for a test. The coagulometer is sensitive and gives const. results. The subcutaneous injection of 1 g. MgCl_2 per kg. of body wt. into rabbits causes an increase in the time of coagulation which persists for several hrs. later. If C is the coagulability of the blood, t its normal time of coagulation, then $C = 1/t$. Let $C = 1$, and $C' =$ the new coagulability

to be detd. after a time t' ; $C' = t/t'$. In addn. to the increase in the time of coagulation, the injection of $MgCl_2$ produces variations in the concn. and physical state of the Ca in the blood.

Conditions of action of asparaginase of *Aspergillus niger*. D. BACH. *Compt. rend.* 187, 955-6(1928).—The enzyme was active only in neutral or slightly alk. media, the optimum p_H being 8.4 to 8.8. At the same time *Aspergillus niger* was able to utilize asparagine completely in media more acid than p_H 6.4. The optimum temp. varied with the p_H of the medium being 42° for p_H 8.6 and 31° for p_H 7.6. The temp. zone of action was wide, extending from 7° to 70°. When the concn. of the substrate (asparagine) increased beyond 1%, the NH_3 produced tended toward a limit which was independent of the concn. of the substrate. Complete hydrolysis of the asparagine was not attained, but reached about 80% under optimum conditions. As the hydrolysis proceeded there was a diminution in its velocity after about 36 hrs., due principally to a destruction of the enzyme. The presence of asparagine tended to protect the asparaginase from autodestruction.

L. W. RIGGS

Nephelometer in mycology. GEORGE HOCKENYOS. Univ. Illinois. *Science* 68, 459(1928).—Directions are given for the prepn. of water cultures of the fungus *oidium*

for observation in the nephelometer. The readings are proportional to the amt. of growth present in the culture.

L. W. RIGGS

Some factors influencing the germicidal efficiency of alkalis. MAX LEVINE AND J. H. BUCHANAN. *Am. J. Public Health* 18, 1361-8(1928).—The alk. washing compds. used in the carbonated-beverage industry function as detergents and germicides. L. and B. studied the germicidal properties of a number of these compounds. The exposed bacteria did not die at a const. rate. These rates were considered to be unsatisfactory for comparative purposes. The "killing time" for 99.9% of the exposed bacteria was considered to be a suitable, determinable, and desirable criterion of the relative germicidal efficiencies of the alkali solns. studied. The germicidal efficiency of an alkali increased with its normality and OH concn. However, neither of these can be a suitable index of the comparative sterilizing powers of different alkalis. At the same normality the alkalis ranked as sterilizing agents in the order: (1) NaOH; (2) Na_3PO_4 ; (3) Na_2CO_3 . At the same OH-ion concn. the order of sterilizing efficiency was reversed: (1) Na_2CO_3 ; (2) Na_3PO_4 ; (3) NaOH. Addition of NaCl, Na_2CO_3 or Na_3PO_4 to NaOH markedly reduced the "killing time" but did not affect the p_H . The germicidal properties of the alkalis is not a direct function of the OH-ion concn. but is affected by other factors. Undissocd. NaOH may be the controlling factor in the germicidal powers of alkalis. Alky. expressed as NaOH (normality) is a more suitable and reliable index than the p_H .

F. W. TANNER

Rate of the multiplication of yeast at different temperatures. OSCAR W. RICHARDS. *J. Phys. Chem.* 32, 1865-71(1928).—The rate of multiplication of *Saccharomyces cerevisiae* increases regularly with the increase of temperature between 4° and 30° except that the rate of change alters at 9°. Above 30° a decrease in the rate of growth is associated with an increase in temp. At 30° abnormal elongated cells are produced, which indicates that this temperature affects the process of bud formation in a critical manner. More of these abnormal cells appear if the temperature is maintained within narrow limits of variation (cf. *C. A.* 22, 2961).

F. W. TANNER

Germicidal and hemolytic action of α -bromo soaps. ARNOLD H. EGGERTH. Hoagland Lab., Brooklyn. *J. Exptl. Med.* 49, 53-62(1929).—The soaps of the α -bromo fatty acids are usually more germicidal than the unsubstituted soaps. Only when *B. typhosus* was the test organism was there no increase in germicidal action. For any test organism, germicidal action of the brominated soaps increases rapidly with increasing mol. wt. up to a certain point, then diminishes. This is likewise true of the hemolytic titer. The point of max. germicidal action varies with the different species of test organisms. In the series studied, brominated soaps of 12 and 14 C atoms were most germicidal for the Gram-negative organisms, while soaps of 16 and 18 C atoms were most germicidal for Gram-positive organisms. The brominated soaps are, in general, more active in acid than in neutral or alk. reactions. For certain organisms, the brominated soaps are among the most rapid and potent germicides known.

C. J. WEST

Sensitizing properties of the bacteriophage. CLAUS W. JUNGEBLUT AND EDWIN W. SCHULTZ. Stanford Univ. *J. Exptl. Med.* 49, 127-43(1929).—The work presented in the paper demonstrates two fundamental facts: The bacteriophage virus *per se* is not capable of sensitizing guinea pigs to a degree and extent detectable by ordinary exptl. methods. The bacterial protein, after lysis of the organisms by the bacteriophage, acquires new antigenic properties which differ radically from those of the intact bacteria or bacterial cells dissolved by spontaneous autolysis.

THOMAS G. PHILLIPS

Comparison and significance of certain plant serological methods. WALTER SLATMANN. *Planta Abt. E, wiss. Biol.* 6, 277-312(1928).—A large number of serological tests showed that a (+) reaction was obtained for antigens of closely related as well as non-related plants and that the same held true for (−) reactions. Antigens from such genera as *Corylus*, *Amaranthus*, *Delphinium*, *Magnolia*, *Lens*, *Citrus* and *Evonymus* all gave a (+) reaction to immune serum against *Fagus silvatica*. It is believed, therefore, that systematic relationships in plants cannot be demonstrated by the use of serological tests based upon the presence of specific proteins. Immune serum from different rabbits was qual. and quant. very different in many of the tests. The capillary phosphate

method used by S was shown to be more reliable than either that in which phosphate is omitted or the pptn. method employed by Mez and his co-workers. A. E. HITCHCOCK

The glycerophosphatase action of plant seeds and the enzyme synthesis. ANTONIN NEMEC. Biochem. Inst., Prague. *Biochem. Z.* 202, 229-35(1928).—The glycerophosphatase action is greatly enhanced during germination. In expts. with barley and corn there was noted a lowering of activity in the first 2 days but this is followed by a great rise in enzymic activity. The behavior of the glycerophosphatase furnishes thus another example of the mobilization of enzymic capacity of germinating seeds. During the ripening of the seeds the glycerophosphatase action diminishes considerably, and since the germinating ability increases with ripening it grows in proportion to the reduction of the enzymic activity of the seed meal. However, upon the completion of the ripening process the glycerophosphatase action increases once more. S. M.

The sodium and potassium contents of lentils and peas. W. KÜSTER AND J. UMBRECHT. Tech. Hochschule, Stuttgart. *Z. physiol. Chem.* 179, 139-48(1928).—The literature contains numerous ash analyses of leguminous seeds, particularly peas and beans, showing 1-2% Na and 30-40% K in terms of total ash. The ash of lentils, on the other hand, is reported to contain Na 13 and K 35%. This unusual ratio of Na to K in lentils was thought needful of corroboration. It appears that the analysis was performed in 1844 by Levi working in Liebig's lab. at Giessen, and has been accepted unchallenged by numerous textbooks up to the present time. K. and U. have now examined 2 varieties of lentils, a small lentil from Sigmaringen and the large Heller lentil from Thuringen. The values found averaged 0.782 and 3.063% for Na_2O , and 31.954 and 37.473% for K_2O . Parallel analyses of peas gave similar values, viz., 1.806% Na_2O and 40.35% K_2O . Levi's value of 13.50% for Na_2O in lentils may be regarded as very exceptional, and possibly due to unusual soil conditions where the plants were grown.

A. W. DOX

Plant coloring material. VIII. Constitution of monardaein. P. KARRER AND ROSE WIDMER. *Helv. Chim. Acta* 11, 837-42(1928); cf. C. A. 22, 4149.—Methylation of the coloring material of honey balm with Me_2SO_4 and NaOH, keeping the reaction as nearly as possible neutral gives a product (I) insol. in dil. alkali, contg. no free OH groups. Sapon. of I with MeOH-KOH gives $p\text{-CH}_3\text{OC}_6\text{H}_4\text{CH:CHCO}_2\text{H}$ (II) and the dimethyl ether of monardin chloride which contains a free phenolic OH group in which II was substituted. Monardein (III) shows color change with alkali, similar to anthocyan dyes with free OH in 4'-position. Hydrolysis of III with 20% HCl for 3 min. gives a product contg. $p\text{-HOC}_6\text{H}_4\text{CH:CHCO}_2\text{H}$ (IV) and the residue but no sugar, showing that IV is not combined in the sugar group. On the basis of the foregoing information and a comparison of the dimethyl ether of pelargonidin with that of monardin K. and W. visualize the sugar-free portion as being formed in the following reaction between a depside-aldehyde $\text{HOC}_6\text{H}_4\text{CH:CHCOO}$ and HO -

Yellow coloring material in the red rose. P. KARRER AND KURT SCHWARZ. *Ibid* 916-9. —The sugar free yellow dye (I) which is contained in red rose petals is shown to be identical with quercetin. I was isolated by extg. the rose petals with 5% H_2SO_4 which removes the combined sugar group, and then with ether. I which is present in the ether ext. with a hydrocarbon is sepd. therefrom by means of its soly. in hot water or in alkali. The pentaacetate of I was identical with quercetin pentaacetate (II) m. 193°. The ozone decoloration of II gives diacetylprotocatechuic acid, m. 151°.

FREDERICK C. HAHN

Chemistry of the red and blue pigments of flowers and fruits. ERNEST H. HUNTRESS. Mass. Inst. Tech. *J. Chem. Education* 5, 1392-8(1928).—A brief review of the work of Willstätter, Karrer and Robinson.

LOUISE KELLEY

The color reactions of lignin. FRAN PODBREZNÍK. Inst. du Pin, Bordeaux. *Bull. Inst. Pin* No. 53, 233-6 (Oct.), No. 54, 245-50(Nov., 1928).—P. first discusses the func-

tion and relative importance of surface adsorption and of slow chem. reactions in the production of characteristic colors on treating lignin with various reagents. The 2 chief practical difficulties in applying these reactions to lignified membranes are (a) those due to uneven coloring of the tissues, and (b) those due to non-uniform d. of the material. P. describes the technic which he has devised for carrying out these tests, particularly on wood tissues, in which (a) is eliminated or reduced to a min. by grinding the material to a powder and incorporating suitable inert, white pigments and (b) is eliminated or reduced to a min. by compressing the material. Most of the reactions found in the literature as being given by aromatic amines and phenols (a bibliography of 43 references is given) have been repeated, and in a no. of cases the results obtained contradicted published data. The following new characteristic reaction was found: pine sawdust is colored orange by heating very gently with a soln. of $\text{KClO}_3 + \text{HCl}$. It is shown that the coloring of lignified tissues can be due neither to the methylpentosans nor to other aromatic compds., such as vanillin, coniferyl alc. or Czapek's "hadromal." Of a no. of aromatic compds., eugenol gave reactions which, on the whole, most closely resembled those of lignified tissues. As exd. lignin and oxidized lignin give the same reactions as the lignified tissues, P. concludes that they are due mainly to lignin, but that other factors are also probably involved as lignin may undergo partial hydrolysis or depolymerization in carrying out the reactions. A. PAPINEAU-COUTURE

Localization and disappearance of alkaloids in the epidermis of the tobacco leaf. J. CHAZE. *Compt. rend.* 187, 837-9(1928); cf. *C. A.* 21, 3385.—Tests in the cells of the epidermis of tobacco leaves, during the hot dry month of July, showed exceedingly variable quantities of nicotine as estd. by microchem. color and pptn. reactions. L. W. RIGGS

Critical study of the method of Sachs applied as a measure of the migrations of substances. R. COMBES. *Compt. rend.* 187, 666-8(1928); cf. Thoday, *C. A.* 4, 1312, and following abstr.—In order to eliminate the errors of the Sachs' method noted by Thoday and others, the detns. were made on disks of the leaves cut out with a punch to secure uniform size. Loss of N was detd. during both day and night in green leaves, Sept. 14-20, leaves beginning to turn yellow, Oct. 20-Nov. 2, and yellow leaves, Nov. 2-13. Results by this method showed about $\frac{1}{3}$ as much loss of N during the autumnal yellowing of beech leaves as by the Sachs' method. L. W. RIGGS

Influence of traumatism on the migration of substances in plants. R. COMBES. *Compt. rend.* 187, 993-5(1928); cf. preceding abstr.—Traumatism accelerated the migration of matter from the leaves toward the stock of the chestnut during the night. The action of traumatism upon the exchange of material accounts for an error of the Sachs' method. L. W. RIGGS

Positive null and negative antagonism of binary mixtures of electrolytes with reference to plants. L. MAUME AND J. DULAC. *Compt. rend.* 187, 668-70(1928); cf. *C. A.* 21, 1273, 2491, and following abstr.—Mixts. of any 2 in mol proportions of NaCl, KCl and NH_4Cl did not affect the elongation of the root. In mixts. of NaCl with CaCl₂ or NaNO_3 with $\text{Ca}(\text{NO}_3)_2$ there was a recoil of disocn. leading to a diminution of the pressure of the ions in contact with the root; hence there is a positive antagonism of the salts and a diminution of the toxicity. The case illustrated by mixts. of NaCl and K_2SO_4 is inverse to the preceding condition. Here the mixt. of electrolytes is followed by greater disocn., an increase in the ionic pressure and an increase in toxicity. L. W. RIGGS

Correlation between the positive antagonism and absorption by the plant. L. MAUME AND J. DULAC. *Compt. rend.* 187, 769-71(1928); cf. preceding abstr.—In a series of solns. contg. a Ca salt in const. concn. and a Na or K salt with the same anion as the Ca salt but in variable concns. what influence does increasing concn. of the latter exert on the absorption of the Ca salt? As the concn. of the accompanying salt was increased the absorption of Ca decreased. With concns. of the accompanying salt ranging from 0.0005 to 0.02 the Ca in the leaves of the wheat plant was a decreasing function of the logarithms of the vol. equivs. of the accompanying salt. L. W. R.

Volatilization of iodine in Northern algae. PIERRE DANGEARD. *Compt. rend.* 187, 899-901(1928); cf. *C. A.* 22, 3193.—Volatilization of I in *Laminaria* and *Fucus* was observed on the northern coast of Norway in localities where the temp. of the ocean water was about 0° . L. W. RIGGS

Some effects on *Pisum sativum* of a lack of calcium in the nutrient solution. DOROTHY DAY. Mills Coll. *Science* 68, 426-7(1928).—The object of this study was to det. the effect of the lack of Ca on the gross anatomy and histologic structures of the plant. As compared with plants receiving a complete fertilizer, plants deprived of Ca showed less growth, chlorotic lower leaves, tough curled upper leaves and death

in 9 or 10 weeks. The anatomical structure of root and stem remained practically const., the difference being the amt. of elongation. Plants deprived of Ca for 5 weeks and showing the above-mentioned characters made a rapid recovery of the normal condition upon the addn. of Ca to the nutrient soln. L. W. RIGGS

Easy sampling of plant tissues. R. P. BARTHOLOMEW. Univ. Arkansas. *Science* 68, 516(1928).—A paper cutter with a 10-in. blade is recommended for cutting green plants, such as clover, into 0.5-in. pieces for sampling for chem. analysis. It works better than knife, razor or scissors. L. W. RIGGS

Protochlorophyll. WILLIAM H. EYSTER. *Science* 68, 569-70(1928).—A review of the work of Liro and others indicates that protochlorophyll is not a decompn. product of some other org. substance, as leucophyll, but is a pigment which develops without the influence of light and changes photochem. into chlorophyll upon exposure to light. It is probable that this change occurs only in the presence of a sp. enzyme. L. W. R.

Occurrence of manuka manna. F. P. WORLEY. *Trans. Proc. New Zealand Inst.* 59, No. 2, 404-5(1928).—Manuka manna is a white, finely cryst. and sol. substance found occasionally on the leaves and stems of *Leprospermum scoparium* in dry mid-summer. The substance is a complex sugar which on hydrolysis yields only glucose. Probably it is produced by the sap-sucking *Scolypopa australis* in the nymph form, and perhaps by other insects. L. W. RIGGS

Effects of the absence of boron and of some other essential elements on the cell and tissue structure of the root tips of *Pisum sativum*. A. L. SOMMER AND HELEN SOROKIN. Univ. of Minn. *Plant Physiology* 3, 237-54 (1928); cf. *C. A.* 21, 3700; 22, 613; 23, 414.—*Pisum sativum* (var. Golden Vine) were grown in culture solns. with and without the following elements: B, Mg, S, Mn, K, N, Fe, P and Ca. Each of the last 8 expt. series contained cultures with and without B. The control soln. had the compn. KNO_3 0.80 g.; KH_2PO_4 0.15 g.; $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ 0.50 g.; CaSO_4 (satd. soln.) 300 cc.; B (as H_3BO_3) 0.0005 g.; Mn (as MnSO_4) 0.0015 g.; Al (as $\text{Al}_2(\text{SO}_4)_3$) 0.0005 g.; Cu (as CuSO_4) 0.000125 g.; I (as KI) 0.00025 g.; F (as KF) 0.00025 g.; NaCl 0.0127 g. In the absence of B the plants exhibited short, thick and stunted roots. Plants grown in the absence of B and also in the absence of certain of the other essential elements showed pathol. changes roughly similar to those found in the absence of B only. The meristematic region of root tips grown without B became abnormal. The cells ceased dividing normally and existing cells underwent premature development of pathol. changes. Isolated xylem elements appeared in regions occupied by the meristem in normal roots, or in the region of elongation. The primordia of the secondary roots began to be formed abnormally close to the root tip. Usually, however, they were soon suppressed and secondary roots seldom developed. S. and S. believe that the profound structural changes observed in these expts. indicate that physiol. investigations of the various elements must be accompanied by morphological, histological and cytological studies if their fullest significance is to be attained. WALTER THOMAS

Calcium, potassium and iron balance in certain crop plants in relation to their metabolism. WALTER F. LOEWING. Univ. of Iowa. *Plant Physiology* 3, 261-75 (1928).—Samples of 4 acid muck soils known to exhibit marked response to Ca and K were treated with powd. CaCO_3 or KCl in the ratio of 4000 and 400, resp., to 1,000,000 of soil. Yellow Dent corn, Marquis wheat, and Mammoth Red Fancy clover were grown in pots in these soils which were maintained at 20% moisture content. At the end of 10 weeks the compn. of the entire plants (including roots) was detd. with respect to Fe, Mg, Ca, K, nitric N, total N and total carbohydrates. Osmotic pressure and pH detns. were also made in the freshly expressed sap. Two of the soils examd. showed depressed yields of the grain crops from CaCO_3 addns., which L. attributes, in part, to the creation of K_2O insufficiency, resulting in interference with carbohydrate storage and, in part, to a reduction of sap acidity to the point where interference with internal mobility of Fe resulted. KCl proved injurious on 3 of the soils examd. The compn. of the soil will det. the causes operative. With muck soils relatively high in Fe, toxic amts. of this element may accumulate in the tissues because of increased sap acidity. In soils low in Ca and Mg the addn. of KCl may result in the depression of the CaO and MgO content of the tissues to the point of starvation. Soil and sap acidity favor iron solv. and absorption. High yield in young grain plants was assocd. with high carbohydrates and high org. N. Low yields were characterized by low protein, low carbohydrate and high nitrate content. WALTER THOMAS

An apparatus for the growth of plants in a controlled environment. A. R. DAVIS AND D. R. HOAGLAND. Univ. of California. *Plant Physiology* 3, 277-92(1928).—A description, illustrated with 6 figures, of an equipment that has given satisfactory results in expts. on the growth of plants under controlled conditions of light, temp.,

humidity and culture soln. The initial cost of the unit was approx. \$500, and the cost of maintenance per day of use approx. \$2.50, with electricity at 3 cents per kw. The results obtained have definitely shown the feasibility of establishing an environment which can be duplicated at will, thus leading in turn to the duplication of yields, no. of tillers, height of tops and other external evidences of growth. Such a controlled environment permits the isolation of a single variable and a quant. study of diverse physiol. phenomena.

WALTER THOMAS

Aluminum toxicity. FORMAN T. McLEAN AND BASIL E. GILBERT. Rhode Island Agr. Expt. Sta. *Plant Physiology* 3, 293-302(1928).—Following the technic previously described (*C. A.* 22, 293) a no. of different kinds of plants were grown in nutrient culture solns. contained in 250-cc. jars, for the purpose of studying their susceptibility to injury by Al and to test the efficiency of PO_4 as a preventive of Al injury. Very low concns. of Al, 3 to 13 parts per million, were stimulating to plants, while higher concns. were toxic. Al in combination with org. acids, such as citric and tartaric, was dialyzable and toxic at very low acidities (about p_H 6.5). High acidity, therefore, is not an invariable or necessary accompaniment of Al toxicity. Non-dialyzing forms of Al which could not pass through a collodion membrane in sufficient amts. to cause toxicity were decidedly toxic when placed in contact with the roots of barley. P, when put into soln. with Al compds., completely overcame the toxicity of the Al when the concn. of the P in the form of phosphate was equiv. to that of the Al. This is attributed to pptn of Al as AlPO_4 .

WALTER THOMAS

Biochemical studies on seed viability. I. Measurements of conductance and reduction. R. P. HIBBARD AND E. V. MILLER. Michigan State Coll. *Plant Physiology* 3, 335-52(1928).—Postulating that non-living cells should be more permeable than living ones and that, therefore, salts should leach out more rapidly from dead cells than from live ones, expts. were made to det. the change in resistance of distd. water in which seeds were soaking for the purpose of correlating the change in resistance with the viability of the seeds. The app. previously described (Mich. Expt. Sta. *Tech. Bull.* 23, (1915)) was used. The seed samples were added to beakers contg. 100 cc. of 0.00005 M KMnO_4 . These were placed in a const-temp. water bath at 25°. The quantity of seeds used was: timothy, 1 g.; peas, 50 seeds; wheat, 100 seeds. All seeds were sound. Resistances were detd. and the readings made at regular intervals. It was found, for the most part, that resistance rose with germinating percentages. The data obtained indicated that the conductance method is as accurate for distinguishing between seeds of high, low and medium germinating power as most workers have obtained with other methods. The weakness in the method consists in the supposition that the electrolytic content and its nature are the same for different samples of seeds of the same species and that change in soln. resistance would be solely dependent upon the change of permeability of the seed. A new and very simple method of detg. the viability of seeds has been developed. It consists in detg. the time-rate of reduction in KMnO_4 soln. in which seeds are soaking. Seeds of low viability exhibit the property of reducing the KMnO_4 in less time than is required by seeds of higher viability. The method is as follows: 100 corn seeds are ground coarsely in a meat chopper and then with quartz sand to rupture the individual cells. One-g. samples are allowed to stand in 20 cc. of distd. water for 1 hr. After filtering, 1 cc. is drawn off and added to 0.5 cc. 0.00125 M KMnO_4 . With the exception of a few of the high germinating samples there was a correlation between viability and time of reduction of KMnO_4 . The higher the germination the longer the time required for complete reduction of KMnO_4 . The substance that reduces the KMnO_4 is not an enzyme, but is probably an amino acid, amide or peptide.

WALTER THOMAS

Plant physiology in Russia. R. B. HARVEY. Cambridge Univ., England. *Plant Physiology* 3, 353-5(1928).—An account of a visit to the principal agr. expt. stations and universities in European Russia. H. was impressed with the thoroughly conscientious and helpful governmental support for fundamental research throughout Russia. Very few of the scientists in Russia are Communists; yet their work is given excellent support. The physiol. labs. visited are well equipped. The scientists are left alone by the politicians. The work of Kostychev on respiration and enzyme action and of Maximov on photosynthesis, root physiology and development, and drought resistance is briefly described.

The effect of animal and vegetable proteins on the respiratory metabolism of normal and diabetic individuals. S. BERNSTEIN AND A. LEIMDÖRFER. *Wiener med. Wochschr.* 78, 1342-7(1928).—Animal and vegetable proteins are found to be different in their effects on the respiratory metabolism. Ingestion of large amts. of animal protein increases the O consumption, decreases the respiratory quotient, and produces a definite ketonuria. In the case of diabetics these effects are more pronounced. They may be neutralized by the ingestion of an equiv. amt. of vegetable protein. A. G.

Recent advances in animal nutrition. W. GODDEN. Rowett Research Inst., Aberdeen. *Agr. Progress* 5, 20-31(1928).—This paper reviews the results of recent research on animal nutrition with particular reference to vitamins and mineral elements.

K. D. JACOB

Premature alterations of the intestinal permeability in slow avitaminosis. Attenuated scurvy of the guinea pig. IGINO SPADOLINI AND GIOVANNI DOMINI. *Boll. soc. ital. biol. sper.* 3, 771-3(1928).—The behavior of the intestinal permeability in attenuated avitaminosis was investigated. Guanidine and curare were used as test drugs. In attenuated scurvy of the guinea pig the intestinal permeability for both drugs was increased; the animals were particularly sensitive to these convulsant poisons. P. M.

The effect of experimental fasting on the potassium and calcium ion content of blood serum. B. A. SCHATZILLO AND D. CH. KONSTATINOWSKAJA. *Biochem. Z.* 201, 318-22(1928).—It is corroborated that the blood serum Ca in advanced stages of fasting is diminished.

S. MORCULIS

Physiologic action of vitamin B. Phenomena of secretion of certain glands. MARIE SKARZYNSKA-GUTOWSKA. *Compt. rend. soc. biol.* 99, 1168-9(1928); cf. *C. A.* 22, 3437. —Intravenous injection of ext. of vitamin B caused no secretion of the saliva, whereas excitation of the *chorda tympani* caused a secretion in the same subject. In the dog with a permanent gastric fistula, the injection of 2 cc. per kg. of ext. of vitamin B caused $\frac{1}{6}$ to $\frac{1}{8}$ the flow of gastric juice that followed the injection of 0.5 mg. of histamine. In vivisection expts. ext. of vitamin B was without action on the gastric secretion, while 0.5 mg. of histamine caused about $\frac{1}{6}$ the flow of gastric juice that was produced by the same dose in a dog with a permanent gastric fistula. The pancreas secretion was not affected by vitamin B. In this test the pylorus must be ligated. Vitamin B increases slightly the renal secretion.

L. W. RIGGS

Pathogenesis of avitaminosis B in the dog: Lipuria. J. A. COLLAZO AND A. MUNILLA. *Compt. rend. soc. biol.* 99, 1448-9(1928).—The pathogenesis of avitaminosis B in the dog is explained in part by the large increase in the elimination of fats by the kidneys. This appears sufficient to account for the loss of wt. and the cachexia which precedes the death of the animal.

L. W. RIGGS

F—PHYSIOLOGY

E. K. MARSHALL, JR.

The chemistry of body processes. The nature of the action between gelatin and electrolytes. A. L. FERGUSON. *Fifth Colloid Symposium Monograph* 1928, pp. 159-78. In the first half of his paper, F. gives his reasons for the view that "this attempt at isolation and segregation of so-called colloid phenomena from classical chemistry is, in my judgement, fundamentally unscientific and unwarranted by the facts." The author concludes that, just as the gulf between org. and inorg. chemistry was filled in, so will be that between colloid and classical chemistry, and states: "But even after complete harmony is established between the adsorption and chemical views, substances of large mol. wt. and also substances while they are temporarily existing in a highly associated condition, will be best studied in a group by themselves under the subject colloid chemistry." F. then considers the work of Ehrlich, Kolmer, H. G. Wells, K. G. Falk, stressing the chemical aspect, and then gives an epitome of his results from complex boundary potentials, etc., with gelatin, acid and alkali (see *C. A.* 21, 3517). The combining wt. of gelatin is given as 1090. A concluding note refers to colloidal medicinal, which ends thus: "From the remarkable success attending the very small amount of work which has been done thus far in the prepn. of medicinals in the colloidal form, it would seem that there are wonderful opportunities here for work in chemotherapy."

JEROME ALEXANDER

Studies in the physiology of work. V. The economy (energy) of work in building a wall. ERNST BAADER AND GUNTHER LEHMANN. Kaiser Wilhelm-Inst. für Arbeits-

physiologie, Berlin. *Arbeitsphysiologie* 1, 40-53(1928).—The purpose of the study was to det. the energy output in laying a brick wall. The bricks used were American, 2.3 kg., Berlin, 3.2 kg. and the cloister form, 6.6 kg. The bricks were laid at the rate of 6 per min. and the height of the wall was 1.04 m. The work was divided into 4 sections, the lower 3 of which each measured 28 cm. and the top layer 20 cm. high. The energy output was measured by means of the Benedict respiration app. A det. of the metabolism standing was first made and then in 1-3 work periods, and the energy output of the work calcd. by subtracting that during standing from the total during the work periods. The energy requirement in small cal. varied per brick from 611 with the cloister form in the lowest layer to 156 with the American form at the top layer. Laying bricks at the bottom of the wall required the most energy with all 3 forms. The heat output per unit vol. of wall was inversely proportional to the size of the brick, but this was limited because with the larger form, the static work which caused fatigue was too great. The most practicable form of brick is one of medium size. T. M. C.

The economy (of energy) of carrying a load over a level stretch. E. ATZLER AND R. HERBST. Kaiser Wilhelm-Inst. für Arbeitsphysiologie und das physiol. Lab. der deut. Hochschule für Leibesübungen, Berlin. *Arbeitsphysiologie* 1, 54-74(1928).—The purpose was to det. the optimum conditions in the economy of energy output in carrying loads with the hands. The subject was 31 years old, 176 cm. in height and weighed 69 kg. The respiration expt. were made in the postabsorptive state by means of the Douglas method. The loads were either sacks of sand or metal disks with handles. In the first series, the load was equally divided between the two hands with the arms hanging nearly straight downward. The loads were 9.1, 18.2, 29.1 and 38.2 kg. The speed was 30 to 120 m. per min. The loads were also carried with arms at a slant forming an angle of 22° in order to increase the static work. In a second series, the load was carried either in the left or in the right hand straight downward or at an angle. The min. heat output for subject with load was at 60 m. per min. and varied from 0.576 small cal. per horizontal kilogram-meter with a load of 9.1 kg. to 0.731 for a load of 38.2 kg. carried with both hands. With double the speed the heat output was double that at 60 m. per min. The relation shown between speed and load based upon the cal. per horizontal kg. m. indicated that a speed of 100 steps per min. of 60 cm. length was most economical for all loads. The optimum load, independent of the speed, was 43% of the body wt. Right-handed carrying by a right-handed person was more economical than left-handed carrying. The efficiency of carrying with both arms at the sides was 17%. T. M. CARPENTER

Chemical studies on sex differences of blood protein in *Caudina chilensis* J. Müller. TETSUTARO TADOKORO AND SHUKICHI WATANABE. Hokkaido Imp. Univ., Sapporo. *Science Repts. Tohoku Imp. Univ.* [4], 3, 535-45(1928); cf. C. A. 22, 1181. —The serum protein of this organism was examd. for sex differences with the following results: Male protein combines with a greater quantity of HCl, has a higher isoelec. point, higher N and S content, higher NH_2N , and greater quantities of arginine and lysine N are found in the hydrolytic products. The acetylated male protein shows a lower acetyl content than the female. These differences agree with those found in the muscle and serum proteins of higher animals. DAVID DAVIDSON

The influence of external temperature on the endogenous nitrogen metabolism of homotherms. EMILE F. TERROINE AND HELENE SORG-MATTER. Inst. Physiol. Strasburg. *Arch. intern. physiol.* 30, 115-25(1928). —When the external temp. was decreased in expts. with mice and pigeons, there was an increase in respiratory metabolism and a proportional rise in the endogenous N metabolism. The minimal N metabolism can therefore only be attained at thermal neutrality. The ratio [(N output: energy output) \times 1000] was constant at 2 to 2.4 with both types of animals at various temps. These results are in agreement with author's results on other homotherms. (Cf. C. A. 22, 796-7.) H. J. DEUEL, JR.

The quantitative law of the minimal nitrogen metabolism of the homotherms. HELENE SORG-MATTER. Physiol. Inst., Strasburg. *Arch. intern. physiol.* 30, 126-32(1928); cf. C. A. 22, 796-7, 2194. —In expts. on rats and roosters of varying wts., the energy loss showed variations of more than 50%, while the minimal N loss presents exactly the same variation, the ratio between them remaining const. The ratio

$\left[\frac{\text{N output}}{\text{energy loss}} \right] \times 1000$ agreed with those of the previous paper at 2.20-2.53. The law, therefore, holds for animals of widely differing wts. H. J. DEUEL, JR.

The action of adrenaline on the respiratory metabolism of normal and ovariectomized female rats. L. ASHER AND SIL. HONKABE. Univ. Berne. *Arch. sci. biol.* (Italy) 12, 8-19(1928). —Ovariectomy in 3 rats caused no change in the basal metabolism

or the basal respiratory quotient. The average increase in O consumption following the subcutaneous administration of 1 mg. of adrenaline was 30.1% in the normal animals and 19.5% in the operated ones. There was practically no change in the respiratory quotient caused by the injection of adrenaline in either series of expts. The action of adrenaline is therefore dependent in part on the presence of the ovaries. The thyroid and ovaries stand in a functional relationship. H. J. DEUEL, JR.

The adrenaline content of the suprarenal capsule in the chick embryo. MIZUHO OKUDA. Nagasaki Col., Japan. *Endocrinology* 12, 342-8(1928).—Adrenaline appears in the suprarenal gland of the chick embryo about the 8th day at approx. the same time the chromic reaction in the cells appears, confirming the intimate relationship between them. The adrenaline content of the gland increases parallel to that of their wt. but a somewhat marked increment is found on the 14th and 20th days. The behavior of tyrosine found by Sendju (cf. *C. A.* 20, 2362) in the chick embryo suggests its closer relation with adrenaline. H. J. DEUEL, JR.

Basal metabolism studies. A. I. ÖW AND A. KRÉMA. Krankenhaus wiener Kaufmannschaft. *Wiener klin. Wochschr.* 41, 1453-6(1928).—Administration of quinine lowers basal metabolic rate (B. M. R.) 9 to 15% and lowers blood sugar about $\frac{1}{4}$. Neither *pyrimidone* nor ergotamine tartrate (*gynergen*) had a consistent effect on B. M. R. or blood sugar. The ingestion of 50 to 250 g. of fat daily by normal individuals lowers B. M. R. but the B. M. R. in Basedow's disease is unchanged or increased by the ingestion of this quantity of fat. Subcutaneous injection of 0.5 mg. adrenaline increased B. M. R. 22 to 30% after 20 min. and 4 to 6% after 50 min. During the same intervals blood sugar changed from 116 mg. % to 171 and to 165. D. B. DILL

Regulation of carbohydrate metabolism. II. The role of lactic acid in the intermediary metabolism of carbohydrate. ALEXANDER PARTOS. *Fermentforschung* 10, 50-65(1928); cf. *C. A.* 22, 2596.—Not only does lactic acid injected intravenously bring about an increase in blood sugar by activation of the prodiastase of the liver but expts. *in vitro* show that the glycogen of finely ground rabbit liver is more rapidly converted into glucose in the presence of lactic acid. Control expts. with liver inactivated by heating to 100° showed that the lactic acid alone does not hydrolyze glycogen. In the presence of adrenaline ("Tonogen") the glycogen cleavage in pulped liver is greater and it is still further increased by addn. of lactic acid. With the living animal the effect is quite the opposite, the adrenaline hyperglucemia being changed to a hypogluccemia by injection of lactic acid. The effect of insulin *in vitro* is to inhibit glycogen cleavage, and this inhibition is counteracted by lactic acid. This compensating effect is not observed *in vivo*, but instead there is an increase in the insulin hypogluccemia when lactic acid is injected. Pituitary ext. ("Glandutrin") accelerates glycogen cleavage *in vitro* and still more when lactic acid is added; *in vivo* the acceleration is counteracted by injection of lactic acid. Thyroxine alone has little influence on glycogen cleavage but with lactic acid the cleavage is accelerated. On the other hand, thyroxine hyperglucemia is hardly affected by lactic acid. Ovarin ext. ("Glanduovin") promotes glycogen cleavage and still more so in the presence of lactic acid; but *in vivo* the hyperglucemia is changed to hypogluccemia by subcutaneous injection of lactic acid. The paradoxical effect of lactic acid is probably due to an action not only on the liver prodiastase but also on the nerve systems which control glucemia in the living animal. III. The action of electrolytes on the blood sugar. *Ibid* 66-71.—To ascertain whether lactic acid is specific in causing hyperglucemia when injected intravenously into rabbits, similar expts. were performed with other acids, all at the same H-ion concn. H_2SO_4 gave hypogluccemia; HCl, HNO_3 , H_3PO_4 and AcOH gave hyperglucemia. The effect on blood sugar is therefore not a matter of H-ion concn. Na salts of the above acids showed the same effect as the free acids themselves; hence the influence on blood sugar is due to the anion present. A. W. DOX

Arginine metabolism. II. K. FELIX, H. MÜLLER AND K. DIRR. Univ. Munich. *Z. physiol. Chem.* 178, 192-201(1928); cf. *C. A.* 18, 2366.—Two possible series of reactions have been suggested to explain the biol. conversion of arginine into creatine. The first of these is an oxidative process without intervention of the enzyme arginase, the intermediate steps being guanidinebutyric acid, and guanidineacetic acid, while the second series postulates the cleavage of arginine into ornithine and $CNNH_2$, the latter then uniting with glycine or sarcosine. To det. what substitutions protect the arginine mol. from the action of arginase several derivs. were prepd. and tested. An alteration in the guanidine or in the carboxyl group inhibits enzymic cleavage. The α -amino group must also be present, but one of its H atoms may be replaced by an acyl or presumably by an amino acid radical, but substitution by an alkyl inhibits the cleavage. Esterification of the carboxyl has a greater inhibiting effect in the case of

monobenzoylarginine than with arginine itself. Although the optimum pH for cleavage of arginine is at 9, that for its mono-Bz deriv. is at 7. This may possibly be due to the greater soly. of the latter in neutral than in alk. reaction. The arginase was prepd. from calf liver by the Edlbacher and R  thler method. (*C. A.* 20, 55.) *d*-Arginine-HCl, *d*-arginine- HNO_3 , monobenzoyl-*d*-arginine and *d*-arginine Me ester HCl gave cleavage varying from 97 to 65%, *d*-monobenzoylarginine Et ester only 7%, and *d*-nitro-arginine, *d*-dibenzoylarginine and *d*-arginic acid no cleavage at all. Control expts. showed the absence of histozyme, and addn. of BzOH had no inhibiting effect. The prepn. of mono- and di-benzoylarginine is described in detail. A. W. Dox

The nuclear substance of liver cells. N. ISHIYAMA. Univ. Berlin. *Z. physiol. Chem.* 178, 217-20(1928).—By digesting finely minced calf liver with pepsin-HCl and centrifuging the turbid soln., the nuclear substance was obtained free from protoplasm. The yield after removal of fat by EtOH and Et₂O was 3.5 per kg. liver. The product contained 13.08% N and 2.72% P, giving a P:N ratio of 1:4.81. The corresponding ratio for herring sperm is 1:3.237, for protamine nucleate 1:3.21, for thymus nucleohistone 1:3.44. The nuclear substance of avian blood, however, according to Ackerman, has a P:N ratio of 1:4.4, more closely approximating that of liver. Nucleic acid prepd. from the liver nuclei gave a P:N ratio of 1:1.89, as compared to 1:1.7 for thymonucleic acid. If the P is assumed to be present as thymonucleic acid, the 2.72% P in the liver prepn. would represent a nucleic acid content of 31.55%. The remaining 68.45% must be protein with N content of 12.36%. Although this value is vitiated by accumulation of analytical errors, the conclusion seems justified that the protein component of the nuclei of liver cells does not belong to the known basic proteins such as the protamines and histones, whose N content is much higher. This may explain the fact that no one has yet succeeded in extg. basic proteins from the nuclei of liver cells. A. W. Dox

The rate of lactic acid formation in muscle contraction. Comments on the paper of the same title by G. Embden and E. Lehnartz. OTTO MEYERHOF. Inst. Biol. Berlin-Dahlem. *Z. physiol. Chem.* 178, 306-10(1928); cf. *C. A.* 22, 3441.—Polemical. The high oxidation quotient reported by E. and L. is erroneous and is due to the fact that the manometer measurements before muscular contraction were made with the muscle satd. with O, while after the contraction the measurements were made with muscle deprived of O. Sufficient time was not allowed for the muscle to come to O equil., hence the O consumption reported is too low and the calcd. oxidation quotient too high. The accuracy of the method used for micro detns. of lactic acid is also questioned. The rate of lactic acid formation in muscle contraction. Reply to the foregoing remarks of O. Meyerhof. G. EMBDEN AND E. LEHNARTZ. Univ. Frankfurt. *Ibid* 311-5.—Meyerhof's objections are not considered valid. Microtitrations in the lactic acid titrations were made with 0.002 *N* instead of 0.005 *N* I, the reagent being added in portions of 0.01-0.005 cc. and the end point being remarkably sharp. The max. error could hardly have been over 2%. The error in measurement of O consumption is greatly overestimated by M. High lactic acid formation and high O consumption ran parallel, which could not have been the case if M.'s contention were valid. A. W. Dox

The cleavage of lactacidogen in muscle contraction. G. EMBDEN AND H. JOST. Univ. Frankfurt. *Z. physiol. Chem.* 179, 24-40(1928).—Previous studies on the cleavage of lactacidogen are not altogether satisfactory because the method of detn. did not take into account the H_2PO_4 derived from cleavage of phosphocreatine and hydrolysis of $H_4P_2O_7$, the 2 recently discovered constituents of muscle. The present method is based on the fact that lactacidogen is quant. pptd. in the presence of an excess of Mg ions by EtOH contg. NH_3 , and easily freed from all other reducing substances. The reducing power of the ppt. is then detd. by the Hagedorn-Jensen micro method (*C. A.* 17, 2721) and multiplied by the factor 1.5, since lactacidogen has only $\frac{2}{3}$ the reducing power of the glucose contained therein. By means of this improved method it is shown that in the moment of muscle contraction a rapidly reversible lactacidogen cleavage occurs wherein the liberated H_2PO_4 is a multiple of the amt. of lactic acid simultaneously formed. The amt. of preformed lactacidogen in the muscle is much smaller than was previously claimed on the basis of detns. made by the older method, which is now shown to be inaccurate. A. W. Dox

Liver glycogen and muscle training. YOSHIAKI WAKABAYASHI. Univ. Hamburg. *Z. physiol. Chem.* 179, 79-82(1928).—A difference in the glycogen content of the liver after strenuous muscular exercise is shown in the case of rats before and after a period of training. Rats that had been forced to operate a tread wheel for 4 periods of 5 min. each during 1 hr. on a no. of successive days showed a glycogen content of 11.3-36.3

mg. per g. of liver immediately after a 5-min. run, whereas control animals making their first run showed an almost complete absence of glycogen. Coincident with the disappearance of glycogen from the liver is an extreme lowering of blood sugar. Possibly various phenomena of severe exhaustion in untrained individuals may be a matter of hypoglycemia.

Is thyroxine the complete hormone of the thyroid gland? A. OSWALD. Univ. Zurich. *Z. ges. expth. Med.* 58, 623-8(1928).—Thyroxine, unlike thyreoglobulin, does not increase the reactivity of the vago-sympathetic nerves. This reactivity is a general protein property. The work of Harrington (*C. A.* 20, 2506) clears up the relationship between thyroxine and the other diiodotyrosine derivs. of the thyroid secretion.

Studies on the excretion of unoxidized substances in the urine. II. The oxygen deficit in health under various diets and in diabetes. HANS E. BÜTTNER. Universität-Poliklinik Würzburg. *Z. ges. expth. Med.* 59, 192-205(1928); cf. *C. A.* 22, 2787.—The O deficit in 7 well individuals for 14 days varied from 7 to 13 g. per day, av. 10.22 g. per day. The O deficit divided by the N excretion averaged 1.35, being lower in the morning. Diets with excess of carbohydrates or proteins did not change the O deficit on the av. Diabetes showed an increased O deficit which did not parallel the acidosis. Insulin reduced the O deficit in diabetes.

The changes in the hydrogen-ion concentration of the blood during sleep. JÁNOS KUNZE. Königl. ung. Pazmany-Peter-Universität zu Budapest. *Z. ges. expth. Med.* 59, 218-51(1928).—A lowering of 0.02-0.06 in the p_H was observed in sleep as compared with the subjects when awake. This difference was greater than the exptl. error.

The action of parathyroid hormone on the actual reaction of the blood. K. CSEPAI AND ST. WEISS. Königl. ungar. Pazmany-Peter-Univ. zu Budapest. *Z. ges. expth. Med.* 60, 133-4(1928).—By the colorimetric method of Hollo and Weiss the p_H was determined in 23 patients with various diseases following the administration of 1 unit per kg. parathyroid hormone. In about 50% of the cases the p_H was lowered. There was no relation between blood Ca and p_H .

Studies on the physiological chemistry of the aging of tissues. III. Studies on beef cornea. M. BÜRGER AND G. SCHLOMKA. Univ. Kiel. *Z. ges. expth. Med.* 61, 466-76(1928); cf. *C. A.* 22, 3203.—The wts. of the cornea were: 1 year, 0.41 g.; 1-4 years, 0.62 g.; 5-9 years, 0.72 g.; 10-14 years, 0.75 g.; 15-18 years, 0.75 g. The N contents were: 3 weeks, 2.53 and 17.3%; 3 weeks, to 1 year, 2.55 and 16.5%; 1-9 years, 2.75 and 17.8%; 10-17 years, 2.88 and 15.3%, resp., for the moist and the dried cornea. The cholesterol content similarly was: up to 2 years, 0.079 and 0.525%; 2-14 years, 0.10 and 0.562%; 15-18 years, 0.125 and 0.665%.

The place of absorption of active iron oxide (Siderac) in the alimentary canal. JEROME MARKS. Univ. Berlin. *Z. ges. expth. Med.* 61, 560-1(1928).—Fasting guinea pigs were fed 5 mg. "Siderac" Baudisch, and at intervals of 1-72 hrs. the alimentary canal were sectioned at various levels and the Fe identified by the Turnbull blue reaction. The Fe was found intracellularly only in the duodenum.

The effects of maximal bodily exertion. V. The influence of various maximal exertions upon the composition of the blood. W. EWIG AND R. WIENER. Universitäts-Poliklinik zu Königsberg. *Z. ges. expth. Med.* 61, 562-89(1928).—Bibliography. VI. **The influence of training upon the composition of the blood, especially the acid-base balance.** WILHELM EWIG. *Ibid.* 590-607.—Bibliography.

Basal metabolism of young women. HUGHINA MCKAY. Ohio State Univ. *J. Home Econ.* 20, 591-4(1928).—Tentative conclusions drawn from observations on the 15, 16, 17, and 18-year groups of girls indicate that calories per sq. meter steadily decrease with age. The heat production for every year was found higher than the corresponding values of Benedict and Hendry (*C. A.* 15, 3644).

The relationship of lactic acid to the optical activity of normal and diabetic blood before and after glycolysis. SYDNEY L. WRIGHT, JR., ELIZABETH F. HERR AND JOHN R. PACE. Univ. of Pa. and Pa. Hospital, Phila. *J. Biol. Chem.* 80, 571-7(1928).—A study was made of the levorotatory substances formed from glucose by the glycolytic action of blood. The assumption is favored that these levorotatory substances are, in large measure, the salts of *d*-lactic acid.

The physiology of ergothioneine. BLYTHE A. EAGLES AND HARRY M. VARS. Yale Univ. *J. Biol. Chem.* 80, 615-22(1928).—Feeding expts. on pigs and the application of the diazo color reaction to protein hydrolyzates indicated that certain proteins yield a precursor of ergothioneine in the living organism. The ergothioneine content of pig blood could be raised from an undetectable, to a measurable quantity. A. G.

The nature of blood sugar. MICHAEL SOMOGYI AND HILDEGARDE V. KRAMER. Jewish Hospital of St. Louis. *J. Biol. Chem.* **80**, 733-42(1928).—Detns. of the true sugar of blood by the Shaffer-Hartmann, ferricyanide and the colorimetric methods gave identical results. The assumption that blood contains any fermentable sugar other than glucose, is thus unwarranted. The variation in the results obtained by the various methods for detg. blood sugar are due to the presence of reducing substances, other than glucose.

ARTHUR GROLLMAN

The metabolism of the bile. III. The enterohepatic circulation of the bile acids. CARL H. GREENE, MARTHA ALDRICH AND LEONARD G. ROWNTREE. Mayo Clinic. *J. Biol. Chem.* **80**, 753-60(1928); cf. *C. A.* **22**, 3917.—Curves of the excretion of bile acids in the bile after their oral administration are given which indicate absorption in the intestine. The quant. *Pelletier* test gives similar readings in the arterial jugular and portal blood of a fasting dog. When the bile acids are injected into the duodenum, there is an increase in their concn. in the portal blood.

ARTHUR GROLLMAN

Gas analytical investigations of the cerebrospinal fluid. EDITH KLEMPERER AND MAX WEISSMANN. *Wiener med. Wochschr.* **78**, 919-21(1928).—The CO_2 and O_2 contents of the cerebrospinal fluid were detd. in a number of psychiatric patients. The CO_2 tension varied from 45.93 vol. per cent in a case of *lues latens* to 64.05 vol. per cent in a case of progressive paralysis after treatment with malaria. Highest values were obtained in cases of progressive paralysis. Maniac-depressives and schizophrenic types gave values as low as 47.29%. The O_2 tension varied only slightly.

A. G.

The behavior of α -ketovalerolactone- γ -carboxylic acid in the animal body. R. ENGER AND H. SIEDENTOPF. Phys.-Chem. Inst., Leipzig. *Ber. Verhandl. sächs. Akad. Wiss. Leipzig, Math.-phys. Klasse* **80**, 122-6(1928).—The distn. residue from pyruvic acid does not produce sugar but might produce MeAc. The authors tested it by intravenous injection into carefully prepd. dogs without obtaining a trace of MeAc. When perfused through the isolated liver by the procedure of Friedman MeAc was produced in quantity. There was an immediate temporary increase in the β -hydroxybutyric acid. The substance as such disappears from the blood stream. It does not seem to split into 2 mols. pyruvic acid as was expected but to split off CO_2 and oxidize to β -hydroxybutyric acid and thus to MeAc.

H. C. HAMILTON

The problem of calcification: its influence on the tenure of human life. MAXWELL LAUTERMANN. *J. Dental Research* **8**, 563-77(1928).—An address devoted to the processes of both normal and pathological calcification.

JOSEPH S. HEPBURN

Coefficient of diffusion of lactic acid through muscle. GRACE P. EGGLETON, P. EGGLETON AND A. V. HILL. Univ. London. *Proc. Roy. Soc. (London)* **B103**, 620-8(1928).—The coeff. of diffusion of lactic acid through muscle is detd. by means of the equation: amt. diffused per $\text{cm}^2 = 2c \sqrt{kt/\pi}$, in which c is the uniform concn. of lactic acid in the muscle, k the diffusion const., and t the time. The stimulated upper legs of a frog are kept in well-stirred O-free Ringer soln., and detns. are made of the surface area of the muscles, their lactic acid content, and the lactic acid content of the liquid. In a live muscle, k is approx. 6×10^{-6} when the initial concn. of lactic acid is low, and approx. 5×10^{-6} in extreme fatigue. Apparently diffusion in a live muscle occurs (1) through the lymph interspaces as rapidly as in free soln. with a diffusion const. of approx. 6.6×10^{-4} , and (2) through the living fibers with a const. of approx. 5×10^{-6} . In a relatively unfatigued muscle, the lymph spaces occupy approx. 8% of its vol. In fatigue, the osmotic pressure increases within the fibers, lymph is absorbed, and the diffusion const. decreases to a value representing closely packed fibers. In dead muscle after heat rigor, the diffusion const. tends to increase to its value in free soln. since the membranes of the fibers are no longer intact.

JOSEPH S. HEPBURN

Further investigation of the influence of mental activity upon respiratory gas exchange and upon energy loss. GREGOR V. KHLOPIN, V. YAKOVENKO AND V. VOLSHINSKII. *Arch. Hyg.* **98**, 158-75(1927).—Mental work, such as the reading of scientific books, caused an increase in the rate of O consumption and of CO_2 excretion with av. increases of 7.5% and 4.3%, resp. At the same time there was a slight quickening of the pulse and of the respiration. Mental arithmetic exercises, lectures and exams., caused even larger increases. The memorizing of foreign words, or of meaningless combinations of letters, was not sufficiently difficult to cause decided increases in the rate of gas exchange. The effect of mental activity upon the rate persists for some time after the end of the exercise. The increased loss of energy, measured in calories, was scarcely noticeable when words were memorized (0.1%); with scientific reading, 7.3%; with mental arithmetic, 20.74%. These changes in the rate of gas exchange and in heat production can be attributed not only to increased rate of metabolic change in the nervous system, but also to physiological changes in other organs.

P. Y. JACKSON

A comparison of various formulas for the calculation of basal metabolism. HERM. v. HOESSLIN. *Arch. Hyg.* 99, 91-5(1928).—Tables are given to show corresponding values for basal metabolism calcd. by the formulas of Benedict, Du Bois, Dreyer and Gruber. The formula of Meek for the surface area of the body gives results about 14% higher than the corresponding formula of Du Bois; but there is no theoretical basis for reporting basal metabolism in terms of body surface. P. Y. JACKSON

The role of the blood in transmineralization. CURT OEHME AND PAUL TÖRÖK. *Deut. Arch. klin. Med.* 160, 233-48(1928).—Following a milk diet the ingestion of 280 mille-equiv. of NaCl or KCl dissolved in warm water produced in the blood, in a number of expts., a temporary condition of acidosis; after a potato diet the result was an alkalosis. The Ca and K concn. of the plasma showed no variations corresponding to change in the quantity of these elements in the diet. P. Y. JACKSON

The relation of the reaction to epinephrine to the potassium-calcium ratio and other ratios. W. F. PETERSEN, S. A. LEVINSON AND SERGIUS ARQUIN. Univ. of Illinois. *Arch. Internal Med.* 42, 256-69(1928).—An analysis was made of 20 normal persons, 100 seemingly normal subjects (who however showed on examn. the presence of healed tuberculosis, cardiovascular-renal changes, a high degree of nervousness or a positive Wassermann test), 49 patients with various diseases and 12 patients with exophthalmic goiter. They were sepd. into a sympathetic (76) and a parasympathetic (73) group. A comparison of the outstanding cases of each group showed the following differences: In the sympathetic group the permeability of the skin capillaries (1) and the serum globulin (2) were higher, K/Ca (3), CO₂-combining power (4), electrical muscular reactivity (5), weight-length ratio (6) and blood pressure (7) were lower. The cholesterol content (8) and the time of appearance of erythema after irradiations with the Kromayer lamp (9) were also slightly lower. There was no material difference in the basal metabolism. The exophthalmic goiter group approached the sympathetic group in its response to adrenaline and in 1, 2, 3, 4, 6, 8 and 9, and the parasympathetic group in 5 and 7. MARY JACOBSEN

Absorption of undigested proteins in human beings. III. The absorption of unaltered egg protein in adults. HENRY SUSSMAN, ALEXANDER DAVIDSON AND MATTHEW WALZER. *Arch. Internal Med.* 42, 409-24(1928); cf. C. A. 22, 4588.—Unaltered protein was absorbed by 85.3% of 34 adults. In 4.3% the wheal appeared 15 min., in 26.1% 30 min. and in 78% 1 hr. after ingestion. The absorption is influenced by the same factors as that of fish protein. Most persons showing absorption from the upper intestinal tract also showed absorption from the rectum. The latter was slower and less pronounced. MARY JACOBSEN

Lactose metabolism in women. O. WATKINS. Harvard Med. School and Huntington Memorial Hosp., Boston. *J. Biol. Chem.* 80, 33-66(1928).—"Certain peculiarities in lactose metabolism are assocd. with the sexual activities of women. During the last stages of pregnancy there is a more or less const. excretion of small quantities of lactose. During the last few days before delivery there is a sudden very marked rise in lactose excretion which reaches its height on the day of delivery. After delivery, the lactose excretion immediately drops to a low level where it remains for 2-5 days. There is then a sudden and often tremendous excretion (as high as 4%) of lactose and, during the first few weeks of lactation, the fluctuations are very marked. By the end of the 1st month the lactose excretion has assumed a const. and lower level and this level slowly approaches the normal values for residual reduction of the urine as lactation progresses. The tolerance for lactose of most normal women is, in the intermenstrual period, the same as that of normal men, the tolerance dose being 10 g. Menstruation causes an increase in the tolerance of women so that at this time many women show no urinary response to the ingestion of 20 g. of lactose. During pregnancy the tolerance is increased, being in some women 3 times as high as in other individuals. Also the urinary response to the ingestion of lactose is slower in pregnant women and the return to normal is correspondingly slow. During lactation the tolerance is apparently the same in every way as it is in normal men and in most women in the intermenstrual period. None of the phenomena observed seems to be related in any way to the degree of activity of the mammary glands. Considering the fact that the endocrine glands are so clearly assocd. with sexual activity, it seems entirely possible that the interpretation of all the data that have been collected in the course of the investigation may lie within the field of endocrinology." A. P. LOTHROP

Animal calorimetry. XXXVII. The specific dynamic action of glycine given orally and intravenously to normal and to adrenalectomized dogs. FOLKE NORD AND HARRY J. DEUEL, JR. Cornell Univ. Med. Coll. *J. Biol. Chem.* 80, 115-24(1928); cf. C. A. 22, 460.—A clear specific dynamic action results from the intravenous injection of glycine.

tion of 10 g. of glycine into normal dogs. The values of this effect average about the same as by oral administration. Similar results are obtained with adrenalectomized dogs. The av. increase per hr. is 2.99 (oral) and 2.87 (intravenous) as compared with 3.26 and 3.39 cal. in normal animals. It seems clear, therefore, that the adrenals do not play any significant part in the production of the specific dynamic action of glycine. After adrenalectomy the basal metabolism of the dogs was markedly increased.

A. P. LOTHROP

Differences in serum and plasma content of cholesterol ester. RICHARD E. SHOFF. Rockefeller Inst., Princeton, N. J. *J. Biol. Chem.* 80, 125-6(1928).—The cholesterol ester values obtained for serum and heparin plasma more nearly represent the correct values for the non-cellular portion of the blood than do the values obtained for citrate or oxalate plasma since either Na citrate or $K_2C_2O_4$ appears to be able to cause a partial hydrolysis of that portion of the serum cholesterol generally detd. as ester of cholesterol. The differences are not very great but are of importance in that they are a source of potential error. **Cholesterol esterase in animal tissues.** *Ibid* 127-32.—

"Blood serum obtained from an animal post mortem always contains less cholesterol ester than did serum obtained from the same animal preceding death and often contains none. Passage of CO_2 into freshly drawn blood has no effect on the cholesterol ester content of the serum. Cholesterol esterase capable of splitting either cholesterol ester in normal cow serum or cholesterol oleate in H_2O suspension is present in many animal tissues. The continued activity of cholesterol esterase post mortem with cessation either of cholesterol ester formation or absorption may explain the complete absence or diminution of cholesterol ester in blood serum obtained from an animal after death."

The effect of age on the total and combined cholesterol of the blood serum. *Ibid* 141-8. There is a marked and rather rapid increase in serum cholesterol and cholesterol ester from birth for a relatively short period of time during the early life of the animal. This is followed by a less marked and more gradual decline with advancing age. The sera of calves at birth and before having received colostrum contain very small quantities of free cholesterol only. The ester appears soon after the first nursing and the total cholesterol content of the serum begins to increase. Changes with age are more uniform and regular in males than in females.

The composition of human milk. MARION BELL. N. Y. Homeopathic Med. Coll. and Flower Hosp. *J. Biol. Chem.* 80, 239-47(1928).—The comps. of the milks of 88 normal women were detd. The av. amts. of ash and protein decreased and of lactose and fat increased with the time interval post partum. Individual cases frequently failed to follow the trend. Supplementary feedings of carbohydrate or fat made only slight differences in the compn. of the early milk but in general the lactose content was a little higher in both cases and the milk fat was highest in those receiving supplementary fat. The av. vols. secreted were greater after supplementary carbohydrate feeding and less after fat feeding than in the controls. The results obtained in this study are compared with those reported by other investigators.

Cutaneous and venous blood sugar curves. I. In normal individuals after insulin and in liver disease. MYER FRIEDENSON, M. K. ROSENBAUM, E. J. THALHEIMER AND JOHN P. PETERS. Yale Univ. and New Haven Hosp. *J. Biol. Chem.* 80, 269-88 (1928).—"Cutaneous and venous blood sugar values have been detd. simultaneously before and at $1/2$ hr. intervals after the ingestion of 50 g. of glucose or a mixed breakfast contg. from 75 to 100 g. of carbohydrate in normal subjects and patients with diseases of the liver. Similar detns. on normal individuals in the postabsorptive state have been made before and after the administration of 10 units of insulin. The characteristics of the normal arterial (cutaneous) and venous blood sugar after 50 g. of glucose and after a mixed breakfast are indistinguishable and are as follows: In the postabsorptive state there is usually little or no difference between cutaneous and venous sugars; but positive (arterial > venous) differences of moderate degree occur with reasonable frequency and negative differences of significant magnitude are occasionally observed. At 30 min. a definite arterial hyperglucemia is established which usually still exists at the end of an hr. It is usually higher at 30 than at 60 min. In $1/3$ of the expts. the cutaneous blood sugar had returned within the normal fasting range at the end of 90 min. The venous sugar never rose as high as the arterial. Hence a definite positive arterial-venous difference, varying in magnitude from 6 to 50 mg., was detected in every instance. This was sometimes absent at either the 30 or 60 min. interval, but never at both. It was usually maximal at the point of greatest hyperglucemia. It was found even when cutaneous or venous sugar or both showed minimal rises. It had often disappeared by the end of 90 min. and, indeed, at this time negative differences of significant or even considerable size were sometimes observed. Insulin (10 units)

when given to a normal individual in the postabsorptive state results in hypoglucemia which is usually most marked at the 60-min. period. The appearance of a distinct and significant positive arterial-venous difference can usually be demonstrated. During the recovery definite negative differences were demonstrated in 1 subject. In severe liver disease an excessive or prolonged hyperglucemia can usually be demonstrated after 50 g. of glucose. All subjects, however, developed a positive arterial-venous difference. The deviation from the normal in some of these cases is so small and the range of normal variation so large, that it is doubtful whether the detn. of such curves will aid in the diagnosis of hepatic disease."

The resistance of animals to barometric depression with various mixtures of oxygen and carbon dioxide. RODOLFO MARGARIA. *Arch. sci. biol.* 11, 425-52(1928).—The aim of the present studies was to det. whether the effects of diminished pressure is due exclusively to the diminished partial pressure of O_2 , and if CO_2 really enables one to reach larger depressions and to what degree. The expts. were performed on guinea-pigs kept under a bell jar fitted with the proper devices for introducing gas mixtures, for reducing the pressure, recording instruments, etc. Each expt. was run contemporaneously on two animals and repeated at least once for each gas mixt. The max. limit of resistance in air and O was first detd. and this was followed by similar detns. with mixts. of O_2 and CO_2 until the latter reached 21.5%. The resistance of the animals to depression was noticeably increased by the addition to O_2

of small amts. of CO_2 . The variations in the resistance of the animals as a function of the percent of CO_2 in the inspired air is given in the fig. The ordinates represent the fictitious altitudes on the left, and on the right the log of the corresponding pressure in mm. Hg; the abscissas show the % CO_2 in the O_2 - CO_2 gas mixt. The dotted curve indicates the corresponding partial pressure of O_2 .

New physiological data on the hormones of the hypophysis. RENZO AGNOLI. *Boll. soc. ital. biol. sper.* 3, 448-50(1928).—The influence of the hormones of the hypophysis on the deamination of amino acids was studied. The expts. were made on dogs kept on a meat-free diet. In the first group of animals the influence of the active principle of the posterior lobe was investigated. The latter was injected intravenously together with the same quantity of glycocoll previously used in detg. the curve for the velocity of deamination on the same animal. The animal was then bled from an artery, the amino acid detd. colorimetrically by Folin's method, and the results compared to those previously obtained by injecting glycocoll alone. Various preps. contg. the active principle of the posterior lobe were used. None of these showed any influence on the curve of velocity of deamination. In the 2nd group of animals, an ext. of the whole fresh hypophysis was used. The deamination process was accelerated. The difference between this and the control was 1.90 mg. after 5 min.; 2.01 mg. after 10 min.; 0.75 mg. after 30 min., and 0.80 mg. after 60 min. In the 3rd group, the animals were injected with the lipoidal extract of the anterior lobe prepd. according to Robertson's method. These were the most active in accelerating the velocity of the deamination process. The anterior lobe contains, therefore, an active principle which speeds the removal of amino acids from the circulation and enables the tissues to either fix them or to deaminate them. The principle appears to be of a lipoid nature and is specific since it is found in no other gland but the hypophysis.

PETER MASUCCI

The solution of egg-albumin and the digestion of fibrin by pure pancreatic juice with and without calcium chloride. S. D. FRISCO. *Boll. soc. ital. biol. sper.* 3, 465-8 (1928).—Fibrin (0.5 g.), previously boiled for a long time, and 5 cc. of pancreatic juice were placed in a test tube into which was introduced a Mett tube. Another set of tubes was treated likewise except that 0.1 g. $CaCl_2$ was added. Observations were made from time to time to detect the digestion of fibrin during the interval in which the Mett tube remained intact. The results show that it was possible to detect a marked digestion of fibrin by pure pancreatic juice at a time when the Mett tube immersed in the same juice appeared perfectly intact. In the tubes containing pure pancreatic juice, and pancreatic juice and $CaCl_2$, both Mett tubes were dissolved but the one containing the $CaCl_2$ was dissolved twice as much. The difference in the digestion of fibrin detd.

by Sörenson's method was very small, hardly comparable to the difference noted in the solution of the Mett tubes. This indicates that the phenomenon of solution in the Mett tubes does not constitute a reliable index or even an approx. method of detg. proteolytic digestion by pancreatic juice.

PETER MASUCCI

The index of refraction of blood serum during muscular work. U. CASSINIS. *Boll. soc. ital. biol. sper.* 3, 481-3(1928).—The n of blood serum of 8 subjects was taken at rest and after a run of 600 m. and a march of 4800 m. The n was always greater after the exercise and corresponded to an increase of 0.38 to 1.01% of protein in the serum. This increase was not real but only apparent; it was due to the loss of H_2O from the blood.

PETER MASUCCI

The group-specific absorption power of blood lipoids. L. LATTES, P. SCHNEIDER AND K. V. BEOTHY. *Boll. soc. ital. biol. sper.* 3, 511-7(1928).—Exts. were made of blood groups O, A and B (1) by collecting the blood directly into 95% EtOH in the proportion of 1:10, incubating at 37° for 24 hrs., filtering, and evapg. the filtrate to dryness at 37°; (2) extg. powdered blood with boiling alc., washing with Et₂O and benzine to remove impurities, evapg. the alc. filtrate to dryness; (3) the residue from (2) and (4) extn. in the cold with Et₂O. The various exts. were tested by the hanging-drop method with A and B erythrocytes. Conclusions: The conception of Landsteiner and Schiff that group-specific isoantigens are not true proteins but lipoproteins was confirmed. The cold and hot alc. exts. gave rise to group-specific absorption of isoagglutinins of normal human blood and likewise did the lipoids obtained by extg. the alc. with Et₂O or benzine. The alc. ext. deprived of its ether-sol. fraction had no group-specific absorption power.

Rates of elimination of hormones. II. Lymph and adrenaline. EMILIO GHIRARDI. *Boll. soc. ital. biol. sper.* 3, 541-2(1928).—G. was unable to confirm Viale's results that normal dog lymph when added to Ringer soln. increases the amplitude and frequency of pulsation of an isolated heart. The lymphatic system cannot be considered as a route through which adrenaline circulates.

PETER MASUCCI

The state of sugar in the blood. P. DE LUCIA. *Boll. soc. ital. biol. sper.* 3, 626-31(1928).—The addn. of 5, 6 and 12% butyric acid and of 2, 5 and 10% valeric acid to blood lowers the surface tension, and increases the residual N in the phosphotungstic acid filtrate. The reducing power of such filtrates is the same as that of blood not treated with the acids. Conclusion: sugar (glucose) in the blood is not combined with the proteins and is not adsorbed. The increase of residual N cannot be due to creatine or uric acid, which are reducing substances, but is probably due to uric acid amino or undetd. N fractions.

PETER MASUCCI

Variations in the glucemic titer during the menstrual period. LUIGI MANZI. *Boll. soc. ital. biol. sper.* 3, 631-6(1928).—Women who were affected with inflammatory lesions of the genital organs showed an increase in blood sugar from 0.097 to 0.118% during menstruation and 0.065 to 0.098% during the intermenstrual periods. In healthy normal women, the blood sugar was 0.089 to 0.103% during menstruation and 0.084 to 0.096% during the intermenstrual period. The ovarian hormone has some influence, although slight, on carbohydrate metabolism.

PETER MASUCCI

Pancreatic secretion produced by hydrochloric acid with a blocked and unblocked vagus. U. LOMBROSO AND ANTONINO TOMASINO. *Boll. soc. ital. biol. sper.* 3, 789-92(1928).

PETER MASUCCI

The dry content and hydrogen-ion concentration of normal feces. N. C. LUNDIG. *Acta Med. Scand., Suppl.* XXVI, 50, 384(1928).—The usual p_H of normally passed feces is 6.0-8.0. A fecal p_H of 1.1 was observed in one individual. The dry residue depends on the length of time the feces remain in the colon and does not depend upon the food.

S. MORGULIS

Oxalic acid in the urine. ERIK M. P. WIDMARK. *Acta Med. Scand., Suppl.* XXVI, 340(1928).—On a normal diet the daily elimination of oxalic acid is 14-56 mg. Lying in bed seems to lower the excretion. Normal values for oxalic acid excretion were found in chronic polyarthritis, in oxalate calculus, etc.

S. M.

The hydrogen-ion concentration, and the lipase content of duodenal juice. TH. E. H. THAYSEN AND A. NORGGAARD. *Acta Med. Scand., Suppl.* XXVI, 390-1(1928).—The lipase content of various duodenal samples varies much and in accordance with the p_H . With low p_H values the lipase activity is slight but at p_H 6.1-8.0 a low lipase action is rare.

S. MORGULIS

The electrolyte content of the cerebrospinal fluid. L. ABRAMSON. *Acta Med. Scand., Suppl.* XXVI, 399-404(1928).—The Ca detd. by de Waard's method was 4.7-6.3 mg. per 100 cc.; the K 15.5-19.5 mg. The K/Ca for cerebrospinal fluid is 2.7-3.82.

S. MORGULIS

The place of formation of blood acetone. MARTIN ODIN. *Acta Med. Scand., Suppl. XXVI*, 457-61(1928).—Following intravenous injection of 5% NaHCO_3 , the acetone content of alveolar air rose from 0.25 to 0.45 mg. per l. At the same time there was noted an increase in the acetone bodies of the urine. The CO_2 capacity of the blood increased from 39 to 60 vol. % and the p_{H} from 7.42 to 7.57. It is believed that the alkali aids in dissolving the acetone bodies retained in the tissues and thus aids in their removal.

S. MORGULIS

Calcium and phosphorus metabolism. PAUL SCHULTZER. *Acta Med. Scand., Suppl. XXVI*, 560-5(1928).—Rats were fed McCollum's mixt. 3143 modified to contain 1.2 instead of 3.0% CaCO_3 but during the after-period the CaCO_3 was raised to the original 3143. As soon as the Ca was increased in the food the retentions of both Ca and P diminished considerably and they began to manifest rachitic bone changes. The diminished retention was caused by a reduced absorption from the intestine. In another series the Ca of the 3143 mixt. was reduced during the after-periods. The result was a far greater retention of Ca and P which was due to better resorption. In a third series the P of mixt. 3143 was varied by the addn. of phosphates. This effected a very great increase in the retention of both Ca and P, but while that of the P was caused by greater resorption, the increased retention of the Ca was due to diminished excretion in the urine.

S. MORGULIS

The natural guanidinophosphoric acids (phosphagens) in striated muscle. I. Physiological behavior of phosphagen. O. MEYERHOF AND K. LOHMANN. Kaiser Wilhelm-Institut für Biologie, Berlin-Dahlem. *Biochem. Z.* 196, 22-48(1928).—The rate of enzymic hydrolysis of creatine-phosphoric acid in muscle ext. is slower in the presence of carbohydrate, depends much on the p_{H} , and is inhibited by F. The optimum rate is at p_{H} 6.4 to 7.0; at p_{H} above 8.0, especially following preliminary hydrolysis, there is a resynthesis of creatine- H_2PO_4 which can be increased by adding creatine. The phosphagen in crustacean muscle, argininephosphoric acid behaved similarly to the phosphagens from vertebrate muscles, the differences being more of quant. nature. It undergoes hydrolysis in muscles during contraction but is resynthesized during the relaxation in the presence of O_2 . The arginine- H_2PO_4 of the muscle ext. undergoes enzymic hydrolysis and resynthesis like creatine- H_2PO_4 , the tendency to synthesis appearing at p_{H} 7.0 and becoming max. at p_{H} 8.0. The synthesis of the arginine H_2PO_4 is generally greater than that of creatine- H_2PO_4 . The inorg. amidophosphoric acid can likewise be split enzymically by the muscle ext., this being again inhibited by F. The heat formation of this enzymic hydrolysis is 14,000-15,000 cal. per mol. **II. Physico-chemical properties of the guanidinophosphoric acids.** *Ibid* 49-72.—A method is described for the pptn. of arginine- H_2PO_4 and for the identification of its split products. For the understanding of the constitution it is important that the α -amino group is free in the unhydrolyzed compd. The arginine- H_2PO_4 is not attacked by arginase. The heat production for the acid hydrolysis is calcd. at acid and neutral reactions. The heat liberated in the hydrolysis of creatine- H_2PO_4 per mol. is 12,000-13,000 cal. and 10,000-11,000 cal., resp.; of arginine- H_2PO_4 , 11,000-12,000 cal. and 8000-10,000 cal., resp.; and of aminophosphoric acid 16,000 cal. and 15,000 cal., resp. The heat of dissoen. of the arginine and creatine indicates that both exist as amphoteric ions. In arginine the guanidine base is the stronger with a basic dissoen. const. $K_{\text{B}1} > 1$ while the α -amino group has a $K_{\text{B}2} = 10^{-4.8}$, while the acid const. is approx. $K_{\text{A}} = 10^{-2.6}$. In the guanidine- H_2PO_4 the strongest base seems to be esterified with the weakest acid radical. The creatine- H_2PO_4 also has 2 acid dissoen. const. $K_{\text{A}1} = 10^{-3.7}$ and $K_{\text{A}2} = 10^{-4.6}$; the arginine- H_2PO_4 has 2 acid and 1 basic dissoen. const.: $K_{\text{A}1} = 10^{-4.5}$; $K_{\text{A}2} = 10^{-9.8}$; $K_{\text{B}} = 10^{-2.8}$. Amidophosphoric acid has 2 acid dissoen. const.: $K_{\text{A}1} = 10^{-2.8}$ and $K_{\text{A}2} = 10^{-6.2}$.

S. MORGULIS

The decomposition of creatinephosphoric acid in connection with the activity of the muscle. I. D. NACHMANSOHN. Kaiser Wilhelm-Institut für Biologie, Berlin-Dahlem. *Biochem. Z.* 196, 73-97(1928).—The hydrolysis of creatine- H_2PO_4 is followed simultaneously with the lactic acid formation and the development of tension in active muscles. The lactic acid production during tetanus is directly proportional to the tension and is independent of the nature of the stimulus (direct or indirect stimulation) or curarized muscle. The phosphagen hydrolysis is the same in direct or indirect stimulation but is less in curarized muscles. The ratio $\text{H}_2\text{PO}_4/\text{lactic acid}$ is about 2 during 5 sec. of tetanus by the first 2 methods, and then diminishes greatly. In curarized muscles, however, is the ratio 0.8 from the beginning. The "isometric coeff." of phosphagen increases very much corresponding to the great decrease in phosphagen hydrolysis in non-curarized muscles; in curarized muscles, on the contrary, it remains nearly const. up to about 100 kg. tension per g. of muscle. Besides the aerobic phase of phosphagen

synthesis following the stimulation of the frog muscle there is also an anaerobic synthesis during the relaxation lasting about 20 sec., during which about 30% of the phosphagen is resynthesized. This brief period of anaerobic synthesis is not due to the presence of traces of O_2 , because it was also found under conditions of strictest anaerobiosis as well as following 6 tetani when of course, all traces of O_2 must be removed. Following 10 tetani this anaerobic resynthesis fails to occur, but then the muscle also fails to develop much tension. During the anaerobic restitution of phosphagen there is no lactic acid formed, and no NH_3 disappears during that interval. S. MORGULIS

Conditions of calcium deposition in animal tissues. I. The state of calcium in tissues and tissue fluids. HANS KLEINMANN. Univ. Berlin, Charité. *Biochem. Z.* 196, 98-145(1928).—It is concluded from exptl. evidence that Ca in the tissues and tissue fluids may be present as ions in satd. or supersatd. forms as complex salt, as colloid or in combination with protein. To det. why cartilage and connective tissue have a stronger binding effect on Ca than other tissues, it was attempted to find the relative position of the isoelec. zone, the binding capacity for anions and cations being measured at varying acidities. Cataphoresis expts. show that cartilage is a markedly stronger acid than the proteins of muscle or other organs, and therefore has a stronger binding capacity for Ca. Compensation dialysis expts. with serum against solns. of $CaHCO_3$ or Ca phosphate indicate the complete dialyzability of these compds., thus excluding the possibility of their colloidal state. The fact that both the Ca^{++} and the CO_3^{--} content of serum diminishes when shaken with $Ca_3(PO_4)_2$ is corroborated, a condition which does not occur when glass, $CaCO_3$ and other substances are used as the solid phase. The loss of Ca in the presence of $Ca_3(PO_4)_2$ was studied under different concns. of Ca^{++} , PO_4^{--} , alkali, pH, and both in serum and in Ringer soln. **II. Studies on the acidity of the tissue in dystrophic calcification.** HANS KLEINMANN AND I. RENESOW. *Ibid* 146-60.—To find an explanation of the origin of the first $Ca_3(PO_4)_2$ crystals which, according to the previous study, initiate the dystrophic calcification, the acidity of necrotizing tissue has been compared with that of normal tissue. The material consisted of rabbit kidneys which were made necrotic and in which calcification was induced through ligation. The measurements were made with the aid of a micro form of Michaelis' V-electrode in the tissue juice and organ pulp. The method of course, gives no reliable abs. values but acceptable comparative values. In both the press juice and in the finely ground organs there was no *post mortem* acidification and the reaction was much more alk. than in the case of fresh organs. It is concluded that a tissue undergoing coagulation necrosis but remaining sterile within the organism tends to assume the acidity of the surrounding serum, which serves to initiate the crystal formation of $Ca_3(PO_4)_2$ leading to further calcification. **III. Experimental calcification through introduction of calcium salts.** HANS KLEINMANN. *Ibid* 161-76.—Expts. were made on mice, to which Ca and PO_4 ions were introduced with the food or subcutaneously with the addn. of acid- or base-forming substances. It was possible to produce calcification within the lumen of the kidney tubules, kidney epithelium, heart muscle, in epithelium and connective tissue of stomach and intestine as well as in the walls of the lung alveoli by administering an acid phosphate diet, but not with an alk. phosphate diet. Expts. where the Ca and H_3PO_4 compds. were given subcutaneously demonstrate more clearly the effect of alkali or acid on the Ca deposition than do feeding expts. This is manifested first of all in the excretion of the Ca and PO_4 , which is greatly increased by acid. Expts. on $HgCl_2$ poisoning show that the calcification is due to defective Ca and PO_4 excretion in the poisoned animal. The calcification is regarded as being caused by an accumulation of Ca^{++} and PO_4^{--} to the point of exceeding their soly. product, when $Ca_3(PO_4)_2$ ppts. out; a diminished acidity of the tissue fluid in an organ like the kidney will promote this pptn. Part of the $Ca_3(PO_4)_2$ in the presence of CO_3^{--} must be converted to $CaCO_3$, so that the two are found together. S. MORGULIS

Experimental sympatricotony in rabbits. III. How to interpret the temporary cessation of chemical processes determined by sympatricotony following ligation of the pancreatic duct. J. WOHLGEMUTH AND S. HAYASHI. Rudolf Virchow-Krankenhaus, Berlin. *Biochem. Z.* 196, 309-22(1928).—Normal rabbit plasma gives off a small but definite amt. of glucose to human red blood cells, but this is greatly increased almost immediately after ligation of the pancreatic duct. This is attributed to a discharge from the liver of glucemin, which inhibits the glucose fixation. The massive discharge of this substance is conditioned by the loading of blood with pancreatic secretion. This primary effect is then followed by an increased glucose fixation which persists for several days and becomes normal once more. If a few weeks later signs of sympatricotony reappear the loss of glucose again falls considerably below the normal and persists as long as the sympatricotony does. This is due to the circulating adrenaline, as can be

proved by the opposite effect which the administration of ergotamine produces, causing an increase in the amt. of glucose given off by the plasma. Rabbits in which the ligation of the pancreatic ducts failed to produce sympathicotony behave like normal animals in the matter of the glucose-yielding capacity of their plasma, but this capacity is raised when ergotamine is injected into these animals, showing that the animals are nevertheless under the influence of a certain adrenaline action. At the same time, however, there is also produced an insulinemia, because the red cells of these rabbits show distinct capacity for fixing glucose, a property not found in the cells of normal rabbits. The increased glucose-fixing capacity of the cells is an insulin effect. It is thus, concluded that ligating the duct of Wirsung releases in some rabbits an adrenaline production which, perhaps in a reflex way, increases the production of insulin. S. M.

Metabolism of stationary and growing tissues. O. ROSENTHAL AND A. LASNITZKI. Universitäts-Institut für Krebsforschung an der Charité, Berlin. *Biochem. Z.* 196, 340-425(1928).—In mesenchymic tissues (connective, smooth muscle and lymphadenoma) no definite conclusion as to the relationship between metabolism measurements and growth could be formed because the morphological character of these tissues changes so much during growth. However, the anaerobic fermentative process is always greatest when growth is most intense. Nevertheless, the fermentation in 3 cell-rich human sarcomas was smaller than in Jensen's rat sarcoma. Of stationary epithelial tissues the mucous membrane with its higher proportion of growing cells ferments much more strongly than epithelial glands. The fermentative process of liver and kidney during fetal and post-fetal growth is considerably greater than during their stationary state, and the process diminishes with advancing development. The respiratory function changes in the opposite direction. Pathologically growing epithelial tissues likewise possess a high fermentative capacity. In an orderly growing thyroid gland tissue the fermentation process seems to be greater than in the stationary state according to the colloid content. The highest fermentation values are found in the human and animal carcinoma tissues. The fermentation excess ($U = Q_M^{N_2} - 2 QO_2$) is pos. in disorderly growing tissues, except the human sarcoma, but in the case of most other tissues it is neg. The Warburg coeff. $Q_M^{H_2}/QO_2$ is for normal stationary tissues ≈ 3 ; 0.5-1.3 for most orderly pathological growths and is > 2 in all disorderly growths with the following exceptions: stationary lymph nodes, 0.5; strumas, < 0.3 ; human sarcomas about, 1.0. In a number of expts. the metabolism was detd. both in Ringer soln. and in serum. The anaerobic fermentation of fetal and adult rat liver as well as of rat tumors is not altered in inactivated horse serum. On the contrary, the respiration of rat kidney in inactivated serum is 50% greater, while that of the smooth muscle from the rabbit large intestine 50-100% greater than in Ringer. The paper contains comparative data on the respiratory and fermentative function of the same type of tissue from different organisms. S. MORGULIS

The metabolism of body cells. AKIJI FUJITA. Kaiser Wilhelm-Institut für Biologie, Berlin Dahlem. *Biochem. Z.* 197, 175-88(1928).—All organs and cells glycolyze anaerobically but this glycolysis is almost entirely suppressed by satn. with O_2 . This holds also for the placenta and leucocytes, which are thus not to be compared to carcinoma cells. In full-grown animals the metabolism of the eye lens is very nearly nil, but in embryonic lenses the anaerobic glycolysis is a function of the wt., and is greater the younger the embryo. Furthermore, the embryonic lens glycolysis does not cease in O_2 , and considerable aerobic glycolysis continues. In this respect the organs made up of practically non-nucleated cells behaves like the non-nucleated erythrocytes, the respiratory metabolism being absent in both. S. MORGULIS

Reversible transformation of cathemoglobin. BR. JIRGENSONS. Lättländische Univ., Riga. *Biochem. Z.* 198, 206-8(1928).—The transformation of cathemoglobin to hematin (and globin) is reversible. At higher temp. (70°) the hematin spectrum appears, at lower temp. it again changes to the cathemoglobin spectrum. S. M.

The volume changes of red blood cells of cows and fetuses in hypertonic salt solutions. D. VON DESO. Tierärztliche Hochschule, Budapest. *Biochem. Z.* 199, 41-7(1928). Salt solns. of such concn. were selected as to avoid the occurrence of salt swelling. The vol. changes in the red blood cells were measured with a hematocrit at 3500 revolut'ns per min. The expts. show that the fetal blood cells shrink relatively more than the mother's cells in hypertonic solns., contain more free water and also more colloids than the adult red cell. S. MORGULIS

Experimental studies on the relation of the carbon coefficient to the oxygen coefficient of the urine. ADOLF BICKEL. Universität Berlin. *Biochem. Z.* 199, 195-201(1928).—The C coeff. of urine is the ratio C/N; the O coeff. is the ratio to the total N

of the O_2 necessary for the complete oxidation of urinary products. For instance, creatinine would require 6 atoms of O for its complete oxidation; hence the coeff. is $6 \times 16/3 \times 14 = 2.286$, or 2.286 g. O_2 for every g. N. Urea is in this respect the most ideal nitrogenous waste product, its O/N coeff. being zero (infinitely small). For urine the magnitude of this coeff. will be directly proportional to the C, N and S contents, and inversely proportional to the O content, and it is also obvious that it cannot conform with the value of the C/N coeff. The O_2 required for the complete oxidation of urinary substances is detd. by the following procedure of Müller. A definite amt. of pure KIO_3 (either as the solid or in soln.) is placed in 300-cc. Erlenmeyer flask contg. a little water. To this is added 30 cc. concd. H_2SO_4 and, after leaving it 15 min. a measured quantity of urine is introduced and the mixt. is heated on a sand bath to 200° . The oxidation of the org. matter may be considered completed when no more I_2 fumes come off. After cooling the mixt. is dild. with a little H_2O and the free I_2 is driven off by boiling. The clear, colorless soln. is again cooled and made up to 500 cc. with H_2O . In 100-cc. portions the N is detd. by the usual procedure of liberating the NH_3 with an excess of $NaOH$, while in other portions the excess of KIO_3 is detd. by titrating with 0.1 N $Na_2S_2O_3$ after addn. of an excess of pure KI . A correction, of course, must also be made for urinary Cl because the reaction: $2KIO_3 + 10NaCl + 6H_2SO_4 = K_2SO_4 + 5Na_2SO_4 + 6H_2O + I_2 + 5Cl_2$ takes place. This is done by a sep. Cl detn. by the usual method. The O_2 consumption in the complete oxidation of the urinary org. matter is calcd. from the following formula: $mg. O_2 = 0.1869 \times (a - 17.84 b - 1.207 c)$, where $a = mg. KIO_3$; $b = cc. 0.1 N Na_2S_2O_3$ used in the titration of 100-cc. aliquot; and $c = mg. Cl$ in 10 cc. urine. The results of expts. in which both ratios O/N and C/N were simultaneously detd. by the methods described show that these do not always vary in a parallel manner.

The acid-base ratio in the organism and the activity of the gastrointestinal canal. Acid-base equilibrium in man following removal of the stomach. P. ASCHMARIN AND E. MARRISON. *Inst. Exptl. Med., Leningrad. Biochem. Z.* 199, 307-25(1928).—A study of the acid-base metabolism in a patient after gastrectomy shows that the reduced NH_3 no. exceeds the normal. The p_H of the urine is lowered on changing to a strongly alk. diet, during which period the difference between the acid and base in the urine becomes very large. The CO_2 -tension in the alveolar air falls after eating. A large amt. of $NaHCO_3$ is required to raise the p_H of the urine.

S. MORGULIS

The carbon dioxide combination in the blood. I. The velocity of dehydration and hydration of carbon dioxide components in blood. O. M. HENRIQUES. *Staats Seruminst., Copenhagen. Biochem. Z.* 200, 1-4(1928).—The av. length of a lung capillary is 0.3 mm. and it requires 1 sec. for the blood to pass this distance. The reaction between hemoglobin and O is so rapid that the time suffices for the gas exchange. From Faurholt's data on the velocity of hydration of CO_2 and of dehydration of H_2CO_3 and HCO_3^- at 0 and 18° have been recalcd. for a p_H 7.4. This is found to require very considerable time. Thus, within the 1 sec. which the blood occupies in passing the lung capillary only 0.4% at 0° and 16% at 38° will change from $H_2CO_3 \rightarrow H_2O + CO_2$. Under av. conditions in the change from the venous to the arterial blood 5 and 11.75 vol. % bound CO_2 (at 0 and 38° , resp.) must be freed from the erythrocytes. By the dehydration process within 1 sec. only 0.02 and 1.95 vol. %, resp., could thus be freed. The CO_2 exchange in the lungs can, therefore, not be explained simply on the basis of dehydration. II. **The experimental demonstration of rapidly reacting bound carbon dioxide in hemoglobin.** *Ibid* 200, 5-9.—By means of a special app. described in the text, the rate of liberation of CO_2 was studied both from serum and hemoglobin solns. Whereas in the former only 22 vol. % CO_2 is liberated *in vacuo*, in the latter 28 vol. % is set free in 5 sec. The rate of the liberation of CO_2 follows the order of a monomol. reaction, $K = 0.0048$, for the hemoglobin soln. It is concluded that a part of the CO_2 in hemoglobin is a chemically bound complex which gives off its CO_2 with a very great rapidity. III. **The experimental demonstration of a CO_2 -hemoglobin complex in solutions of carbon dioxide and hemoglobin.** *Ibid* 10-17.—The HCO_3^- -ion activity in a soln. of CO_2 and hemoglobin is measured electrometrically according to Donnan's principle, with a Donnan dialysis app. as an ion-electrode (figures of the various app. are given in the text). The Donnan potential, the p_H , the total CO_2 and total Cl^- were detd. The calcn. of the Cl analyses shows that the Cl^- is also partly in a complex combination with the hemoglobin, but the degree of combination is differently related to the p_H than that of the CO_2 . At the same time the isoelec. point of the hemoglobin shifts from p_H 6.8 to 5.5 so that at a given p_H hemoglobin is more electroneg. than in a salt free soln. The value of pK_1 is about 0.2 less in erythrocyte pulp than in serum. The name "carbhemoglobin" is proposed for the CO_2 -hemo-

lobin complex. IV. The carbon dioxide-binding capacity of reduced and oxyhemoglobin. *Ibid* 18-21.—At the same CO_2 tension reduced hemoglobin binds much more O_2 into a complex than does oxyhemoglobin, but at tensions above 100 mm. Hg both forms of hemoglobin combine with practically the same amt. of CO_2 . V. Physiological considerations concerning the carbohemoglobin problem. *Ibid* 22-4.—In blood the exchange of chemically bound CO_2 proceeds entirely through carbohemoglobin, both the bicarbonate (HCO_3^-) and the CO_2 (H_2CO_3) playing the same subordinate role in respiration as do the Cl ions. S. MORGULIS

A note on the supposed chemical basis of the physiological action of hypertonic solutions. NICOLAI SHILOV. Research Inst., Moscow. *Biochem. Z.* 200, 145-8 (1928).—In view of the tenacity with which blood regulates its H-ion concn. and osmotic pressure, the effect of hypertonic salt soln. injections must exert an important influence on the potential difference between capillary wall and the moving blood column ("flow potential"), whereby also the wall acts as a neg. adsorbent. Evidence is cited to show that HCO_3^- is absorbed much better than CO_3^{2-} ions, and in cases of acidosis CO_2 will tend to accumulate in the capillary wall. This is found to be the first step in the chem. change which underlies sclerosis. In other words, the adsorption of CO_2 activates the capillary wall, making it susceptible to various physical and chemical actors. Normally this CO_2 adsorption is inhibited by the proper Cl^- and HCO_3^- balance. Apparently this CO_2 adsorption affects also the deposition of cholesterol, a problem which is now investigated by the author. S. MORGULIS

The physiology of the thyroid gland. XI. The role of the thyroid gland in the specific dynamic phenomenon in metabolism. G. MANSFELD AND ELIZABETH SCHEFFER CSILLAG. Univ. Pécs. *Biochem. Z.* 200, 194-200 (1928).—The specific dynamic effect of meat and sucrose was studied on 2 male dogs before and after thyroidectomy. Removal of the thyroid gland, leaving intact 2 parathyroids, has no influence upon the specific dynamic action of food. Likewise, castration following the thyroidectomy, does not alter the specific dynamic action. S. MORGULIS

Kidney metabolism and kidney development. P. GYÖRGY, W. KELLER AND TH. BREHME. Kinderklinik, Heidelberg. *Biochem. Z.* 200, 256-66 (1928).—The kidney cortex of young and old animals has a low, while the kidney papillary tissue has a relatively enormous anaerobic glucolytic function, so that the lactic acid fermentation of the latter is 4 to 5 times as great as that of the cortex. In nearly the reverse order to the glucolysis values are the respiration quotients of the different kidney portions. For the papillary region, in accordance with Warburg's value U for the classification of tissues, the values are pos. or strongly pos. Previously, pos. values for N in normal tissue were found only in the retina, so that the canal system of the kidney like the retina must be recognized as an organ with specialized functional properties. The same results were obtained with kidneys from animals and man. S. MORGULIS

The permeability of cells. XIV. The problem of the elimination of different sugars through the salivary gland. JULES JEANGROS. Univ. Bern. *Biochem. Z.* 200, 367-78 (1928). When intravenous injections of concd. solns. of various sugars are made and the secretion of saliva is at the same time greatly stimulated through pilocarpine, there was no sugar found in the saliva. Even when in addn. to the above 0.9% NaCl soln. of 37° was also injected intravenously in order to produce hydremic plethora still no sugar passed through the salivary glands. This fact shows that the permeability of the salivary gland cells differs very fundamentally from that of the kidney cells. S. MORGULIS

The relation between phosphoric acid and glucolysis in blood. W. A. ENGELHARDT AND A. E. BRAUNSTEIN. Biochem. Inst., Commissariat for Public Health, Moscow. *Biochem. Z.* 201, 48-65 (1928); cf. *C. A.* 22, 2781.—No appreciable increase is observed in the inorg. P of rabbit blood in incubation for several hrs. provided there is no hemolysis (cf. *C. A.* 19, 3276). Hemolysis causes a very great increase in the P values, and the same effect is found even when blood is dild. with isotonic salt solns. The change in P varies according to the nature of the anion, whereby the effectiveness of these anions corresponds to the Hofmeister lyotropic series $\text{F} > \text{Cl} > \text{Br} > \text{CNS}, \text{NO}_3$. Likewise, the more the concn. of the soln. differs from isotonicity the larger is the resulting increase in inorg. P. This rise in P is due to the cells and does not occur in serum or plasma dild. with salt soln. However, if washed erythrocytes are boiled with 1.5 vols. of Ringer soln. and this ext. is added to serum an increase is found in the total inorg. P after several hrs. This leads to the conclusion that the corpuscles contain the substrate from which P is hydrolyzed. When either washed erythrocytes or serum and boiled erythrocyte ext. were dild. with variable quantities of isotonic soln. of different salts no effect was observed except in case of NaF, which inhibited the formation of

P. This difference in behavior of whole blood and of the 2 artificial systems is attributed to the presence of glucose in the former and to the glucolysis. On adding glucose to the latter the behavior becomes similar to that of whole blood. Expts. with glucolyzing systems show that the factors promoting an increase in the inorg. P cause a corresponding diminution in glucolysis, so that there is a definitely reciprocal relationship between the intensity of glucolysis and the P increase. The hydrolysis of inorg. P is believed to proceed unhindered by glucolysis but is immediately transformed into an org. ester which becomes stabilized. The inorg. P balance in whole blood represents the algebraic sum of these 2 opposite processes. Anything which inhibits glucolysis results at the same time in a rise of the org. P.

S. MORGULIS

Studies on the effect of the sympathetic innervation on the phosphate and creatinine content of the striated muscles of vertebrates. WERNER SCHMID. Univ. Bern. *Biochem. Z.* 201, 125-47(1928).—The masseter and sublingual muscles were used for analysis. The inorg. P was detd. in an ext. prepd. from 0.2-g. portions, deproteinized with an equal vol. of 7% CCl_3COOH and dild. exactly to 30 cc. The detns. were made either by the Fiske-Subbarow or by the Lohmann-Jendrassik method. For the total P the muscle was ashed with 1 cc. H_2SO_4 + 2 cc. H_2O_2 . Kleinmann's nephelometric method was followed. For the creatinine detn. several samples of about 0.15 g. were boiled with 1% HCl until soln. was complete. After neutralization the soln. is boiled once more to ppt. the proteins and filtered when cool. An aliquot of the filtrate (0.8) is placed in a 50-cc. flask with an equal vol. 2 N HCl and autoclaved 20 min. at 115° and the creatinine is detd. colorimetrically. With these methods comparative analyses were made on the muscles above mentioned with or without sympathetic innervation as well as in animals deprived of their suprarenals. On the side on which the sympathetic nerve was destroyed the muscles regularly showed a lowering of about 10% of the org. P as compared to the muscle on the unoperated side. There was no difference in the creatinine content. Removal of the suprarenal glands had no effect of this nature. It is concluded that the muscle deprived of the sympathetic innervation has an increased permeability. The factor of the vasodilation due to loss of sympathetic innervation has been excluded.

S. MORGULIS

The physiology of glands. CXVI. The respiratory metabolism during work in the normal condition and after treatment with adrenaline. LEON ASHER AND WALTER H. SCHEUCHZER. Univ. Bern. *Biochem. Z.* 201, 148-64(1928); cf. *C. A.* 23, 426.—Subcutaneous injection of adrenaline into rats causes a slight rise in the metabolism during work as compared to the untreated rats. In view of the fact that adrenaline causes an increase in the basal metabolism it follows that work is done more economically under adrenaline.

S. MORGULIS

The lactic acid metabolism of the central nervous system. I. HANS JUNGEMANN. Univ. Breslau. *Biochem. Z.* 201, 259-68(1928).—The lactic acid is detd. by the Mendel-Goldscheider veratrole reaction in the spinal cord of frogs and toads. The av. lactic acid content of cords surviving in salt soln. is 0.14%. The lactic acid passes into the salt soln. at first very rapidly, then more and more slowly, and this continues even after 8 hrs. Even in the presence of O there is an increased lactic acid in the cord after 2 hrs., and a relatively large increase after 4 hrs., but in a N atm. much more lactic acid is produced. The lactic acid formed in N atm. is not removed by subsequent admission of O. Stimulation in O, however, causes a loss of lactic acid, while in N the lactic acid remains unchanged.

S. MORGULIS

The artificial raising of the lipid content of the central nervous system. I. MARC SEREJSKI. Inst. for study of Nervous Activity, Moscow. *Biochem. Z.* 201, 292-7(1928).—A rise in the lipid content of the brain was produced by feeding homologous brain lipids.

S. M.

The cholesterol in the protoplasmic structure. I. Studies on beef heart. G. PFEIFFER. Landwirtschaftliche Hochschule, Bonn. *Biochem. Z.* 201, 424-34(1928).—The total cholesterol was extd. from the heart tissue, either fresh or dry. Preliminary hydrolysis of the tissue with 2% NaOH and ether extn. yield exact results. The sapon. of cholesterol esters is very slow and is not completed even after 10-12 hrs. S. M.

The destruction of acetoacetic and β -hydroxybutyric acid in the muscles. I. SNAPPER AND A. GRÜNBAUM. *Biochem. Z.* 201, 464-72(1928).—On perfusing the lower extremities of the dog with blood to which β -hydroxybutyric acid has been added 45-75% is destroyed without being oxidized to acetoacetic acid. When acetoacetic acid is added to the blood used for the perfusion about 80% disappears, but 18-20% is recovered as β -hydroxybutyric acid adsorbed in the muscles and bones. On perfusing artificially the calf tongue, 13-40% of the added β -hydroxybutyric acid is destroyed and no acetoacetic acid is produced; while on perfusing with acetoacetic acid 75.5-

84.5% disappears, of which 29–67.5% is recovered as β -hydroxybutyric acid, so that in 4 expts. only 13–21% but in one expt. as much 54.5% acetoacetic acid actually disappeared. In all these expts. it is necessary to analyze not only the blood, but also the perfused muscles, fat, skin and bones.

S. MORGULIS

Iron metabolism. V. HENRIQUES AND H. ROLAND. Univ. Copenhagen. *Biochem. Z.* 201, 479–85(1928).—Analyses of 24-hr. urines from healthy or sick individuals 0.08 to 0.32 mg. Fe were found. Usually it is claimed that a mg. is secreted per 24 hrs. Through prolonged intravenous injection of iron salts the Fe excretion in the urine of the dog was raised to 13.5 mg. per 24 hrs. The excretion of Fe through the bile is not significant and in the dog does not exceed 0.2 mg. daily. In a patient with a bile duct fistula a max. daily secretion of 0.5 mg. was observed. Long-continued intravenous injection of ferrous lactate causes no increase in the Fe excreted through the bile. S. M.

The restitution of the fluid after hemorrhage. Kozo HIROTA. Kyoto Imperial University. *J. Biochem. (Japan)* 9, 87–102(1928).—A rabbit is killed by a loss of 50% of its blood even if this is due to several bleedings carried out at intervals of a few hrs. If the hemorrhage is less than 30% of the total blood, more than half of this loss is restored from tissue fluids, but the restoration of the fluid does not go on parallel to the recovery of the blood pressure. The liver is very active in this restoration. This effect manifests itself principally in the rise in colloidal osmotic pressure to counteract its lowering due to diln. The relation between the restitution of the blood pressure and that of the colloidal osmotic pressure and blood vol. offers evidence in favor of Bayliss-Starling's theory of lymph production. With a high blood pressure and a low colloidal osmotic pressure there is little restoration of the blood vol., but the vol. restoration is marked when there is a high colloidal osmotic pressure and a low blood pressure.

S. MORGULIS

The utilization of nutrient material following shortening of the intestine. VILJO TUOMIKOSKI. Univ., Helsingfors. *Skand. Arch. Physiol.* 54, 249–320(1928).—Removal of the large intestine from the cecum to the pelvic colon has the following effect on the utilization of food. The utilization of water was generally poorer, only about 71%. The addn. of water produced only a slight improvement in the water resorption, while the addn. of fat or vegetables made it somewhat worse. Also the utilization of protein was somewhat diminished, particularly that of vegetable protein, while that of animal protein was almost as good as under normal circumstances. The addn. of fat seems to have made the utilization of protein less effective. The utilization of fat was as good as normal. The utilization of carbohydrate was definitely diminished, which holds also for the utilization of ash. The assimilation threshold was somewhat lower than normal, and with increasing amts. of food the utilization became less effective.

S. MORGULIS

Fat and lipid metabolism. VII. Cholesterol and lipid phosphorus of the bile. S. LEIBER. Inst. Medicine, Charkow. *Zhurnal expil. biol. med.* 9, 181–93(1928); cf. *C. A.* 23, 419.—Loading dogs with olive oil, olive oil and cholesterol or with oleic acid causes very little alteration in the cholesterol content of the bile 1–24 hrs. after the administration. On the contrary loading the animal with meat and lecithin does lead to a considerable increase in the bile cholesterol during the first 6 hrs. Loading with lecithin alone also produces at times a certain rise in the total and lipid P of the bile during the first 4–6 hrs. a similar result following also the loading with olive oil. Following the blocking of the reticulo-endothelial system the cholesterol of the bile is increased, while after splenectomy the amt. of cholesterol and of lipid P in the bile decreases. It is concluded that in the dog the liver does not generally function as an excretory organ for cholesterol or phosphatides.

S. MORGULIS

Experiments on the comparative value of thyroxine and meat feeding on the movement of the empty crop of chickens. A. S. LIERNERFARB. Communist Univ., Moscow. *Zhurnal expil. biol. med.* 9, 492–500(1928).—Thyroxine injections, like feeding the dry gland substance, prolongs the activity of the empty crop but does not affect the duration or rhythm of individual contractions. On the contrary, meat feeding has little influence on the duration but does affect the rhythm and the crop twittings become very prominent. In all 8 cases, however, feeding meat or thyroid and thyroxine injection, there is a preliminary brief period of inhibition of crop activity. S. M.

Evidence drawn from a study of the therapeutics of Graves' disease of two functions in the thyroid physiology. G. SCOTT WILLIAMSON AND INNES H. PEARSE. St. Bartholomew's Hosp., London. *Quart. J. Med.* 22, 21–32(1928).—There are 2 functions in the thyroid physiology—the secreting function and the iodo-colloid function. These are not mutually derivative. The secreting function of the gland is directly related to the thyrotoxicosis of Graves' disease, which is relieved by simple removal of

pure secreting tissue. Iodo-colloid functions has only an indirect relation to thyrotoxicosis. An abs. loss of a thyroid reserve of iodo-colloid occurs in 48% of Graves' diseases. This mobilization of colloid depends on some factor in secretion, since, when I feeding is excluded, excision of pure secreting tissue causes or allows a reserve of normal colloid to appear in the remainder of the gland. I feeding can also restore a reserve of colloid. However, such a restoration does not abolish the thyrotoxicosis. There is no abs. lack of circulating I in Graves' disease, but there is a complicating relative lack in 48% of cases, which is relieved by I feeding.

JOHN T. MYERS

The precipitate obtained by cooling the plasma, or the precipitate of Wooldridge. EDGARD ZUNZ. *Arch. sci. biol.* (Italy) 12, 121-40(1928).—The Wooldridge ppt. may be sepd. into 2 fractions, one sol. and the other insol. in abs. alc. The portion sol. in abs. alc., confers on a soln. of serzyme contg. Ca, the property of coagulating the dild. dioxalated plasma used as a solvent for fibrinogen. This fraction also appears to contain a cytozymic substance, probably of the phosphatide group, which hinders coagulation. The portion insol. in abs. alc. contains a substance of a protein nature. After filtration through a Berkefeld filter, the Wooldridge ppt. does not appear in the oxalated or citrated plasma of the normal dog or rabbit, nor in the plasma not spontaneously coagulable by anaphylactic or peptonic shock. Apparently the cytozymic constituents sol. in abs. alc. are retained by the Berkefeld filter, a fact which favors their cellular origin. The portion sol. in abs. alc. acts on the plasma filtered through a Berkefeld filter in a manner analogous to that of the cytozyme. It causes incomplete coagulation of normal citrated plasma filtered and then recalcified, but does not modify the fluidity of filtered plasma from shock. Under the combined effect of the addn. of this product and the passage of a current of CO₂, the coagulation becomes complete in normal, citrated, filtered and then recalcified plasma and appears in the filtered plasma from peptonic shock, but generally not in the filtered plasma from anaphylactic shock.

L. W. RIGGS

Relativity applied to biological problems. Value of urinary acidity. L. TIXIER. *Bull. sci. pharmacol.* 35, 571-4(1928); cf. *C. A.* 22, 2957, 3927.—The relations of urinary monometallic phosphates, acid Na urate and amino acids to each other and to the total acidity of the urine are discussed. The following ratio multiplied by 100 gives a coeff. of alkalization of the phosphates: (phosphoric acidity—uric acidity—amino acid acidity)/(total acidity detd. with phenolphthalein indicator). The various factors in this ratio are expressed as $\frac{1}{2}(P_2O_5)$. If the coeff. is less than 100 it indicates free org. acids furnished by secondary fermentation in the digestive tract. If the ratio is greater than 100 it indicates an elimination of phosphates in the bimetallic state.

L. W. RIGGS

Isolation of the gastric and pancreatic secretory excitants from the circulation by vivi-dialysis. H. NECHELS AND R. K. S. LIM. *Peking Union Med. Coll. Chinese J. Physiol.* 2, 415-34(1928); cf. *C. A.* 22, 2180.—Vivi-dialyses of the carotid, femoral, caval and portal blood in dogs show that secretory excitants for the stomach and pancreas may be present in blood during fasting as well as after feeding. The excitants are more easily obtained from the portal than from the arterial blood. There is evidence of an increase of pancreatic excitant after meals or the introduction of HCl into the small intestine, and there is presumptive evidence of a similar increase of the gastric excitant. It is suggested that the excitants in fasting blood may be left over, either directly or indirectly through the action of secretagogue remainders, from the digestive period, and are not spontaneously and continuously increted.

L. W. RIGGS

Chemical regulation of cardiac activity. Effect of certain tissue products on the activity of the isolated heart. L. STERN, S. J. RAPEPORT AND A. F. SCHARIKOWA. *Compt. rend. soc. biol.* 99, 687-9(1928); cf. *C. A.* 21, 3972.—Exts. of most tissues have the power of stimulating the activity of cardiac muscle as shown in perfusion expts. with the isolated frog heart. This would indicate the absence of a sp. substance or particular hormone, but does not exclude the action of special products of internal secretion on the heart *in situ* in the living organism. Ratio between the effects of various tissue products on the coronary circulation and on cardiac activity. *Ibid* 689-91.—Liquid suspension of muscle and liver in concns. of 0.1 to 1.0 cc. per 100 cc. of Ringer-Locke soln. increases both cardiac activity and coronary circulation. In concns. of 2 cc. per 100 cc. it decreases both the cardiac activity and coronary circulation. Liquid suspension of spleen in concns. of 0.1 to 1.0 cc. per 100 cc. of Ringer-Locke decreases the cardiac activity, but increases the coronary circulation.

L. W. RIGGS

Relations between the adipose bodies of the sexual glands and the hypophysis. ALEXANDRE LIPSCHÜTZ AND RAMON PAEZ. *Compt. rend. soc. biol.* 99, 693-4(1928).—The adipose body of the guinea pig testicle injected into the male or female rat or mouse

had no influence on the development of the genital organs. The adipose body of the ovary or testicle of the large Chilian frog was equally inactive, as was also the hypophysis of the same frog. These expts. were made at a time of sexual repose, when perhaps the active substances were temporarily absent. L. W. RIGGS

Differential properties of the collagen fibers of the cornea and sclerotic. R. COLLIN. *Compt. rend. soc. biol.* 99, 833-4(1928).—In the ox the percentage of water in the cornea was 81.53, in the sclerotic 66.03. Notwithstanding the larger water content of the cornea, its ash content is also greater than that of the sclerotic in the ratio of 7:4. These findings are discussed histologically. L. W. RIGGS

Variations of the alkaline reserve and erythrocyte chlorine as a function of the pulmonary ventilation. A. SCHWARTZ AND F. SCHMID. *Compt. rend. soc. biol.* 99, 856-8(1928).—Hyperventilation in the rabbit caused a fall in the alk. reserve and in the erythrocyte Cl. Respiration for 1 min. in an atm. rich in CO_2 caused a rise in each of these factors. Hyperventilation following the administration of lobeline caused a fall in each of these factors. The administration of H_3PO_4 was followed by a fall in the alk. reserve and a rise in the erythrocyte Cl content. L. W. RIGGS

Are there nonfermentable reducing substances in the blood? Estimation of reducing substances of the blood by the method of Hagedorn-Jensen. JEAN ROCHÉ. *Compt. rend. soc. biol.* 99, 861-3(1928); cf. Fontes and Thivolle, C. A. 22, 2177, 2588, 3185; Bigwood and Wuillot, C. A. 22, 3673.—Filtrates from the defecation of blood by Na_2WO_4 contained more sugars than those defecated by $\text{Zn}(\text{OH})_2$ (Hagedorn-Jensen), and much less nonfermentable residue. Comments on the preceding paper. G. FONTES. *Ibid* 863-4.—The different yeasts used in fermentation and the different methods of defecation are discussed. L. W. RIGGS

Content of normal ocular tissues in reduced glutathione. D. MICHAEL AND P. VANCEA. *Compt. rend. soc. biol.* 99, 891-2(1928).—The reduced glutathione content is practically the same in similar tissues of the eye of the ox, rabbit and dog. Its distribution was: cryst. lens 356 mg. per 100 g., retina 162, choroid 78, lacrymal gland 50, cornea (vitreous body) 33, conjunctiva (sclerotic) 10. L. W. RIGGS

Influence of the testicular sexual hormone on the basal metabolism in animals. L. PTASZEK. *Compt. rend. soc. biol.* 99, 929-31(1928).—The testicles intervene in the basal metabolism and insure the stability of heat production. Double castration in healthy animals causes a stable lowering of the basal metabolism, and in this condition a subcutaneous injection of the testicular hormone produces a temporary return to normal of the respiratory exchanges. The extirpation of the testicles stimulates the activity of other endocrine glands, causing their temporary hyperfunctioning, which may for a time compensate for the diminution of respiratory exchanges. L. W. R.

Influence of rarefied air on the number of erythrocytes. G. LEJHANEK. *Compt. rend. soc. biol.* 99, 982-4(1928).—Between Nov. 7 and Dec. 1, a rabbit weighing 936 g. and under 300 mm. Hg pressure lost slightly in wt. while the erythrocytes increased from 5.48 to 9.45 millions. Under ordinary pressure between Dec. 1 and Apr. 13 the animal reached a wt. of 1825 g. while its erythrocytes fell from 9.45 to 4.72 millions. An attempt is made to express the relation between the no. of erythrocytes and the pressure by an equation. L. W. RIGGS

Urobilin in the organs. M. ROYER. *Compt. rend. soc. biol.* 99, 1006-7(1928).—In 4 healthy dogs the liver contained an av. of 32.5 mg. per kg. of organ, spleen 6.0, kidney 19.6 and heart 8.38. That of the muscle, pancreas, lung and blood was much lower. With dogs carrying a biliary fistula for several days and in which the feces contained no stercobilin and the urine no urobilin, the content of urobilin in the organs fell to 0 or less than 0.5 mg. per kg. It appears that the urobilin of the organs arises from the intestinal urobilin after its passage into the general circulation. L. W. RIGGS

Instability of the number of red corpuscles in splenectomized animals. E. TROILLO. *Compt. rend. soc. biol.* 99, 1008-9(1928); cf. C. A. 22, 4602.—In splenectomized guinea pigs the av. no. of red corpuscles is the same as in normal animals, but there is a diminution in the hemoglobin with relation to the no. of erythrocytes. The leucocytes nearly double in no. in the course of a year. A striking difference between normal and splenectomized guinea pigs is in the sudden changes in the red cell count of the latter, which may be 6, 4 or 8 millions within a period of 2 weeks. Apparently the spleen exerts a regulatory action on the no. of red corpuscles. L. W. RIGGS

Presence of adrenaline and of choline in the lymph. G. VIALE. *Compt. rend. soc. biol.* 99, 1009-10(1928).—Lymph of the normal dog added in the variable proportions of 1 to 20 per 100 of a perfusion liquid in the isolated toad heart increased the amplitude and rhythm of the contractions. Lymph from dogs deprived of their suprarenals did not produce these effects. Lymph from the normal dog intravenously

injected into dogs caused an increase in arterial pressure. Its effects are comparable to those of adrenaline. The most active lymph was that collected under the lymphogogic action of choline. Lymph from dogs deprived of their suprarenals was without action on the arterial pressure. Lymph from normal animals had a mydriatic action on the isolated eye of the toad, while lymph from animals deprived of suprarenals was without action.

L. W. RIGGS

Influence of diathermy of the thyroid gland on the basal metabolism. L. PRASZEK AND M. SZUPERSKI. *Compt. rend. soc. biol.* 99, 1028-9(1928).—In hyperthyroidism a remarkable lowering of the basal metabolism was observed after a 10-min. application of heat. In hypothyroidism heat caused an increase in the basal metabolism. Subjects with normal thyroid functioning showed slight changes in basal metabolism on the application of heat to the thyroid.

L. W. RIGGS

Purines extracted from muscles. A. DMOCHOWSKI. *Compt. rend. soc. biol.* 99, 1148-9(1928).—Dog and rabbit muscle were extd. with water at 40° and also at 100°, then, after defecation with AcOH, the purine content was detd. by the method of Krüger and Schittenhelm, also the purine N contents of fresh muscle and of extd. muscle. The quantity of purine N obtained directly from the ext. averaged only 5 mg. per 100 g., but after hydrolysis with H₂SO₄ the quantity was 40 mg. per 100 g., or about 1/4 the total purine N of the muscles. The distribution of purines between adenine and hypoxanthine on the one hand and guanine and xanthine on the other is considered. Further work is in progress.

L. W. RIGGS

Intestinal biodialyzates as agents inhibiting gastric secretion. JULIAN WALAWSKI. *Compt. rend. soc. biol.* 99, 1169-71(1928).—Intestinal biodialyzates, prepd. according to Gutowski (cf. C. A. 18, 3616), and introduced into the circulation of animals caused a pronounced inhibition of secretion of gastric juice.

L. W. RIGGS

Serocholesterolemia in the experimental anorchitic syndrome. GH. WERNER. *Compt. rend. soc. biol.* 99, 1185-6(1928).—In 10 adult guinea pigs there was an increase in the cholesterolemia 2 to 8 months after castration. Rabbits gave similar results 3 years after castration. The results with sheep were contradictory, but there was a tendency to a diminution of cholesterolemia during the 6 months following castration, after which the cholesterolemia rose to the av. normal figure.

L. W. RIGGS

Determination of urea in different samples of the same bleeding. BROCC-ROUSSEU, G. ROUSSEL AND GALLOT. *Compt. rend. soc. biol.* 99, 1203-4(1928).—Tests were made with 36 healthy horses, the urea being detd. by the xanthidrol method in 50-cc. samples of blood at the beginning and end of the bleeding. At the beginning the urea averaged 0.312 g. per l., at the end 0.316 g. per l.

L. W. RIGGS

The lungs and cholesterolemic regulation. L. BOUISSET AND L. C. SOULA. *Compt. rend. soc. biol.* 99, 1206-9(1928).—Expts. with dogs showed that increase of pulmonary ventilation caused a decrease in the cholesterolemia in arterial blood. Asphyxia produced the opposite effect.

L. W. RIGGS

Variations in the inorganic phosphorus, calcium and potassium in the blood serum produced by intracardiac and subcutaneous injections of peptone in the rabbit. X. CHAHOVITCH AND (MLLE.) M. VICHNJITCH. *Compt. rend. soc. biol.* 99, 1264-7(1928).—Repeated subcutaneous injections of peptone in the rabbit caused a fall in the inorg. P, Ca and K. Intracardiac injections of peptone caused nearly the same results. After the injections are discontinued the inorg. P, Ca and K rapidly tend to assume their initial figures. In the course of the injection of peptone, there are short periods when the soln. is not absorbed. During these moments the P and K tend to approach their initial figures. (Cf. following abstr.).

L. W. RIGGS

Content of inorganic phosphorus, calcium and potassium in experimental peritoneal effusions. X. CHAHOVITCH AND (MLLE.) M. VICHNJITCH. *Compt. rend. soc. biol.* 99, 1267-70(1928); cf. preceding abstr.—In exptl. peritoneal effusions, produced by injection of NaCl and MgSO₄, the content in Ca and K is lower than in the blood serum. Also in peritoneal effusions produced by the injection of peptone the content in K is lower than in the blood serum. Effusions produced by the injection of Na₂SO₄ contain less Ca but more K than blood serum. Effusions caused by the injection of NaCl, MgSO₄ or Na₂SO₄ contain generally less or sometimes the same content of inorg. P as the blood serum.

L. W. RIGGS

Variations in the alkaline reserve and chlorine content of the blood in experimental intestinal occlusion. F. DOMENECH ALSINA AND J. RAVENROS PIJOAN. *Compt. rend. soc. biol.* 99, 1278(1928); cf. Orr and Haden, C. A. 23, 435.—Expts. with dogs showed that occlusion at the terminal part of the duodenum by section of the intestine and invagination of the walls was followed by an increase in the alk. reserve and a diminution in the Cl content of the blood. Occlusion at the terminal part of the ileus

by the same procedure caused but little change in the alk. reserve, but a diminution in the Cl content. Ligature of the intestine caused similar changes but less pronounced. If a 10-12-cm. segment of the upper intestine is deprived of blood circulation, the alk. reserve and Cl content of the blood are affected the same as by occlusion at the same level. If a segment is deprived of blood circulation at the terminal portion of the ileus, there is a lowering of the Cl content of the blood without much change in the alk. reserve, or the same results may follow as with occlusion at this level. L. W. R.

Virtual adrenaline. G. MOURIQUAND AND A. LEULIER. *Compt. rend. soc. biol.* 99, 1309 11(1928).—The work of Molinelli and Mazzocco (cf. following abstract) is questioned. L. W. RIGGS

Alleged existence of a virtual adrenaline in the suprarenals. E. A. MOLINELLI AND P. MAZZOCCO. *Compt. rend. soc. biol.* 99, 1000-3(1928); cf. Mouriquand *et al.*, *C. A.* 21, 954, 2142.—The detn. of adrenaline was made simultaneously by the methods of Bailly, of Folin, Cannon and Denis, and by biologic tests on the chloralosed dog under artificial respiration after section of the vagus. With beef suprarenals the adrenaline content of glands was detd. 3 hrs. and 24 hrs., resp., after death. The method of Bailly showed an increase in the adrenaline content of suprarenals 24 hrs. after death; that of Folin, Cannon and Denis a slight increase or decrease, and the biologic method a decrease or no change. The increased intensity of the color reaction by the method of Bailly is attributed to some substance other than adrenaline. L. W. RIGGS

Influence of muscular work on the appearance of rigidity by monobromoacetic acid. MIGUEL O. ALMEIDA AND THALES MARTINS. *Compt. rend. soc. biol.* 99, 1346-7(1928).—From perfusion expts. with frogs it appears that muscular contractions cause a modification of the state of the muscles which favors the contracting action of $\text{CH}_2\text{BrCO}_2\text{H}$. This modification, which is not sp., rapidly disappears if the muscle receives sufficient O, but persists if the muscle is deprived of O. L. W. RIGGS

The estrual cycle of normal and splenectomized rats. E. B. DEL CASTILLO. *Compt. rend. soc. biol.* 99, 1403-4(1928).—The ablation of the suprarenals in white rats did not hinder the estrual cycle or the appearance of puberty. **Action of splenectomy and of epiphysectomy on the estrual cycle of the white rat.** *Ibid* 1404-5.—No change in the estrual cycle could be attributed to the loss of either gland. **Action of poisoning by fluorine or thallium on the estrual cycle of the white rat.** *Ibid* 1405.—The results support the conclusion of Buschke, Zondek and Bermann (cf. *C. A.* 21, 3084) with reference to Tl. Rats receiving 0.05 mg. NaF per day, with or without ultra-violet irradiation, failed to show the estrual cycle. L. W. RIGGS

Regulation of pulmonary ventilation by acidity of blood, tissue fluids and tissue. ROBERT GESELL. Univ. Mich. *J. Am. Med. Assoc.* 91, 1256-8(1928).—The exceptions to the rule that H-ion concn. of the blood controls ventilation are so many, that a rule for the exceptions is suggested by a theory formulated as follows: The respiratory center possesses an acid metabolism of its own. The rate of formation of acid in the center and the rate of transport of acid from the center det. the acidity of the center. Changes in the H ion concn. of the respiratory center rather than of the blood constitute the prime factor in respiratory control. By virtue of its own metabolism and its extreme sensitivity to minute changes in its own H-ion concn., the respiratory center is sensitive to minute changes in its own oxidations, and therefore to changes in the tension of O in the arterial blood. Since the supply of O det. the abs. and relative amts. of lactic acid and CO_2 formed in living tissues, and since it controls the efficiency of transport and elimination of acid, it constitutes an indirect regulator of pulmonary ventilation. The capacity of the center to respond to changes in the arterial CO_2 tension consequent on fluctuations in the general metabolism, however, must also be a factor. This theory receives exptl. support from the results of intravenous injections of HCl and of NaHCO_3 . L. W. RIGGS

Energy output during harvesting work. G. FARKAS, J. GELDRICH AND A. SZAKÁLL. *Magyar Orvosi Arch.* 29, 265-79(1928).—By means of the Douglas bag method it was detd. that the O_2 consumption during mowing was 2000 cc. per min., *prepn. of sheaves* 950, *binding into sheaves* 1800 and *collecting sheaves immediately after mowing* 1700. **Energy used during threshing.** *Ibid* 280-99.—The consumption of O_2 was least in filling the bags and was at a max. in carrying the sacks of grain to the second story of the barn. The values oscillated between 700 and 2170 cc. per min. The laborers lost much wt. during harvest but this loss ceased during threshing. The total energy used by a laborer in 24 hrs. when engaged in threshing is estd. upon the basis of gas metabolism expts. at from 3000 to 4500 kg.-cal. Upon the basis of wt. measurements, taking into account the estd. amt. of food consumed, the total energy was under 5000 kg.-cal. **Energy expenditure of man during industrial work.** G. FARKAS AND J. GELD-

RICH. *Ibid* 300-22.—The sep. parts of industrial operations in a particular trade were evaluated and the results were combined to show the total activity. During work the net heat increase of the tailor was 59 to 65 kg.-cal. per hr., shoemaker 72, locksmith 95, joiner 177, cartwright 176-208 and blacksmith 257 during light work and 327 during heavy work. Consumption of energy during dancing. G. FARKAS AND A. SZAKÁLL. *Ibid* 323-31; cf. Liljestrand and Stenström, *C. A.* 14, 2654; 16, 1611.—The energy consumption of the waltz, fox-trot and charleston was studied by the Douglas bag method. The detns. were made on the basis of the no. of steps per min. and the speed, using only the basic steps of the dances. The subjects danced alone. Speed is much less in dancing than in walking, while the no. of steps per min. is greater. The rhythmic movements of the over-body entailed by dancing increase the metabolism. **Respiratory exchange of man during organ playing.** G. FARKAS AND J. GELDRICH. *Ibid* 332-8.—During normal organ playing the av. energy increases were 80 kg.-cal. per hr. for easy selections and 130 kg.-cal. for difficult. Of the total energy output 30 to 40% was expended with hand work and the remainder with the pedals. **Respiratory exchange of man during horseback riding.** J. GELDRICH. *Ibid* 339-51.—When sitting on horse back so that rider and animal are at complete rest the respiratory exchange was increased 7%. Slight movements such as to control an uneasy horse at stand-still caused an increase of 37%. Riding at walk caused an increase of 122%, trot 490% and at gallop 672%. The increased energy output per m. of distance at walk was 0.012 kg.-cal., trot 0.022, gallop 0.018. Values of respiration experiments in childhood. A. SZAKÁLL AND I. LÉVAY. *Ibid* 352-62.—The subjects were 5.5 to 14 years of age. Variations in the amts. of energy of -9.9 to +17% below or above the Benedict and Talbot standard figures were considered as normal and due to the restlessness of the child and other uncontrolled factors. Increases or decreases of energy outside of these limits may indicate a pathological condition. Puberty had no apparent influence on the metabolism.

L. W. RIGGS

Changes of the p_H of the gastric content after the drinking of water, alcohol and acetic acid solutions. J. VÁNDORFY AND E. BARÁTH. *Magyar Orvosi Arch.* 29, 399-404 (1928).—Tests were made by the electrometric method on samples of gastric contents taken by fractional extraction. In normal acidity the p_H ranged between 1.5 and 2. in cases of superacidity between 1 and 1.5 and in cases of sub- and anacidity over 2 and 3, resp. The fluctuations caused by drinking water, alc. or AcOH solns. were not large.

L. W. RIGGS

Influence of hormones on the thallium epilation in rats. K. BERDE. *Magyar Orvosi Arch.* 29, 405-10(1928).—Sixty white rats were given 0.2 mg. of $TlAcO$ by mouth each day for 90 days. The animals were divided into several groups which received thyroid, parathyroid, thymus and adrenaline, resp. Animals of one group were castrated before beginning the expt. These various treatments had no apparent effect on the loss of hair by Tl except in the animals which received thymus ext., in which case the epilatory action of Tl was increased.

L. W. RIGGS

Production of fibrinogen. F. FALUDI. *Magyar Orvosi Arch.* 29, 424-33(1928).—From expts. with dogs provided with a gall bladder fistula it was concluded that the bilirubin secretion had no relation to the production of fibrinogen, the latter being produced probably in the reticulo-endothelial system.

L. W. RIGGS

Physics and vital processes. W. F. G. SWANN. Bartol Research Foundation. *Science* 68, 411-9(1928).—A lecture.

L. W. RIGGS

Pancreatic hormone and mineral metabolism. II. Influence of the pancreas hormone on the blood constituents, especially on the inorganic salts. SOSHIO TAKEUCHI. Tohoku Univ. *Tohoku J. Exptl. Med.* 11, 327-43(1928); cf. *C. A.* 22, 2624.—More than 40 references are made to the literature. With normal dogs the pancreas hormone causes a decrease of blood sugar, inorg. P, K and Ca; a tendency to increase Cl and serum albumin; and no particular change in Na or Mg. In dogs with pancreatic diabetes the pancreas hormone decreases the blood sugar, inorg. phosphates, K and Ca; increases the Cl and serum albumin; shows a tendency to increase Na, but causes no notable change of Mg.

L. W. RIGGS

Influence of air pressure changes on the composition of the blood. II. Animal respiration under increased and diminished pressures. (Ratio between blood composition and the type of respiration.) KOKICHI IZUMIYAMA. *Tohoku J. Exptl. Med.* 11, 374-406(1928); cf. *C. A.* 22, 4171.—As with man, so also with the dog and rabbit, a sudden application of increased breathing pressure was followed by a diln. of the blood. Breathing pure O at atm. pressure gave the same result. This diln. of the blood may be considered as a regulatory mechanism of the respiratory surface of the blood, which,

under some conditions such as anemia, does not take place. Under diminished respiratory pressure the blood thickens. By abnormal changes of the partial pressures of O in the air, a compensation through the respiratory surfaces of the lungs and blood occurs. Changes of the blood concn. by increased or decreased respiratory pressure results from a water exchange between tissues and blood. L. W. RIGGS

The influence of the endocrine glands on the catalase action of the blood. II. Pancreas and catalase. STEFANO CASTAGNA. Univ. Sassari. *Arch. farmacol. sper.* 45, 241-4 (1928); cf. *C. A.* 22, 4541.—Total pancreatectomy was performed on 3 dogs and the catalase action of the blood examd. for a certain period after the operation. The method used was the same as employed in previous expts. (cf. *C. A.* 20, 2529; 22, 97). The catalase action was normal for about 7 days after the operation; then it decreased slowly, being after 18 days 76, 78 and 88%, resp., of the original effect as detd. before pancreatectomy. **III. Catalase and thyroid.** *Ibid* 245-8.—In 4 dogs, thyroidectomy was followed by an immediate decrease of the catalase content of the blood. Five days after operation, the values for catalase ranged between 49 and 69% of the original values. G. SCHWOCH

The effect produced on the respiratory rhythm by varying the chemical composition of the blood circulating in the nervous system (with special regard to the variation of the cations). LUIGI CONDORELLI. Univ. Napoli. *Arch. farmacol. sper.* 46, 7-28 (1928); cf. *C. A.* 21, 3941.—Blood to which a certain amt. of an electrolyte had been added was allowed to act on the respiratory centers of dogs. The animals were prepd. for the expts. in a special way, making it possible to restore the normal blood circulation at any moment. The blood was administered under a pressure of 200 mm. Hg; its temp. was kept at 38°. The respiratory rhythm was recorded by 2 pneumographs according to Marey's method, one being applied to the thorax and the other to the abdomen. From the graphs obtained the following results were noted: By allowing Ringer soln. to circulate in the nervous system, hardly any deviation from the normal state was observed in the animal. Also depriving the blood of O₂ scarcely caused a disturbance. Satn. of the blood with CO₂ caused violent disturbances, the most conspicuous being the complete independence of the thoracic and abdominal movements. The symptoms observed in the expts. with blood satd. on CO₂ are the same as are seen in cases of uncompensated heart disease. After restoring normal circulation, the respiratory troubles disappear soon. Hypercalcemia produced by adding 10 mg. % Ca (as CaCl₂) to the blood causes polypneic dyspnea. Immediately after adding 13 mg. % K (as KCl), a marked increase in the depth of the respiratory movements was observed, while addn. of 26 mg. % K at first causes intensive dyspneic polypnea, then tachypnea and finally respiratory paralysis. By adding 600 mg. % NaCl, a marked tachypnea and a strong dysharmony between thoracic and abdominal respiration was observed. The addn. of 1000 mg. % NaCl caused at first polypnea, then irregular bradypnea and finally respiratory paralysis; by adding 1250 mg. of Na citrate, very similar effects were produced. The mere elevation of the osmotic pressure of the blood is not responsible for the injurious effects observed in the expts.; this view was proved by the fact that by raising the content of electrolytes in the blood to a level twice as high as normal, no noteworthy phenomena were observed. G. SCHWOCH

Sexual hormones, especially feminin. F. WADEHN. *Z. angew. Chem.* 41, 352-5 (1928). A survey of the different methods of prepg. ovarian hormone is given, the prepn. of which in H₂O-sol. form is designated as the most important feature of the progress made during the last 2 years in regard to this subject. The chem. properties of the hormone as far as they are known are described. As other sources, from which ovarian hormone may be obtained, are mentioned: testicles, blood of females, urine of males and females. Substances very similar in action have been isolated from wheat grains, pussy-willows, potatoes, yeast and rape seed. The various methods of testing the activity and the more or less favorable therapeutic results are discussed. G. S.

The effect of gestation and lactation upon the growth and composition of swine. D. J. GRISWOLD, P. F. TROWBRIDGE, A. G. HOGAN AND L. D. HAIGH. *Missouri Agr. Exp. Sta. Res. Bull.* 114, 6 pp. (1928).—The ash of prenatal and newborn pigs contains more Na, Cl and S, and less Mg, K and Si than the grown and partly grown animals. The higher percentages of Si in the older animals may be due to dirt carried in the hide and hair. The percentage of Fe is low and fairly const. for all ages and conditions. The large part of the ash is CaH₄(PO₄)₂, and the proportion is about the same in all animals, about 75% of the total ash. Before birth this proportion appears to be somewhat less. Digestion trials indicate that the coeffs. of digestibility of the pregnant animals are somewhat higher than those of non-pregnant animals. Less fat is digested after the animals have been confined in crates for a few days than at the begin-

ning of this period. More ash is excreted than is digested by the lactating animal.

J. J. S.

Inorganic iron in the body. E. STARKENSTEIN AND H. WEDEN. Univ. Prag. *Arch. expil. Path. Pharm.* 134, 274-87(1928).—Both in the blood and in the tissues inorg. Fe is always to be found, although but a small portion of it can be recovered in aq. exts. It cannot be all extd. even with weak HCl, but if 5 N HCl is used and the ext. is pptd. with trichloroacetic acid all of the inorg. Fe can be recovered without breaking down the hemoglobin combination with Fe to any considerable extent. Not more than half of the total inorg. Fe of the blood (1 mg. % per 1 kg. of body wt.) is recovered from the filtrate of protein-free blood. Of the organs, the liver contains by far the highest percentage of Fe, with spleen, stomach, brain, kidney and bone-marrow showing lower values. Beef blood contains somewhat less inorg. Fe than does rabbit blood. Human blood approaches that of other mammals, and varies in Fe but little from one person to another. In a given individual the amt. is const. The inorg. Fe of the body is to a large extent present in a form insol. in water, and when extd. with HCl the greater part is found in the ferrous form. Stomach, intestine, liver and urine contain HCl-sol. inorg. Fe in the ferrous form exclusively. In the blood and in the spleen ferrous and ferric Fe are present in about equal proportions. Aq. exts. of organs, blood serum and milk have the inorg. Fe almost entirely in the ferric form.

G. H. S.

Fate of inorganic iron in surviving organs. E. STARKENSTEIN AND H. WEDEN. Univ. Prag. *Arch. expil. Path. Pharm.* 134, 288-99(1928).—The various tissues and organs may be arranged according to their oxidizing power as follows: very strong, blood; strong, milk; moderate, brain, lung, urine; slight, muscle; very slight, heart, kidney and intestinal content. The liver, spleen and gastric content were inert. Arranged according to reducing power the tissues are: strong, brain, lung; moderate, liver, urine, and gastric and intestinal contents; slight, kidney and blood; and very slight, heart and muscle. Milk and spleen were inert. These facts indicate the behavior of the tissues as regards ferrous and ferric compds. Of particular significance is the power for reduction possessed by the contents of the stomach and intestine. It is also of interest that the reducing power of the blood is confined entirely to the erythrocytes.

G. H. S.

Central water regulation and hypophysis antidiuresis. S. JANSSEN. Pharmacol. Inst. Freiburg i. Br. *Arch. expil. Path. Pharm.* 135, 1-18(1928); cf. *C. A.* 23, 424 — Section of the cord at the level of the 5th cervical does not interfere with central regulation of water, except that immediately after the operation the urinary output is diminished because of shock. The concn. of the urine undergoes no marked change. Apparently the impulse regulating water metabolism does not follow the pathways involved in the regulation of temp., metabolism and the circulation. Since the vagus is also not concerned in the regulation it would seem that central water regulation is hormonal in character. Apparently the secretions of the hypophysis are the substances involved in stimulation of the centers regulating water output.

G. H. S.

Origin of the bile acids. IV. Experiments on dogs with a complete biliary fistula and a reversed Eck fistula. E. ENDERLEN, S. J. THANNHAUSER AND M. JENKE. Surg. Clin. Heidelberg and Med. Clin. Düsseldorf. *Arch. expil. Path. Pharm.* 135, 131-6(1928); cf. *C. A.* 22, 2973 —The formation of bile acids directly from cholesterol is impossible, and apparently the oxidation products of cholesterol cannot serve for the origin of bile acids through processes of intermediary metabolism. When allocholesterol is administered intravenously bile acids are formed, suggesting that perhaps allocholesterol is formed within the body and that it may be of biol. significance. V. Is there any connection between the decomposition of fatty acids and the formation of bile acids? E. ENDERLEN, S. J. THANNHAUSER AND A. DISTL. *Ibid* 137-42.—In dogs the injection of fats and fatty acids does not lead to an increased excretion of bile acids.

G. H. S.

Experimental study of the "vagus pressure phenomenon." LUDWIG BRAUN AND BERNARD SAMET. Univ. Wien. *Arch. expil. Path. Pharm.* 135, 362-8(1928).—Injury to the coronary arteries results in an increase in the irritability of the vagus.

G. H. S.

Cerebral innervation of respiration. I. Respiration after extirpation of definite portions of the brain, and the point of attack of exciting and paralyzing agents, morphine in particular. RUDOLF SCHOEN. Med. Klin. Leipzig. *Arch. expil. Path. Pharm.* 135, 155-87(1928).—Respiration in rabbits is regulated from two distinct regions of the brain; being stimulated from the mid-brain, and retarded from the thalamus, striatum and apparently also from the cerebrum. Exciting agents, such as 5% CO₂, lobelin, and cardiazole attack the bulbar centers; and morphine intoxicates through the suprabulbar centers.

G. H. S.

Changes in the soluble ferrous salts in the body. MARIANO MESSINI. Univ. Padua. *Arch. expil. Path. Pharm.* 135, 346-61(1928).—Intoxication phenomena, from both the quant. and qual. points of view, indicate that within the body ferrous sulfate is changed to phosphate. G. H. S.

Influence of bile upon absorption from the digestive tract. HEDWIG LANGECKER. Univ. Prag. *Arch. expil. Path. Pharm.* 136, 257-77(1928).—Bile markedly increases absorption from the gastrointestinal tract, so that substances otherwise non-toxic become toxic and those capable of absorption normally exhibit an accelerated effect. G. H. S.

Relation between hemolysis and viscosity. I. Hemolysis with hemolytic serum—nature of its early stages. YASUTARO OGAWA. *Acta Schol. Med. Univ. Imp. Kioto* 9, 431-47(1927).—An effort was made to det. if the hemoglobin colorimeter is a reliable index of hemolysis when the liberation of cell constituents other than hemoglobin is measured by changes in viscosity. Two vols. of 85% NaCl, 1 vol. of 5% red-cell suspension of goat blood, 1 vol. of hemolytic serum were mixed, let stand and centrifuged. Sp. viscosity was measured with an Ostwald viscometer and the degree of hemolysis with an Autenreith colorimeter. By means of dilution the hemoglobin and viscosity curves were found to be parallel. Viscosity is therefore a measure of hemolysis. The degree of viscosity and hemolysis by hemolysin were parallel. In relation to time, viscosity increased rapidly while change in hemoglobin content was gradual. The increase in viscosity is probably due to the distension of protein by the liberation of electrolytes from red blood cells. This precedes the release of hemoglobin. The degree of viscosity in its time course rather than the liberation of hemoglobin is best in detg. hemolysis. II. **Physical and chemical hemolytic agents.** *Ibid* 449-64.—A study was made of viscosity when hemolysis is caused by phys. and chem. agents. Viscosity increases more rapidly with temp. (40-60°) than the liberation of hemoglobin. A hypertonic salt soln. produces a similar effect. A hypotonic soln. of 0.8% has the same result but with less than 0.8% the viscosity curve rises gradually, paralleling the hemoglobin curve. Ultra-violet rays produce no change in viscosity for 2-4 minutes. After that the viscosity and hemoglobin curves increase. Caustic potash, if isosmotic, causes gradual increase in viscosity; with more concd. KOH the increase is rapid. III. **Difference of hemolysis in different species with reference to viscosity.** *Ibid* 465-78.—The effect of heat, sublimate and saponin on the red blood corpuscles of different animals in relation to viscosity and hemolysis was studied. The goat, rabbit, guinea-pig, dog, ox and man were chosen to represent the mammals, the hen and duck birds, the tortoise reptiles and the toad amphibia. The blood was citrated and centrifuged and the red corpuscles were washed with isotonic NaCl soln. and centrifuged. A 5% suspension of red corpuscles was made in 0.85% NaCl for mammals and the toad, 0.9% for the birds and tortoise. A 1% hemolyzed soln. of red corpuscles was used as the standard soln. in the colorimeter. Hemolysis with heat 55° occurs before 16 min. in dog, rabbit, man and guinea-pig; after 16 min. in goat, ox, tortoise, toad, hen and duck. Heat at 55° causes the following changes in viscosity: rapid rise in goat and toad in 1-4 min.; after 4 min. a slight change in man, rabbit, hen, ox and duck; a gradual rise in 1-4 min. in guinea-pig, dog, and tortoise. Hemolysis with an isosmotic saline soln. of 0.000843% sublimate is generated before 22.56 min. in tortoise, hen, rabbit and goat; after 22.56 min. in ox, toad, man, guinea-pig, dog and duck. The viscosity in hemolysis by sublimate rises rapidly in 1-4 min. and then gradually in goat, guinea-pig, rabbit and dog while in man, ox, hen, toad and tortoise there is no change in 1-4 min. An isosmotic saline soln. of 0.00002% saponin produces hemolysis in 2-4 min. with exception of the ox. Change of viscosity in hemolysis by saponin occurs in 1-2 min. in toad, hen and goat. No change at first and then gradually a rise in viscosity occurs in ox, dog, guinea-pig, man, duck, rabbit and tortoise. JOHN T. WOLF

Chemical composition of the mammary gland of the cow. O. LAXA. *Lail* 7, 336-42(1927).—Analyses of whole gland in the original condition, on the dry basis and on the dry, fat-free basis, resp., gave: H₂O 76.40, —, —; fat 9.50, 39.32, —; protein (N × 6.37) 11.84, 51.07, 82.41; ash 1.18, 4.92, 8.48; undetd. 1.08, 4.98, 9.11; dry matter 23.60, —, —%. Consts. of fat (washed in boiling water): sapon. no. 196.5-197.1, Reichert-Meissl no. 6.82, Wauters-Polenske no. 1.5, refractive index (40°) 48, iodine no. 48.13-48.23, free acids 36, Hehner no. 94.9, mol. wt. of insol. acids 286. In two samples cholesterol was 0.52% and phosphatides 0.97%. Nitrogenous matter in the fresh gland, on the dry basis and in the total protein, resp.: insol. albumin (nucleoproteins) 6.52, 24.78, 69.54; albumin and globulin 0.72, 2.73, 7.67; casein 0, 0, 0; albumoses and peptones 1.74, 6.61, 18.54; amino acids 0.40, 1.52, 4.25%. H. F. Z.

Percentages of chlorine and sodium in milks of various animals. L. BARTHE

AND E. DUFILHO. *Lait* 8, 97-9(1928).—In human milk there is more Cl than Na, and there is more Cl present than is needed to combine with Na to form NaCl. The extra Cl is probably largely combined with Ca. In the colostrum period Cl exceeds 0.1%, but after a few weeks becomes established at 0.06-0.07%, finally increasing with Na as period of lactation advances. In mare milk there exists above 0.1% Cl in the colostrum period, descending later to 0.05-0.07%. Only traces of Na can be found at any time. Cl as detd. in various biological fluids, particularly milk, is wrongly expressed as NaCl. H. F. ZOLLER

Individuality of quarters of the cow's udder. J. PROKS. *Inst. Lact. École Polytec. Prague. Lait* 8, 553-62(1928).—The quarters of the udder give similar but not identical milks. Points noted were: variability in compn. of ash and a difference in const. of the butterfat. It is maintained that each quarter is largely independent of the others and functions individually. H. F. ZOLLER

HENDERSON, LAWRENCE JOSEPH: *Blood—A Study in General Physiology*. New Haven: Yale Univ. Press; London: H. Milford, Oxford Univ. Press. 397 pp.

The changes in blood produced by Röntgen therapy. CASSIO STARNOTTI. *Phototherap. Inst., Florence. Arch. farmacol. sper.* 46, 49-89(1928).—A study of the influence of x-rays on the blood picture of 12 healthy employees of the institute, 7 of whom worked in the Röntgen or radium dept., and of 7 patients suffering from psoriasis or eczema. G. SCHWOCH

Basal metabolism in pulmonary tuberculosis. ANTHONY AND H. L. KOWITZ. *Beitr. klin. Tuberk.* 68, 18-27(1928).—In febrile and subfebrile cases of pulmonary tuberculosis increased basal metabolism rates are found more frequently than in afebrile cases. Increased basal metabolism is not necessarily associated with fever, but is more frequently an expression of the activity of the tuberculous process. The extent and type of the process is not a measure of the basal metabolism. An unfavorable prognosis cannot be concluded from an increased basal metabolism and *vice versa*. A temporary increase in basal metabolism need not go hand in hand with an unfavorable general condition. Since the respiratory quotient in febrile cases of pulmonary tuberculosis is usually lower than in the afebrile and diminishes in cases in which the basal metabolism increases, it is assumed that in pulmonary tuberculosis there is a disturbance of the carbohydrate metabolism. H. J. CORPER

Immunizing action of "Kotoimmunogen" of the tubercle bacilli. R. TORIKATA AND Y. IMAMAKI. *Torikata-inst. f. Immunitätsforsch. Osaka. Beitr. klin. Tuberk.* 68, 306-35(1928).—"Koktoimmunogen" is prepd. from a glycerol bouillon culture of human tubercle bacilli, heated for a half hr. on a water bath, and filtered through a Silberschmidt thimble. The filtrate was injected into the right lung of guinea pigs, followed several weeks later by the injection into both lungs of a suspension of living tubercle bacilli, with the result that the right lung either did not become infected or proved less infected than the left non-treated lung and in addition the remaining organs in the immunized animal revealed less tuberculosis than the organs of the similarly infected untreated controls. No apparent injury resulted from the "Koktoimmunogen" treatment. Similar results were obtained with the protein-free "Koktoimmunogen". H. J. CORPER

Non-specific tuberculin reactions in tuberculosis-free individuals receiving prior old tuberculin treatment. J. HAMEL. *Univ. Würzburg. Beitr. klin. Tuberk.* 68, 345-52(1928).—A typical tuberculin reaction was obtained in 12 of 20 adults free from tuberculosis and reacting negatively to subcutaneous injections of old tuberculin ranging from 50 to 100 mg. and receiving treatment at intervals of 8 to 40 days ranging to a total as high as 593 to 1593.6 mg. of old tuberculin. The reaction occurred several days after the last injection given subcutaneously by using for intracutaneous injection 0.01 mg. of old tuberculin. H. J. CORPER

Comparative study of basal metabolism and sedimentation reaction in tuberculosis at low and high altitudes. H. KAPP. *Beitr. klin. Tuberk.* 68, 378-93(1928).—The basal metabolism in av. decreased at high altitude, at Davos, as compared to low altitude in the same tuberculous individual. Mild cases revealed greater limitation of basal metabolism than severe ones. The sedimentation rate also diminished at the higher altitude. The voluntary respiratory pause which is naturally shortened in the tuberculous individual was further shortened at high altitude with a diminution of from 14 to 25% in com-

paring Basel with Davos. The climatothrapy of tuberculosis at high altitudes is believed to be more of a protective than a stimulative treatment. H. J. CORPER

The Costa reaction in bone and joint tuberculosis. M. M. ALTSCHULER. Ukrain orthop. Kinder-Inst., Kiev. *Beitr. klin. Tuberk.* 68, 399-405(1928).—The Costa pregnancy reaction was tested on 175 patients with the result that it was found not to be sp. for tuberculosis but could be used as a substitute for the sedimentation reaction. The test consists of taking 1.5 cc. of 2% novocaine soln., adding 3 drops of 5% Na citrate and 3 drops of blood from the finger, shaking a number of times and centrifugating or allowing the mixt. to stand 12 hrs. in a cool place to complete sedimentation. A drop of pure formalin is added which results in a positive case in flocculation over the erythrocyte sediment within 15 min. which later becomes a ppt. The severe and moderately severe cases of bone and joint tuberculosis gave a pos. reaction. The reaction frequently would become pos. before the development of severe clinical symptoms and thus was of prognostic value. The highest percentage (79%) of pos. findings attained in severe closed forms of the disease. H. J. CORPER

The sugar content of skin in physiological and pathological conditions. ERICH URBACH and GRETE SICHER. Univ.-klinik Syphilidologie u. Dermatologie in Wien. *Wiener klin. Wochschr.* 41, 1481-2(1928).—Values for sugar in skin and musculature, resp., are: Dog 67, 54 mg.%; rabbit 117, 55 mg.%. Analysis of blood does not always reveal abnormal conditions in skin. In pathological conditions after ingestion of sugar, the skin tissue may retain sugar for a long while. Skin tissue amounts to $\frac{1}{4}$ the body wt., its mass being 3 times that of the liver. D. B. DILL

The variation of circulating proteins in the course of various diseases. I. The problem, normal values, diphtheria, scarlet fever, measles, typhus, grippe, sepsis, pneumonia, fibrinous bronchitis, asthma, bronchiectasis. WILHELM STARLINGER and FISBERTH WINANDS. Universitätsklinik in Freiburg. *Z. ges. expil. Med.* 60, 138-59 (1928). II. Phthisis, lues, malaria, rheumatic fever, circulatory disorders, kidney diseases. *Ibid* 160-84. III. Diseases of the hematopoietic system and the liver, malignant tumors, leucemia, granuloma, peptic ulcer, gastroenteritis, diabetes and other diseases of the organs of internal secretion. *Ibid* 185-208. IV. Spontaneous and irritability variations in health and disease, purulent and serous effusions, conclusions. *Ibid* 208-32. —This is an extensive review with the addition of a large mass of new data not suitable for abstracting. Bibliography. F. L. DUNN

The variations in the potassium, calcium and magnesium content of the cerebrospinal fluid. BELA FISLER. Medizinischen Klinik zu Kiel. *Z. ges. expil. Med.* 61, 549-59(1928).—Detns. were made in 154 patients with various diseases. F. L. DUNN

The behavior of the blood-sugar after the intravenous injection of dextrose. L. WISLICKI. Krankenhaus am Urban, Berlin. *Deut. med. Wochschr.* 54, 1831-2(1928).—The rapidity with which the blood of normal individuals resumes its normal sugar content after the injection of glucose is used in the diagnosis of diabetes mellitus. In this disease, the rate of disappearance of the injected sugar, is markedly diminished. ARTHUR GROLLMAN

The calcium in diseases of the skeletal system. H. K. BARRENSCHEEN and E. GOLD. Univ. of Vienna. *Wiener med. Wochschr.* 78, 1340-2(1928).—The Ca contents of the blood and urine were detd. in 22 clinical diseases of the skeletal system. The detn. of the Ca contents of these fluids is considered of diagnostic and prognostic value. ARTHUR GROLLMAN

Protein metabolism in fever. J. DONATH. *Wiener med. Wochschr.* 78, 1349-50 (1928). —A review with references to the literature. ARTHUR GROLLMAN

The relation of the carbohydrate and protein metabolism of intestinal bacteria to the etiology, prognosis, therapy and epidemiology of infectious intestinal diseases. E. PRIBRAM. *Wiener med. Wochschr.* 78, 1369-70(1928).—The ability to split carbohydrate is inversely proportional to the toxicity of intestinal bacteria. The carbohydrate-splitting enzymes inhibit the formation of toxic protein products. ARTHUR GROLLMAN

The histogenesis of essential lipoid histiocytosis (Niemann-Pick's disease). W. BLOOM. *Arch. Path.* 6, 827-59(1928).—Essential lipoid histiocytosis is a congenital lipoid dystrophy in which there is a great increase in phosphatides and a less increase in cholesterol in practically all of the cells and tissues (including the blood). The stored lipoids in Niemann-Pick's disease are probably lecithin, while in Gaucher's disease the stored material is kersin. The reactive connective tissue of the body responds in this disease by mobilization, hypertrophy and accumulation of large quantities of lipoids.

The various epithelial, muscle, ganglion and cartilage cells respond by lipoidal degeneration.

HARRIET F. HOLMES

The chemical analysis of liver and spleen from a case of lipoid histiocytosis (Niemann-Pick's disease). R. P. MACFATE. *Arch. Path.* 6, 1054-7(1928).—The liver and the spleen from a case of Niemann-Pick's disease showed a great increase over the normal in total lipid, fatty acid, lipid P and cholesterol content and a decrease in lipid N content. Kerasin was negligible. The analytic results reported agree, in general, with those of other workers. Lipemia and hypercholesterolemia are present in Niemann-Pick's disease but absent in Gaucher's disease, while kerasin is present in Gaucher's disease, but not to any considerable extent in Niemann-Pick's disease. H. F. H.

The value of the diazo test in blood. S. MILTON RABSON AND LILLIAN JACOBS. Lebanon Hospital, N. Y. *Arch. Internal Med.* 42, 386-9(1928).—Of 415 consecutive routine tests and 40 selected cases with severely damaged kidneys, 7 patients gave a positive diazo test (plasma by Hewitt's method). Four of these are living and their condition has improved. The diazo reaction seems to run parallel with the creatinine content rather than with that of the other N compds. Positive reactions were found below 1.8 mg. creatinine and negative ones above 3 mg. (max. 7.9 mg.) The test is not always positive in uremia, or even in uremic coma, and does not permit differentiation of the latter from coma of other origin. In a case of kidney obstruction the reaction became negative after the obstruction was relieved. The diazo test should be carried out as a routine test.

MARY JACOBSEN

Observations on the work of W. Schmitt on the theory of the colloidal reactions of the spinal cord fluid. JULIUS K. MAYR. *Kolloidchem. Beihefte* 27, 347-8(1928).—Schmitt (*C. A.* 22, 2610) misunderstood statements made in Mayr's article (*Arch. Dermatol. Syphilis* 1923) in regard to effect of electrolytes on coagulation. Mayr's expts. showed a certain amt. of electrolyte was necessary and that the reaction was in direct relation to concn. of electrolyte present.

L. F. MAREK

The action of alcoholic solutions of phenol as a substitute for lipid extracts in the Wassermann reaction. E. CIAMBELLOTTI. *Boll. soc. ital. biol. sper.* 3, 740-2(1928).—An alc. soln. of phenol may take the place of a lipid ext. and act as an antigen in the Wassermann reaction. C. attempted to throw some light on the mechanism of this reaction. Using colorimetric methods, he found that all the phenol could be accounted for when added to a Bordet-Gengou system. This excluded the thought that phenol entered into a definite chem. entity with some constituent of luetic serum. The role of phenol as an antigen may be due to its precipitating action on serum albumins with adsorption of guinea-pig serum.

PETER MASUCCI

The determination of the respiratory quotient and basal metabolism in dermatopathic cases: the problem of specific constant errors. E. CIAMBELLOTTI. *Boll. soc. ital. biol. sper.* 3, 735-7(1928).—The errors creeping into the detns. are enumerated.

PETER MASUCCI

A contribution to the study of the behavior and modifications of fresh and heated serum. E. CIAMBELLOTTI. *Boll. soc. ital. biol. sper.* 3, 737-9(1928).—Fresh and heated serums behave in a profoundly different manner toward abs. alc. added in equal proportions. In the majority of fresh luetic serums exposed to alc. the deviation of the complement does not take place and therefore, hemolysis results. In non-syphilitic serums the deviation of the complement is complete and thus hemolysis is inhibited. If, however, these serums are heated the reaction parallels the Wassermann test. This indicates that alc. reacts with heated serums differently than with fresh serums. The changes caused by heat take place in normal as well as luetic serums. Sachs' theory that heat modifies only the most labile serum globulins is not supported by these facts.

PETER MASUCCI

The action of calcium on uremia, glucemia and chloremia. E. CIAMBELLOTTI. *Boll. soc. ital. biol. sper.* 3, 744-6(1928).—The purpose of these expts. was to det. the effect of Ca on the uremic, glucemic and chloremic titer. Ten cc. of 10% CaCl_2 soln. and of an org. Ca prepn. (Biocal) were injected intravenously into patients whose diet had been regulated and kept const. Samples of blood were taken 24 hrs. after the injection. The results indicated that when the uremic titer was abnormally high, it was either reduced to about normal or arrested at various levels, depending on the patient, by the action of Ca. When uremia was normal, Ca had no effect. Ca influenced the glucemic titer in the same way; this did not include any diabetic cases. The chloremic titer was normal in all cases studied and it was not influenced by the action of Ca. There was definite improvement in the dermatosis, which coincided with the lowering of the uremic and glucemic titer. C. ascribes a much more complex and important role to Ca than is usually attributed to it.

PETER MASUCCI

Alterations of the intestinal permeability in experimental hypocalcemia from oxalates and phosphates. IGINO SPADOLINI. *Boll. soc. ital. biol. sper.* 3, 766-7(1928).—Hypocalcemia was produced in animals by subcutaneous injections of oxalates and phosphates. Adrenaline, guanidine or histamine, was then administered orally. The quantity of these drugs used was such that they were absolutely ineffective in normal animals. In hypocalcemic animals, however, the same quantity of these drugs were toxic, giving rise to those symptoms which are characteristic when the drugs are injected subcutaneously or intravenously. This would seem to indicate functional changes in the gastro-enteric mucosa. PETER MASUCCI

Lesions of the intestinal mucosa in experimental hypocalcemia from oxalates and phosphates. Studies on the pathogenesis of the parathyroidectomy syndrome. IGINO SPADOLINI. *Boll. soc. ital. biol. sper.* 3, 763-6(1928).—Animals were rendered hypocalcemic by injecting subcutaneously $\text{Na}_2\text{C}_2\text{O}_4$ and Na_2HPO_4 . When the hypocalcemia was slight ($\text{Ca} = 8-9 \text{ mg. \%}$) the lesions were slight but significant. The principle part affected was the villus. This showed a transudate with atrophy of the epithelial elements, and stasis with capillary hemorrhages. When the hypocalcemia was more intense ($\text{Ca} = 4-6 \text{ \%}$) the lesions in the villus were more manifest and often there was complete destruction of the villus by necrosis. These lesions are similar to those observed in the initial stages of parathyroid insufficiency. PETER MASUCCI

Hypocalcemia from bacterial toxins in partial parathyroid insufficiency. IGINO SPADOLINI. *Boll. soc. ital. biol. sper.* 3, 768-70(1928).—The expts. were done on dogs with one parathyroid completely removed or on dogs with both parathyroids incompletely removed. The results are given in the form of a chart and show that the introduction into the circulation of bacterial suspensions or bacterial filtrates produces a rapid lowering of blood Ca . This is much more pronounced than that observed in normal dogs. The low Ca values persist for a long time. Successive doses of toxin fail to lower further the Ca content. Besides a deficiency in hormone, bacterial toxins may play a part in the hypocalcemia of parathyroid insufficiency. PETER MASUCCI

The presence of an arsenic-resisting lipase in the blood serum of patients with Basedow's disease. PAOLO INTROZZI. *Boll. soc. ital. biol. sper.* 3, 774-6(1928).—The lipase in serum of 10 patients with Basedow's disease was studied by Rona's method. In 9 the lipase was resistant to atoxyl. Since all the lipases extd. from organs are As-labile except that of the pancreas and thyroid, the question is raised whether the atoxyl-resisting lipase in Basedow's disease is of thyroid or pancreatic origin. PETER MASUCCI

The stomach secretion in achylia and hypochylia gastrica. KNUD FABER AND J. E. HOLST. Univ. København. *Acta Med. Scand.* 69, 46-68(1928).—The gastric secretion was studied in 26 patients with the aid of the test meal or with histamine. In 22 the Congo red reaction following Ewald's breakfast was neg.; in the remaining 4 the reaction was at times pos. and at times neg. Following histamine the reaction of these 4 patients was invariably pos. In achylic patients the injection of histamine had no definite effect on the amt. of secretion. In practically all cases there was a rise in the pepsin content of the secretion after histamine, an effect which appears sooner, is greater and more persistent than the effect on the acid secretion. Furthermore, there may be an effect on the pepsin secretion without a simultaneous influence on the acid secretion. In such cases the histamine has no effect on the chloride concn., although generally the pepsin and Cl concns. vary together. S. MORGULIS

Uric acid loading as a functional kidney test. ERIK VOLLMOND. *Acta Med. Scand., Suppl.* XXVI, 270-7(1928). S. MORGULIS

The functional test of the liver. The effect of diathermy. A. V. FRISCH AND F. LASCH. II Med. Universitäts-Klinik, Wien. *Acta Med. Scand.* 69, 241-53(1928).—The effect of diathermy applied under standard conditions for 30 min. to the region of the liver has been studied by 3 liver functional tests: the galactose elimination after ingestion of 40 g.; the cholesterol and bilirubin contents of the duodenal contents; and through the sugar-regulating mechanisms. The galactose was detd. in the urine polariscopically. In patients without any liver involvement or in such liver patients with a neg. galactose test the diathermy diminished still further the amt. of the eliminated galactose. In liver patients without a pos. galactose test, however, the diathermy had little or no effect at all. The urine excretion was generally increased under the influence of the diathermy, but this was not a very regular effect. The bilirubin test shows a very striking diminution during the treatment which is still appreciable even 30 min. later. In the case of the cholesterol there is a diminution following the treatment but during the diathermy one patient showed a marked drop while another a rise in the cholesterol of the duodenal juice. The blood sugar was not influenced by the diathermy except in 2 cases,

where there was fall in glucemia much greater than could be explained by normal variations, and this was found in a diabetic and nephritic patient. S. MORGULIS

Simple reaction for differentiation of normal and syphilitic serums by aid of organic colloids. R. DOURIS AND J. BECK. *Compt. rend.* 187, 683-6(1928); cf. C. A. 22, 2204.—Na oleate gave a colloidal form of oleic acid upon the addn of H_3PO_4 . These reagents added to normal serum gave a transparent liquid, but with syphilitic serums a cloudy liquid. L. W. RIGGS

Protection against anaphylactoid shocks by means of magnesium thiosulfate. AUGUSTE LUMIERRE AND (MME.) MALESPIN. *Compt. rend.* 187, 736-7(1928); cf. C. A. 15, 393.—Further expts. on the suppression of anaphylactic shock indicated that $MgSO_4$ was superior to $Na_2S_2O_3$ for that purpose. The protection against anaphylactic shock caused by the injection of $BaSO_4$ was less effective if the $MgSO_4$ was injected immediately before the $BaSO_4$, than if injected simultaneously or immediately after. L. W. R.

Adsorption of cobra venom and diphtheria toxin by carbon. A BOQUET. *Compt. rend.* 187, 959-61(1928).—Fifty mg. of desiccated cobra venom was dissolved in 50 cc. of physiol. salt soln., pH 6.8, and 1 g. of sterilized C (variety not stated) was added and agitated. After 2 hrs. the suspension was filtered; the suspension, filtrate and C were equally inoffensive. Injections equiv. to 100 fatal doses had no venomous action. This inactivation of venom by C was independent of temp. between 12 and 38°, it required only 8 to 10 sec. of contact and it acted in the pure serum of the horse as in physiol. salt soln. Neither heat to 70° for 30 min. nor acids, 0.2 to 0.5 cc. of 0.1 N HCl per 10 cc., liberate the venom fixed on C. The tests with diphtheria toxin gave similar results. L. W. RIGGS

Vaccination against viper venom and experimental rabies by mixtures of virus-venom with excess of virus. (MME.) PHISALIX. *Compt. rend.* 187, 1006-8(1928). L. W. RIGGS

Glucemia and glucosuria in normal and in diabetic man. C. BACALOGU AND S. STRUGARIU. *Compt. rend. soc. biol.* 99, 1175-8(1928).—The condition of the nervous system plays an important role in the glucemia of both normal and diabetic subjects and in the curative power of insulin. In diabetics the highest figures for glucemia were not coincident with the highest figures for glucosuria. The strongest acidoses and ketoses were not coincident with the highest figures for glucemia or glucosuria. In uremias complicated with renal impermeability, there was an increase in blood urea and glucemia without glucosuria. L. W. RIGGS

The pH of the blood plasma and cerebrospinal fluid in pellagra. L. BALLIF AND I. GHERSCOVICI. *Compt. rend. soc. biol.* 99, 1187-8(1928); cf. C. A. 22, 2002.—In 20 cases of grave acute pellagra the plasma pH averaged 7.27, alk. reserve 49, Ca 34 and urinary pH 4.8. In 10 cases of chronic pellagra the corresponding figures were 7.34, 54, 28 and 5.4, while in 30 nonpellagra cases the figures were 7.34, 60, 25 and 5.6. In the cerebrospinal fluid of the 30 nonpellagra subjects the plasma pH was 7.21, alk. reserve 46.22 and Ca 27. In grave pellagra the figures were 7.17, 60 and 37.1. L. W. R.

Influence of anthrax infection on the functioning of the hematoencephalic barrier. L. STERN AND N. W. KOLPIKOW. *Compt. rend. soc. biol.* 99, 1191-2(1928).—During the period of incubation and before the bacilli appear, no change is observed in the hematoencephalic barrier. In the period of septicemia beginning with the appearance of the infection, the barrier is changed so that the passage of both crystalloids and colloids into the cerebrospinal fluid may take place. Influence of anthrax infection on the placental barrier. *Ibid* 1192-4.—During the period of incubation the placental barrier showed no alteration. Neither trypan blue nor $Na_4Fe(CN)_6$ passed from mother to fetus. In the period of infection the permeability of the placental barrier was increased so that crystalloids and sometimes trypan blue passed the barrier. L. W. RIGGS

Preparation of precipitating serums with cardiac muscle. E. NICOLAS AND K. KATRANIEFF. *Compt. rend. soc. biol.* 99, 1305-7(1928).—The technic is described. Treatment of animal producers of precipitating serums. *Ibid* 1307-9. L. W. R.

Glucemia in infants with nutritional disturbances. M. MANICATIDE AND A. BRATESCO. *Compt. rend. soc. biol.* 99, 1370-1(1928).—The glucemia was detd. in infants representing several varieties and complications of dyspepsia. The content and duration of alterations of the glucemia are generally in inverse ratio to the power of assimilation by the liver. L. W. RIGGS

The lipoids of the blood after splenectomy. Action of adrenaline. T. J. COMBES. *Compt. rend. soc. biol.* 99, 1435-6(1928).—Cholesterol increased while lecithin remained unchanged in the blood following splenectomy. After a certain period the cholesterol content of the blood became normal in splenectomized animals. This may be due to the existence of vicarious organs, probably the lymph nodes. Injection of adrenaline

did not modify within 30 min. the lipoidal content of the blood. The spleen is not a reserve organ for cholesterol and lecithin. L. W. RIGGS

Milk sickness and the metabolic disturbances in white snake-root poisoning. HAROLD A. BULGER, FRANCIS M. SMITH AND ARLINE STEINMEYER. Wash. Univ. *J. Am. Med. Assoc.* 91, 1964-6(1928).—Disturbances in the metabolism of animals produced by white snake-root suggest the cause of certain clinical features of milk sickness and indicate rational treatment of this disease. Among the symptoms are ketosis, lipemia and a tendency to profound hypoglycemia. Administration of carbohydrate is indicated. L. W. RIGGS

Experimental study of anemia caused by bleeding and hemolysis. J. DVORÁK. *Magyar Orvosi Arch.* 29, 385-98(1928).—With strong bleeding of cats, carried out during several weeks, the red corpuscles remained of about normal size and megalocytes were very scarce. Poisonings by pyrodine, maretine and tolulenediamine caused decided megalocytosis in cats which was similar to human maretine poisoning. The difference between the anemias caused by bleeding and by poisoning indicate that the specificity of the poison is an important factor in producing the typical blood picture of pernicious anemia. L. W. RIGGS

Change in the neuromuscular apparatus in diabetics. I. MARTON. *Magyar Orvosi Arch.* 29, 411-9(1928).—A detn. of the galvanic irritability of the median nerve region in 40 diabetics and 31 nondiabetics of both sexes was made. The decreased irritability of many diabetics points to nerve-muscle lesions, and these lesions may have their source in an originally reversible decrease of irritability caused by the dehydration of the tissues in consequence of the high sugar and Ca contents of the blood, the acidic metabolism and possibly the lack of insulin. There is a remarkable parallelism between the biochem. and colloidochem. action of glucose and Ca salts. L. W. RIGGS

Nuclear derivatives and the lethal action of ultra-violet light. FREDERICK L. GATES. Rockefeller Inst. *Science* 68, 479-80(1928); cf. Harris and Hoyt, C. A. 13, 2384; Cowdry, C. A. 22, 3454.—A discussion. L. W. RIGGS

Radium emanation and goiter. R. R. D. MILLIGAN AND N. M. ROGERS. *Trans. Proc. New Zealand Inst.* 59, No. 2, 389-94(1928); cf. C. A. 22, 1001.—Ra emanations had no apparent effect either in developing goiter in healthy trout, or curing goiter in goiterous trout. L. W. RIGGS

Goiter and water supply. WAGNER-JAUREGG. Wien. *Gas. u. Wasserfach* 71, 817 21(1928).—The literature concerning the relation between water supply and the occurrence of goiter is reviewed and shown to be somewhat conflicting. W.-J.'s expts. with rats indicate that other factors than drinking water are more important in the causation of goiter as rats in regions where goiter prevailed developed goiter even when given drinking water from goiter-free regions and *vice versa*. The possible influence of bacteria or org. impurities in causing goiter make it desirable to secure the purest water supply, free even from bacteria considered to be non-pathogenic. R. W. RYAN

Nitrogen metabolism in experimental blastomatous growth. I. B. MISHCHENKO AND M. M. FOMENKO. Charkow Röntgen Inst. *Z. Krebsforsch.* 27, 427-35(1928).—Rats inoculated with angiomyxosarcoma showed no marked changes in N metabolism during the early stages of the tumor growth, but there was a loss shortly before death. However, highly toxic products of incompletely oxidized nitrogenous substances appear during the growth of the tumor, which greatly depress metabolic activity. There is an increase in residual N in the blood during the growth of the tumor, reaching a max. shortly before death. H. G. WELLS

Further studies on the combined serum-lipoid treatment of mouse carcinoma. P. RONDONI. Univ. Milan. *Z. Krebsforsch.* 27, 495-502(1928).—Mice were inoculated with transplantable carcinoma. Treatment with a mixt. of serum and lipoid causes about 50% reduction in the rate of tumor growth. Lipoid or serum alone has very little effect. H. G. WELLS

The metabolism of carbohydrates, calcium and iodine in experimental malignant tumors. ANNA GOLDFEDER. *Z. Krebsforsch.* 27, 503-36(1928).—With transplanted mouse carcinomas and Rouse fowl sarcoma, carbohydrates increased the rate of tumor growth, by furnishing a source of nourishment. The glycogen content of tumors decreases with increasing malignancy. Ca exerts an inhibiting effect on tumor growth, perhaps because it raises the Ca content of the tumor tissue until it equals that in the normal tissues. I at first increases the rate of growth and then decreases it, sometimes leading to its disappearance. H. G. WELLS

DELAFIELD, FRANCIS, AND PRUDEN, T. MITCHELL: *A Text-Book of Pathology*. 14th ed., revised by Francis C. Wood. Edinburgh: E. & S. Livingstone. 1339 pp. 55s. *J. State Med.* 36, 743(1928).

H—PHARMACOLOGY

A. N. RICHARDS

The vitamin action of preparations of oleum jecoris in experimental tuberculosis. G. PLATONOV. *Am. Rev. Tuberculosis* 18, 458-61(1928).—The subcutaneous injection of oleum jecoris and its preps. produces a vitamin-like effect, the action of Na morrhuate being greater than that of oleum jecoris. The effect of subcutaneous injections of oleum jecoris depends on the form and dose of the injections, and on the length of the intervals between them. In producing oleum-jecoris preps., care must be taken to avoid all factors that destroy the vitamin constituents of this oil, such as high temp., sunlight and oxidation.

H. J. CORPER

The contracture-producing effect of barium chloride on smooth muscle. MARCEL FLORKIN. Inst. Leon Fredericq, Liege. *Arch. intern. physiol.* 30, 148-51(1928).—BaCl₂ has a max. effect in producing contracture in the frog stomach in a concn. of 1%. The contracture can be further increased by subsequent treatment with CHCl₃ or NH₃ but not with additional BaCl₂.

H. J. DEUEL, JR.

The effect of adrenaline-like alkaloids: ephedrine and ephetonine. LADISLAUS TAKACS. Budapest Königl. ung. Pázmány Peter Univ. *Wiener klin. Wochschr.* 41, 1375-8(1928).—Ephetonine, prep'd. by E. Merck, is a HCl salt of synthetic racemic ephedrine. Peroral administration of active ephedrine and ephetonine increases blood pressure. The high level is maintained longer than in the case of adrenaline. Thus when 0.1 g. of ephetonine was administered followed by 0.05 g. portions every 3 hrs. for 12 hrs., blood pressure rose from 95 to a level of about 122 mm. where it remained for the 12-hr. period. Twelve hrs. later, with no further drug administration, it had returned to 97 mm. In larger doses these drugs stimulate the parasympathetics. Emptying of the stomach is retarded. They can be employed in asthma and bronchitis.

D. B. DILL

The effect of peroral administration of "Glukhorment" on the glucose metabolism in animals. R. OESER AND W. B. SACHS. Klin. Charité, Berlin. *Z. ges. expil. Med.* 59, 1-9(1928).—In rabbits "Glukhorment" produces a hypoglucemia in 10-15 hrs. in doses of 1-1.5 g. per kg. Symptoms produced are relieved by administration of glucose. The hyperglucemia following adrenaline is partly inhibited in doses of 0.25-1.0 g. per kg.

F. L. DUNN

The influence of phosphate on the oxygen demand in work. KARL MINSBERG. Univ. Klinik zu Freiburg. *Z. ges. expil. Med.* 59, 262-9(1928).—H. confirms the work of Embden (Handbuch der normalen u. path. Physiol. Bd. 8. Teil 1. 381) on the effect of phosphates in diminishing fatigue. The amt. of O required is less with phosphate, because of a better resynthesis of lactic acid in the muscles.

F. L. DUNN

The place of action of cocaine on the central nervous system. RUDOLF ALLERS AND OTTO HOCHSTÄDT. Univ. Wien. *Z. ges. expil. Med.* 59, 359-68(1928).—In thalamus cats following the subcutaneous injection of cocaine, convulsions of a tonic extensor type occurred. In decerebrate animals cocaine resulted in a decrease of the decerebrate rigidity and an appearance of spontaneous movements, including breathing. A. and H. confirm the increased tolerance of decerebrate animals for cocaine. Psicaine did not have the same effect on decerebrate rigidity.

F. L. DUNN

The effect of insulin on the phosphates in blood and urine. ADOLF HOLLIGER. Henry Ford Hospital, Detroit. *Z. ges. expil. Med.* 59, 717-23(1928).—Insulin lowers the phosphates in both arterial and venous blood, in man and in dogs. The lowering is due not to an increased excretion but to a retention.

F. L. DUNN

Clinical results of chemotherapy in ophthalmology. F. SCHIECK. Univ. Würzburg. *Deut. med. Wochschr.* 54, 1579-81(1928).—A review of the chemotherapeutic agencies used in ophthalmological practice.

ARTHUR GROLLMAN

The distribution of mercury in the various organs of the dog after injections of salyrgan. JOHANNES MÜLLER. Westfälischen Wilhelms-Universität, Münster, Westphalia. *Deut. med. Wochschr.* 54, 1881-2(1928).—Elimination of salyrgan occurs chiefly through the kidneys. Immediately after its intravenous injection, it is found in the gall-bladder, large intestine, kidneys and adrenals.

ARTHUR GROLLMAN

The problem of slow (peroral) poisoning by potassium cyanide. W. GLASER. Heilstätte Denklingen, Rhine Province. *Deut. med. Wochschr.* 54, 1930(1928).—Delayed death from KCN taken by mouth is considered as theoretically possible.

A. G.

Acute iodine intoxication following pyelography with umbrenal. WALTER K. FRÄNKEL. *Deut. med. Wochschr.* 54, 2105(1928).—A report of a case of I poisoning following pyelographic examn. with umbrenal, a com. prepn. of LiI.

A. G.

Blood sugar and respiratory metabolism time curves of normal individuals, follow-

ing simultaneously administered glucose and insulin. I. M. RABINOWITCH AND ELEANOR V. BAZIN. Montreal General and the Shriner's Hospitals, Montreal. *J. Biol. Chem.* 80, 723-31(1928); cf. *C. A.* 22, 262.—The results of a study of the effect of simultaneously administered glucose and insulin showed that insulin not only does not enhance the oxidation of sugar in the normal individual but actually interferes with the normal mechanism.

Chemical substances in the treatment of septicemias. RUDOLF FLECKSEDER. *Wiener med. Wochschr.* 78, 1184-6(1928).—A review of the chemotherapeutic measures used in the treatment of generalized septicemia.

Arsenic, its accumulation, tolerance and distribution, after therapeutic use. K. ULLMAN. *Wiener med. Wochschr.* 78, 1389-95(1928).—A review with references.

Treatment of nervous and other forms of syphilis with sulfosin. KNUD SCHROEDER. *Klin. Wochschr.* 7, 1636-9(1928).—Sulfosin, injected intramuscularly, has a beneficial action on the nervous symptoms associated with syphilis and appears also to be a general antiluetic agent. It is best used in conjunction with other antiluetic chemotherapeutic agents.

A study of the capillaries of the skin in cases of high arterial pressure; and of the influence of nitrites upon them. G. DEUSCH AND A. LIEPELT. *Deut. Arch. klin. Med.* 160, 207-11(1928).—No regular variations were observed in the capillaries which would distinguish between high blood pressure with and without kidney affections. The intravenous injection of nitroscleran (NaCl , 6; Na_2PO_4 , 3.6; K_2PO_4 , 2; NaNO_2 , 29.40, water to 1 l.), is followed in normal or hypertonic persons by a lowering of blood pressure accompanied by an enlargement of the capillaries. The max. effect was observed after about 10 min. The capillary circulation became continuous and more rapid. The small arteries and arterioles are the points of attack of nitrites.

The effect of adrenaline upon calcium; a study of the mechanism of the action of adrenaline. HEINZ LAWACZECK. *Deut. Arch. klin. Med.* 160, 309-22(1928).—The Ca contents of the blood of normal persons and of various pathol. subjects were detd. before and after the injection of adrenaline. In some cases a slight increase in blood Ca was noted; in others a decrease, and in some cases no change; in a few cases there was a decrease in the Ca content of the serum with no change in that of the whole blood. A noticeable increase was observed in the amt. of serum Ca passing through the ultrafilter; the effect of adrenaline apparently was to liberate Ca from protein combination.

Investigation of hypoglycemia after the injection of insulin. II. The causes of the decrease in eye pressure in hypoglycemia. ERNST WIECHIMANN AND FRITZ KOCH. *Deut. Arch. klin. Med.* 160, 361-7(1928).—No parallel was observed between the curves for blood pressure and for eye pressure in hypoglycemia; in fact a case was observed in which a rise in blood pressure accompanied a decrease in eye pressure. The injection of toxic doses of insulin was followed by an increase in hemoglobin, with a decrease in eye pressure. Ingestion of food caused a decrease in blood hemoglobin and usually a rapid rise in the eye pressure. These changes are probably related to the sweating observed in hypoglycemia; the fluid from the eye and from the tissues is poured into the blood, but not rapidly enough to counteract the loss of fluid in the sweat.

Danger of the administration of ephedrine in heart failure. W. A. BLOEDORN AND P. F. DICKENS. U. S. Naval Medical School, Washington, D. C. *Arch. Internal Med.* 42, 323-30(1928).—A patient with heart trouble who took 0.97 g. ephedrine in 20 days against "asthma" gradually developed acute cardiac decompensation and pulsus alternans. The condition improved under digitalis.

Peptone treatment in bronchial asthma. MAXIMILIAN A. RAMIREZ. French Hospital, N. Y. *Arch. Internal Med.* 42, 368-75(1928).—In 60 cases Armour's peptone was given intradermally (Pasteur Vallery Radot, Blamoutier), intramuscularly, intravenously (Auld) and by mouth for 1-2 months and was found to be of no value. Thomas and other authors have arrived at the same conclusion. The literature is reviewed.

Cholesterol in the blood serum and organs of the rabbit after the introduction of adrenaline. MARIO MAZZEO. *Arch. sci. biol. (Italy)* 11, 381-9(1928).—In the first series of expts. the influence of adrenaline on the cholesterol curve was investigated, beginning $\frac{1}{2}$ hr. after and ending 24 hrs. after the injection of adrenaline. In the second series the cholesterol content of the blood and certain organs (suprarenals, kidneys, spleen, liver, ovaries, testicles) of animals not injected with adrenaline was compared to

that of animals injected with adrenaline. The rabbits were injected with 1 cc. of a 1:1000 soln. of adrenaline per kg. of body wt. Conclusions: (1) The introduction of adrenaline causes an increase of cholesterol in the blood; (2) this increase begins $\frac{1}{2}$ hr. and reaches a max. between the 6th and 18th hr. after the introduction of adrenaline; (3) the increase of cholesterol in the blood is followed by a marked decrease of cholesterol (more than $\frac{1}{2}$) in the suprarenal capsules and a slight decrease in the other organs; (4) the introduction of adrenaline in the organism does not seem to produce an increase of cholesterol in all the organs and tissues, but causes a distribution of cholesterol in the tissues and liquids different from that of the normal. PETER MASUCCI

The action of insulin on the glucolysis of blood "in vitro." G. B. TAFURI. *Arch. sci. biol.* (Italy) 11, 414-23(1928).—The technic used was that of Kauffmann, Cosla and Roche. The CO_2 was detd. by the Van Slyke method and the glucose by the Cruto method. Duplicate blank tests were run and the results for CO_2 and glucose differed less than 0.6-0.7% of the amt. present in the blood. Pig, dog and beef bloods were used. The results are given in tabular form, showing the kind of blood used, whether or not insulin was added to the blood, CO_2 in the blood before and after glucolysis, CO_2 produced by insulin action, glucose consumed due to insulin action. The results show (1) that the addn. of insulin to pig and dog blood markedly accelerates the process of glucolysis; (2) there is no acceleration in beef blood; in fact the difference disappears if the concn. of phosphates in beef blood is made equal to that of pig and dog blood; (3) these results support the contention that insulin accelerates the glucolysis and reveals the fundamental importance of phosphates in the process of glucolysis. PETER MASUCCI

The action of carbon dioxide on animals kept under reduced partial pressure of oxygen. RODOLFO MARGARIA. *Arch. sci. biol.* (Italy) 11, 453-66(1928).—The theory that the condition of anoxemia is rendered more tolerable by the more or less direct action of CO_2 was tested experimentally. If the theory is correct, then CO_2 should increase the resistance to anoxemia whether the condition is brought about by diminishing the atm. pressure or by simply reducing the partial pressure of O_2 and maintaining the total pressure unchanged. Guinea pigs were used for test animals. The app. was the same as that mentioned above. The air in the bell jar was replaced at a const. velocity by N_2 gas. The concn. of O_2 in the bell jar at any moment was calcd. by means of the formula $\text{O}_2 = 10^{a-b} + 10^c - 10^{c-b}$, derived from the fact that the velocity with which the per cent of O_2 diminished in the jar was proportional to the concn. of O_2 at that moment. The term, $10^c - 10^{c-b}$, is the correction for the O_2 impurity in the N_2 gas; for the derivation of the formula, the original should be consulted. A table is given, showing the av. values for the partial pressures of O_2 and CO_2 for each gas mixt., the vapor pressure of CO_2 in the alveoli from the inspired air, and the partial pressure which O_2 would reach in the alveoli in the absence of respiratory exchange. Conclusions: Guinea pigs placed under anoxemia by the substitution of the air with N_2 died when the O_2 tension in the alveoli was 10-11 mm. Hg. The presence of CO_2 in the proportion of 0 to 10% did not modify the resistance of the animals to anoxemia. The symptoms of the animals in these expts. were markedly different from those observed when the animals were kept under rarefied O_2 . Conclusion: In barometric depression, the diminution of the partial pressure of O_2 alone is not sufficient to explain all the phenomena observed: there must be another factor intervening. PETER MASUCCI

Sodium thiosulfate as an antidote. The transformation of sodium thiosulfate in the organism. E. MENEGETTI. *Arch. sci. biol.* (Italy) 12, 549-74(1928).—The many poisons for which $\text{Na}_2\text{S}_2\text{O}_3$ is used as an antidote throw some doubt on its real efficacy. Its actual role can only be detd. by studying its chem. properties and the transformation it undergoes in the animal organism. At p_{H} 11 to 5 the decompn. of $\text{Na}_2\text{S}_2\text{O}_3$ is very slow and almost negligible; there is no sepn. of S or change of titer in 24 hrs.; at p_{H} 5, S seps. in 24 hrs. In the presence of weak oxidizing agents and in an alk. or neutral medium, $\text{Na}_2\text{S}_2\text{O}_3$ is transformed into sulfate, trithionate and tetrathionate. In an acid medium it decomposes into sulfate, polythionates, sulfites, and S. In the stomach when in contact with gastric juice p_{H} 1.7, a part is transformed according to the reaction $\text{S}_2\text{O}_3^{++} \rightarrow \text{SO}_2 + \text{S}$. Even in acid urines p_{H} 4.63 the decompn. of $\text{Na}_2\text{S}_2\text{O}_3$ is so slight that it is barely detectable in 24 hrs.; in blood the H-ion concn. is below the min. necessary for decompn.; injected into animals it is not possible to detect any decompn. in any of the organs. When added to tissue pulp only a trace of H_2S can be detected after an hr. but if HCl is added H_2S develops quickly; HCl also accelerates the elimination of H_2S from organs to which S has been added. When $\text{Na}_2\text{S}_2\text{O}_3$ is injected into animals either subcutaneously or intravenously it does not decompose according to the reaction $\text{S}_2\text{O}_3^{++} \rightarrow \text{SO}_2^{++} + \text{S}$ but is partly eliminated as Na_2SO_4 and partly oxidized to sulfate; polythionates are formed but no S is liberated. When $\text{Na}_2\text{S}_2\text{O}_3$

is injected as an antidote, the substances which must be considered as possibly reacting with the poison are: thiosulfate, polythionates (tri and tetrathionate) and sulfate. When given orally the substances formed and absorbed are thiosulfate, polythionates, sulfites, H_2S , polysulfates and sulfides.

PETER MASUCCI

The action of insulin and pilocarpine on the secretion and the quantity of lactose in milk. G. BUCCIARDI. *Boll. soc. ital. biol. sper.* 3, 527-30(1928).—The injection of 20 units of insulin diminished the lactose in milk an av. of 25%. The decrease may be as high as 75% on the day of the injection. The day following the injection the lactose returns to normal, but if the injections are repeated 5-8 times, the animal stops secreting milk. The injection of 0.001 g. pilocarpine showed an increase in milk secretion and the lactose content showed an increase of 10-12%.

PETER MASUCCI

The action of histamine and choline on the tone and rhythmic contraction of blood vessels. MARIO RIGONI. *Boll. soc. ital. biol. sper.* 3, 565-68(1928).—The stomach artery of heef was used for this study, and Roncato's technic was followed. Under these conditions histamine produces vasoconstriction, and increases the frequency and height of the rhythmic contractions. Acetylcholine produces vasodilation followed by slight constriction and diminution of frequency of the rhythmic contractions, whose height remains unchanged; when the diminution of tone is immediate and intense, then there is a momentary arrest of the rhythmic contractions, while at other times this becomes gradual. There is a definite antagonism between histamine and acetylcholine which may be demonstrated on the same specimen without it losing its activity.

P. M.

The supposed vasodilating action of amino acids and of urea. GIUSEPPE RUSSO. *Boll. soc. ital. biol. sper.* 3, 592-5(1928).—The study aimed to establish (1) whether amino acids act on the vessels in concns. approaching those present in the org. external and internal liquids and under isotonic conditions or (2) if the action were negative, whether stronger concns. with isotonic conditions still maintained would react positively. Amino acids in low concn. do not appreciably act upon the tone of the vessels or the stomach muscles of the frog. The vasodilator action of amino acids in strong concn. (0.8%) in Ringer is due to the hypertonicity and is not specific. Urea behaves similarly to amino acids. No specific action on the vessels or the smooth muscle fibers can therefore be attributed to amino acids or urea.

PETER MASUCCI

The behavior of glucemic titer after the injection of diuretin into normal female rabbits, followed by repeated treatments with the citrated blood of pregnant rabbits. G. RIGGIERI. *Boll. soc. ital. biol. sper.* 3, 620-21(1928); cf. C. A. 22, 2210.—After treatment with citrated blood from pregnant rabbits, diuretin causes hyperglucemia, whereas, without the blood treatment, diuretin produces hypoglucemia. After treatment with citrated plasma from rabbits at the end of the gestation period, diuretin has no effect on the blood sugar.

PETER MASUCCI

The toxicity of phenylguanidines and their influence on the glucemic titer. LETTERIO CANNAVO. *Boll. soc. ital. biol. sper.* 3, 618-19(1928).—Phenyl- and diphenylguanidines were administered to dogs, rabbits, guinea pigs and white rats, orally, subcutaneously, intramuscularly, and intravenously. Results: (1) Phenylguanidine was more toxic than guanidine; the animals showed symptoms of acute intoxication of the nervous centers. During the intoxication, the glucemic titer did not change. The administration of glucose and adrenaline failed to influence the degree of intoxication. (2) Diphenylguanidine was still more toxic. The intoxication was manifested by violent tonic clonic contractions and convulsions. Glucose lessened somewhat the toxicity. The animals showed hyperglucemia. The introduction of phenyl groups into the guanidine mol. increased the toxicity and eliminated the hypoglucemic action.

P. M.

Synthetic thyroxine. Pharmacological experiments. G. CORONEDI. *Boll. soc. ital. biol. sper.* 3, 657-59(1928).—Synthetic thyroxine was tested biologically for (a) its action on the vagus-depressor; (b) its influence on diuresis; (c) its physiol. opotherapeutic action. The expts. were made on dogs and rabbits deprived of their thyroid and parathyroid glands. A 0.1% aq. soln. of thyroxine in the form of the K salt was injected intravenously. Results: (a) The injection of thyroxine brings back to the normal physiol. level the excitability of the vagus which had diminished or completely disappeared. The depressor behaves similarly. In both cases, the effect is transitory, as, in a few min., paresis and paralysis again set in. (b) The administration of thyroxine to oliguric and anuric animals produces a renal discharge equal to that obtained by the use of the whole gland ext. (c) The intravenous or subcutaneous administration of the synthetic product to dogs with typical symptoms of thyroid-parathyroid insufficiency attenuates the symptoms without changing the morbid picture of cachexia or the fatal course of the disease. The use of whole glandular exts. under similar conditions gives results that are more clean cut and decisive, and the effect is more sustained.

Conclusion: Thyroxine is a thyroid hormone, but the possibility that the gland secretes other principles must not be excluded. It is not advisable to substitute the synthetic or natural thyroxine for the whole glandular ext. in therapy without further extensive clinical tests.

PETER MASUCCI

The absorption of calcium by intestinal musculature during adrenaline action. L. JENDRASSIK AND SZ. DONHOFFER. Med. Klinik, K. Erzsébet-Üniv., Pécs, Ungarn. *Biochem. Z.* 201, 199-205(1928).—The Ca absorption by the musculature of the intestinal wall of the rabbit reveals no regular behavior during adrenaline action. S. M.

The similarity of action of calcium and adrenaline on the isolated frog heart. S. V. TZIGANOV. Pharmacol. Lab., State Med. Inst., Odessa. *Zhurnal ekspl. Biol. Med.* 10, 35-46(1928).—On the isolated heart of the frog Ca and adrenaline act along different paths and produce finally different results. Adrenaline acting on the neuromuscular substance increases the irritability of the sympathetic nervous system to its normal stimulus, with the result that in the normal heart there is an acceleration of the beat, diminished diastolic relaxation and some increase in systole. The work of a single heart beat diminishes and the systole-diastole cycle is shortened. Adrenaline is thus a real heart stimulant. Ca on the contrary produces a condition of hypodynamia in the heart. Ca produces a lowering of the irritability of the autonomic nervous system of the heart and of its ganglia, and as a result of this the heart beat becomes slow and the rhythm is upset. Ca increases the work of a single contraction, diminishing the working capacity of the heart. Depending upon the duration of its action and various other conditions, Ca may produce either systole or diastole. Adrenaline cannot compensate the effect on the heart of Ca or K, and Zondek's view of the identity of the ionic and nervous stimulus does not find corroboration.

S. MORGULIS

The relation between concentration and action of adrenaline. DAVID WILKIE. Univ. of Edinburgh. *J. Pharmacol.* 34, 1-14(1928).—The isometric and isotonic responses of strips of sheep carotid to varying concns. of adrenaline agree with the formula $Kx = y/(A - y)$, where x = concn., y = % of the max. action (A) and K = const. The relation between the concn. of adrenaline and the output of the frog's aorta perfused with varying concns. of adrenaline also agrees with this formula for concns. above 3×10^{-8} . The relation between the concn. of adrenaline and the rise in blood pressure in the pithed cat also follows the formula given.

C. RIEGEL

The emetic action of digitalis bodies and strophanthidin in cats with denervated hearts. MELVIN DRESBACH AND KENNETH C. WADDELL. Albany Medical Coll. *J. Pharmacol.* 34, 43-64(1928).—In cats with the heart denervated digitalis compds. or strophanthidin caused emesis when administered several days after the operation. In acute expts. where only a few hrs. were allowed for recovery from operation, the animals failed to vomit in the greater no. of cases. **Conclusion:** The heart is not the only seat of action of digitalis compds. in producing emesis.

C. RIEGEL

Further observations on the motility of the human stomach. W. H. DICKSON AND M. J. WILSON. Univ. of Toronto. *J. Pharmacol.* 34, 65-72(1928).—The effect of a no. of compds. on peristalsis was detd. by fluoroscopic observation. Those having no effect included aspirin, NaBr, chlorodyne, CaCO_3 , AcOH , malic acid, tartaric acid, alanine, HCl and parathyroid ext. Those with stimulating action were NaH_2PO_4 , butyric acid, valeric acid, caproic acid, histamine and CaCl_2 . Those causing depression were codeia phosphate, propionic acid, lactic acid and CO_2 .

C. RIEGEL

Comparative studies of pupillary reaction in tetrapods. IV. The mode of action of pilocarpine on the pupil of the rat. THEODORE KOPPÁNYI. Syracuse Univ. *J. Pharmacol.* 34, 73-83(1928).—In the normal eye of the rat pilocarpine causes dilatation of the pupil by incomplete paralysis of the parasympathetic myoneural junction. As proof of this statement the following observations are cited: (1) Physostigmine, arecoline and nicotine constrict the pupil even after dilatation by pilocarpine. (2) No dilatation is produced by pilocarpine after homatropine or atropine. (3) Pilocarpine causes dilatation after the sympathetic myoneural junctions are paralyzed by ergotamine. In the eye with the short ciliary nerves cut, pilocarpine causes constriction, because of stimulation of the parasympathetic myoneural junctions. Observations cited in proof of this are: (1) Constriction occurs after the pupil had been dilated by cocaine or ephedrine. (2) Pilocarpine has no action after atropine. (3) Nicotine, arecoline and muscarine have the same action in the denervated and normal eye.

C. RIEGEL

The site of the toxic action of nicotine on the respiratory mechanism. J. EARL THOMAS AND F. E. FRANKE. St. Louis Univ. *J. Pharmacol.* 34, 111-35(1928).—A portion of the diaphragm in dogs was excised so that it was protected from the direct action of the drug, but retained connection with the central nervous system through the intact phrenic nerve. In such animals administration of nicotine caused paralysis of

the intact side, but the excised portion of the diaphragm continued to contract rhythmically. Evidence that the contractions observed in the excised muscle were true respiratory movements is given by the fact that they were augmented by asphyxia and by stimulation of sensory nerves, that they were inhibited by stimulation of vagus and superior laryngeal nerves, and stopped when the phrenic nerve supplying the muscle was cut. These expts. are taken to indicate that respiratory failure from nicotine is due, not to central action of the drug, but to a peripheral paralysis of respiratory muscles.

C. RIEGEL

The absorption of quinine and hydroxyquinoline sulfate through the vagina. DAVID I. MACHT. *J. Pharmacol.* **34**, 137-45(1928).—Solns. of quinine (1%) and hydroxyquinoline sulfate (1 to 5%) were introduced into the vaginas of rabbits, cats and dogs. After both drugs tremors and spasmodic movements of the extremities were observed, with stimulation of respiration and circulation. With large doses the above symptoms were followed by a state of depression and arrest of the heart. Serum taken from animals after the injection of quinine was much more toxic to the growth of *Lupinus albus* seedlings than serum from animals not so treated. This effect with hydroxyquinoline was not so marked.

C. RIEGEL

The role of the liver in controlling the distribution of blood. ALVAH R. McLAUGHLIN. Michigan State College. *J. Pharmacol.* **34**, 147-68(1928).—The livers of cats and dogs, perfused with sugar-free Locke soln., showed a decreased outflow when the perfusion fluid contained adrenaline, pituitary ext., or BaCl_2 , and an increased outflow when the fluid contained NaNO_2 . With rabbits the majority showed decreased outflow after adrenaline, but in some cases (5 of 43 from recently killed animals; 7 of 26 livers stored in the cold for some time) there was an increased outflow in the first few expts., but decreased outflow in later trials. Three of the 26 stored livers always showed increased outflow. The variable effects are attributed to autolysis and consequent change in H-ion concn. Results on guinea pig livers were similar to those obtained with rabbit livers. When the liver vol. was measured by means of an oncometer it was found that the decreased outflow was accompanied by decreased liver vol. It is concluded that the decreased outflow was due to constriction of intrahepatic portal radicles.

C. RIEGEL

The prevention of experimental effusions by calcium salts. HARRY GOLD. Cornell Univ. *J. Pharmacol.* **34**, 169-77(1928).—Intravenous injections of NaI or of thiosinamine into dogs and cats failed to produce effusions into the serous cavities. In cases of effusion produced by injection of oil of turpentine into the pleural cavity, animals receiving Ca salts prior to the turpentine showed less fluid than those not receiving Ca. In effusions produced by CuSO_4 Ca had an inhibiting effect in cases of less degree of irritation. The effect of more intense irritation is not inhibited by any dose of Ca, and large amts. of Ca in themselves produce toxic symptoms.

C. RIEGEL

Studies on toxicity of sodium fluosilicate. S. MARCOVITCH. Univ. of Minnesota. *J. Pharmacol.* **34**, 179-86(1928).—Cessation of movement in the larvae of *Culex quinquefasciatus* was taken as a measure of the toxicity, which was in the following order: Na_2SiF_6 , Na_3AsO_3 , Na_3AsO_4 , NaF, the fluosilicate being 8 times more toxic than the fluoride. The fluosilicate was also the most toxic of the four to *Lumbricus terrestris*, *Paramecium caudatum*, and *Euglena viridis*. With rabbits, K_3HAsO_3 given by mouth was much more toxic than Na_2SiF_6 , and the latter more toxic than NaF. K_3HAsO_3 intravenously administered was more toxic than Na_2SiF_6 .

C. RIEGEL

The action of acridine antiseptics—acriflavine and rivanol—on streptococci with special reference to subcutaneous infections in mice. C. H. BROWNING AND R. GULBRANSEN. Glasgow Univ. *J. Pharmacol.* **34**, 187-95(1928).—Mice were infected with streptococci and this followed immediately by injections of solns. of varying concns. of acriflavine (trypaflavin) and rivanol at the site of infection. In another series the culture of streptococci and the antiseptic were mixed *in vitro* and then injected immediately after mixing. In both series of expts. the results were so varied that no conclusions could be drawn as to the efficacy of the antiseptics. Tested *in vitro* on cultures of streptococci acriflavine, in two-thirds of the tests, was four times as efficient as rivanol.

C. RIEGEL

Ergotamine tartrate: Its direct hyperglucemic action and its influence on the hyperglucemia produced by adrenaline in normal unanesthetized dogs. G. E. FARRAR, JR., AND A. M. DUFF, JR. Johns Hopkins Univ. *J. Pharmacol.* **34**, 197-202(1928).—Intravenous injection of ergotamine tartrate into dogs increased the blood sugar 25 mg. % in 60 min. Adrenaline after ergotamine caused the usual rise in blood sugar. Ergotamine given during the action of adrenaline does not abolish the hyperglucemia.

C. RIEGEL

A note on the rhythmic contractions of the ureter as influenced by pituitary extract

and by histamine. CHARLES M. GRUBER. Washington Univ. *J. Pharmacol.* **34**, 203-7(1928).—Dil. solns. of pituitary ext. and of histamine caused increased rate and force of contractions of a segment of ureter when added to the Tyrode-Locke solns. in which the segment was suspended. Decreased rate and increased force were observed with higher concns. Addition of histamine to the solns. bathing segments of ureter in which contractions had been inhibited by pituitrin and Na phenobarbital caused the contractions to begin again. C. RIEGEL.

Mercury diuresis. KENNETH I. MELVILLE AND RAYMOND L. STEHLE. McGill Univ. *J. Pharmacol.* **34**, 209-22(1928).—Intravenous injection of HgCl_2 caused diuresis in rabbits. Injection of HgCl_2 into the renal artery caused a decreased outflow of urine. When this injection was followed by an injection into the femoral artery diuresis occurred. Urine collected during diuresis showed normal urea content, no protein, and no sugar, but increased chloride content. There was no increase in lymph flow, and diuresis occurred even after tying of the thoracic duct. The results are taken to indicate the extra-renal action of HgCl_2 injected intravenously. C. RIEGEL.

A study of the fate and toxicity of bromine and chlorine containing anesthetics. G. H. W. LUCAS. Univ. of Toronto. *J. Pharmacol.* **34**, 223-37(1928).—Bromoform mixed with olive oil was given to rabbits by rectum. From 0.3 to 1.2% of the bromoform was recovered in the urine as bromide. Both after the rectal injections and after anesthesia by inhalation of bromoform the livers of the animals contained Br and showed damage to the cells. Bromoform and Br were found in small quantities in tissues other than the liver. Liver tissue *in vitro* decompd. composed bromoform and chloroform. Br was found in urine and livers of animals receiving ethylene bromide, ethyl dibromide, methylene bromide, trimethylene bromide, ethylidene bromide and acetylene dibromide. C. RIEGEL.

Comparative study of ephedrine, racemic ephedrine and pseudoephedrine. CHU-UNG PAK AND BERNARD E. READ. Peking Union Med. Coll. *Chinese J. Physiol.* **2**, 435-58(1928); cf. *C. A.* **22**, 2005.—The blood pressor actions of these 3 optical isomeric substances in doses of 0.5 to 1 mg. per kg. of body wt., have an approx. ratio of ephedrine: racemic ephedrine: pseudoephedrine equals 1.0:7:0.5. Repeated injections of these isomers produce a gradually decreasing elevation of the blood pressure and this phenomenon is more conspicuous in the case of pseudoephedrine and much less in that of ephedrine. The difference of max. rise of blood pressure between repeated injections is much greater between the initial and second injections than between subsequent injections. Vagotomy to a certain degree prevents this. The peripheral blood vessels of the toad are constricted by initial perfusion of 0.2% ephedrine soln. but vasodilatation is produced after prolonged perfusion. These isomers have a mutually immunizing effect on blood pressor action. This phenomenon is more strongly marked in the case of ephedrine after previous injection of pseudoephedrine or *vice versa* than in the case of racemic ephedrine after previous injection of ephedrine. Synthetic racemic ephedrine is less sympathomimetic than natural levo-ephedrine and less musculotropic than dextro-pseudoephedrine. By the use of ergotoxine and cocaine, racemic ephedrine is shown to be more musculotropic than natural ephedrine and more neurotropic than pseudoephedrine. L. W. R.

Cardiovascular action of the semicarbazone of tropinone, oximes of tropinone, and of pseudopelletierine. RENÉ HAZARD AND JEANNE LÉVY. *Compt. rend.* **187**, 676 S (1928); cf. *C. A.* **22**, 3930.—If the ketonic function of tropinone is replaced by semicarbazide, a semicarbazone is produced, m. 254-258°, which has a cardiovascular action of the same quality but much more intense for equal doses than tropinone. With certain individual animals it may act in doses of 1 mg. per kg. Opposite effects follow the combination of ketones with hydroxylamine, when the oximes produced have but slight action in doses of several cg. per kg. L. W. RIGGS.

Sensitivity of higher centers to the hypoglycemia caused by insulin. EDGARD ZUNZ AND JEAN LA BARRE. *Compt. rend. soc. biol.* **99**, 631-2(1928).—The higher nerve centers react to post-insulinic hypoglycemia by modifying, *via* the vagi, the physiologic insulinemia. L. W. RIGGS.

Fever-producing action of dinitro- α -naphthol in the dog. C. HEYMANS AND JEAN J. BOUCKAERT. *Compt. rend. soc. biol.* **99**, 636-8(1928).—In a dog deeply anesthetized, deprived of its central thermal regulation and subjected to artificial respiration, dinitro- α -naphthol causes a rise in temp. to 40.8°. Accordingly this hyperthermia is of peripheral origin. The injection of dinitro- α -naphthol in a dog with intact bulbar centers caused a rise in the blood pressure, the bulbar-stimulating action of dinitro- α -naphthol compensating the hypotensive peripheral action. L. W. RIGGS.

Renal or tissular origin of diuresis by an organo-mercury compound. PAUL GOVAERTS. *Compt. rend. soc. biol.* **99**, 647-9(1928).—Expts. with dogs appeared to prove

that the action of novasurol (a Hg combination of *o*-chlorophenol with diethylmalonyl-urea) was essentially upon the kidneys. L. W. RIGGS

Therapeutic action of antimony on *Spirochaeta duttoni*. J. SCHOCKAERT. *Compt. rend. soc. biol.* 99, 654-7(1928); cf. Uhlenhuth, *C. A.* 20, 1274.—Expts. with mice confirmed the results of Uhlenhuth with syphilitic rabbits. L. W. RIGGS

Action of acetylcholine on the eye of the rabbit. MAX COURLAND AND ERNEST KAHANE. *Compt. rend. soc. biol.* 99, 1136-8(1928).—Acetylcholine produces myosis, and probably increases intraocular tension. L. W. RIGGS

Kottmann reaction in animals injected with potassium carbonate. HÉLÈNE DEREVICI. *Compt. rend. soc. biol.* 99, 1184-5(1928).—Expts. with dogs proved that the injection of K_2CO_3 in doses of 0.03 to 0.05 g., according to the wt. of the animal, caused a retardation of the Kottmann reaction, while the injection of $CaCl_2$ caused its acceleration. L. W. RIGGS

Action of white mistletoe (*Viscum album*). ARNOLD HOLSTE. *Compt. rend. soc. biol.* 99, 1257-9(1928).—The ext. of white mistletoe dilates the arterioles and capillaries by direct peripheric action. L. W. RIGGS

Phylactic action of sodium salicylate against hemolysis by sparteine sulfate. Cellular phylaxis. P. DODEL. *Compt. rend. soc. biol.* 99, 1293-4(1928).—An isotonic soln. contg. 1% Na salicylate and 0.037 to 0.05% sparteine sulfate does not hemolyze sheep erythrocytes. If the erythrocytes, after remaining in contact with Na salicylate for 12 hrs., are washed and centrifuged in 0.9% NaCl soln., they have acquired a strong resistance to the hemolyzing action of sparteine. Similar protection was obtained with Na oleate, stearate and palmitate, and with pyramidone. Na salicylate does not exercise a phylactic action against the hemolyzing action of quinine; on the contrary it increases the hemolyzing action of quinine. The probable mechanisms of these reactions are discussed. L. W. RIGGS

Influence of oxygen inhalations on the hepatic functions. G. PARTURIER, FAQUÉ AND MANCEAU. *Compt. rend. soc. biol.* 99, 1302-4(1928).—Fasting subjects, lying down, respired 50 l. of O in 2-min. periods with a rest of 2 to 3 min. between the periods. Samples of the blood were taken immediately before and after the respiration of the O. The results of 50 tests showed that the blood content in residual N, urea, cholesterol and uric acid and also the cholemia were unchanged in normal, choleocytic and diabetic subjects. The glucemia was increased in the normal subject and was reduced in the choleocytic and diabetic subjects, the insufficient liver being unable to restore the glucemia to its normal value. L. W. RIGGS

Action of natural ephedrine in limited doses on the heart of the rabbit *in situ*. LEON LAUNOY AND PIERRE NICOLLE. *Compt. rend. soc. biol.* 99, 1387-9(1928).—Moderate doses of natural ephedrine injected *in vivo* caused at first a negative chronotropic and inotropic action. Atropine was without effect on this reaction. This first phase was of short duration and was followed by a positive chronotropic and inotropic action, which appeared slowly and was prolonged. This second phase did not appear with doses of 5 mg. per kg., or larger. L. W. RIGGS

Studies of hyperglucemia following injection of morphine. I. Role of the sympathetic. B. A. HOUSSAY, J. T. LEWIS, E. A. MOLINELLI AND A. D. MARENZI. *Compt. rend. soc. biol.* 99, 1406-7(1928).—Expts. with dogs indicated that morphine caused hyperglucemia by direct or reflex stimulation of the sympathetic nervous centers. II. Role of the suprarenals. B. A. HOUSSAY, J. T. LEWIS AND E. A. MOLINELLI. *Ibid* 1408-10. The suprarenals have a certain influence, but are not the sole cause of the production of hyperglucemia by morphine. The diminution of hyperglucemia by morphine which follows the suppression of the adrenaline secretion is a transitory phenomenon which later becomes attenuated or compensated. The suprarenals contribute to the hyperglucemia due to morphine by a discharge of adrenaline. III. Role of the liver innervation. *Ibid* 1411-2.—The injection of morphine causes a glycogenolysis by the excitation of the hepatic nerves, and this is one of the causes of the hyperglucemia produced. IV. Role of the parasympathetic innervation. *Ibid* 1413-4.—In the absence of all sympathetic and parasympathetic innervation of the abdomen, the subcutaneous injection of morphine does not modify the glucemia. L. W. RIGGS

Urobilin of the blood, bile and urine of the dog after injection of urobilin. MARCEL ROYER. *Compt. rend. soc. biol.* 99, 1419-20(1928).—Urobilin dissolved in slightly alk. physiol. saline and intravenously injected was not toxic in doses of 5 to 40 mg. per kg. A dose of 10 mg. disappeared from the blood within 30 min. and a dose of 20 mg. within 80 to 90 min. The quantity of urobilin found in the urine or bile was only about $\frac{1}{100}$ of that injected. **Role of the organs in the disappearance of urobilin injected into the blood.** *Ibid* 1420-2.—Since the liver is not the only organ with power to retain urobilin

from the blood, the increase of urinary urobilin depends not solely on liver insufficiency but also on the insufficiency of other organs, particularly muscle. L. W. R.

Action of a polymethylene derivative of guanidine on glucemia and the glycogen of the liver and muscles. B. VARELA, J. A. COLLAZO AND P. RUBINO. *Compt. rend. soc. biol.* 99, 1441-3(1928).—The action of synthalin on glucemia is different according as it is given by mouth or is parenterally injected. In the latter case with rabbits hypoglucemia always follows, sometimes with convulsions and death. Of 8 rabbits receiving synthalin by mouth only 2 showed a slight diminution of glucemia. The glycogen in the liver, myocardium and muscles appears to be reduced by synthalin, also perhaps by an accompanying fatty degeneration in the liver (cf. following abstr.).

L. W. RIGGS

Experimental toxicity of a polymethylene derivative of guanidine. B. VARELA, J. A. COLLAZO AND P. RUBINO. *Compt. rend. soc. biol.* 99, 1444-6(1928).—Parenteral administration of toxic doses of synthalin is followed by convulsions, which, unlike those produced by insulin, are not relieved by the administration of glucose. Synthalin by the digestive route does not cause convulsions, death occurring after prolonged muscular asthenia and coma. (Cf. preceding abstr.)

L. W. RIGGS

Insulin and folliculin. R. COURRIER. *Compt. rend. soc. biol.* 99, 1630-1(1928).—Expts. with rabbits and guinea pigs indicated that insulin and folliculin do not act in the same way on the genital tract. If these substances cause sterility, it is by mechanisms essentially different.

L. W. RIGGS

Mixed extracts of glands and tissues of warm-blooded animals; their action on the heart of warm-blooded animals in situ. G. KATZ AND E. A. LEIBENSON. *Compt. rend. soc. biol.* 99, 1637-8(1928).—Mixed exts. from endocrine and other glands of the ox were tested with anesthetized and unanesthetized cats. The exts. produced a marked stimulating effect on the cardiac contractions in both cases.

L. W. RIGGS

Action of adrenaline on the heat output, blood calcium and potassium in normal man and in man with thyroid disease. M. R. CASTEX AND M. SCHTEINGART. *Compt. rend. soc. biol.* 99, 1649-50(1928).—The injection of adrenaline increased the heat output, but showed no relation to variations of Ca or K in the blood.

L. W. RIGGS

Action of trypan blue on the blood cells of the rabbit. HARALD BERONIUS. Univ. Upsala. *Compt. rend. soc. biol.* 99, 1675-7(1928).—Intravenous injection of trypan blue in the rabbit was followed by thrombocytosis and leucocytosis.

L. W. RIGGS

Action of thyroxine on the electric excitability of the parasympathetic innervation of the frog heart. JAN WALDENSTRÖM. *Compt. rend. soc. biol.* 99, 1681-2(1928).—In the doses used, thyroxine exercised no dynamic action on the functions of the frog heart.

L. W. RIGGS

Action of chlorophyll on the respiratory metabolism of normal and thyroidectomized rats. HAKAN RYDIN. *Compt. rend. soc. biol.* 99, 1683-5(1928).—Na chlorophyllate (Siegfried of Zofingen) increased the elimination of CO₂ and absorption of O in both normal and thyroidectomized rats. It may be considered a general cellular stimulant having the power to increase the fundamental metabolism of the cells. **Action of chlorophyll and of thyroxine on the sensitivity of the organism to rarefaction of oxygen.** *Ibid* 1685-7.—Both chlorophyll and thyroxine increased the respiratory metabolism of rats. The action of chlorophyll was well marked but less energetic than that of thyroxine. **Action of chlorophyll and thyroxine on body weight.** *Ibid* 1687-8.—Although chlorophyll increased the respiratory metabolism in rats, it did not affect the body wt. Thyroxine, on the other hand, caused either a decrease of body wt., or a decrease of the rate of increase of body wt. With chlorophyll and thyroxine injected simultaneously the results were similar to those following the injection of thyroxine alone.

L. W. RIGGS

Rotogravure ink dermatitis. EDWARD A. OLIVER. *J. Am. Med. Assoc.* 91, 870-3(1928).—Fifteen cases are reported. Para Red, the dry color used in the ink, appears to be the irritating agent.

L. W. RIGGS

Caffeine diuresis. F. FALUDI. *Magyar Orvosi Arch.* 29, 447-52(1928).—Caffeine and its derivs. do not increase the velocity of the ultrafiltration of serum or plasma. The swelling of colloids is not much influenced by the dild. solns. of these materials, whereas their concd. solns. exert an inhibitory effect. Since the same observations can be made in cane sugar solns. it is concluded that the hydration of proteins has nothing to do with the diuretic effect of caffeine.

L. W. RIGGS

Action of wasps poison on oils, triacetin and lecithin. ANGELO CONTARDI AND PIA LATZER. *Rend. ist. lombardo. sci.* 60, 853-6(1927).

R. SANSONE

Pharmacological research on *Digitalis ferruginea* L. V. VERGNANO. Univ. Parma. *Arch. farmacol. sper.* 45, 280-6; 46, 1-6(1928).—The Italian Pharmacopeia does not consider *D. ferruginea* as a substitute for *D. purpurea*. The leaves of the plant

were dried and powdered in the usual way. A 5% infusion was prepd. by treating 1 g. of the powdered leaves with 20 cc. water at 72° and filtering the soln. obtained. Baylat's microchem. reaction was strongly positive with the leaves, and the test of Keller-Kiliani carried out with either the powder or the infusion, gave also a strongly positive result. For comparison, the same tests were carried out with *D. purpurea* and *D. lutea*; they were positive in the first plant and weakly positive in the second one. Biologically, the 5% infusions were compared by examg. their influence on the cardiac rhythm of *Rana esculenta* and also by registering cardiograms according to Engelmann's method. The infusion (1 cc.) was injected into the abdominal cavity. These expts. carried out under identical conditions showed that the action of all 3 infusions is of the same type in regard to the changes produced in the cardiac rhythm. It was evident, however, that *D. ferruginea* was more active than *D. purpurea*, because the reduction of the heart beat, the larger amplitude of the diastolic phase, the peristalsis of the ventricle, and the final ventricular arrest in the systolic phase occurred in a shorter time than with the 2 other prepn's. *D. lutea* had the weakest action; with the doses employed, the ventricular arrest in the systolic phase could not be produced.

G. SCHWOCH

Intensity of action of quinine salts. EZIO MILANESI. Univ. Parma. *Arch. farmacol. sper.* 46, 29-43(1928).—The paralyzing effect of radiated and non-radiated quinine salts was examd. on *Paramecium* and *Vorticella*. The bisulfate (I) and basic hydrochloride (II) of quinine, when irradiated by a Hg-vapor lamp for 30 min. did not differ in their action from the resp. non-radiated salts. In comparing the action of non-radiated quinine salts, it was noticed that I starts to exert its paralyzing effect at a quinine concn. about 4 times as low as do II, the bihydrochloride (III), the sulfate (IV), and the free quinine base. This cannot be caused by the difference of the H-ion concn., since the solns. of II and IV are alk., while those of I and III are acid, a 0.05 N soln. of III even having a lower p_H value (2.8) than a 0.05 N soln. of I (3.1). The solns. II, III, and IV do not show any fluorescence when examd. in sunlight, while I shows azure fluorescence. When examd. with ultra-violet rays, only a slight fluorescence is observed in II, III and IV, while it is intense in I. Wood's light causes II, III and IV to fluoresce rather distinctly; yet it causes a very intense fluorescence in I. M. believes that this higher degree of fluorescence is responsible for the superiority of I in respect to the paralyzing action on protozoa.

G. SCHWOCH

The reticulo-endothelial system and its resistance to inorganic poisons. II. G. VECIA. Univ. Bari. *Arch. farmacol. sper.* 46, 44-8(1928); cf. C. A. 22, 3224.—According to V., the main function of the reticulo-endothelial system is to protect the organism against inorg. poisons; when hyperplasia and hypertrophy of the reticulo-endothelial elements is produced by injecting collargol, this function may be intensified. This hypothesis was confirmed by new expts. V. used groups of rabbits and administered As_2O_3 to the controls, and As_2O_3 + collargol to the test animals. As_2O_3 was given daily in increasing doses ranging from 3 to 25 mg. The collargol was employed as a 2% soln. in physiol. NaCl soln.; it was injected into the marginal ear vein previously to the As_2O_3 administration. One to 5 injections of 2 cc. each were applied to different groups of the test rabbits. The results showed that on the av., the test animals lived longer than the controls, and that the av. total dose of As_2O_3 received by the test animals before the occurrence of death was larger. The max. resistance was observed in the animals having received 3 collargol injections. No relation exists between wt. of rabbit and tolerable dose of As_2O_3 .

G. SCHWOCH

Biochemical studies on iodine. K. SCHARRE. Agr. Hochschule München-Weihenstephan. *Z. angew. Chem.* 41, 980-2(1928); cf. C. A. 21, 3205.—The influence of I given perorally as NaI or KI to different groups of animals was investigated with regard to the milk secretion and the I content of various organs. The effect of inorg. I on the growth of yeast was studied. To groups of goats were given daily I, 7.5, 15, 60, 120 or 180 mg. The intestinal absorption was complete. These doses all caused a considerable elevation of the I content of the body fluids, especially of the milk. Up to 120 mg., no definite increase of the milk secretion could be observed, while 180 mg. caused a considerable increase. With 120 mg., the abs. fat content as calcd. per day was higher, the percentage fat content lower than in the controls. With 180 mg., the percentage fat content was lowered, whereas the abs. fat content first rose and then fell again. The I passes over into the milk very quickly, within fractions of 1 hr. After the I application is stopped, the I content of the body fluids returns to normal within a few days. The health of the animals was not impaired even by the highest I doses. In expts. with cows, similar results were obtained. Small doses had no pronounced effect. A considerable increase of the milk secretion was caused by 76.45 mg. I; at the same time, the percentage fat content was lowered a little, while the abs. fat content was dis-

tinctly raised. In expts. with pigs, S. examd. different organs, after having administered I for a certain time. In lungs, muscles, heart and body fat, no pronounced difference was seen as compared with the controls, while larger differences were found in spleen, liver and kidneys. However, the abs. increase was very small. Cows raised on pastures near the sea-shore of the Northern Sea showed an I content of the milk from 50 to 800% higher than the cows of Upper Bavaria. As to the expts. concerning the effect of I on growth of yeast, the following compds. were tested: NH_4I , KI , NaI , LiI , RbI , CsI , CaI_2 , MgI_2 , HI , $\text{KH}(\text{IO}_3)_2$, KIO_3 , NaIO_3 , RbIO_3 , $\text{Ca}(\text{IO}_3)_2$, KIO_4 , NaIO_4 , and HIO_4 . Conclusion: Inorg. I is of no particular importance for the metabolism of yeast.

G. SCHWOCH

Reaction of the isolated intestine to blood taken from the adrenal vein of rabbits before and after stimulation of the splanchnic nerve. ALEXANDRA PTSCHELINA. W. A. Obuch-Inst. f. Gewerbekrankh.-Forsch. *Arch. ges. Physiol.* (Pflüger's) 220, 371-9(1928).—Blood taken from the adrenal vein before, during and after stimulation of the central end of the splanchnic nerve usually exerts an adrenaline-like effect upon the isolated intestine. The action of the blood is more pronounced in those cases where stimulation of the peripheral end of the nerve also causes the blood to exhibit an adrenaline action. Substances other than adrenaline leading to typical adrenaline effects are present in the blood, and consequently the isolated intestine does not offer a strictly sp. method for demonstrating the presence of adrenaline in the blood. G. H. S.

Mechanism of polyphasic actions. I. Phase effects of the cocaine group. EDUARD RENTZ. Univ. Riga. *Arch. expl. Path. Pharm.* 135, 19-38(1928).—The phase effects of local anesthetics upon frog blood vessels, whose connection with the central nervous system has been interrupted, are not modified by gynergen or atropine, or by a deficiency of Ca or K in the perfusion fluid. In vessels perfused with solns. of local anesthetics the constricting action of BaCl_2 is weakened or completely suppressed, while after exposure to some compds. of the cocaine group atypine and suprarenine may still be active even though the reactivity to Ba is lacking or is reversed. Apparently the phase effects of local anesthetics upon vascular preps. are essentially of a muscular nature, the stimulating and paralyzing effects being referable to reversible changes in state of a single substrate within the vessel wall. G. H. S.

Effect of temperature upon the velocity of combination and of action of digitalis substances. HANS FISCHER. Univ. Zürich. *Arch. expl. Path. Pharm.* 135, 39-81(1928).—The increased activity of digitoxin upon the frog heart brought about by elevation of the temp. is largely independent of thermic effects upon the normal heart itself. Study of temp.-effect relationships shows that the fixation of digitoxin to living substrates must be regarded as a chem. process, or at least is assocd. with a process of chem. nature. What this chem. process is, is not clear, but it probably involves a union between the substrate mol. and one or more of the 5 reactive OH groups of the digitoxin mol. It also appears obvious that the effect-phase is likewise a chem. process, one in which the presence or absence of Ca is of no moment. Elevation of temp. influences the concn. requisite to cause irreversible arrest of the heart. Digitaligenin action is due to processes of like nature, but with this compd. the substrate enters into a loose union, such as is reversible. Ca has no determining effect upon this process. Manifestly, since both digitoxin and digitaligenin both enter into chem. union with the tissues, and with one the reaction is irreversible, with the other reversible, it follows that the tissue may be damaged by the one and not by the other compd. G. H. S.

A hitherto unknown effect of ephedrine. KARL CSÉPAI AND FRIEDRICH DOLESCHALL. Univ. Budapest. *Arch. expl. Path. Pharm.* 135, 109-12(1928).—Ephedrine alters reactivity, or sensitivity to adrenaline. As regards blood pressure adrenaline causes invariably a greater increase if given subsequently to an injection of ephedrine. The most significant effect observed, in a case of hyperthyroidism, gave values as follows: 0.01 mg. of adrenaline intravenously administered increased pressure by 40 cm., 0.01 mg. of ephedrine caused an increase of 30 cm., and a second injection of adrenaline (after the pressure had returned to normal) resulted in an increase of 95 cm. The increases observed do not represent merely summation effects. G. H. S.

Effect of yellow phosphorus upon rickets in rats. H. WESE. Univ. München. *Arch. expl. Path. Pharm.* 135, 111-7(1928).—Rats were rendered rachitic with McCollums diet No. 3143. Yellow P, in olive oil, given by mouth exerted no effect as a preventive or therapeutic agent. The thickening of the subepiphyseal bony tissue caused by the P has no relationship to rickets. G. H. S.

Comparative study of the activity and toxicity of the vapors of the lower aliphatic alcohols. H. WESE. Univ. München. *Arch. expl. Path. Pharm.* 135, 118-30(1928).—White mice were exposed to MeOH , EtOH , PrOH and BuOH and their isomers, under

const. conditions as to temp. with equimol. amts. volatilized in a const. space. The narcotizing and toxic effects, due to absorption through the lung, were detd. With unsatd. vapors the toxic and narcotic effects increased with the no. of C atoms, but with satd. the relations were somewhat changed, in that BuOH and iso-BuOH were less active as narcotics than was PrOH, while sec-BuOH and Me₂COH were more effective. As regards toxicity Me₂COH was between PrOH and AmOH, BuOH between EtOH and MeOH, and Me₂CHCH₂OH was lower in intoxicating power than MeOH. Narcosis, effected with MeOH daily for periods of from 9 to 18 days caused death, the necropsy revealing fatty infiltration of the liver, bronchopneumonia, and nephritis. G. H. S.

Mechanism of the action of hydrocyanic acid: Functional importance of glutathione. I. HANS HANDOVSKY. Univ. Göttingen. *Arch. expil. Path. Pharm.* 135, 143-54(1928).—Study of the muscle of rabbits subjected to a reversible HCN intoxication revealed an increase in free glutathione and an increase in lactic acid with an unchanged carbohydrate value. In later stages the lactic acid is increased as is also carbohydrate, but in still later stages the increase in lactic acid is assocd. with a reduced carbohydrate. In this last condition the glycogen is reduced while the lower sugars are above the normal value. G. H. S.

Effect of histamine on the vessels of the kidney. M. MORIMOTO. Univ. Berlin. *Arch. expil. Path. Pharm.* 135, 194-7(1928).—The vessels of the kidney (dogs, cats) are constricted by histamine in high dilns. G. H. S.

Intensifying the effect of narcotics by antipyretics. K. STEINMETZER. Univ. Wien. *Arch. expil. Path. Pharm.* 135, 198-209(1928).—The narcotizing action of such agents as paraldehyde, chloral hydrate and veronal is intensified by antipyretics, such as antipyrine, pyramidon and quinine. Only under suitable concn. relationships between narcotic and antipyretic is this effect exhibited. G. H. S.

Substances which stimulate and paralyze the respiratory center. FRITZ TIEMANN. Univ. München. *Arch. expil. Path. Pharm.* 135, 213-27(1928).—Study of the effectiveness of vagal inhibition upon respiratory activity revealed the fact that the inhibition is intensified by intoxication by morphine and chloral hydrate and by avertin narcosis. During morphine intoxication, as with the other two substances the irritability of the respiratory center is diminished. The effects of chloral hydrate are dependent upon the dosage, the vagus being not involved. In avertin narcosis a non-irritability of the vagus may develop and the inhibitory effect may thus be reduced. The strongest stimulation of the respiratory center was caused by CO₂, the effect of lobeline and atrinal being less marked. Atropine was without effect. Both lobeline and atrinal are able to overcome or weaken the inhibitory effect of vagal stimulation. With larger doses lobeline paralyzes the respiratory center, leading to an intensified inhibition of the vagus. G. H. S.

Disposal of digitalis and its action in warm-blooded animals. I. Effective dose of different digitalis glucosides on the heart. H. WERSE. Univ. München. *Arch. expil. Path. Pharm.* 135, 228-44(1928).—For the isolated cat heart the minimal lethal dose, per g. of heart, is: digitoxin 0.0046 mg., g-strophanthin 0.002 mg., scillaria 0.0022 mg. When injected intravenously into the intact animal the lethal doses, per g. of heart, are: digitoxin 0.0743, g-strophanthin 0.022, scillaria 0.049 mg.; per kg. of body wt. digitoxin 0.33, g-strophanthin 0.1, and scillaria 0.22 mg. The proportion of glucoside closely bound to the heart is between 4.5 and 9% of that in the circulating blood. The major portion is bound to other organs, as is evident since none of it is excreted. Digitoxin and strophanthin do not appear to be destroyed in the blood, while scillaria, because of hydrolytic cleavage, quickly loses its activity. The heart of the warm-blooded animal will take up a const. quantity of glucoside, without regard to the concn. or abs. quantity present. The velocity of action of the glucoside is a simple linear function of the concn. G. H. S.

Comparative effects of the ganglion poisons on the function of the isolated adrenal. A. I. KOZNETZOV. Militär-Med. Akad. zu Leningrad. *Arch. expil. Path. Pharm.* 135, 15(1928).—The poisons of the group tested influence adrenal function, causing an initial stimulation of secretory activity, and (with large doses) a subsequent inhibition. Cytisine, meotine and lobeline are most active, coniine and sparteine are less so, and gelsemium is of least effect, an arrangement which corresponds to their effect on the autonomic nervous system. It is suggested that this fact may be explained upon the similarity of the embryonic development of the medulla of the adrenal and the ganglia. G. H. S.

Increase in the action of local anesthetics by conducting substances. I. WERNER LIPSCHITZ and RICHARD WEINGARTEN. Univ. Frankfurt a. M. *Arch. expil. Path. Pharm.* 137, 1-24(1928).—Under suitable conditions such substances as methylene

blue and caffeine serve to intensify the anesthetizing properties of cocaine. **II. Caffeine effect on sensory nerves.** WALTHER LAUBENDER. *Ibid* 25-44.—Caffeine increases the effect of alpine, cocaine and novocaine. G. H. S.

Theory of veratrine intoxication. YAHIKO KODERA AND E. TH. BRÜCKE. Univ. Innsbruck. *Arch. ges. Physiol. (Pflüger's)* 220, 274-86(1928).—The behavior of muscle in veratrine intoxication indicates that there is a reactive component whose irritability is essentially different from that of the muscle fibrils. This veratrine component, or "tetanogenic component," may play some part in the normal functioning of muscle. G. H. S.

Isamine-blue therapy of malignant tumors. R. ROOSEN. *Z. Krebsforsch.* 27, 359-61(1928).—The effect of isamine-blue on tumors depends on its reducing their water content. H. G. WELLS

Chemical and pathological study of the effects of copper on the liver. FREDERICK B. FLINN AND WM. C. VON GLAHN. Columbia Univ. *J. Exptl. Med.* 49, 5-20(1929).—Cu or its compds. used does not cause the deposition of pigment in the livers of rabbits, guinea pigs or rats. Neither does it produce a cirrhosis on these animals. Spontaneous deposition of pigment occurs frequently in the livers of normal rabbits on the usual lab diet. The feeding of a diet of carrots exclusively will produce pigment deposition in the livers of rabbits, in every way identical with that ascribed to Cu. The pigment deposited in the livers is probably of exogenous origin. C. J. WEST

A new type of arsenical derivatives of quinoline (BERLINGOZZI) 10.

I—ZOÖLOGY

R. A. GORTNER

Relation of hydrophilic colloids to winter hardiness of insects. WM. ROBINSON. *Fifth Colloid Symposium Monograph* 1928, pp. 199-218.—Newton (*C. A.* 18, 3205) having noted a relation of this kind in wheat, expts were made on a cold-hardy moth, *Callasamia promethia*, a non-hardy granary weevil, *Sitophilus granarius*, and an intermediate type, the "white grub" (genus *Phyllophaga*). Thoenes' (*C. A.* 19, 3497) method was used, which consists in measuring the heat of fusion of ice, the free water being frozen, the "bound water" remaining unfrozen at -20° . "The different insects gained or lost in bound water in direct proportion to their winter hardiness." As winter approaches, it is of great advantage to the species if free freezable water is transformed into bound non-freezable water. JEROME ALEXANDER

The distribution of argininephosphoric acid in the musculature of invertebrates. OTTO MEYERHOF. Zoölogical Stat. Napoli. *Arch. sci. biol. (Italy)* 12, 536-48 (1928).—Argininephosphoric acid (*A*) had previously been shown to occur in the muscle of Crustacea instead of creatinephosphoric acid (cf. Meyerhof and Lohman, *C. A.* 22, 1370); (Fisk and Subbarow *C. A.* 21, 2311; 22, 1184). The amt. of *A* in the muscle of Crustacea is 60-75% of the total PO_4 or 1.5-1.9 mg. per g. fresh muscle. The muscle of *Pecten* contained a max. of 60-75% of *A* but usually less. It was decreased in the animals which had remained for a long period in the aquaria or at a high environmental temp. A smaller quantity of argininephosphoric acid was present in *Pecten jacobaeus* than in *Pecten opercularis*. In *Holothuria tubulosa* and *Stichopus regalis* the amt. varied from 66 to 86% of the total phosphate. Although in previous expts. with invertebrates, a direct relationship was found between the activity of the muscle and the content of *A*, this was not true in *Holothuria* and *Stichopus*. The stimulation of the muscles of these animals for 1 hr. with a tetanizing current or allowing the isolated muscle to stand at 20° for the same length of time decreased the argininephosphoric acid content less than 50%. However, it was largely destroyed when the muscle was allowed to stand for 1 hr. at 45° . The marked stability of *A* may in part be explained by the sluggish rate of contraction of these muscles. The long muscle and the retractor muscle of the proboscis of *Sipunculus* contained *A*. In the retractor muscle there was about 4 mg. of P_2O_5 phosphagen per g. of muscle, which was much higher than in the long muscle. This value was very much decreased on activity. The max. rate of hydrolysis of pure argininephosphoric acid and also of the CCl_3COOH ext. of crab muscle occurred at 0.01N-H ion. However, the exts. of *Pecten*, *Holothuria* and *Sipunculus* showed the max. sapon. rate at 0.1 N-H ion. It is suggested that impurities in the ext. or in the HCl may act catalytically. A strong retardation in the sapon. rate occurred when molybdate was added. No argininephosphoric acid was found in the muscles of the *Cephalopoda*, in the smooth muscle adductors of the muscles or in the ring muscle of the *Holothuria*. Conclusion: In general the argininephosphoric acid decomps. with the activity of the muscle. H. J. DEUEL, JR.

The role of the iodine component in the thyroxine molecule. B. ZAVADOVSKII, N. A. RASPOPOVA, T. P. ROLITSCH AND E. W. UMANOVA-ZAVADOVSKA. *Kommunistischen Swerdlhoff Universität Moskau. Z. ges. expth. Med.* 61, 528-38(1928).—See C. A. 22, 2583.

Studies on the occurrence of arsenic in the organism of fish. ERIK SADOLIN. Univ. Köbenhavn. *Biochem. Z.* 201, 323-31(1928); cf. C. A. 23, 210.—In As poisoning the As_2O_3 is not substituted for H_3PO_4 in lecithin, because ether exts. of the dry As-contg. liver are As-free. Neither does it substitute the H_3PO_4 in nucleic acid, the presence of As in the liver nucleoproteins being simply an adsorption. Likewise the fact that As is partly excreted through hair and nails does not represent a vital function. Since As occurs normally in fish, its distribution has been studied with the following results. The As is present principally in fat-sol. combinations which are easily sol. in the usual fatty acid solvents. The As is apparently an acid compound since it is extracted with dil. alk. solns. The concn. of As is greater in the oily liver than in muscle tissue, where likewise the As is found in larger amt. in the oily portion than in the oil-free residue.

S. MORGULIS

Favoring influence of a diet of murier noir (*Morus nigra*) leaves on the development of grasserie in silk worms. TAHIR ERTOGROUL. *Compt. rend. soc. biol.* 99, 831-2 (1928).—A diet of *Morus nigra* leaves always favored the development of the grasserie disease of silk worms.

L. W. RIGGS

Hypnosis and habituation of fish of the genus *Gobius* under the influence of certain hypnotics of the barbituric series. JEANNE LÉVY. *Compt. rend. soc. biol.* 99, 1325-6 (1928).—*Gobius lota* show habituation to butylethylmalonylurea. Fish already habituated to butylethylmalonylurea show habituation to heptylethylmalonylurea and vice versa.

L. W. RIGGS

Physiologic role of the aerial sacs of birds. P. PORTIER. *Compt. rend. soc. biol.* 99, 1327-8(1928).—The aerial sacs by removing the alveolar air from the lung and rejecting it at the periphery increase the O tension in the lung and consequently in the blood. Thus the O tension in mammals is 97.3 mm. and that of birds 146 mm. By this means anoxemia at high altitudes during long flights is prevented. Birds after a long rapid flight show no signs of dyspnea.

L. W. RIGGS

Elimination of carbon dioxide in the insects. W. H. THORPE. Univ. Calif. *Science* 68, 433-4(1928).—The CO_2 output was studied by means of a 0.1% soln. of *o*-chlorophenol indophenol indicator, the larva being held motionless in a film of fluid under a raised cover slip. The findings were confirmed by means of phenol red, cresol red and bromocresol purple. Also the O absorption was studied by the method of Fox (et C. A. 15, 2453). Both methods gave consistent results when tested upon various aquatic larvae having well-developed tracheal gill systems. Expts. with large, heavily chitinized insects were rather inconclusive.

L. W. RIGGS

Isopropyl alcohol as a preservative. PHILIP H. POPE. Reed Coll. *Science* 68, 487-8(1928).—Newts were preserved in isopropyl alc. of 5 concns. ranging from 36.4 to 72.8% (40 to 80% com. strength). A control was preserved in EtOH at 70%. The results favored the use of isopropyl alc. in concns. of 40 to 50%. It competes in price with EtOH without the restrictions of the latter, and is without the irritating properties of HCHO.

L. W. RIGGS

12—FOODS

F. C. BLANCK AND H. A. LEPPER

Regulations on the use of preservatives in the framing of food laws. A. JUCKENACK. *Z. Untersuch. Lebensm.* 56, 16-25(1928).—A presentation of the case against the indiscriminate use of chem. preservatives in human foods and beverages.

C. R. F.

Fiber containers and food preservation. J. D. MALCOLMSON. Robt. Gair Co., N. Y. *Food Industries* 1, 160-1(1929).—Because of their high insulating value, fiber containers are of special value in the marketing of products in conjunction with dry ice, i. e., frozen CO_2 . Corrugated cardboard with walls 0.625 in. thick had approx. the same insulating value as 1 in. of balsa wood. The uses of grease- and water-proof papers are discussed.

C. R. F.

Identification of coal-tar colors used in food. S. W. SNYDER. *Textile Colorist* 51, 39-42(1929).—The 2 usual methods, dyeing on wool and extg. the color with immiscible solvents, are described.

RUBY K. WORNER

The nature of the water-soluble protein in wheat kernels. R. HERZNER. Hochschule Bodenkultur, Wien. *Biochem. Z.* 202, 320-8(1928).—An ext. with H_2O is made

from the finely ground kernels (4:1) which is allowed to stand 12 hrs. The soln. is siphoned off, satd. with $(\text{NH}_4)_2\text{SO}_4$ and the ppt. is suspended in water. This mixt., under toluene, is dialyzed for 1 and 4 weeks in specially prepd. pig bladders against distd. H_2O . The globulin is removed by filtration and the colored soln. is now concd. by ultrafiltration, and subsequently electrodialyzed. In the course of these 4 essential steps in the purification the ash content changes from 0.97 to 0.54, 0.49 and finally 0.0%. The soln. now has a reaction of p_{H} 6.69, and the soly. of the protein is thus due neither to salt nor to acid. The electrophoresis expts. show that the amphoteric point is at p_{H} 5.10; the max. heat coagulation was observed at p_{H} 4.97; the max. alc. pptn. occurred at p_{H} 5.43 (calcd. p_{H} 4.90). The elementary analysis of this protein is: 51.44% C, 7.24% H and 16.11% N. It is suggested that this protein is similar to the animal pseudoglobulin.

S. MORGULIS

Wheat and flour experiments in England. A. A. J. DE 'SIGMOND. *Kísérlet Közlemények* 30, 530-8(1927).—The strength of wheat or flour depends on two factors chiefly: (a) appropriate quantity and quality of gluten, and (b) sufficient sugars and diastatic energy for the fermentation of the dough. Two methods for improving were found especially interesting; the tempering or conditioning of wheat and the over heating of a small part of the wheat according to the Kent-Jones' method. The lab. of Kent-Jones at Dover is described.

S. S. DE FINÁLY

A new carbohydrate from rye flour and its application in the development of a method for the detection of rye flour in wheat or other flours. J. TILLMANS, H. HOLL, AND L. JARIWALA. Univ. Inst. for Food Chem., Frankfurt a M. *Z. Untersuch. Lebensm.* 56, 26-32(1928).—Differences in the behavior of rye and wheat gliadins pptd. by 70% EtOH, especially in their titration curves, were noted. A carbohydrate, derived from the rye flour by the addn. of alkali to the EtOH ppt., was recovered and purified. It was white, cryst. and very slightly sweet. Before inversion, $[\alpha]_D^{20}$ was -43.93° , and after inversion, -92.70° . The total sugars as invert were 100.2%. Combustion gave C 43.38, H 6.43 and N 0.0%. The mol. wt. was 487.9 with the formula $\text{C}_{18}\text{H}_{30}\text{O}_{11}$. The compd. is designated *trifructose anhydride* or *trifructosan*. The following procedure is used to detect rye flour in flour mixts.: To 5 g. of flour add 20 cc. of 70% EtOH and centrifuge for 15 min. Cool to -3° in a salt-ice mixt., stirring thoroughly the pasty mass during the cooling and centrifuge again for 5 min. The ext. should be perfectly clear. 10 cc. is decanted into a test tube contg. 0.5 cc. N NaOH dissolved in 70% EtOH. Turbidity ranging in degree from slight to a ppt. indicates the presence of rye flour. About 10% of rye flour may be detected thus in flour mixts.

C. R. F.

Determination of glutenin and relation to gliadin. P. SPANYÁR. *Kísérlet Közlemények* 30, 610-4(1927).—The method of Blish (*C. A.* 22, 122) has been tested and slightly modified. Exptl. data show that the ratio of gliadin to glutenin is 60:40 as stated by former analysts. Slight differences do not lessen the "strength" of the flour

S. S. DE FINÁLY

Technical control in bread baking. C. B. MORRISON. *Am. Inst. Baking, Chicago Food Industries* 1, 148-53(1929).—No chem. data yield information of as great importance as the baking test. Dough possesses a typical foam structure caused by the dispersion of gas through the dough during fermentation. The coagulation of the protein by heat fixes this foam structure. Starch undergoes some degree of gelatinization, and the coagulated protein and starch exhibit changes in phys. properties in the direction of elasticity. Though the temp. of the interior of the bread during the baking is near that of the b. p. of water, the exterior of the loaf is at a very much higher temp. The crust, therefore, undergoes dextrinization, and pyro-decompn. of carbohydrates and proteins accompanied by color changes occurs.

C. R. F.

Results of biological milk control methods at Altona. A. BEHRE. Chem. Lab. Altona. *Z. Untersuch. Lebensm.* 56, 38-50(1928).—B. considers that sediment (quant.), acidity, Janus green reductase tests and leucocyte and streptococci counts furnish the most information regarding the quality and wholesomeness of milk.

C. R. F.

The freezing-point determination in milk. P. WEINSTEIN. Chem. Res. Inst., Bochum. *Z. Untersuch. Lebensm.* 55, 590-602(1928).—The f.-p. method when applied to milk will detect about 5% addn. of H_2O . The av. value of $\Delta 10^3$ was 53.5. The use of f. p., catalase, refraction and detn. of fat-free dry matter is valuable in detg. milk quality.

C. R. F.

The importance of choline in summer and winter milk. W. VAUBEL. *Deut. med. Wochschr.* 54, 1971(1928).—Butter produced during the summer months is much richer in lecithin than that produced during the winter. This higher lecithin content is associated with a higher choline content and a higher content of vitamin B.

A. G.

The electrometric determination of chlorine in milk. THURE SUNDBERG. *Bd.*

Health Lab., Stockholm. *Z. Untersuch. Lebensm.* 56, 32-8(1928).—The adaptation of the potentiometer for the detn. of Cl in milk serum was feasible and gave results almost identical with those obtained by the Volhard method. A calomel electrode was used. C. R. F.

The potentiometric determination of chlorine in milk. C. ROHMANN. Chem. Inst., Univ. Münster. *Z. Untersuch. Lebensm.* 55, 580-90(1928).—The method deals with the electrometric titration of the Ag and Cl ions in the presence of a protective colloid such as gelatin. Heating the milk had little effect on the results. Acidity did influence the results unfavorably. In the titration, a reversible adsorption occurs. Complications make the method difficult of application. C. R. F.

"Chromiform," a new preservative for milk samples. FONZES-DIAON AND LAFORCE. *Ann. fals.* 21, 536-9(1928).—Addn. of 0.25 g. $K_2Cr_2O_7$ and 0.25 g. $(CH_3O)_2$ to 250 cc. was found to preserve milk samples, even when exposed to daylight, provided they were in completely filled and well-stoppered bottles. After 2 months the acidity was only slightly increased and the total solids slightly decreased, lactose and Cl were unaffected, casein underwent but very little hydrolysis and its detn. by pptn. was sufficiently accurate, butter-fat could be detd. either by extn. of the coagulum obtained by the official Fr. method or by the Gerber method and the amt. found was the same as in the fresh milk, the various consts. had practically the same values as in the fresh milk, and the total solids and ash had to be corrected only for the amt. of $K_2Cr_2O_7$ added. A. PAPINEAU-COUTURE

Know your foods. I. Oleomargarine. H. A. SCHUETTE. *J. Chem. Education* 5, 1621-6(1928). E. H.

"Tracers" in margarine for detecting its addition in small quantities to butter. L. HIRON. Univ. de Liège. *Ann. fals.* 21, 532-4(1928).—The application of the law requiring addn. of 5% sesame oil and 0.2% potato starch to margarine in Belgium for the last 28 yrs., though it has given satisfactory results, has not necessarily eliminated adulteration of butter entirely, it being probably carried out by addn. of small amts. of coconut oil or neutral lard or both to butters with high volatile-acid contents. The relation between n and Polenske no. is suggested as a promising method for the detection of such fats in butter (cf. following abstract). A. PAPINEAU-COUTURE

Proposed method for the detection of coconut oil in butter. L. HIRON. Univ. de Liège. *Ann. fals.* 21, 534(1928); cf. preceding abstract.—The ratio of the butyrorefractometer reading at 20-5° of the insol. volatile fatty acids obtained in the Polenske distn. to the Polenske no. itself is 6-7 units higher with pure butter than with the butter adulterated with 10% coconut oil. A. PAPINEAU-COUTURE

Judging cheese according to Orla-Jensen. I. SZANYI. *Kísérlet Közlönyek* 30, 507-19(1927).—Instead of the present method of judging cheese on the basis of the fat content of dry matter, the 6th International Dairy Congress proposed Orla-Jensen's method of giving the relation of fat to protein. Fifty full cheese analyses were made. The data of Orla-Jensen were found correct. The judging of cheese is more exact and better by Orla-Jensen's method, but proteins cannot be detd. without lab. app. Moreover, this method does not state the fat content, which is the most valuable component of cheese. S. S. DE FINÁLY

Some factors affecting connective tissue content of beef muscle. H. H. MITCHELL, T. S. HAMILTON AND W. T. HAINES. Dept. Animal Husb., Univ. of Ill. *J. Nutrition* 1, 165-78(1928).—Toughness of lean meat is due largely to the connective tissue fibers which consist of 2 proteins, *elastin* and *collagen*. Chem. methods for their detn. and sepn. are given. No const. or significant differences in connective tissue content were found between heifer and steer beef. Eye muscle of rib and tenderloin in calves gave the lowest % of collagen, while next in order and indistinguishable from each other were round, porterhouse and sirloin. Fore shanks, chuck ribs and navel showed the highest % of collagen. The % of elastin in muscle is a small and usually insignificant part of the collagen. The distribution of elastin among the different retail cuts of meat differs from the distribution of collagen but is significant and consistent. Inconclusive results indicate that age does not greatly influence the content of connective tissue in muscle. The results lend no support to the belief that the appearance, texture and firmness of lean meat gives reliable information concerning its tenderness. No obvious relation was found between the grading of beef carcasses and the fat content of the lean of selected samples. C. R. F.

The evaluation of preserved fish. HANNS LENCGERICH. Res. Inst. for the Fish Ind., Altona. *Z. Untersuch. Lebensm.* 55, 568-78(1928).—A discussion of quality factors, including chem. tests on cooked and raw marinated herring. C. R. F.

Vegetable food as a source of iodine. ROSE E. REMINGTON. S. Car. Med. Coll.

Science 68, 590(1928).—Potatoes, lettuce, beet tops and turnip tops are mentioned among plants grown in S. Carolina as contg. much more I than is usually reported for such plants. L. W. RIGGS

Apple sauce another logical apple product. C. R. FELLERS. Mass. Agr. Coll., Amherst. *Glass Container* 8, No. 2, 11-20(1928).—Methods of manuf. including formulas are given. Canned apple sauce is thought to offer excellent possibilities for off-grade and cull apple utilization. C. R. FELLERS

Principles for the evaluation of marmalades, confections, jams and jellies. A. BEYTHIEN. *Z. Untersuch. Lebensm.* 56, 80-106(1928); cf. *C. A.* 22, 1634.—Definitions and proposed standards in detail for these food products are given. These standards were agreed upon by a Commission composed of the Assocn. of German Food Chemists and representatives of the industries involved. The addn. of 0.3% pectin (calcd. as Ca pectate) to fruit jams and marmalades and 0.6% to fruit jellies is proposed without the necessity of declaring the use of pectin on the label. The use of glucose in amts. up to 25% in jams, jellies and marmalades, with label declaration, is permitted. Added color must be declared but not small quantities of added acids. C. R. F.

Chemical analysis of haw jam. GY. BILUSKA. *Kísérlet Közlemények* 30, 570 (1927).—Several analyses of haw jams were made in order to get data for judging adulterations. An adulteration by gourd-jam (*Cucurbita pepo*) can be detd. by finding high cane sugar content, low acidity and low ash-alkalinity. An adulteration with both gourd-jam and tomato can only be detd. by microscopic examn. S. S. DE F.

California ripe olives. History, research, technology of processing, grading and marketing. W. V. CRUESS. Univ. Calif., Berkeley. *Food Industries* 1, 170-4(1929).—Following the lactic fermentation in brine a 2.5 to 3% NaOH soln. is used to destroy the natural bitterness of the olives. Several treatments with successive bleachings are required for the alkali to penetrate the flesh to the pit. The cause of the bitterness in olives may be a glucoside about which little is known. For canning in either tin or glass containers, the usual process is 60 min. at a temp. of 240° F. in a steam retort, thus precluding danger of *Cl. botulinus* survival in the canned product. C. R. F.

Microscopic pollen analysis of Bohemian honeys. ANNALIESE NIETHAMMER Deut. Tech. Hochschule, Prague. *Z. Untersuch. Lebensm.* 50, 467-70(1928).—The kinds of pollen found in the comb of honey samples obtained in the various sections of Bohemia are enumerated. Among the principal honey-producing plants are lotus, sinapis, onobrychis, trifolium, ranunculus, salvia and geranium. C. R. F.

Extension of the analysis of honey. J. STITZ. *Kísérlet Közlemények* 30, 524 (1927).—A color scale is proposed to judge colors of honeys and another one to state the reaction of diastatic enzymes of the honey. A table gives water content, dry matter and original d. on basis of d. of honey dild. 1:3 with water. In detg. the kinds of honeys, their ash content should be analyzed. From the ash compn. can be detd. the kind of flower from which honey was made. S. S. DE FINÁLY

The adulteration of coffee. A. DUTRA. Brazilian Embassy, Paris. *Ann. fals.* 21, 539-41(1928).—A brief outline of the chief forms of adulteration of coffee and of the measures which should be taken to repress them. A. PAPINEAU-COUTURE

Determination of caffeine in tea. (MRS.) S. GOBERT. Lab. Central du Service de la Répression des Fraudes, Paris. *Ann. fals.* 21, 517-8(1928); cf. *C. A.* 21, 969.—The method previously described for the detn. of caffeine in coffee has been adapted for the analysis of tea, as follows: to 3 g. of finely powdered tea in a glass centrifuge tube add 4 cc. of 22° Bé. NH₄OH, let stand 30 min. with occasional shaking, ext. with four 25-cc. portions of AcOEt, shaking 10 min. each time, centrifuge 3-7 min., decant the solvent, distil carefully, dry the residue 30 min. at 100°, ext. twice with 50, and once with 25 cc. boiling H₂O, letting each ext. stand a few min. on the water bath, cool the combined exts., add 15 cc. 1% KMnO₄, let stand 15 min., ppt. with 12-vol. H₂O₂ contg. 1% AcOH, let stand 15 min. on the water bath, filter, wash, evap. the filtrate to dryness, heat 15 min. at 100°, ext. with three 25-cc. portions of hot CHCl₃, filter into a tared Erlenmeyer flask, evap. carefully, dry 30 min. at 100° and 6 hrs. in a desiccator. *Det. H₂O* by drying 5 g. for 4 hrs. at not over 100°. A. PAPINEAU-COUTURE

Comparative investigations on the detection of inadmissible amounts of cacao shells in cacao and cacao products. J. GROSSFELD AND A. SIMMER. Food Res. Inst., Berlin. *Z. Untersuch. Lebensm.* 55, 553-9(1928).—A comparison of the crude fiber and microscopic methods gives fairly consistent results in the detection of excess shell in cacao. C. R. F.

The lauric acid content of coconut and palm-kernel oils as a means of detecting these oils in food fat mixtures. J. GROSSFELD. *Z. Untersuch. Lebensm.* 53, 529-53 (1928).—By studying a large no. of mixts. of oils contg. coconut or palm-kernel oils

in varying proportions, formulas are proposed whereby the approx. amts. of these oils in fat mixts. can be quantitatively detd. C. R. F.

Bacteriological field studies in canning. Thermophilic contamination in the canning of peas and corn. E. J. CAMERON, C. C. WILLIAMS AND R. J. THOMPSON. Nat. Canners Assn. Wash., D. C., *Bull.* 251, 1-56(1928).—By the use of a motorized field lab., many canners' problems relating largely to bacterial food spoilage were studied. The findings of James (C. A. 19, 2711) that the usual spoilage in canned corn results from holding the raw product before canning, are discredited. Heat-resistant, thermophilic, flat-sour and anaerobic, sulfide-producing bacteria found in sugar, manure and rarely soil, contaminate wooden tanks and equipment in canneries, thus infecting the foods before canning. Not all of the cells are destroyed during the final processing by heat and unless the food is promptly cooled to below approx. 35°, spoilage may result. C. R. F.

Heat transfer determinants. II. K. L. FORD AND A. G. OSBORNE. Glass Container Assn., N. Y. *Glass Container* 8, No. 2, 5-48(1928); cf. C. A. 23, 449. Typical heat transfer graphs using cider and sirups in glass containers show that agitation greatly accelerates the penetration of heat to all parts of the container. It is recommended that bottles be placed on their sides during pasteurization. The use of high initial water bath temps. during the first part of the process decreases the total heat treatment and results in a distinct improvement in the flavor of pasteurized fruit juices. C. R. FELLERS

Detoxicated cottonseed meal. PAUL MENAUL. *Oil and Fat Ind.* 5, 333-5(1928).—Pure gossypol was prepd. by extg. cottonseed meal with ether, concg. the soln. pptg. the gossypol by petroleum ether, washing with the same, redissolving in ether, repptg. and repeating this procedure 5 times. This product decomposed at 100° into H₂O and an insol. reddish brown caramel. This decompn. does not take place unless the gossypol has been removed from the glands and exposed to the air. The method for detoxicating the cottonseed meal comprises raising the H₂O content to about 40%, then heating to above 100° preferably with steam under pressure, which causes a swelling of the meal tissue, forcing the gossypol to exude to the outside where it decomposes. Feeding trials covering 3 years with this detoxicated cottonseed meal failed to disclose a trace of toxicity, even among young animals receiving a ration contg. as much as 30% non-toxic meal. F. SCHERUBEL

Soil and pasture in relation to pining and bush-sickness of sheep. R. E. R. GRIMMETT AND BEATRICE W. SIMPSON. *Trans. Proc. New Zealand Inst.* 59, 395-403 (1928). Scottish pining soil and New Zealand bush-sick soil have similar mech. compns. The pining soil has more available P, K and Mg, but less Ca. The citric-sol. Fe is low in both types. The herbage of pining pasture contained Fe about equal to that of non pining pasture but much less Mn. The pining and bush-sick diseases of sheep are characterized by pronounced anemia. Further study is necessary to det. the relation, if any, between the deficiencies of Ca and Fe and the excess of Mn in the pasture herbage, and the incidence of the disease. (Cf. following abstr.). L. W. R.

Mineral content of pastures. Lime deficiency in King Country soils, and the effect on plant and animal. B. C. ASTON. *Proc. Trans. New Zealand Inst.* 59, 406-14 (1928), cf. C. A. 22, 4182; 23, 462 and preceding abstr.—Analyses of 27 soil samples and the ash of 11 samples of pasture herbage showed a deficiency in Ca. Feeding expts. with sheep in these pastures proved that their food was deficient in Ca. Sheep suffering from a deficiency of Ca in their food recovered rapidly on the pasturage of well-limed soils. The liberal liming of soils in this region is essential to successful sheep husbandry. L. W. RIGGS

Microchemical reactions for caffeine (WAGENAAR) 17. Cylindrical filtering apparatus for milk (U. S. pat. 1,693,741) 1. Apparatus for drying cereals (Brit. pat. 290,776) 1. Apparatus for pasteurizing and cooling milk (Brit. pat. 290,615) 1. Apparatus for sterilizing milk in containers carried in perforated baskets (Brit. pat. 290,555) 1. Pasteurizing milk (U. S. pat. 1,695,300) 4. Fermentation [products for food for live stock] (Swiss pat. 126,986) 16. Preserving fruit and vegetables (Austrian pat. 109,411) 13.

VIVIANI, C. *L'uovo di gallina (processi di conservazione e commercio)*. 2nd ed. Milan: Ulrico Hoepli. 406 pp. L. 22.50. Reviewed in *Chimie et industrie* 20, 800 (1928).

WALKER TISDALE, C. J., and WOODNUTT, WALTER E.: *Practical Cheesemaking*. Revised. London: George Allen & Unwin, Ltd. 204 pp. 4s. 6d., net. Reviewed in *J. Ministry Agr.* 35, 689(1928).

Bread. BRITISH ARKADY CO., LTD., R. WHYMPER and H. HEWITT. Brit. 289,978, Feb. 12, 1927. A compn. for subsequent incorporation into flour or dough for bread-making is prepd. from yeast and an enzyme-producing fungus such as *Aspergillus oryzae* or *Penicillium*.

Curing meat. M. L. BACON. Brit. 290,728, Nov. 18, 1927. Beef, mutton, bacon, hams, tongues or other kinds of meat are placed in an autoclave which is then evacuated (suitably to about 0.5-in. Hg pressure). Dry or liquid curing material is then introduced and evacuation is continued and maintained for the rest of the curing process which may be completed in 60-70 hrs. As a finishing step, pressure may be employed for a short period such as 1 hr. An app. is described.

Preserving fish, etc. D. A. HANSEN. Brit. 290,292, May 12, 1927. Fish or livers, roes or other parts of fish are treated with a soln. contg. borax together with an equal or smaller quantity of an acid preservative such as boric or salicylic acid.

Utilizing meat-pickling brine. EML SCHEITLIN. Can. 285,135, Nov. 27, 1928. To 100 l. pickle resulting from the pickling of meat is gradually added dil. acid, for instance 10% guaiacolsulfonic acid, until no further solid is pptd. The ppt. is then sepd. from the liquor by filtration and dried, preferably *in vacuo*. The dry product is light-colored, and is closely related to the press juice obtained by the pressing out of meat. It is valuable for *pharmaceutical purposes*.

Soluble gum composition. ALBERT LEO. Can. 284,906, Nov. 20, 1928. A sol. gum compn. contains 100 parts pure standardized citrus pectin, 19 parts of HNaCO_3 , 14 parts of citric acid. This compn. is used in making jams and jellies.

Artificial coffee aroma. HERMANN STAUDINGER and THADEUS REICHSTEIN (to Internationale Nahrungs- und Genussmittel A.-G.). U. S. 1,696,419, Dec. 25. Fugitive mercaptans and sulfides are mixed and reacted on by O-contg., N-contg. and other compds. present in natural coffee aroma.

Chocolate. HERMANN STAUB, JR., and CHARLES EGGSTEIN. Swiss 126,813, April 6, 1927. Before or during the milling of the chocolate mass, an alkali carbonate and a substance contg. CO_2H_2 are stirred in.

Food from bananas. C. JAEGER. Brit. 290,195, May 9, 1927. A product rich in vitamins is prepd. by treating thin layers of dried bananas with ultra-violet rays

Conditioning raisins or other dried fruits. SUN-MAID RAISINS GROWER OF CALIF. Brit. 289,722, Nov. 11, 1927. Dried fruits such as raisins are treated with steam and ozone or ozonized air and then, while protected from the air, are quickly dried preferably on a shaking heated metal grill at a temp. of about 400° and vapors are exhausted from the drying chamber. A larger proportion of steam is first used and then a larger proportion of ozone.

Composition for treating fruits and vegetables. HENRY G. ZELLNER (to Zeltrocide Chemical Corp.). U. S. 1,696,704, Dec. 25. A compn. for treating citrus fruits or other fresh fruits or vegetables to prevent decay is formed from borax 100, NaHCO_3 20, Na_2CO_3 18, KMnO_4 2 and CuSO_4 1.5 parts. U. S. 1,696,703 specifies a mixt. suitable for treating citrus fruits comprising borax 100, NaHCO_3 20 and KMnO_4 2 parts, for preventing decay from blue mold, green mold, stem end rot and anthracnose.

Curing ripe olives. GEORGE S. HEWETT. U. S. 1,695,489, Dec. 18. Olives from which the natural bitterness has been removed (suitably by immersion in dil. NaCl soln.) are immersed in a boiling brine and after removal from the brine are heated to a high temp. (suitably about 230°) until crisp.

Apparatus for evacuating and sealing containers for cheese or other perishable food products. D. ROBERTSON. Brit. 290,198, May 9, 1927.

Animal food. HARRY M. WEBER (to Ellis-Foster Co.). U. S. 1,695,567, Dec. 18. A baked and air-dried dog biscuit enriched in vitamins may be formed of ingredients such as wheat flour, rice bran, cod-liver oil, salt, malt ext., glucose, milk and water and has a glazed hard surface substantially free from fissures so that the vitamin content is preserved from oxidation.

Stock food. HOWARD F. WEISS (to Wood Conversion Co.). U. S. 1,695,445, Dec. 18. A stock food is specified comprising the composite sugar products of hydrolysis of western larch wood, including galactose, in a concd. state and in admixt. with finely divided hydrolyzed larch wood residues.

Apparatus and fermentation method of treating hay, straw, clover or other farm "roughage" to prepare it for stock feed. CHARLES R. MABEE (to Mabee Patents Corp). U. S. 1,693,611-2, Dec. 4.

13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

The relation of science to industry. ROBERT A. MILLIKAN. *Science* 69, 27-31 (1929); *Nela Bull.* 16, 13-5(1929).—An address. C. G. F.

Contributions of chemistry to industry. II. WALTER A. SCHMIDT. *J. Chem. Education* 5, 1603-14(1928); cf. *C. A.* 23, 221. E. H.

Industrial changes due to chemistry. EDWARD R. WEIDLEIN. *Am. J. Pharm.* 100, 765-91(1928). W. G. GAESSLER

Studies in chemical patent procedure. I. Hall patents for aluminum production. LLOYD VAN DOREN. *Ind. Eng. Chem.* 21, 120-4(1929). E. H.

Chemical engineering education and research in Great Britain. W. E. GIBBS. *Chemistry and Industry* 47, 1304-7(1928); cf. *C. A.* 23, 653. E. H.

Importance of colloid-chemical and colloid-physical research in future problems of the chemical industry. E. A. HAUSER. *Ind. Eng. Chem.* 21, 102-4(1929). E. H.

Business organization and system in repair shops of the chemical industries. ADOLF JAKOB. *Chem.-Ztg.* 52, 887(1928).—Suggestions are made for increasing efficiency in the conduct of repair shops. W. C. EBAUGH

The Mutual Relief Association (Notgemeinschaft) of German Science and Chemistry. ALFRED STOCK. *Z. angew. Chem.* 41, 1233-4(1928).—In 1920 there arose an organization to ward off the threatened collapse of German science and research. By pooling interests and resources this end was attained. Under the direct control of scientists themselves, money from private and public sources was received; grants were made to institutions and individuals, and materials, app., books, necessary expenses, etc., provided. The "Notgemeinschaft" has developed into an indispensable factor in German intellectual life. W. C. EBAUGH

Nomenclature. G. E. CARLETON AND F. EDER, et al. *Bull.-Tech. Series*. Compressed Gas Manufs. Assoc., T. S. 331-5(1928).—A report by the sub-committee on nomenclature adopted by the cylinder-testing committee of the Association, giving symbols to be used in calcs. of cylinder problems, with their meanings. They have been made to agree, as far as feasible, with those used in engineering practice. AUSTIN M. PATTERSON

Gas reactions in hot-cold vessels in the large-scale technic. HUGO ANDRIESENS. *Chem.-Ztg.* 52, 941-2(1928).—Enumeration of the industrial processes carried out by that method. ALBERT L. HENNE

Extraction of krypton and xenon from air and from gases dissolved in water. GEORGES CLAUDE. *Compt. rend.* 187, 581-5(1928).—The recovery of Kr and Xe from air in com. liquefaction of air and from gases dissolved in water is discussed. Gases taken from great depths will be examd. In the recovery from air the ratio of Kr: Ne remains the same as in the original air notwithstanding the difference in volatility. L. D. ROBERTS

Dust filtering. F. HOYER. *Chem. Rundschau* (Budapest) 5, 1-3(1928).—Two methods for dust filtration are given: (1) arrangements on the principle of rapid change of area, to ppt. small flying particles, and (2) filtration arrangements for systems either under pressure or in evacuated areas. S. S. DE FINALLY

Filtration equations for compressible sludges. A. J. V. UNDERWOOD. *J. Soc. Chem. Ind.* 47, 325-9T(1928); cf. *C. A.* 22, 127.—"The resistance of the cloth" is defined as the resistance when the cloth is coated with a small quantity of sludge. Mathematical derivations for equations of the rate of flow are made for incompressible and compressible "elastic" and "inelastic" sludges. The "scouring" effect in the filtration of heterogeneous sludges is not yet proved since the errors introduced by neglecting the resistance of the cloth lead to similar results as those by assumption of scouring. A. FLEISCHER

Theory and practice of centrifugal separation. B. L. BROADBENT. *Chem. Age* (London) 19, 435(1928).—An abstr. of a lecture on uses and types of centrifuges. G. B. TAYLOR

Generation of electricity in benzine pipes, and the maximum permissible rate of flow in tap hose and pipes. BRUNO MÜLLER. *Apparatebau* 40, 266-8(1928).—The flow should not exceed 13 ft. per sec., but there is no danger of sparks with a tension below 300 v. J. H. MOORE

Amount of condenser water used in ice plants. J. HUBER. *Wochschr. Brau.* 45, 270-2(1928).—A practical discussion with equations is given on the efficiency of different types of condensers. A. SCHULTZ

Flow constants of IG-orifices for water, oil, steam and gas. R. WITTE. Ludwigshafen am Rhein, Germany. *Z. Ver. deut. Ing.* 72, 1493-1502(1928).—A summary of some 18 years' experience in measuring the flow of liquids and gases at the Oppau and Leuna works, where hundreds of metering operations are conducted daily on the most varied materials. The present differences obtained with carefully constructed orifices of several types are used as the basis of calcs. These new calibrations were undertaken because variations of 1 to 3% in results had been obtained by using the older values, and pipe sizes used had changed so much from those employed when the older const. were measured. Results are reported for (1) water in pipes of 50 to 500 mm. diam.; (2) steam in pipes of 50 to 500 mm. diam., and under pressure of 4 to 40 atm., at the same or higher Reynolds numbers (Reynolds number, R , = pipe diam. \times velocity/kinematic viscosity); (3) viscous liquids and air in the region of smaller Reynolds numbers than with water. By the use of 51 curves and diagrams results are reported in detail. An accuracy of $\pm 0.5\%$ is attainable, if due attention is given to pipe diam. and the form of the orifice. For one and the same throttling diaphragm and for different media the mechanics is the same, but this is not the case if one changes over from one pipe size to another. From the experimentally detd. const. and their curves as given values can be found for computing the flow of gases and liquids in pipes of from 50- to 500-mm. diam.

W. C. EBAUGH

Breakdown of oil and high-tension cables. A. GYEMANT. Siemens Schuckert Werke, Gartenfeld. *Z. tech. Physik* 9, 398-404(1928).—The theory of G. on elec. breakdown due to the mech. rupture of the dielec. medium by charged material from the electrode surface with consequent breakdown channel formation is discussed further. It is assumed that gas residues on the electrodes are always present; they ionize if sufficient potential is applied, contract locally to small charged bubbles and finally overcome the cohesion resistance of the oil (or other material). Theoretical considerations on various kinds of stretching of the charged bubble lead to an approx. result for the breakdown potential $F = \sqrt{(10\pi/3)[(\gamma/a) + (2np/3)]}$ with γ the surface tension about 20, a the bubble radius of 10^{-3} , n a factor detg. the shape of the stretched bubble, depending on viscosity η possible = k/η and equaling about 0.03, p the external pressure of 10^{-6} in abs. units. For semisolid cable insulation, paper impregnated with oil, the energy necessary for the fiber sepn. is additional and $F = \sqrt{(10\pi/3)[(\gamma + 0.15K\lambda)/a + 2/3np]}$ with $K\lambda$ the energy required of about 10^2 ergs (K is elastic strength, λ of molecular dimensions). Quant. comparison with practical figures is quite satisfactory, e. g., for $\gamma = 20$ dynes per cm., $a = 10^{-3}$, F is found 150 kv. For "moist" oils a different mechanism of breakdown is obviously required; the theory holds only for dry oils. The temp. influence on F can be found from γ and a as functions of t and gives approx. F^2 proportional to $1 - 0.005 t$. Equally good results are found for the pressure influence on F and for the viscosity. From the theory it is explained why F for treated paper is higher than for paper or oil themselves, because of the additive energy effects. A further approximation for F gives $F^2 = (10\pi/3)[(\gamma + 0.15 K\lambda)/a]$. More study of λ is required; it depends on the fiber size; γ and $0.15 K\lambda$ are of the same order of magnitude.

B. J. C. VAN DER HOEVEN

Ultra-violet light and its application, with special regard to the tanning industry. GIACINTO BALDRACCO. Nat. Inst. for the Leather Ind., Turin. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 6, 244-58(1928).—The elementary facts are given on the character of ultra-violet light, and its application in science and industry is discussed. Tanning exts., when irradiated with ultra-violet rays, can be distinguished by the difference in fluorescence.

G. SCHWOCH

Utilization of volcanic power. A. RITTMANN. *Naturwissenschaften* 16, 797-800 (1928).—Efforts in Italy, California and the Dutch Indies to utilize high-pressure steam from fumaroles are described. A purification process has to be employed to eliminate the corrosive gases. The steam collected is of up to 14 atm. pressure. B. J. C. v. d. H.

The electric insulator industry in Germany. SCHUL OTTO. *Rev. gén. mat. plastiques* 4, 719-25(1928).—An outline of developments in this industry in Germany since the war, particularly as regards the manuf. of papers impregnated with artificial resins, etc.

A. PAPINEAU-COUTURE

Tests for molded synthetic resin insulators. H. S. *Rev. gén. mat. plastiques* 4, 730-2(1928).—An outline of the methods recommended by the Union des Syndicates de l'Electricité and the French public services for the detn. of surface resistance, transverse resistance, dielec. resistance, difference in phase angle, dielec. const., tensile strength, bending strength, compressive strength, hardness, resistance to shock, effects of water and heat treatment.

A. PAPINEAU-COUTURE

Effects of high temperatures on impregnated and non-impregnated in

J. MÜLLER AND C. H. MÖLLERING. *Leipzig Monatschr. Textil. Ind.* 43, 33. Cotton tapes, non-impregnated and impregnated (I) with yellow linseed oil insulation varnish in naphtha, (II) with "Endolack," a prepn. contg. rosin dissolved in alc., and (III) with "Votalack," a prepn. of stearin and asphalt dissolved in ligroin, were given phys. tests before and after heating for prolonged periods in an oven. The effect of 48 hrs.' heating at 150° on the non-impregnated material was a slight gain in strength. Each of the treated tapes was stronger before heating than the raw material, and tapes treated with I and III showed a further gain in strength on heating. The rosin prepn. (II) apparently caused a slight loss in strength on heating, possibly due to phys. changes in the impregnating material. Heating for 96 hrs. at 150° caused a small loss in strength of all the tapes, with the greatest loss shown by the tape treated with II. Tests made at 135° showed general stability for all the tapes except those prepd. with II. Another series of tests with III, "Votalack," showed no loss in strength in 96 hrs.' heating at 100° but did show losses of 4-5% at 130°. Tests made by heating in an atm. of N₂ gave substantially similar results.

E. R. CLARK

Physiological factors of mine ventilation. R. R. SAYERS. *Bur. Mines, Circ.* No. 6089, 16 pp. (1928).—Data are presented in which recent investigations on the physiol. effects accompanying silicosis and experienced in the presence of high temps. and poisonous gases peculiar to mines, are given consideration. The improvement in health which ensues when siliceous dust is reduced to 5 g. per cu. m., is emphasized. The beneficial effects of air-conditioning in mines is stressed, and figures are furnished showing the physiol. effect of high temps. upon workers. The toxicol. symptoms of lethal gases accumulating in mines and other insufficiently ventilated sources have been studied and blood tests have been made. The employment of a recorder for CO is described, with results obtained by use of this device. The treatment of CO poisoning is discussed. The work is comprehensive and references are given.

FREDERICK G. GERMUTH

Occupational diseases caused by the handling of hydrocarbons and their principal derivatives. DUVOIR. *Ann. méd. légale criminal. police sci.* 8, 453-501 (1928).—A review dealing with intoxication by means of benzene and petroleum hydrocarbons and their Cl and NO₂ derivs., PhNH₂ and its derivs., pitches, tars and bitumens, more particularly from the medico-legal standpoint.

A. PAPINEAU-COUTURE

Some queries about respiratory disease in industry. R. M. HUTTON. Ontario Dept. of Health, Toronto, Canada. *J. Ind. Hyg* 10, 297-304 (1928).—Analysis of data to answer these queries shows that dust is the determining factor; that with some exceptions the metal dust causes high mortality and that brass and iron foundrymen and especially the grinders in the cutlery trades have the highest mortality of all. The organic dust trades do not show similar effects.

H. C. HAMILTON

Bituminous compositions for electrical insulation (Brit. pat. 290,886) 22. Formation of porous castings from carbamide-formaldehyde condensation products [for insulators] (Swiss pat. 120, 827) 18.

Gas mixtures. UNION PROCESSES, INC. Swiss 126,814, Sept. 6, 1926. A gas mixt. is resolved into its components by a liquid which absorbs some in larger quantities than others.

Separation of gas mixtures. MATHIAS FRÄNKEL. Swiss 126,906, Jan. 12, 1926. A system of cold chambers through which the gas is passed is described.

Cooling, liquefaction and separation of gases. ARTHUR SELIGMANN. Ger. 466,133, Oct. 30, 1924. See U. S. 1,573,752 (*C. A.* 20, 1478).

Apparatus and system for separating methane from natural gas or other gases from mixtures by regulated liquefaction. WM. S. BOWEN. U. S. 1,694,308, Dec. 4.

Distillation and evaporation. I. G. FARBENIND. A.-G. Fr. 640,710, Sept. 9,

1927. Substances such as tar oils or salts which are difficult to distil or evap. are projected by means of a disk rotating at a high speed against the heated sides of a distn. vessel so that they vaporize in thin layers. The disk may be mounted obliquely and rotate on 2 axes. Substances of low b. p. may be added to the liquid to be distd.

Purification of oils. AKTIEN-GESELLSCHAFT FÜR KOHLENSAURE-INDUSTRIE and ERNST B. AUERBACH. Fr. 640,022, Aug. 25, 1927. See Brit. 285,064 (C. A. 22, 4678).

Solvents and emulsifying agents. FRIEDRICH POSPIECH. Can. 284,847, Nov. 13, 1928. Solvents and emulsifying agents for liquid and solid substances which are themselves insol. in water, as for instance oils, fats, mineral oils, hydrocarbons, waxes and the like, are obtained if aromatic or aliphatic alcs. which are difficultly sol. or insol. in water, are treated either by themselves or in combination with hydrocarbons, with the alkali salts of fatty acids, sulfo fatty acids, or naphthenic acids, also with sulfonates or aromatic or hydroaromatic hydrocarbons or their derivs. as well as also with the corresponding free acids.

Concentrating by freezing. SOCIÉTÉ DES ÉTABLISSEMENTS DAUBRON. Fr. 640,857, Feb. 22, 1927. In concg. a liquid by freezing out the water contained therein, the liquid is filtered from the snow crystals through a wall at the base, the upper portion of the snow being gradually heated so that water replaces the liquid and the filtering can continue.

Delivering liquids in measured quantities. SOC. HARDOLL ANCIENS ÉTABLISSEMENTS HARIVEAU & DOLMIER & RENÉ PORTE & CIE RÉUNIES. Austrian 109,367, Dec. 15, 1927. Constructional improvements are described in the means for operating the control valve of a device of the type comprising 2 alternately filled and emptied measuring vessels.

Drying and transporting materials. INTERNATIONAL CEMENT-GUN COMPANY G. M. B. H. Fr. 640,424, Sept. 3, 1927. Substances such as NH_4Cl are caused to descend from one level to the next in a vessel under pressure in which leveling scrapers are caused to rotate and meets a counter current of warm air under pressure to which neutralizing acid gases may be added.

Working medium for vapor engines. SIEMENS-SCHUCKERTWERKE A.-G. (Wilhelm Gumz, inventor). Ger. 467,664, Mar. 11, 1927. α -Methylnaphthalene, alone or mixed with β -methylnaphthalene, is used.

Method for preheating water by steam to a predetermined temperature. I. G. NORKIN. Russ. 4655, Feb. 29, 1928.

Grading materials. KRUPP, F., GRUSONWERK A.-G. Fr. 640,624, Aug. 12, 1927. Materials such as crude mining products are graded according to their phys. properties by submitting the material, piece by piece, to radiant energy such as electromagnetic waves, heat rays, infra-red, ultra-violet, Röntgen or cathode rays. The rays emitted from the piece by reflection are directed towards a wave detector, thermoelectric element, etc., which controls an app. for directing the pieces in different directions.

Sublimation of sulfur and other substances. J. THAME. Brit. 290,849, June 23, 1927. In effecting sublimation of S or other volatilizable substances, the substance is introduced in small quantities into a vaporizing retort and the vapor is conveyed by suction or by a current of an inert gas to a cooled condensing chamber fitted with scrapers to remove the deposit from its walls and to convey it to discharge orifices which may be provided with air-locks. Various details of app. are described.

Coating wire or bands, etc. INTERNATIONAL GENERAL ELECTRIC CO. Brit. 290,252, May 11, 1927. A wire, band or the like being coated is drawn through a receptacle contg. roughened balls which may be formed of glass, while the coating material is caused to flow through the receptacle (preferably in opposite direction to that in which the wire is drawn). The process is suitable for enameling elec. conductors.

Preventing formation of hard incrustations from liquids, particularly boiler incrustation. ENGELBERT JUNGBLODT. Ger. 467,625, July 28, 1925. The liquids are subjected to the action of radioactive substances during heating, so that the deposits sep. in slimy form. E. g., radioactive substances may be applied to the surface to be protected.

Removing cores from a series of vertical molded hollow bodies. ALFRED PRETSCH. Ger. 466,149, Aug. 3, 1926. The cores are joined at their ends by a bridge piece and are withdrawn from the molds, which stand on a common base, by suitable gripping mechanism.

Recovery of fibers from waste liquids. ADOLF M. R. KARLSTRÖM. Fr. 640,568, Sept. 6, 1927. Fibers such as those in waste wood-pulping liquids are recovered by aspirating the liquid mixed with air or gas upwardly into a conical vessel in such a way

that the fiber is carried to the top because of the bubbles of air and is there collected, while the liquid is collected at the base.

Preserving cut flowers, fruit and vegetables. MARIA GARZULY. Austrian 100,411, Dec. 15, 1927. The flowers, etc., are kept in a 0.24 *N* soln. of glucose prior to refrigeration.

Disperse systems. CARL A. AGTHE (to J. R. Geigy S. A.). U. S. 1,696,374, Dec. 25. Material to be emulsified by dispersion such as fish oil, pitch or cresol is mixed with both sulfite cellulose lye and colloidal silica.

Refrigerating apparatus. FRANZ GÄDEKE and WILHELM HENNING. Fr. 640,256, Aug. 30, 1927.

Refrigerating apparatus. HANS HAAGER. Fr. 640,310, Aug. 31, 1927.

Refrigeration system and apparatus (utilizing shavings of solidified carbon dioxide to effect heat transfer through a sheet metal partition). CASSIUS C. PALMER. U. S. 1,695,292, Dec. 18. An app. is described.

Refrigerating system of the absorption type. ZEBULON WIRT. U. S. 1,694,156, Dec. 4.

Continuous-cycle refrigerating apparatus of the absorption type. ELECTROLUX, LTD. Brit. 290,207, July 26, 1926. The inert gas flowing from the absorber and the liquefied refrigerant flowing from the condenser to the evaporator are subjected in a "surface app." to the cooling action of the mixt. of refrigerant and inert gas flowing from the evaporator to the absorber.

Refrigerating system of the constant-pressure absorption type. BALTZAR C. VON PLATEN and CARL G. MUNTERS (to Electrolux Servel Corp.). U. S. 1,693,970, Dec. 4.

Refrigerating system of the reversing absorption type. G. MANSIO (to G. Beaumont) Brit. 290,585, May 13, 1927. The generator-absorber is charged with a soln. of NH_4NO_3 0.25, $\text{Ca}(\text{NO}_3)_2$ 0.7 and water 1 part. An app. is described.

Device for reversing vapor flow in absorption refrigerators. GASWERKSBAU- und MASCHINEN-FABRIKS A.-G. FRANZ MANOSCHEK. Austrian 109,216, Nov. 15, 1927. Constructional details.

Refrigerating system of the compression type. CLAUDE C. VAN NUYS (to Air Reduction Co.). U. S. 1,696,558, Dec. 25.

Refrigerating apparatus of the compression type. A.-G. BROWN, BOVERI, ET CIE. Brit. 290,216, May 9, 1927.

Refrigerating apparatus of the compression type. W. DUNKERLEY. Brit. 290,426, April 19, 1927.

Compression-type refrigerating system for freezing out constituents of oils, wines, etc. M. HIRSCH. Brit. 290,305, May 12, 1927. The app. is also suitable for freezing *peat* to facilitate subsequent drying.

Cable insulation, etc. TELEGRAPH CONDENSER CO., LTD., and S. G. BROWN. Brit. 290,699, Jan. 10, 1927. Spirally rolled condensers and the insulation of cables are divided into a plurality of layers by an isolated conducting sheet or sheets such that the voltage across each layer is below the level (about 300 v. for oil-satd. paper) at which breakdown may occur because of the ionizing action of the voltage assocd. with the air trapped in the material. The isolated layers may comprise "vegetable black" or other C.

Heat- and sound-insulation composition. P. H. USSING. Brit. 289,830, May 3, 1927. Straw is softened with NaOH, milk of lime or the like, washed and pounded and then treated with an Al salt and a sol. soap to ppt. an Al soap (preferably the stearate or resinate) on the fiber. The material is then formed into sheets on a wire screen, dried and pressed.

Apparatus for coating webs of fibrous material with mica for electric insulation. EMIL HASELEY. U. S. 1,696,397, Dec. 25.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Analyses of the waters of the Salt Creek field applied to underground problems. J. S. ROSS and E. A. SWENDBERG. *Am. Inst. Mining and Met. Engineers, Tech. Pub.*, No. 157, 3 17(1928).—The compn. of water in wells drilled for oil is of importance in detg. the source of the water and the relations of the well to adjacent wells and formations. In the Salt Creek field, Wyoming, a fairly high degree of efficiency has been attained in the control of field operations by utilizing the information afforded by water

analysis. Extensive drilling operations may be avoided by a knowledge of the source of the water encountered.

L. W. RIGGS

Portable water purification in North America with special reference to chlorination. ORNSTEIN. *Gas u. Wasserfach* 71, 1081-3(1928).—A review of the necessity for chlorination and of the methods used. The possibility of destroying excess Cl with SO_2 is noted. O. notes that he installed the first chlorination equipment at Niagara in 1912. Since that time no corrosion phenomena due to chlorination have been noted. The chlorination app. itself has had no repairs outside of the replacement of a low-pressure manometer.

R. W. RYAN

Significance of the B. coli test for ground water and other sources of potable water. M. NEISSER. *Gas u. Wasserfach* 71, 1105-7(1928); cf. C. A. 22, 470.—A discussion of the significance of the usual tests for *B. coli* depending on indole formation. This test is of value for the individual source, provided that inspections of the source are made at least twice every week. It may be carried out by technicians and may give valuable warning, but should not be relied on to too great an extent. The danger of water contamination by men repairing breaks in mains is pointed out.

R. W. RYAN

The determination of the bacterial count of water. W. PLUCKER and W. BARTELS City Food and Res. Lab., Solingen. *Z. Untersuch. Lebensm.* 55, 51-60(1928).—A medium consisting of 5% gelatin and 0.75% agar gave results fully equal to those obtained with nutrient gelatin. The highest bacterial counts were obtained when the media were standardized at p_{H} 7.

C. R. F.

Boiler-feed water treatment advances toward status of exact science. J. A. HOLMES. *Chem. Met. Eng.* 35, 695-6(1928).—Modern equipment in the boiler plant makes desirable the use of frequent chem. tests for the control of both water treatment equipment and the condition of the water in the boiler. Simple test kits suitable for use in the boiler house itself are available.

R. E. GREENFIELD

Origin and prevention of corrosion in boilers. P. WIEGLEB. *Chem.-Ztg.* 52, 922-3(1928).—Descriptive.

ALBERT L. HENNE

Corrosion and corrosion protection as related to the chemical and physical characteristics of water. L. W. HAASE. Berlin-Dahlem. *Gas u. Wasserfach* 71, 1009-16(1928).—The modern theory of corrosion is reviewed with special attention to corrosion by CO_2 and methods for its removal. Removal of free or aggressive CO_2 is best accomplished by lime water as marble does not neutralize much of the bicarbonate acidity on account of the slight soly. of $\text{Ca}(\text{HCO}_3)_2$, while lime water forms the normal carbonate. Under favorable conditions of low salt content and temp., and with suitable mech. arrangements, spraying in air will remove all but 3 to 5 mg. of CO_2 per l. This should precede lime treatment in water containing much CO_2 . The formation of a protective coating on cast iron in the presence of O is noted unless the water was too alk. Addns. of Cl to a water disturbs the CO_2 equil. and may cause the formation of aggressive CO_2 , and should precede the lime treatment. Agents for destroying Cl form HCl, upsetting the CO_2 equil. Pure waters such as rain water have a "salt hunger" and may take up Pb. Fe oxide particles act as centers for the deposition of Ca carbonate from water treated with lime and supersatd. with CaCO_3 . High salt content increases the apparent soly. of the CaCO_3 , thus preventing the formation of a coating. Treated waters form more adherent coatings than natural waters because of the formation of larger crystals of CaCO_3 . The addn. of lime water to waters contg. CO_2 has satisfactorily reduced corrosion.

R. W. RYAN

Tests of the Remscheid system for protecting pipe. THIESING and L. W. HAASE. Preuss. Land. für Wasser-, Boden-, und Luft-Hygiene, Berlin-Dahlem. *Gas u. Wasserfach* 71, 961-4, 988-95(1928).—Very complete tests were made of the Bücher system for protecting iron pipes from corrosion by water contg. excessive amts. of CO_2 . Sufficient lime water prepd. from hydrated lime was added to convert all of the CO_2 and bicarbonate to carbonate. In the presence of O a protective layer was quickly formed. After the initial period, in which an excess of lime was used, the hardness of the water was increased only 0.5 mg. CaO per 100 cc. H_2O . Such coatings are formed on cast iron, zinc or lead but on steel the protective coating is only formed in electronegative places. The Fe content of the treated water from various parts of the system averaged less than the untreated water and the taste, odor and color of the water was satisfactory.

R. W. RYAN

New sewage works, Chesterfield (England). S. THORNHILL. *Munic. Eng. Sanit. Record* 81, 506(1928).—The total area drained is 8468 acres. The detritus tanks hold 84,000 gal. Heavy solids are removed by mech. dredgers. The sewage is then screened, where mech. rakes remove the garbage and floating matter. It passes through a narrow 800-ft. channel, provided with a weir for 3 times dry weather flow to 9 pre-

liminary settling tanks, total capacity 375,000 gal., where most of the remaining solids are removed. The 3 aeration tanks are each 242 by 87 ft. divided into 14 longitudinal channels and have a total capacity of $1\frac{1}{2}$ million gal. at 4 ft. depth. The sewage is agitated by 10 ft. paddle wheels. The sludge from the final settling tanks is pumped back to the aeration tanks for recirculation. The 39 sludge beds (sludge lagoons), total area approx. 16,000 sq. yd., are allowed 1 hr. settlement. The top water is drawn off to the sludge level, while draining, by means of sluice boxes, and the sludge allowed to air-dry.

C. H. BADGER

Sewage purification plant at Sedgley (England). A. E. DICKS. *Munic. Eng. Sanit. Record* 81, 467(1928).—Sewage received at the Beacon Hills disposal works in detritus tanks is screened before exit. Up to 3 times dry weather flow is taken to 3 sedimentation tanks, then to dosing tanks supplying 4 bacterial filter beds made of cold blast slag, each 60 ft. diam. with revolving pipe arm sprinklers, underdraining to a central well. The humus in the filtrate settles in 2 humus tanks, the effluent going into Tipton Brook. Between 3 and 6 times dry weather flow goes to storm tanks, over 6 times dry weather flow directly to the brook. Heavy settling from the detritus tanks is buried. Sludge is air-dried and sold. Humus is dug into land. The Upper Gornal Works and Lower Gornal Works are similar in equipment. Estn. of cost works is £104,200.

C. H. BADGER

Sewage-treatment works of the Sanitary District of Chicago. F. W. MOHLMAN. *Chem. Bull. (Chicago)* 15, 359-61(1928).—The sewage-treatment works of Chicago comprise 3 small Imhoff-tank-trickling filter plants at Morton Grove, Glenview, and Northbrook; the Des Plaines River activated-sludge plant for 60,000 population; the Calumet Imhoff-tank plant for 225,000 population; the North Side activated-sludge plant for 800,000 population and the West Side Imhoff-tank plant for 1,850,000. The Des Plaines and Calumet plants have included large exptl. units for research on sludge drying, handling and secondary sewage treatment. Excess activated sludge from the North Side plant is pumped to the West Side plant where it will be digested with fresh solids in the Imhoff tanks. The West Side plant is now under contract and will be in operation by 1930.

W. D. HATFIELD

Design of sludge-digestion tanks. RICHARD H. GOULD. *Proc. Am. Soc. Civil Eng.* 54, Pt. 1, 2655-65(1928).—After a brief review of the development of sep. sludge digestion, and the recent work on temp. and reaction control, a description is given of some existing sludge-digestion tanks and 6 new sep. sludge-digestion tanks which are utilizing the recent data on capacity, gas collection, temp., reaction control and stirring or recirculating devices.

W. D. HATFIELD

Submerged contact aerators for sewage treatment. KARL IMHOFF. *Surveyor* 74, 421(1928).—Advantages of submerged contact aerators are small area, small construction cost and simplicity, less affected by poisonous industrial wastes than the activated sludge process. Biochem. O demand by use of submerged contact aerators at 7 plants was lowered 27-69%. The quantity of air needed for this process is about 0.2 cu. ft. per gal. sewage when the detention period is from $\frac{1}{4}$ to 1 hr. The process depends on microorganisms which must be regularly removed from the contact material.

A. L. E.

Alkaline digestion of sewage grease. S. L. NEAVE AND A. M. BUSWELL. III. State Water Survey Div. *Ind. Eng. Chem.* 20, 1368-9(1928).—In the acid phase of digestion, the quantity of grease in sewage sludge decreases during anaerobic digestion, the principal products being lower fatty acids and CH_4 . Eighty lab. tests show that alk. digestion mixts. also affect the degradation of grease and soap with CH_4 production. Values between p_H 7.2 and 7.6 were maintained throughout the digestion period. The transformation of Na salts of formic, acetic, propionic, butyric, valeric and oleic acids, Ca acetate and oleate and glycerol by alk. digestion gave yields of CH_4 varying from 50 to 67%. Normally 1 g. of fatty acid undergoing decompn. required from 25 to 40 mg. of solid nitrogenous substances to supply the metabolic needs of the organisms. With the exception of formic acid and AcOH , 1 g. of fatty acid yielded approx. 1 g. of CH_4 . High temps. (37°) favor the digestion of sludge components other than grease more than grease itself.

C. R. F.

Dissolved-oxygen absorption test. III. E. A. COOPER AND S. D. NICHOLAS. *J. Soc. Chem. Ind.* 47, 320-2T(1928); cf. *C. A.* 21, 2520; 22, 472.—Additional expts. confirm the accelerating effect of Na permolybdate solns. on the rate of dissolved-oxygen absorption by sewage effluent. Increased O absorption is due to stimulated bacterial activity and to direct chem. oxidation induced by the permolybdate. Carbohydrates, glycine, and sometimes NH_4 salts undergo oxidation in aq. soln. in the presence of the permolybdate activator. Fatty acids and urea are unaffected. The active substance

has not yet been isolated. Permolybdate made from molybdic acid is most reliable.
EDWARD BARTOW

The development of housing areas in Dublin. P. E. MATHEWS. *Munic. Eng. Sanit. Record* 81, 545(1928).—Condemnation procedure is described. A water main and an elec. cable are laid in each pathway, crossing under the carriage way at the junction of roads. Sewers are also laid in the pathway where the road is not about to be constructed and the positions of the house drains are unknown. A min. pressure of 30 lb. per sq. in. is provided by the water supply system which consists of a network of 4 in. diam. pipes connected to mains surrounding or running, if necessary, through the area. Sewers are built large enough to allow for an av. daily water consumption of 80 gal. per head per day together with a max. rainfall of 1 in. in 3 hrs. The smallest sewers laid are 9 in. diam. Larger sizes are seldom used except where 2 or more large areas join together. Overflow weirs can be regulated to allow not more than 3 times dry weather flow to enter the city sewers.
C. H. BADGER

Water supply in shale retorting (McKee, Parker) 22. Industrial viewpoint of the phenol waste disposal problem (Marquard) 21. Goiter and water supply (Wagner-Jauregg) 11G. Apparatus for supplying boiler feed water in regulated quantities regardless of variations in level in the supply tank (U. S. pat. 1,695,471) 1. Preventing formation of hard incrustations from liquids, particularly boiler incrustation (Ger. pat. 467,625) 13.

Purification of water. RUDOLF ADLER. Swiss 126,829, Mar. 12, 1927. Stagnant water is freed from germs by free Cl or hypochlorite and filtered through a C mixt.

Treating water with chlorine. J. MUCHKA. Brit. 290,166, May 7, 1927. Free Cl is sepd. from chlorinated water by passing it through C or carbonaceous material in an app. which may be provided with a jet reflux device similar to that of a sand filter. The app. may be lined with "bakelite" or similar material.

Nozzles for distributing water in cooling towers. P. J. ROBINSON and A. T. J. GUERITTE. Brit. 290,553, Jan. 10, 1927. Structural features.

Portable water filter with upper and lower compartments and an intervening filter plate. ALBERT E. JERVIS. U. S. 1,696,487, Dec. 25. Structural features.

Tank and associated apparatus for deactivating water by use of steel chips or turnings, etc. FRANK N. SPELLER. U. S. 1,696,106, Dec. 18. Structural features.

Artificial ferruginous mineral waters. SCHERING-KAHLBAUM A.-G. and W. SCHOELLER. Brit. 290,516, Nov. 17, 1927. Ferrous salts together with substances evolving CO₂ are dissolved in water which may have been previously boiled (or water already charged with CO₂ may be used).

Brine tank construction for water softeners. ORLAND R. SWEENEY (to Ward-Love Pump Corp.). U. S. 1,693,829, Dec. 4.

Tanks and circulating systems for softening water by chemical reagents. JAMES E. TREWHITT and PURLEY E. HILLERY (to Oakland Calif. Towel Co.). U. S. 1,696,369, Dec. 25.

Water-softening material. ELI W. SHAWEN and ALBERT C. ARNETT. U. S. 1,693,873, Dec. 4. Pieces of clay or other similar suitable porous vitreous material are treated with NaHCO₃ and acid, heated to about the temp. of fusion and while hot are treated with NaCl.

Water-softening material. ROY C. TELLIER (to R. H. Molitor). Can. 285,044, Nov. 20, 1928. A water-softening material is prepd. from natural clay, consisting essentially of Al silicate, and having in admixt. therewith a greater or less proportion of compds. of more electropositive metals such as the alkali metals K or Na, or alkali earth metals Ca or Mg (these existing as double silicates of Al or other metals). These double silicates are often zeolitic and have exchange properties. The clay is subjected to a soln. of the salt of an alkali metal; then it is dried and hardened by exposure to an atm. contg. CO₂ and at a temp. not exceeding 100°. The material is baked at a temp. of approx. 700° in the presence of an atm. contg. CO₂ and the baked material is subjected to the action of a soln. of an alkali metal.

Water-softening material. ROY C. TELLIER (to R. H. Molitor). Can. 285,045, Nov. 20, 1928. A clay contg. a substantial proportion of alk. earth is treated with a soln. contg. an alkali metal compd., dried and hardened by exposure to the atm. The hardening operation is completed by heating the material to a temp. below 100°, and in the presence of a gas relatively rich in CO₂, and baking the dried material at a temp.

not over 700°, and the baked material is treated with an aq. soln. of a saline compd. of an alkali metal.

Base-exchange compound. HAROLD J. WHEATON (to American Doucil Co.). U. S. 1,694,155, Dec. 4. A base-exchange compd. insol. in water, of great porosity and absorptive power, has a compn. between $Al_2O_3 \cdot 4 Na_2O \cdot 8 SiO_2$ and $Al_2O_3 \cdot 6 Na_2O \cdot 14 SiO_2$.

Base-exchange water softener apparatus, and "salt-pot attachment." CHESTER T. MCGILL (to Reiter Co.). U. S. 1,694,332, Dec. 4.

Apparatus for softening water by use of base-exchange substances. C. HUF-SCHMIDT. Brit. 290,064, July 5, 1927.

Apparatus for softening water by treatment with zeolites. CHARLES P. EISENHAUER. U. S. 1,695,541, Dec. 18.

Apparatus for softening water by treatment with zeolites. CHARLES P. EISENHAUER (to The Duro Co.). U. S. 1,695,542, Dec. 18.

Treatment of boiler water. RALPH E. HALL (to J. M. HOPWOOD). Can. 284,637, Nov. 6, 1928. To inhibit foaming in steam boilers an antifoaming substance such as tannic or gallic acids or their compds. or decompn. products, pyrogallol, or tartaric or citric acids or their compds. or decompn. products is maintained in the water. Other antifoaming substances include alk. earth metal, hydroxyl and an org. substance having an antifoaming effect like that of the tannins; an alcohol, particularly monohydric alcohol; a wax as beeswax, carnauba wax, Chinese insect wax, spermaceti, wool fats or lanolin; oils as sperm oil, arctic sperm oil, castor oil, shark oil, cottonseed oil, corn oil, wheat oil; cholesterol; or sterol-contg. glucosides as found in various tree barks or roots. The antifoaming substance depends on the boiler water used.

Gravity pressure system and apparatus for continuous chemical treatment of boiler water while the boiler is in operation. CHESTER T. MCGILL (to Reiter Co.). U. S. 1,694,331, Dec. 4.

Prevention of scale and corrosion in boilers. SOCIÉTÉ DES PERFECTIONNEMENTS APPLIQUÉS À L'INDUSTRIE. Fr. 640,465, Feb. 10, 1927. See Brit. 285,057 (C. A. 22, 4695).

Preventing boiler incrustation. GIULIO CRAVICH. Austrian 109,461, Dec. 15, 1927. A device is described for causing a small current of water to pass from the boiler-feed pipe through a vessel contg. a suitable reagent and to return, charged with reagent, to the main stream.

Boiler-cleaning apparatus with special alloy parts. WHITEMORE, HULBERT, WHITEMORE & BELKNAP. Brit. 290,924, Dec. 13, 1927. Part of a swivel tube which is journaled in the stationary head of a blower app. is formed of corrosion-resisting metal such as bronze contg. Cu 88 and Sn 12% or an Fe-Cr alloy contg. 12-30% Cr with C under 0.5% and in some cases Ni and Si up to 1.25-1.50%. Various structural features are specified.

Removing boiler incrustation. AUGUSTE BAUMGARTNER. Swiss 126,044, Jan. 17, 1927. The incrustation is treated with NaOH soln. and then heated by a burner to disintegrate it.

Scale remover. HERMANN KOPPLINGER. Can. 285,449, Dec. 11, 1928. Preparations for preventing scale and for removing incrustations already formed consist of mixts. of a resinous substance forming a highly disperse system with the water by reason of the presence of protective colloids, and additions substantially insol. in water but volatile with water vapors. E. g., (1) powd. colophony (100 parts) is intimately mixed with 4 parts of resin soap and 10 parts of essential oils. (2) Raw turpentine (100 parts) is mixed with 100 parts of more or less saponified pitch resin. (3) Elemi balsam of Manila (100 parts) is mixed with 10 parts of essential oils.

Screening sewage. KARL IMHOFF. U. S. 1,696,846, Dec. 25. A screen is exposed to sewage and passage of the sewage through the screen is prevented until a filter of sludge forms on the screen; sewage is then allowed to pass through the screen and the sludge is then removed from the screen. An app. is described.

Settling and filtration system for sewage disposal. GEORGE G. SMITH. U. S. 1,695,669, Dec. 18.

Plant for treatment of activated sludge. FRIEDRICH STERP and FERDINAND FRÄN-SEMIER. Ger. 466,024, Mar. 18, 1928. A settling space and an aerating space are sepd. by a movable wall.

Refuse incinerator or destructor. G. WATSON. Brit. 289,948, Feb. 3, 1927. Structural features.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

Methods for the examination of soils. J. A. PRESCOTT AND C. S. PIPER. Univ. of Adelaide, South Australia. *Australia Council Sci. Ind. Research, Pamphlet No. 8*, 52 pp.(1928).—Field methods, the prepn. of sample, mech. and chem. analyses and lab. examns. required for soil surveys are described. Under chem. analysis, which occupies the major portion of the pamphlet, are included soil carbonates, ferric oxide and titanium dioxide, Mn oxide, Fe, Al, Ca and Mg, potash and phosphoric acid, citric acid extn., replaceable bases, H_2O -sol. salts, total N, N as nitrate and NH_3 , org. C. and humus and the electrometric and colorimetric detns. of H-ion concn. E. F. SNYDER

Ogle County soils. R. S. SMITH, O. I. ELLIS, F. F. DETURK, F. C. BAUER AND L. H. SMITH. Ill. Agr. Expt. Sta. *Soil. Rept.* 38(1928). **Logan County soils.** R. S. SMITH, E. E. DETURK, F. C. BAUER AND L. H. SMITH. Ill. Agr. Expt. Sta. *Soil Rept.* 39(1928).—The soils of each county are described and mapped. Chem. analyses of the principal soil types are given, together with data secured in pot and field tests with fertilizers. J. J. SKINNER

Soil fertility experiments on Volusia and Westmoreland soils. J. W. WHITE AND F. D. GARDNER. Pennsylvania Agr. Expt. Sta., *Bull.* 229, 31 pp.(1928).—Commercial fertilizer and stable manure reinforced with superphosphate produced a pasture completely free from weeds. J. J. SKINNER

The nitrogen content of Red River Valley soils. J. H. ELLIS AND W. SHAFER. Manitoba Agr. Coll., Winnipeg, Man. *Sci. Agr.* 9, 231-48(1928).—A reputation for high N content has long been ascribed to Red River Valley soils of Manitoba. The early work leading to this reputation is reviewed. The present work shows that the reputation is justified. During a traverse across the Red River Valley to establish the soil types it was observed that all the soils examd. were clay soils, and (with the exception of the soils of the depressions and wet meadow lands) all these soils showed dark intrusions of surface material extending from the surface into the underlying horizon. The N content of these tongued intrusions, and that of the normal profiles were detd. from the analysis of vertical sections through the profiles of 4 different virgin soils. The total N content in the tongued intrusions was higher than that in the normal profiles. The case of Selkirk soil analyzed by Lawes and Gilbert, which showed exceedingly high N content, is presumed to have been taken from tongued intrusions. Nevertheless evidence is given which shows the tongued intrusions in the Red River soil series may have a higher total N content even than that reported by these authors. The cause of the tongued intrusions in the Red River Valley soils is the cracking and opening up of the highly colloidal clay soils through shrinkage during relatively dry periods. These fissures or openings become filled with surface soil and org. material through the action of wind, rains, etc. The dark-tongued intrusions in these soils are shown to be of different forms, depending upon the phys. properties of the soil material. A peculiar broad and relatively shallow type of tongued intrusion, coexistent with a highly developed hummock condition of the surface is shown to have been caused by differential shrinkage and expansion where the profile was composed of clay underlaid by bedded very fine sandy clay. The effect upon the crop due to the peculiar soil heterogeneity described requires investigation. E. F. SNYDER

Soil moisture at permanent wilting of plants. F. J. VEIHMEYER AND A. H. HENDRICKSON. Univ. of California. *Plant Physiology* 3, 355-7(1928).—Although the residual moisture content of some soils at permanent wilting shows close agreement with Briggs and Shantz' ratio of 1.84, which is obtained by dividing the "moisture equiv." of the soil by the percentage of moisture in the soil at permanent wilting, the general use of this ratio for all soils is open to criticism. The exptl. data of V. and H. indicate that the quantity of water available for plant growth cannot be detd. by the "moisture equiv." alone. For accurate work the quantity of readily available moisture can be obtained only when the residual moisture at permanent wilting is known, because the evidence points to the fact that plants are able to reduce the moisture content of different soils to different degrees of dryness before this stage of wilting is reached. W. T.

Statistics of the world production of the most important potassium, phosphorus and nitrogen fertilizers in the years 1925-1927. PAUL KRISCHE. *Ernähr. Pflanze* 24, 451-6(1928). LAWRENCE P. MILLER

Kosseir phosphorite. R. CHIAPPELLI. *Giorn. risicoltura*, 13, 156-60(1928).—Of Egyptian origin and contg. 30% P_2O_5 and 12.50% $CaCO_3$, this rock is finely ground and used especially on Italian soils with an acid reaction. Plot tests with rice on such

soils show the phosphorite in general gives better results than superphosphate, either when they are used alone or when mixed with manure.

ALBERT R. MERZ

Simple and rapid analytical methods for the analysis of insecticides and fungicides.

II. **Titrimetric determination of copper in the presence of iron, arsenic and mercury.** J. BODNÁR AND S. TERÉNYI. *Kísérlet Közlemények* 30, 449-66(1927).—Zecchini's method (*Z. anal. Chem.* 58, 127(1919)) has been examd.; it gave good results, but the method of Bruhns (*C. A.* 13, 939; 15, 351) is better and faster. In the presence of Fe $\text{Na}_2\text{P}_2\text{O}_7$, Na_3PO_4 or H_3PO_4 and H_2SO_4 should be added to the soln. before titrating. If As is present some $\text{Fe}_2(\text{SO}_4)_3$ soln., $\text{Na}_4\text{P}_2\text{O}_7$ and H_2SO_4 should be added. In the presence of Hg, hydroxylamine chloride should be used to ppt. Hg.

S. S. DE FINÁLY

Evaluation of insecticides. C. H. PEET. *Ind. Eng. Chem.* 20, 1164-5(1928); cf. *C. A.* 22, 4734.—Dependable detns. of insecticidal efficiency can be obtained by elimination of controllable variables. Details of the testing are given.

C. H. PEET

Earthworms as pests and otherwise. W. R. WALTON. *Bur. Entomology, U. S. Dept. Agr. Farmers' Bull.* 1569, 1-14(1928).—Earthworms can be eradicated on golf greens or lawns by the use of HgCl_2 , 0.04% aq. soln., for each 1000 sq. ft., followed by a liberal sprinkling of the area with H_2O . Dry *Ph arsenate* when mixed with dry sand or loam in the ratio of 1 lb. to 2 cu. yds., and dusted liberally over the affected areas, likewise proved efficacious. *Mowrah meal*, a product obtained from the madhuca tree in the E. Indies is an excellent vermifuge when fresh, but loses its potency with age and molding. It is applied at the rate of 15 lb. per 1000 sq. ft.; it is comparatively harmless to man, animals and grass.

C. R. F.

Soil and pasture in relation to pining and bush sickness of sheep (GRIMMET, SIMPSON) 12. Mineral content of pastures. Lime deficiency in King Country soils, and the effect on plant and animal (ASTON) 12. Extraction of sugar and K salts contained in molasses (GASPAR Y ARNAL) 28.

Fertilizers. VICTOR EHRLICH and STICKSTOFFWERKE A.-G. RUSE. Austrian 109,402. Dec. 15, 1927. Mixts. of CaCN_2 with superphosphate and other fertilizers are prep'd by drying the superphosphate, etc., and mixing it with CaCN_2 during cooling. A little oil may be added to the CaCN_2 to prevent development of dust.

Fertilizers. F. G. LILJENROTH. Brit. 290,518, July 12, 1927. In prep'd fertilizers contg. NH_4 phosphate by leaching crude phosphate with an acid such as H_2SO_4 or HNO_3 and adding $(\text{NH}_4)_2\text{SO}_4$ to ppt. CaSO_4 , the ppt. is washed with $(\text{NH}_4)_2\text{SO}_4$ soln. to recover the phosphoric acid which it contains. Various other details of procedure are specified also.

Mixed fertilizers. I. G. FARBENIND. A.-G. Fr. 640,263, Aug. 30, 1927. A very hot soln. of NH_4NO_3 contg. very little water is mixed with inorg. fertilizing salts, such as $(\text{NH}_4)_2\text{SO}_4$.

Phosphatic fertilizers. D. TYRER. Brit. 290,075, Aug. 2, 1927. Ca phosphate such as ground rock phosphate and K_2SO_4 or KHSO_4 are heated under reducing conditions, as with coal, and the product is treated with H_3PO_4 or other suitable acid or acid salt to decomp. the sulfide formed. The product may be further treated with NH_3 and various modifications of the process are described.

Insecticidal plant food or fertilizer. FREDERICK G. DOKKENWADEL (one-tenth each to T. W. Millner, V. R. Walley, B. M. Stevens, E. C. Fishel and J. E. Green). U. S. 1,696,709, Dec. 25. Cottonseed hulls are mixed with substances such as NaNO_3 , H_3PO_4 , KCl and H_2O .

Insecticides. BRITISH DYE STUFFS CORP., JAMES BADDILEY and ERNEST CHAPMAN. Fr. 640,736, Sept. 10, 1927. An insecticide contains among other ingredients a sulfonated petroleum and an alkylated sulfonated petroleum, particularly sulfonated petroleum condensed with isopropyl alc.

Insecticides. I. G. FARBENIND. A.-G. Fr. 640,782, Sept. 12, 1927. Alcs. or their derivs., such as Bu or Am or their acetates, to which Monopole soap, Turkey red oil or resin soaps may be added are used as insecticides.

Fungicides. G. OSVALD. Brit. 290,288, May 13, 1927. Seeds, plants, wood, etc., are treated with a disinfectant comprising fungicidal org. dyes which directly dye vegetable substances and which contain in the dye mol. poisonous components such as As, Hg, Cu or F. Dyes derived from *p*-phenylenediamine, benzidine and diaminostilbene may be used and may be admixed with diluents such as talc, magnesia, infusorial earth, etc., or with seed germination stimulants such as salts of K and Mg or Mn compds.

Fungicides for seed grain. I. G. FARBERNIND. A.-G. Brit. 290,364, Feb. 12, 1927. Substances such as chloro-*m*-cresol or nitrophenol-mercury compd. are brought into aq. soln. by use of an acid amide such as formamide, acetamide, urea or urethan.

Mixture for killing weeds. RALPH N. CHIPMAN. U. S. 1,694,205, Dec. 4. $\text{Ca}(\text{ClO}_3)_2$ and CaCl_2 are used together.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

Modern factory methods of manufacturing absolute alcohol. G. SZELÉNYI *Magyar Mérnök Építészegylet Közlönye* 62, 41-49(1928).—The azeotropic mixt. of water-alcohol can be sep'd. by 4 physicochem. methods: (1) By either increasing or decreasing the pressure. The app. of Merriman (*C. A.* 7, 2546) works at 100 mm. Hg pressure. (2) By adding a 3rd material in order to form a compd. of a minimal b. p. with either of the components. This compd. can now be dist'd. (3) By adding a 3rd material forming a compd. of a max. b. p., which remains on distg. (4) By adding a 3rd material dissolving either of the components. The b. p. of this component will be raised so that the other one can be dist'd. This latest method is called the extracting or absorbing method in contrast to methods 2 and 3, called azeotropic methods. Various processes applying these principles, either in use or proposed, are discussed.

S. S. DE FINÁLY

Production of glycerol by fermentation. VI. Influence of sugar concentration upon the yield of glycerol. YOSHINORI TOMODA. *Chem. News* 137, 265-6(1928), cf. *C. A.* 22, 2805.—In fermentation expts. with Na_2SO_3 present, the alc fermentation and glycerol fermentation go on parallel from the start to the end of the fermentation. At a given sulfite concn., the yield of glycerol is proportional to the sugar concn. of the fermenting medium, while at a given sugar concn., the yield of glycerol is proportional to the square root of the total sulfite concn. T. expresses these relations in the equation $w = (a + Kx)\sqrt{y}$, where w is the amt. of glycerol produced (g./100 cc.); x , the concn. of sugar in the mash; y , the concn. of total sulfite; a , a const. (0.42); K , a const. (0.11). Acetaldehyde-bisulfite compd. in the mash favors the formation of glycerol. If the reaction of the fermenting medium is made alk. with NaHCO_3 , glycerol formation is very marked. The presence of an appreciable amt. of combined sulfite produces a considerable increase in glycerol.

RUSSELL C. FERR

The identification of other fruit wines in grape wine. J. WERDER. *Mitt. Lebensm. Hyg.* 19, 394-5(1928).—The presence of sorbitol in wines other than from grapes was found to be an excellent way to detect a possible adulteration, as grape wines do not contain this substance. Further investigations are in progress, and will be published later.

J. C. JURRJENS

New method for the estimation of iron in wine for purposes of clarification. E. JEKEL. *Pharm. Monatsh.* 9, 257-8(1928).—A colorimetric procedure is described for use in connection with an illustrated coloriscope in detg. both the ferrous and ferric content of wine prior to adding $\text{K}_4\text{Fe}(\text{CN})_6$ as precipitant.

W. O. E.

Utilization of the Indian tea enzyme and its production in dry condition. HANS VALENTIN. *Königsberg. Apoth. Ztg.* 43, 1533-6(1928).—The importance of this enzyme as used in the production of a refreshing beverage is discussed in connection with a study of its phys. and chem. characteristics.

Detection of methanol in ethyl alcohol, etc. (KINUGASA, *et al*) 7. Cooler for liquids [beer] (Ger. pat. 466,132) 1. Heater (for use in the alcohol industry) (Austrian pat. 109,213) 1.

Alcohol for Industrial Purposes. New York: American Commercial Alcohol Corp. 420 Lexington Ave. No charge. Reviewed in *Paint, Oil, Chem. Rev.* 87, 22 (1929).

Vorschriften zur Bereitung von Likoren, Branntweinen, Limonadensirupen, Punsch-

essenzen, usw. auf kaltem Wege. Miltitz bei Leipzig: Schimmel & Co. 202 pp. Reviewed in *Chimie et Industrie* 20, 801(1928).

Fermentation. MABEE PATENTS CORP. Swiss 126,986, Jan. 17, 1927. Agricultural products are prepd. for food for live stock by fermentation. The fermenting agents may be hydroxides of Mg, Ca, Na or a mixt. of these with S or malt.

Internal cooling of metallic fermentation vats. BERNDORFER METALLWARENFABRIK ARTHUR KRUPP A.-G. Austrian 109,381, Dec. 15, 1927. The internal cooling tubes of metallic fermentation vats, particularly of Al-lined containers for beer, are electrically isolated or insulated from the container, so as to avoid electrolytic action between the tubes and the container. The tubes may be of Cu coated with enamel or superficially oxidized.

Butyl alcohol and acetone by fermentation. ELLIOTT R. WEYER. U. S. 1,696,022, Dec. 18. A sterilized mash of usual compn. is treated with butylphenol or other suitable antiseptic which is non-toxic to the cultures used for the desired fermentation but toxic to contaminating organisms.

Glycerol. KARL LÜDECKE and NELLY LÜDECKE. Can. 285,399, Dec. 11, 1928. Glycerol is produced from sugar by fermentation in an alk. soln. by distg. off volatile fermentation products of the fermented mash and refermenting the residual mash by the addition of further quantities of sugar, small quantities of Na_2SO_4 and yeast. E. g., 2 kg. of molasses is dissolved with 10 g. of Na phosphate and 750 g. of crystd. Na_2SO_4 in 8.5 l. of water, and a soln. of 10 g. of MgSO_4 , 10 g. NiSO_4 , and 100 g. yeast in 2.5 l. of water is added. This mash is allowed to ferment at 30–35°. After about 2 days the sugar will have fermented. The yeast is then filtered off, the alc. and aldehyde are boiled away and 2 kg. of molasses and 100 g. of sulfite, 5 g. MgSO_4 , the filtered off yeast and 50 g. of fresh yeast are added, the whole being made up to 11 l. After 2 days at 30–35° the sugar will have disappeared. This operation is repeated, 1 l. of water being added each time. If for instance 8 kg. of molasses has been fermented in this manner and the glycerol has been isolated, about 2 kg. of raw glycerol will be obtained, equiv. to 960 g. of pure glycerol.

Diastase. INTERNATIONAL TAKAMINE FERMENT CO. Fr. 640,669, Sept. 8, 1927. A diastatic product is prepd. in a rotating drum on a culture medium of bran which is sprayed with an aq. soln. of Na salicylate and NaF. The acid radical is liberated by spraying in a dil. mineral acid and the medium is inoculated with *Aspergillus oryzae* and incubated. The enzymes are extd. from the koji produced, in the usual manner.

Diastic product. INTERNATIONAL TAKAMINE FERMENT CO. Brit. 290,874, Aug. 29, 1927. A process which may be carried out in a tumbling-drum which is slowly rotated involves treatment of a culture medium which may be prepd. from wheat bran with a water-sol. salt of an antiseptic acid radical such as Na salicylate and NaF, liberation of the acid radical by addn. of a dil. inorg. acid such as HCl, and culturing with *Aspergillus oryzae*. The enzymes are extd. from the koji produced.

Hop extracts. E. C. HORSR. Brit. 290,852, June 29, 1927. Fresh or dried hops are distd. to obtain the oil, the hop pulp is boiled with a sugar soln. to ext. the bitter constituents, the soln. is concd. and the hop oil is added. The sugar soln. used is preferably a dild. malt sirup. An app. is described.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

The deterpenation of essential oils of citrus fruits by the use of surfaced columns. P. LEONE Reale Scuola d'Ingegneria, Palermo. *Ann. chim. applicata* 18, 299–313 (1928).—In view of the promising results obtained by L. (cf. C. A. 22, 3489) and by Romeo (cf. C. A. 22, 3489) on the deterpenation of essential oils of citrus fruits, it was considered advisable to study the possibility of using fractionating columns with packing (cf. Thormann, C. A. 21, 1726). The present paper, which is chiefly mathematical, deals with the application of columns of this type, calcns. showing the proper design of app. for this particular purpose, and the compn. of the vapors evolved from essential oils during deterpenation by fractionation *in vacuo* as a function of the compn. of the liquid. This type of column is highly adapted to deterpenation, and in a single operation should give the max. yield of concd. oil. A simple and rapid method for the detn. of sesquiterpenes and of terpenes is suggested, which involves detns. of their α values after fractionation and isolation.

C. C. DAVIS

The mucilage extracted from the cotyledons of *Anagyris foetida*. PIETRO CONDORELLI AND A. CHINDEMI. Reale Univ. Catania (Sicily), *Ann. chim. applicata* 18, 313-7(1928).—The isolation of a mucilage from the integument of *Anagyris foetida* (cf. Condorelli, C. A. 20, 1095) suggested that there might also be present a similar substance in the cotyledons. The latter were extd. repeatedly with boiling water, the ext. was filtered, evapd. to 0.5 its vol., pptd. with twice the vol. of 96% EtOH, filtered, the mucilaginous mass washed with EtOH, twice dissolved in hot water and repptd. with EtOH, refluxed with EtOH, (even this did not eliminate all colored impurities), boiled in water with animal charcoal, filtered and pptd. with EtOH, which yielded a pale-colored mucilage. In distinction to podalarin (*loc cit.*), this new mucilage was only slightly sol. in cold water and gave a viscous liquid with hot water. It was insol. in EtOH, Et₂O and C₆H₆. It was pptd. even in dil. soln. by basic Pb acetate, but was not pptd. by aq. Na₂SO₄, (NH₄)₂SO₄ or MgSO₄, nor did it give a blue color with I. It was not optically active. Oxidation with HNO₃ yielded 7.03% mucic acid, indicating condensation products of galactose. No saccharic acid was present in the mother liquor. It contains approx. 17% ash composed of SiO₂, P₂O₅, Ca and traces of Fe and K. The mucilage gave the reactions of pentoses. Distn. with dil. HCl yielded furfural corresponding to 6.8% pentosans. Refluxed with 4% H₂SO₄, the mucilage neutralized with BaCO₃, unhydrolyzed mucilage pptd. with 96% EtOH, filtered, distd. *in vacuo* to a small vol. and evapd. to dryness *in vacuo*, yielded a product which gave a negative Seliwanoff reaction (cf. Ber. 20, 181) for ketones and which contained no mannose, but only galactose mixed with a pentose, the latter sugars being isolated by conversion into their phenyllosazones (cf. Ber. 41, 75), the latter in turn being sep'd. by the method of Kultz and Vogel (*Biol. Chem.* 32, 85). The pentosazone m. 160-2°; the hexosazone m. 188-92°. The mucilage has a high absorbent power for salts, and for this reason a large proportion of inorg. compds. present in the cotyledons is extd. with the mucilage and held tenaciously by the latter, which renders difficult the obtaining of a mucilage of a low ash content. Analysis of the mucilage indicated the compn. C₆H₁₀O₅·C₆H₈O₄·8H₂O. The 8H₂O can be eliminated by heating at 110°. The results show that, like the mucilage of the integument, the mucilage of the cotyledons resembles paragalactoaraban, though it differs in some respects from the mucilage of the integument. C. C. DAVIS

Experimental researches on fluid extracts. I. The fluid extract of *Chelidonium*. ADOLFO ALBANESE AND ANTONIO PEDRONI. Reale Univ. Pavia *Ann. chim. applicata* 18, 318-26(1928).—See C. A. 22, 2810. C. C. DAVIS

Microchemical reactions for caffeine. M. WAGENAAR. *Pharm. Weekblad* 65, 1334-9(1928).—In the order of decreasing importance the reactions are (1) pptn. by HgCl₂, (2) pptn. by CsI + I, (3) pptn. by AuCl₃, (4) salting out by (NH₄)₂HPO₄ or (NH₄)₂SO₄, (5) pptn. by Br, (6) pptn. by BiI₃ + KI, (7) pptn. by SbI₃ + KI. For diagnostic purposes PtCl₄ and AgNO₃ are of little value. A. W. DOX

Alcohol in oil of cassia. SCHIMMEL & Co. *Am. Perfumer* 23, 527-8(1928).—Even very small quantities of alcohol in oil of cassia can be easily detected through detn. of the flash point in the same way as has been customary for a long time for petroleum, since it was found that alc. exercises a very decided influence on the flash point. In the present instance the well-known app. of Pensky-Martens was employed. For the execution of the test the container is filled to the mark with the sample previously dried thoroughly with desiccated Na₂SO₄, the cover then adjusted and the insert placed in the tripod by aid of the fork. Now the thermometer ranging from about 30 to 130° is inserted and the heating started with a large direct flame, until the temp. is about 20 to 30° below the flash point expected. Only then the wire netting which first had been turned toward the outside is brought over the flame and the heating regulated so that the thermometer does not rise faster than 2° in 30 seconds. Now, in intervals of about 30 seconds, the ignition is operated by turning the corresponding screw and the ignition flame which should have the size of a pea lowered for a second into the oil container. The temp. at which a distinct flaring up of the vapors takes place is the flash point. For practical purposes a flash point not below 75° would seem sufficient. W. O. E.

Mineral aspects of steatite talc. VICTOR CATET. *Aromatics* 9, 17-8(1928).—The phys. and chem. properties of steatite are considered in connection with its chief sources, and utilization in face and body powders, rouges and powder compacts, etc. W. O. E.

Cajeputh oil from the Far East. G. H. MASSELMAN. *Aromatics* 9, 19-20, 70(1928).—An account of the islands where this oil is produced, the primitive method of production and shipment, and its phys. characteristics. W. O. E.

Optical methods for the perfume and flavor chemist. ANTON V. KAMP. *Aromatics* 9, 30-3(1928).—The optical methods involved in the use of the spectroscope,

refractometer (both Pulfrich and Abbe) and polarimeter are discussed in connection with their illustrations and the customary abbreviations used in expressing the values obtained.

W. O. E.

Transparent emulsions of essential oils. RICHARD E. LINEHAN. *Aromatics* 9, 22-3, 62(1928).—Transparent essential-oil emulsions in concd. aq. sugar soln. and their comparison with other types of flavors are discussed.

W. O. E.

West Australian sandalwood oil. K. VENKATESAIA AND H. E. WATSON. *J. Soc. Chem. Ind.* 47, 322-3T(1928).—Samples of W. Australian oil purchased in London, and of Mysore oil from Bangalore were analyzed, saponified and fractionated. From the results it appears quite obvious that the oils differ widely as regards their main constituents. The component of the Australian oil of high negative rotation had a distinctly higher b. p. than β -santalol; it is, however, possible that certain of the fractions contain one or both santalols. These fractions comprise approx. 50% of the entire oil, but unless an alc. of exceedingly low d. is present, the proportion of santalol in them cannot be very high.

W. O. E.

Sesquiterpene alcohol of the oil of Eucalyptus nova-angelica. L. H. BRIGGS AND W. F. SHORT. *J. Soc. Chem. Ind.* 47, 323-4T(1928).—Eudesmol and globulol have been detected in eucalyptus oils. In the examn. of a specimen of oil from *E. nova-angelica* an alc. m. 80° and with a small *d*-rotation was isolated. Its properties together with those of the HCl salt agree closely with those of eudesmol and eudesmene dihydrochloride, resp. Dehydration with HCO_2H produces a sesquiterpene, the const. of which agree with those of eudesmene, and which yields eudalene, and no other naphthalene hydrocarbon, on hydrogenation.

W. O. E.

Essential oil of Phebalium nudum. C. B. RADCLIFFE AND W. F. SHORT. Univ. of New Zealand. *J. Soc. Chem. Ind.* 47, 324T(1928).—The oil extd. by steam distn. in a yield of 0.24% was a clear, greenish yellow, mobile liquid with a pleasant aromatic odor, and when dry had d_4^{13} 0.9345, n_D^{17} 1.4844, $[\alpha]_D^{14}$ 15.60°. The acid value 146.2 increased after acetylation to 171.6. The aldehydes calcd. as citral amounted to 1.5%; they were found to consist of citronellal and citral. The acidic constituents were cinnamic acid and a very small quantity of an amber-colored phenol which gave a transient green coloration with alc. FeCl_3 . Among the terpenes identified were camphene and limonene. α -Terpineol and terpenyl acetate also were present.

W. O. E.

Balsam of Peru. C. T. BENNETT. *Perfumery Essent. Oil Record* 19, 423-4 (1928).—The common method of extg. the balsam from the tree is described in connection with its characters, constituents and com. statistics. The limits are for $d_{15.5}$ 1.140 to 1.160, n_D 1.588 to 1.595 and that of the extd. cinnamein 1.575 to 1.582, synthetic balsams contg. benzyl benzoate usually having a lower n ; clearly sol. in 90% alc., a flocculent ppt. finally settling out on standing which appears to be of a waxy nature.

W. O. E.

South African geranium oil. W. H. SIMMONS. *Perfumery Essent. Oil Record* 19, 331-2(1928).—The phys. characters of 2 samples from the leaves of *Pelargonium* plants were $d_{15.5}$ 0.901, 0.896; $[\alpha]_D$ -18°0', -19°0'; n_D^{25} 1.4725, 1.4680; ester as geranylacetate 8.6, 9.2%; total alcs. as geraniol —, 56.6%; citronellol by formulation 22.8, 17.6%, soly. in 70% alc. incomplete, 1 in 1.7 and upwards, resp. On comparison with the North African or Algerian oils it will be seen that while there is not much difference in the *d.* the $[\alpha]$ is considerably higher; the ester and citronellol contents also are exceptionally low.

W. O. E.

Cosmetics in ancient times. F. KAISER. *Pharm. Zentralhalle* 69, 793-4(1928).—Certain materials and preps. used in those early periods are discussed.

W. O. E.

Improved method for the examination of pharmaceutical preparations by means of greatly extended capillary pictures, and the analytical quartz lamp. RAPP. *Pharm. Ztg.* 73, 1585-9(1928).—After discussing the studies of Goppelsröder, Kunz-Krause, H. Platz, and Danckwortt in this field, the errors, notably in Goppelsröder's, technic are emphasized, and improvements introduced by enclosing the strip of filter paper in a glass tube prior to immersion in the liquid under examn. Investigations have been made or contemplated on the following points: (1) stability of different alkaloidal solns., aging of such solns.; (2) stability of different liquid specialties on protracted storage; (3) detection of genuine from substitute preps.; (4) differences in com. preps. of ergot and digitalis; (5) comparison of com. galenicals with specially prepd. products; (6) comparison of various plant specialties with galenicals or products bearing similar designations; (7) examn. of homeopathic dilns.; (8) examn. of colloidal preps.; (9) examn. of the compn. of salves; (10) adulterations in balsam of Peru; (11) simplified urine analysis; (12) toxicological investigations. The results obtained in studies on

1, 2, 3, 4 and 6 are reported and discussed, the matters involved under the remaining captions being reserved for future publication. W. O. E.

Content of homeopathic triturations. A. KUHN. *Pharm. Ztg.* 73, 1589-90(1928).—Studies have been made of SiO_2 , Na_2SO_4 and Hg triturations, and the results reported. W. O. E.

Content of iron triturations. ARFRED KUHN. *Pharm. Ztg.* 73, 1590(1928).—A verification of former findings (cf. C. A. 22, 326). W. O. E.

Detection of degallized brandy in pharmaceutical tinctures. WALTER MEYER. *Pharm. Ztg.* 73, 1600-2(1928).—A discussion of certain phenomena involved in the examn. of tinctures made up with alc. products previously denatured with AcMe, MeOH, $\text{C}_2\text{H}_5\text{N}$, phthalic ester, etc. W. O. E.

Simple and rapid detection of fructose alone or admixed with other carbohydrates. LAD. EKKERT. *Pharm. Zentralhalle* 69, 805-6(1928).—In a small porcelain evapg. dish sprinkle 0.01 to 0.03 g. fructose, add 3 to 5 drops 2N KOH or NaOH soln. followed by 0.5 to 1 g. solid caustic alkali. In the course of 0.5 min. the alkali acquires a red to blood-red border, the entire liquid finally becoming bright blood-red. Similar treatment yields with arabinose, yellow to saffron-yellow; xylose yellow; rhamnose yellow; glucose yellow; mannose yellow; sucrose colorless; maltose yellow; lactose lemon-yellow; dextrin yellow; glycogen colorless. W. O. E.

Medicinal use of *Salvia officinalis*. CURT SCHELENZ. *Pharm. Zentralhalle* 69, 806-7(1928).—Attention is directed to the value of this drug in the treatment of night sweats in tuberculosis. W. O. E.

Balsam of tolu. C. T. BENNETT. *Perfumery Essent. Oil Record* 19, 464-5(1928).—A discussion of the physical characters of this balsam, notably its evaluation in detg. the acid no., sapon. no. and tests for resin. The chief constituent is a resin which on sapon. yields an alc., tolu-resinotannol, cinnamic and benzoic acids. Benzyl benzoate with some benzyl cinnamate is present, a trace of vanillin and 1.5 to 3% volatile oil. W. O. E.

Importance of medicinal charcoal in therapy, and nature of adsorption. FRANZ KOENIG. Munich. *Pharm. Ztg.* 73, 1602-3(1928).—An address. W. O. E.

Polarimeter for the practical druggist. R. MAEDER-LÖFFLER. *Pharm. Ztg.* 73, 1621-2(1928).—A discussion of the requirements a druggist may reasonably demand of a polarimeter, and the mode of testing it. W. O. E.

Evaluation of "phosphor solutus." W. BÖTTGER. Leipzig. *Apoth. Ztg.* 43, 1551-3(1928).—An exptl. study of the iodometric evaluation of this product, notably the influence on the results obtainable of working in neutral or acid soln. The results previously reported by Enell (*Pharm. Ztg.* 1905) are discussed. W. O. E.

Recalculation of the "D. A.-B. 5 specific gravity" value into that of the "D. A.-B. 6 density." R. DIETZEL AND F. SCHLEMMER. *Apoth. Ztg.* 43, 1553(1928). W. O. E.

Important aloin reactions. FRITZ WISCHO. Univ. Graz. *Pharm. Monatshefte* 9, 256-7(1928).—After mention of the identity tests commonly applied for aloin, a new reaction is described involving the use of a soln. of 0.4 g. V_2O_5 and 4 cc. concd. H_2SO_4 in 100 cc. H_2O . A freshly prepd. aq. or weakly alc. soln. of aloin or aloes treated with a few drops of this reagent is colored red, finally becoming dirty brown on standing. Various samples of aloes were examd. W. O. E.

The characteristics of the perfumer and his technic. A. MÜLLER. *Genf. parfumeur* 2, 105-6, 109-10(1928). P. ESCHER

Rectification of pine oil. A. BRESSER. *Chem. Rundschau* (Budapest) 5, 27-9(1928).—The process is described for rectifying pine oil in factories either by simple distn. or by previous chem. treatment with alkalies or H_2SO_4 followed by distn. S. S. DE FINÁLY

Change of chemical composition of radix althaeae. J. KABAY. *Magyar Gyógyszerésztud. Társaság. Értesítője* 4, 1, 19-23(1928).—Changes in compn. during the flowering period and during the winter are shown. S. S. DE FINÁLY

G. 2949 (Lopion): A new gold preparation for the treatment of pulmonary tuberculosis. H. SCHMIDT. Lungenheilstätte Ruppertsheim im Taunus, Germany. *Deut. med. Wochschr.* 54, 1757-8(1928).—G. 2949, lopion, an org. compd. contg. 39.25% Au, is considered to be superior to the Au prepn. previously used in the treatment of tuberculosis of the lungs and upper respiratory tract. ARTHUR GROLLMAN

A new chemotherapeutic agent for the treatment of pulmonary tuberculosis. WILHELM MÜLLER. Lungenheilstätte Tátraháza. *Wiener med. Wochschr.* 78, 1534-7(1928).—*Tebeform*, a com. prepn. whose chief constituent is an I deriv. of thymol, is considered as a valuable therapeutic agent in tuberculosis. ARTHUR GROLLMAN

A factory for pharmaceutical preparations in the "Chemischen Industrie A.-G."

HELMUT HILLE. *Chem. App.* 15, 253-4(1928).—The arrangements and dimensions of rooms are shown in 5 cuts, but no details of equipment are given. J. H. MOORE

A new cresol antiseptic. L. M. HIRCHBERG. *Chem.-Ztg.* 52, 826(1928).—It is desirable to have a cresol antiseptic which does not possess the toxic properties of the ordinary cresol-soap preps. A combination of cresol with 5-10% Na stearate offers little advantage, since in dissolving the solid product in H_2O , insol. Na stearate is pptd. By combining cresol with derivs. of the higher fatty acids, especially of stearic acid (either as such or as the Na salts) a solid product is obtained, which forms an emulsion with H_2O and hardly leaves any residue. Unlike the soap soln., which probably increases the toxic action of cresol, the derivs. of stearic acid, *e. g.*, the esters, reduce its toxicity. G. SCHWOCH

Metallic soaps (LAURO) 27. Formula of digitalis glucosides. II. Digitalinum verum (WINDAUS) 10. Detection of methanol in tinctures, etc. (KINUGASA, *et al.*) 7. Determination of calcium in calcium glycerophosphate, calcium lactophosphate and calcium phosphates (LETRUC) 7. Utilizing meat-pickling brine (Can. pat. 285,135) 12. Cyclohexyl-substituted aliphatic acids (U. S. pat. 1,693,801) 10.

Medicinal wafers and tablets of precipitated magnesium hydroxide with a binder of sugar and corn starch. FRANK CROSSLEY (to James E. Plant). U. S. 1,694,341, Dec. 4

Therapeutic preparations from glandular organs. GEORG SCHRÖDER. U. S. 1,695,612 Dec. 18. See Brit. 263,155 (*C. A.* 22, 141).

Therapeutically active substances from the white blood corpuscle elements of bone marrow. ALFRED NEUMANN. Austrian 109,410, Dec. 15, 1927. Red marrow from the bones of the horse, ox or calf is free from hemoglobin and the like by treatment with 1% salt soln. and the residue is dissolved in a feebly alk. medium contg. a preservative. The product is useful in the treatment of anemic diseases and typhus.

Therapeutically valuable derivatives of choline. PHARMAZEUTISCHE INDUSTRIE A.-G. and SUSI GLAUBACH. Austrian 109,407, Dec. 15, 1927. Choline or its salts are condensed with a halide or the anhydride of a halogenated org. acid, particularly a halogenated fatty acid, and the condensation product is treated with urea, or with urea derivs. such as thiourea or urethans, or with guanidine or other biogenous amine such as histamine. *E. g.*, choline chloride is condensed with $CH_3ClCOCl$ to form $Me_2Cl-NCH_2CH(O_2CCH_2Cl)$, which gives with urea a white, non-deliquescent mol. compd. sol. in H_2O and $EtOH$. Therapeutically, the products are more active than choline but not more toxic.

Diethylmethinepropargylbarbituric acid. I. G. FARBENIND. A.-G. Swiss 126,732, Dec. 13, 1926. Addn. to Swiss 124,869. An alkali salt of diethylmethinebarbituric acid is transformed by a propargyl halide. The substance is a sedative and m. 175-8°

Morphine solutions. M. WOELM A.-G. Brit. 289,819, May 2, 1927. Morphine solns. in HCl are treated with Na_2HPO_4 to adjust the p_H to about that of the blood (7.2-7.5) and render the solns. suitable for injection.

Anesthetic composition containing cocaine and adonidin. ERICH HESSE (to Gehe & Co. A.-G.). U. S. 1,695,656, Dec. 18. An anesthetic compn. suitable for local use is prepd. by treating cocaine with an equal or smaller quantity of adonidin.

2-Phenylquinoline-4-carboxylic acid derivatives. J. D. RIEDEL-E. DE HAËN A.-G. Ger. 468,809, Jul. 3, 1928. 2-Phenylquinoline-4-carboxylic acid is converted into its Cd salt in known manner by the addn. of $CdCl_2$ to a $NaOH$ soln. The product is used for combating malaria.

Vitamins. J. K. MARCUS. Brit. 289,798, April 30, 1927. Vitamins A, D and E are sepd. with the non-saponifiable and difficultly saponifiable matter from fish, vegetable or animal oils or fats or tissue, by sapong. and extg. with an org. chloride such as ethylene dichloride. An example is given of the treatment of cod-liver oil. The vitamin ext. obtained may be dried by Na_2SO_4 or other desiccant, filtered and freed from solvent *in vacuo* and the concentrate may be preserved by dissolving it in medicinal mineral oil. Cf. *C. A.* 23, 242.

Hormones. AKTIENFABRIK ZUR ERZEUGUNG VON CHEMIKALIEN IN KOLIN. (Jan Sil, inventor). Ger. 468,810, July 31, 1925. A substance contg. hormones of vegetable origin is prepd. by treating the germs of ungerminated grains such as rye grain with concd. H_2SO_4 in the presence of a catalyst such as 1% of $MnSO_4$ and chlorinating the resulting product.

Nicotine from tobacco. GENERAL-DIREKTION DER ÖSTERR. TABAKREGIE. Brit. 290,204, May 9, 1927. Nicotine salts are dissocd. and removed by a current of air, dry steam or an inert gas at a temp. above 150° in an app., which is described, in which the tobacco is placed on a series of trays superposed in a housing.

Apparatus for the alternate development of formaldehyde and water vapors and sulfur dioxide for disinfection purposes. TH. BREUNLIN & Co. Swiss 126,076, April 16, 1927. Constructional details

Disinfectant. PEROLIN-FABRIKATION A. BRICK G. M. B. H. Ger. 466,141, Feb. 16, 1926. Starch is heated with an aq. soln. of $KMnO_4$ and the paste is dried and powdered. The powder is stirred with ethereal oils and with absorbents for the oils such as kieselguhr, rice meal, or flakes of soap, and paraformaldehyde is incorporated into the mixt., which is dried and pressed into shapes.

18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

Advances in the manufacture of sulfuric acid in recent years. ST. ZEROMSKI. *Przemysl Chem.* 12, 560-8(1928). A. C. Z.

The effectiveness of various contact catalysts in the sulfuric acid contact process. BERNHARD NEUMANN AND ERICH GOEBEL. *Z. Elektrochem.* 34, 734-40(1928).—Tests were made with (I) pure, pptd. Fe oxide, (II) the same mixed with 4% Bi oxide, (III) mixed with 40% KOH, (IV) mixed with Sr oxide, (V) mixed with equal parts of Sn oxide, (VI) equal parts of Cr oxide and Sn oxide, (VII) pure SnO alone, (VIII) Ti oxide alone. As compared with I, II showed no practical advantage, III a harmful effect, IV a slight improvement, V a marked improvement, VI a remarkable improvement, approaching that of Ag vanadate, VII very poor, (high temp required,) VIII much worse than I.

E. M. SYMMES

Sulfuryl chloride and its production. EGIDIUS TERLINCK. *Chem.-Ztg.* 52, 901-3, 944-6(1928).—Descriptive.

ALBERT L. HENNE

The salts storage-house in the Sollstedt potash factory. H. HECKNER. *Chem. App.* 15, 265-6(1928).—Description, with a cross-section and dimensions. J. H. M.

Salt for preserving, refrigerating and flavoring. H. D. KEISER. *Food Industries* 1, 162-4(1929).—The solar evapn. process in use at Saltair, Utah, is described. The water in Great Salt Lake contains 7 times the amt. of salt that is present in sea water. The brine settles in basins for 30 days, after which complete satn. usually occurs. The satd. brine then flows by gravity to harvest ponds where the $NaCl$ crystallizes out, and the bittern is discharged to waste. The bittern contains the Na_2SO_4 , Ca and Mg salts as impurities, but since they occur at densities well below their satn. points, no pptn. takes place and only pure $NaCl$ is left on the harvest floor. Salt layers of from 4 to 6 in. are pptd. each season.

C. R. F.

Salt, bromine and calcium chloride in 1927. A. T. COONS. Bur. Mines, *Mineral Resources of the U. S.* 1927, Pt. II, 99-112(preprint No. 12, published Nov. 9, 1928).

E. H.

Tests on the catalytic preparation of copper sulfate. E. ABEL AND O. REDLICH. *Z. Elektrochem.* 34, 740-4(1928).—It was found impossible to form $CuSO_4$ from Cu, concd. H_2SO_4 and air with $HNOSO_4$ or NO as the carrier. Although it was possible to reduce the formation of an inactive, protective layer, the sensitiveness of the reaction to H_2O is a difficulty hardly possible to avoid. Also the narrow temp. limits necessary to maintain because the reaction is exothermic give trouble. The inhibiting action of the excess HNO_3 is also troublesome. It is not probable that the process can be used satisfactorily.

E. M. SYMMES

Formation of iron carbonyl on storage of commercial hydrogen under pressure. J. G. KING AND J. A. SUTCLIFFE. *J. Soc. Chem. Ind.* 47, 356T(1928); cf. Roscoe and Scudder, *Proc. Chem. Soc.* 59, 126(1891); Bunte and Terres, *Gas u. Wasserfach*, 65, 145(1922); Griffith and Holliday, *C. A.* 23, 61.—Formation of a dark stain when SiO_2 tubing was fused in an O-H flame, H made by the Lane process being used, indicated small quantities of $Fe(CO)_5$ present. No $Fe(CO)_5$ was present before compression to 120 atm. The

method of analysis was burning a measured amt. of H and passing the products through H_2SO_4 and glass wool moistened with the same. The air for combustion was filtered through cotton wool. The Fe was pptd. by NH_3 , filtered, dissolved in a min. of H_2SO_4 , reduced to Fe^{++} and titrated with $KMnO_4$. Amts. of Fe found were 0.0064, 0.0087, 0.0110 g. per 0.4 cu. ft. of H after storing the H 4, 28 and 72 hrs., resp. The max. value found was 1.29 g. Fe per cu. m., representing conversion of 2.6 l. of CO per cu. m. of H, or 2.6% by vol., a relatively large proportion of the 1% CO originally in the H.

E. M. SYMMES

Bleaching powder. Experience with the Backman process. G. ANGEL. *Chem. Trade J.* **83**, 361-2(1928); cf. *C. A.* **19**, 1475; **20**, 3213.—The app. is similar to pyrites furnaces, but made of concrete. The lime feed and bleaching powder discharge are automatic. Inspection is required only every 10 months. While Lunge stated that 4% excess H_2O in $Ca(OH)_2$ is best, this app. requires not more than 0.5% excess. $Ca(OH)_2$ should be stored 10 days before use. Control of the app. is by temp. of the various floors. Bleaching powder of the highest Cl content is obtained when the temp. of the third floor from the bottom is the highest of all floors. Cl is introduced into this floor. Max. temp. should be 35-40°. If the supply of lime is too low the main reaction occurs on a higher floor, and chlorate will form on a lower floor, indicated by sudden rise in temp. The capacity of a Backman tower is 3.5-5 tons per 24 hrs.; the power consumption is 1 h. p. per chamber. The only labor cost is the filling of the bleaching powder containers. No leaks of Cl are possible, as the app. is under a slight vacuum. No Cl can be detected in the exit gases.

E. M. SYMMES

Use of electrometric measurements in the preparation of bleach liquors. ERICH MULLER. *Chem. Fabrik* 1928, 677-8.—The reaction $Cl_2 + 2OH' = ClO' + Cl' + H_2O$ only takes place as long as there is no excess of Cl present. With a Cl excess the reactions $Cl_2 + H_2O = HCl + HClO$; $2HClO + ClO' = ClO'_2 + 2HCl$ occur, involving a waste of Cl. A galvanometer attached to C electrodes, one immersed in a comparison soln. of chloride of lime and $Ca(OH)_2$, the other in the liquid being chlorinated, gives a very sharp indication of the approach of the neutral point.

E. M. SYMMES

The Alsatian bromine industry. CAMILLE HORST. *Bull. soc. ind. Mulhouse* **94**, 592-8(1928); cf. *C. A.* **22**, 4208.—A brief outline of the development of the Br industry from its discovery to the present day, with a brief description of the method used for its production at the Alsatian potash mines.

Gypsum in 1927. R. M. SANTMYERS AND JEFFERSON MIDDLETON. *Bur. Mines, Mineral Resources of the U. S.* 1927, Pt. II, 113-28(preprint No. 13, published Nov. 12, 1928).

E. H.

Magnesia-graphite reactions at high temperatures. FRANK T. CHESTNUT. *Chem. Met. Eng.* **35**, 687(1928).—Attempts to vitrify the inner surface of a pure, elec.-sintered MgO crucible by the Ajax-Northrup high-frequency induction furnace verified reactions of MgO with heated graphite. A graphite sleeve was inserted into the MgO crucible and a 100-kw., 2000-cycle load applied. Cr_2O_3 melted, MgO softened and reduced, SiO_2 melted, so that the temp. was about 3000°. At first a flammable gas was evolved, probably from impurities; then the flame became white. At highest temp. much gas was evolved, with white flames, which reaction continued 5-10 min. after the power was cut off. On cooling the MgO was not vitrified appreciably, and considerable flake graphite was formed.

E. M. SYMMES

The action of light on colored bakelite. DONALD MURRAY. *Nature* **122**, 845(1928).—A communication describing color changes with time.

W. E. V.

Ultra-violet transmission of a new window-glass substitute. R. H. CRIST. *Ind. Eng. Chem.* **20**, 1367(1928).—A study of the ultra-violet transmission of a new formaldehyde-urea condensation product, *aldur*. The transmissions were obtained by means of a monochromator (a quartz prism with two lenses and a thermopile) and a constricted Hg-vapor lamp working at atm. pressure is the source of light. Results are shown by table and curve. Remarkable permanence is shown by *aldur*.

W. H. BOYNTON

Ignition of fire-damp by heat of impact of rocks. M. J. BURGESS AND R. V. WHEELER. *Safety in Mines Research Board* (London), Paper No. 46, 3-23(1928).—Fire-damp can be ignited quite easily in lab. tests of rock rubbing on rock. The source of the ignition apparently is the heated area on the stationary rock, not the brilliant shower of sparks often observed. Comparatively small amts. of energy are required for ignition, e. g., 200 ft.-lbs.

E. M. SYMMES

Mosquito remedies and preventatives. L. O. HOWARD AND F. C. BISHOPP. *U. S. Dept. Agr., Farmers' Bull.* **1570**, 1-12(1928).—The best mosquito protective liquid found consisted of oil of citronella 1 oz., spirits of camphor 1 oz. and oil of cedar $\frac{1}{2}$ oz. This will effectively keep away mosquitoes for several hrs.

Apparatus for concentrating acid. OTTO C. TRAUTMANN. U. S. 1,695,619, Dec. 18. An app. suitable for concg. H_2SO_4 comprises an inclined flue in which the horizontal portions only of a concg. conduit are arranged "in stair-way fashion" with the joints between these horizontal portions outside the flue. Various structural details are specified.

Hydrochloric acid. WILHELM HIRSCHKIND and CARL W. SCHEDLER (to Great Western Electro Chemical Co.). U. S. 1,695,552, Dec. 18. Steam and Cl are passed through hot C in approx. the ratio required to balance the equation $\text{C} + 2\text{H}_2\text{O} + 2\text{Cl}_2 = 4\text{HCl} + \text{CO}_2$ and the gas is passed through an increased or diminished quantity of C as required to prevent the production of H and CO. An app. is described.

Hydrocyanic acid. PAUL J. CARLISLE and PAUL L. MAGILL (to The Roessler and Hasslacher Chemical Co.) Can. 285,200, Nov. 27, 1928. HCN is produced by passing HCONH_2 vapor through a narrow reaction space having brass walls and heated to a temp. above 300° , no portion of the HCONH_2 vapor being more than $1/2$ inch from the heated walls. The brass acts as a catalyst and the temp. control prevents loss of HCN by secondary reactions.

Nitric acid. MONTECATINI SOC. GÉNÉRALE PER L'INDUSTRIA MINERVARIA DE AGRICOLA. Brit. 290,679, May 20, 1927. NH_3 is oxidized catalytically to produce NO and H_2O and the NO after sepn. is oxidized to NO_2 which is absorbed in water and the soln. is treated with O. An app. is described.

Phosphoric acid. ALBERT NOBLE (to Federal Phosphorus Co.). U. S. 1,695,558, Dec. 18. A mixt. of phosphate rock, silica and C is charged into a feed stack over the hearth of a heating chamber, a flame is impinged on the charge in the heating chamber and air is passed downwardly through the feed stack; evolved gases are oxidized in the heating chamber and heat is transferred from the gases to preheat air for combustion of the fuel, and the oxidized P compds. are collected. An app. is described.

Sulfuric acid. SOCIÉTÉ GÉNÉRALE MÉTALLURGIQUE DE HOBOKEN. Fr. 640,203, Aug. 19, 1927. Sulfurous gases, particularly those of variable compn. or flow, are treated to oxidize part of the SO_2 by a contact process and after absorption of the SO_3 formed, the remaining gases are oxidized by oxides of N in a second app. capable of dealing with large fluctuations in the content of SO_2 or in the rate of flow. Cf. C. A. 23, 486.

Sulfuric acid. ROMAN VON ZELEWSKI. Fr. 640,817, Sept. 13, 1927. See Brit. 277,382 (C. A. 22, 2642).

Sulfuric acid by the contact process. VEREIN FÜR CHEMISCHE UND METALLURGISCHE PRODUKTION. Brit. 289,879, May 5, 1927. In catalytic oxidation of SO_2 in stages with sepn. of the SO_3 after each stage, the heat of reaction of each stage is used for heating the chamber of the following stage and the conversion in each stage is so regulated that the heat produced is nearly or quite sufficient for maintaining the conversion in the following stage. An app. is described.

Sulfuric acid production by the contact method. ALPHONS O. JAEGER (to Seldon Co.). U. S. 1,694,123, Dec. 4. Base-exchange material which is not itself catalytically effective is used together with a catalytically effective material such as vanadyl silicate. Numerous examples and details are given. Cf. C. A. 23, 486.

Sulfur trioxide. SELDEN Co. Brit. 290,316, Jan. 4, 1927. SO_2 and O are passed at an elevated temp. over a catalytic mass comprising a 2-component zeolite and contg. a catalyst chemically combined in non-exchangeable form. Various examples are given of the use of artificial zeolitic catalysts contg. V, Mo, Cr, Mn, W and which may contain various non-catalytic elements.

Strongly adsorbing silicic acid. I. G. FARBENINDUSTRIE (Fritz Stöwener, inventor). Ger. 466,439, Sept. 20, 1928. Addn. to 428,041. Silicic acid gel is washed,

formed, pressed or granulated and then dried. The forming, etc., may be brought about by forcing the gel through tubes of small area by means of gases or vapors.

Use of halogen-substituted sulfonic acids and their salts as protective agents. CHEMISCHE FABRIK MILCH A.-G. (to Oranienburger Chemische Fabrik A.-G.). Brit. 289,898, May 6, 1927. Compds. which may be prepd. as described in Brit. 289,841 (C. A. 23, 848) and Brit. 289,863 (following abstr.) are used as protective agents for materials such as wool, silk, artificial silk, cotton, linen, jute, hair, feathers, hides or leather in processes such as washing, fulling, carbonizing, scouring, steeping, bleaching, dyeing, degumming, stripping, ashing, liming and tanning.

Wetting agents (halogen-substituted sulfonic acids). CHEMISCHE FABRIK MILCH A.-G. (to Oranienburger chemische Fabrik A.-G.). Brit. 289,863, May 4, 1927. Various halogen-substituted sulfonic acids (such as may be prepd. by sulfonation of halogenated compds. or as described in Brit. 289,841, C. A. 23, 848) are used in the dyeing, textile, leather and paper industries as wetting, detergent or emulsifying agents. The alkali salts are suitable for washing silk, fine wool and feathers.

Synthesis of ammonia. ALFRED THARSON (to Lazote Incorporated). Can. 285,189, Nov. 27, 1928. In the synthesis of NH_3 a mixt. of N and H is passed over a catalyst contg. oxides of Fe, K and Mg, which is more active than iron alone, at a temp. between 400° and 700° . An iron catalyst contg. a mixed promoter comprising 1% K_2O and 1% MgO will give 25–30% NH_3 under normal synthesis conditions for relatively long periods of time. Mixed promoters comprising Li_2O and MgO , Na_2O and MgO , Na_2O and CaO , or K_2O and BaO can also be employed advantageously.

Catalytic apparatus for ammonia synthesis. SOC. L'AIR LIQUIDE. SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE. Brit. 289,823, Aug. 9, 1926. In an app. in which the gases are circulated through a space so as to have indirect heat exchange with the catalytic material, part of the catalytic material is placed within this space (suitably in concentric tubes). Various structural details are described. Cf. C. A. 22, 3744.

Catalytic apparatus suitable for treating gases for ammonia synthesis. SOC. L'AIR LIQUIDE. SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE. Brit. 289,759, April 30, 1927. The reacting gases are circulated over 2 or more distinct groups of surfaces enclosing the catalytic material and the transfer of heat is regulated by varying the proportions of the gases which circulate over the different surfaces. The app. may be used with H and N contg. varying quantities of CO for NH_3 synthesis.

Separating ammonia from filter liquor produced in the ammonia-soda process. HARALD AHLQVIST. U. S. 1,696,224, Dec. 25. The liquor is distd. and is preheated by direct contact with the vapors produced by the distn. so that further vaporization is effected. The vapors are thereafter conducted in countercurrent heat exchange with fresh liquor and the condensate from the vapors is caused to follow the path of the vapors during the heat exchange, and the condensate consisting of weak NH_3 liquor and the residual uncondensed vapors contg. NH_3 in gaseous phase are separately withdrawn. An app. is described.

Alkali and alkaline earth cyanides. NAAMLOOZE VENNOOTSCHAP NEDERLANDSCHE MIJNBOW EN HANDELSMAATSCHAPPIJ. Dutch 18,802, Oct. 15, 1928. Humic acids or alkali humates are carbonized, e. g., 1000 kg. lignite of 50% water boiled with 150 kg. soda and water is decanted, the soln. evapd., carbonized at 550° to a coke product (revolving kiln) in 30 to 40 mins. (some Fe may be added as catalyzer), then nitrogenized (1000° in N_2 stream).

Alkali and alkaline earth hydroxides. I. G. FARBENIND. A.-G. Brit. 290,719, Feb. 16, 1927. Alkali or alk. earth amalgams are decompd. by stirring with water, by use of stirring devices formed of carbonaceous material such as charcoal, coke or graphite or partly of such material and partly of an alloy comprising mainly Fe, Cr and Ni.

Calcining alkaline earth carbonate material. REED W. HYDE (to Dwight and Lloyd Metallurgical Co.) Can. 284,764, Nov. 13, 1928. Fine particles of alk. earth carbonate material less than $\frac{3}{4}$ " in diam. are placed in a pervious moving layer without admixt. of solid combustible constituents and heated gases are passed downward through the layer to heat the particles to a temp. above the dissocn. temp. of the carbonate but below the fusion temp. of the particles until the CO_2 gas has been expelled. Cf. C. A. 23, 244.

Alkali iodates. I. G. FARBENIND. A.-G. Brit. 290,749, Feb. 22, 1927. See Fr. 633,994 (C. A. 22, 3744).

Alkali nitrates. I. G. FARBENIND. A.-G. Fr. 640,847, Sept. 1, 1927. In the prepn. of nitrates from alkali chlorides by HNO_3 or nitrous vapors, sulfate ions and ions

of metals other than the alkalis are eliminated from the soln. in which the conversion is effected by the addn. of nitrates, oxides or carbonates of metals which form difficultly sol. sulfates. Cf. C. A. 22, 2815.

Metal carbonyls. LEO SCHLECHT and EMIL KEUNECKE (to I. G. FARBENIND. A.-G.). *Cah.* 284,972, Nov. 20, 1928. Scrap Fe is heated to 600° and subjected to the action of air and steam until completely transformed into Fe_3O_4 , then reduced with H at 450–500° and thereupon treated with CO.

Metallic chlorides. VEREINIGTE STAHLWERKE A.-G. Brit. 290,568, May 14, 1927. Chlorides such as those of Mn and Fe which are volatilized during the chlorination of ores are freed from HCl and H_2O before being treated for the production of the metals. Treatment of the chloride vapor with MgO or by fractional condensation may be used to effect the purification.

Metal cyanides or mixtures containing them. NIKODEM CARO and ALBERT R. FRANK. Ger. 467,479, Oct. 24, 1926. Mixts. of NH_3 and CO, at ordinary or raised pressure, are caused to react on carbonates or bivalent metals at a temp. near their dissociation temp. Fluxes such as alkali carbonates or CaF_2 may be included in the reaction mixt. Metals such as Fe or Ni, which promote the decomposition of NH_3 , or compds. of such metals, should not be present; app. of ceramic material or quartz is accordingly preferred.

Decomposition of complex fluorides. MAX BUCHNER. Can. 285,080, Nov. 27, 1928. Complex fluorides or mixts. containing them are decomposed by heating in chambers of a metal containing Fe, Ni and Cr, and of low C content, while maintaining relative movement between the solids and the gaseous products of decomposition.

Calcium, aluminosilicates phosphorus and potash. EMIL COLLETT. Fr. 639,893, Aug. 22, 1927. Phosphates are heated with coke and feldspar or leucite or a mixt. thereof. Bauxite and lime may also be added. The slag obtained is used to produce a cement.

Alumina. ELEKTRIZITÄTWERK LONZA. Fr. 640,737, Sept. 10, 1927. Bauxite or other Al material is ground, mixed with very finely divided C, and made into briquet with tar or pitch and reduced electrothermally. Cf. C. A. 23, 592.

Hydrated alumina. MARTIN TOSTERUD (to the Aluminum Co. of America). Can. 285,147, Nov. 27, 1928. A hydrate of a compn. between Al_2O_3 and $\text{Al}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$ is produced by heating $\text{Al}(\text{OH})_3$ with an aq. soln. of NaOH at about 170° for a suitable period, and digesting the solid residue with a soln. capable of dissolving a portion thereof. E. g., $\text{Al}(\text{OH})_3$ is heated at 170° in a soln. containing about 120 g. of NaOH per l., the soln. being used in the proportion, roughly, of 1 l. per 300 g. of $\text{Al}(\text{OH})_3$. Satisfactory conversion is usually obtained in an hour. Then heat at about 170° in a soln. containing about 160 g. of NaOH per l., using 1 l. of the soln. to 250 g. of the coarse hydroxide, approx. until the desired conversion to the fine state is attained.

Aluminum chloride from clay. OSKAR JONAS, KURT WEGER and GOTTHARD TREBITZ (to I. G. Farbenind. A.-G.). Can. 284,769, Nov. 13, 1928. Calcined clay (100 tons) is dumped into a container having a double bottom so as to form a layer several meters in height. To start the reaction a small part (about $\frac{1}{10}$) of the required total amt. of acid corresponding to 900 tons of 26% HCl is preheated and, together with the acid washing water from a previous extn., flowed over the clay. After the clay is entirely covered with said dil. acid, the main quantity of the above-indicated strong acid required for the extn. is gradually introduced into the container while the corresponding amt. of finished ext. is continuously withdrawn from below, a const. level being maintained. The supply of the HCl and the withdrawal of ext. is regulated so that the temp. in the reaction zone rises to at least 105° and up to 120°. By this means the greatest part of the spent acid leaves the container after one single pass, yielding a clear finished liquor of AlCl_3 corresponding to about 120–130 g. Al_2O_3 per l. The exhausted residue of clay is washed with water and removed from the container.

Ammonium chloride. J. W. MOORE, W. G. POLACK and CASTNER-KELLNER ALKALI CO., LTD. Brit. 290,045, May 18, 1927. Interaction of gaseous NH_3 and gaseous HCl to produce tough crystals of NH_4Cl of fibrous character as described in Brit. 273,093 (C. A. 22, 1831) is carried out with gases which are not dried; the heat of the reaction prevents condensation of moisture and the reaction is effected at a temp. of 230–310°. Cf. C. A. 22, 3497.

Ammonium sulfate. S. ROBSON. Brit. 289,950, Feb. 3, 1927. $(\text{NH}_4)_2\text{SO}_4$ is formed by the direct combination of NH_3 , SO_2 and H_2O while the constituents are in the form of gases or vapors or of a mist dispersed in a gas.

Ferric oxide. T. STORER and C. J. A. TAYLOR. Brit. 290,421, April 9, 1927. Galvanizers' or enamellers' waste liquors or other ferrous salt solns. to which are added

a non-gaseous oxidizing agent such as MnO_2 , with or without addn. of lime or CaCO_3 , are subjected to heat and pressure and the pptd. ferric oxide is washed and dried and is suitable for use as a pigment. A soln. of Mn chloride which may be produced in the process may be used for forming MnO_2 for further use.

Manganese sulfate and oxides. K. E. DITTMANN, K. FAERBER and GELSENKIRCHENER BERGWERKS-A.-G. Brit. 290,491, Sept. 10, 1927. Ores, wastes, etc. contg. Mn are decompd. with SO_2 soln. and the Mn sulfate soln. thus obtained is sepd., boiled down on the sulfate, and roasted in a closed vessel to utilize cyclically the SO_2 liberated. The sulfate may be roasted with C and then sintered with an air supply regulated in accord with the oxide desired.

Sodium acetate. FRANCIS G. RAWLING. U. S. 1,695,742, Dec. 18. The liquor obtained from the treatment of wood sulfite or a similar liquor is concd. treated with NaOH and lime, and the resulting mixt. is heated to produce water-sol. NaOAc and relatively insol. Ca salts and these are then sepd. from each other.

Drying natural sodium carbonate. WILLIAM F. SEYER. Can. 285,137, Nov. 27, 1928. Dry Na_2CO_3 (8 parts) is mixed with 1 part of wet $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ and dried in a rotary drum drier, or the wet $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ crystals are first ground to a size between 0.5 mm. and 2.0 mm. and then slowly mixed in the proportion of 3 to 5 with dry Na_2CO_3 at 30° and the mixt. is dried in any rotary drier. This single-stage process depends upon the fact that $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$, when containing less than 20% of water, will not bake on any hot surface.

Sodium nitrate. ROBERT GRIESSBACH and KURT RÖHRE (to I. G. Farbenind. A.-G.) U. S. 1,696,197, Dec. 25. NaNO_2 is pptd. from solns. as a difficultly sol. double salt by adding Na_2SO_4 and the double salt is decompd. by heating with water required for dissolving the nitrate, the nitrate soln. being then filtered off and cooled to recover the nitrate.

Sodium nitrate. I. G. FARBEIND. A.-G. Brit. 290,860, July 21, 1927. NaNO_2 is recovered from aq. solns. such as those obtained by leaching caliche by converting it into a double or mixed salt sparingly sol. at ordinary temp. (suitably by use of Na_2SO_4) and treating the ppt. thus formed for sepn. of the NaNO_2 (suitably by heating the double salt to above 70° with just sufficient water to dissolve the NaNO_2).

Obtaining sodium nitrate from aqueous solution. I. G. FARBEIND. A.-G. (Robert Griessbach, inventor). Ger. 467,684, Oct. 15, 1926. The NaNO_2 is converted to a difficultly sol. double or mixed salt, for instance by treating the soln. with Na_2SO_4 , and the ppt. is sepd. and worked up. An example is given.

Sodium bisulfate. JOHN N. CAROTHERS and CHARLES F. BOOTH (to Federal Phosphorus Co.). U. S. 1,693,947, Dec. 4. High-grade NaHSO_4 is obtained by adding water and strong H_2SO_4 to crude niter cake to yield a product contg. approx. 85% NaHSO_4 , heating the mixt. to about 150° , cooling to approx. atin. temp., and then disintegrating.

Silicon fluoride. DEUTSCHE GOLD UND SILBER-SCHNEIDANSTALT VORM. ROESSLER (Kurt Andrich, inventor). Ger. 467,637, Dec. 14, 1926. SiF_4 is made by treating mixts. of silicic acid and fluorides with Cl, or substances yielding Cl, at a raised temp. in the presence of a reducing agent. The reducing agent may be solid or gaseous; C and CO are among those specified.

Titanium oxide. REGINALD H. MONK. U. S. 1,695,341, Dec. 18. Refractory Ti compds. such as those from rutile or ilmenite after elimination of other impurities and a large portion of the Fe content are converted into water-sol. sulfates by mixing with alkali metal sulfate and an acid solvent such as H_2SO_4 , heating the mixt. at $120\text{--}300^\circ$ until a solid cake is formed, cooling and crushing the cake.

Titanic oxide. LOUIS E. BARTON and CHARLES J. KINZIE (to Titanium Pigment Co.). U. S. 1,695,270, Dec. 18. Titaniferous ore is heated, but without fusion (suitably at a temp. of about 200° and then at 350°) with an admixt. of H_2SO_4 and alkali metal sulfate, to form water-sol. salts, and the resulting product is treated with water and the soln. heated.

Apparatus for making solid carbon dioxide. JAMES W. MARTIN, JR. (to the Drice Corp. of America). Can. 285,166, Nov. 27, 1928.

Apparatus for the manufacture of solid carbon dioxide. WALTER S. JOSEPHSON (to Drice Corporation of America). Can. 285,526, Dec. 11, 1928.

Carbon disulfide. JULIUS KOMLÓS, ALEXANDER KOMLÓS and ERNST F. ENGELKE. Swiss 126,816, Feb. 11, 1927. S vapor and a hydrocarbon are allowed to react at a temp. at which CS_2 and H_2S are the chief products. Thus, S and C_2H_2 are heated to 445° . Cf. C. A., 22, 484.

Carbon disulfide. I. G. FARBENIND. A.-G. Fr. 640,783, Sept. 12, 1927. CS_2 is solubilized in water by mixing it with an alc. such as Bu or Am and a soap.

Catalytic oxidation of sulfur dioxide. ALPHONS O. JAEGER and JOHANN A. BERTSCH (Jaeger to the Selden Co.). U. S. 1,695,285, Dec. 18. Gases contg. SO_2 , O and at least one catalyst poison (other than As alone) such as HCl are passed at elevated temps. over catalytically active zeolites which are free from Pt, *e. g.*, zeolite catalysts contg. V. Cf. C. A. 22, 1018.

Catalytic oxidation of sulfur dioxide. ALPHONS O. JAEGER and JOHANN A. BERTSCH (Jaeger to Selden Co.). U. S. 1,696,546, Dec. 25. A catalyst is used comprising a zeolite which contains at least one catalytically active element such as V, Mo, W, U, Cr or Mn in non-exchangeable form and is combined with a catalytically active acid radical such as those of acids of V, W, U, Cr, Mo, Mn and Ti.

Catalytic production of sulfur trioxide. SELDEN Co. Brit. 290,089, Sept. 14, 1927. In oxidizing SO_2 at least part of the reaction gas is passed through heat exchange devices embedded in the catalyst, then in reverse direction through a second series of heat-exchangers surrounding the first and then, after a second reversal, through the catalyst itself. An app. is described.

Catalytic material. WALTER A. PATRICK (to Silica Gel Corp.). U. S. 1,695,740, Dec. 18. A hard porous material such as silica gel which has not been completely dried has pores of a size to adsorb water vapor to such an extent as to contain at 30° at least 21% of its own weight of water when in equil. with water vapor at a partial pressure of about 22 mm. Hg, and this material is treated with a substance capable of forming a catalyst such as with a Pt or Fe compd. and then treated, as by heating, to form the catalyst.

Nickel catalyst suitable for hydrogenating processes. KARL SCHIRMACHER, FRIEDRICH STOLZ, HANS SCHLICHENMAIER and WALTER KROHS (to I. G. Farbenind. A.-G.). U. S. 1,695,666, Dec. 18. A highly active Ni catalyst is obtained by the reduction of a finely cryst. Ni compd. such as Ni nitrate assocd. with silicic acid or other suitable inert substratum.

Activated carbon. ARTHUR B. RAY, ERNEST G. DOYING and JOHN J. BUTKOVSKY (to Carbide and Carbon Chemicals Corp.). U. S. 1,694,040, Dec. 4. Nut cellulose is impregnated with H_3PO_4 and the mixt. is heated to a temp. not materially below 350° (and which may be above 600°), steam is passed over the heated material to carry off volatile P compds. and the latter are recovered from the steam and returned for further use. Other dehydrating agents such as ZnCl_2 also may be used.

Apparatus for the production of carbon black. ROY H. UHLINGER (to Thermatomic Carbon Co.). Can. 285,031, Nov. 20, 1928. An app. for carrying out the process of the following patent is specified.

Carbon black. ROY H. UHLINGER (to Thermatomic Carbon Co.). Can. 285,032, Nov. 20, 1928. Carbon black passed from a decomposing furnace admingled with gases produced therein is subjected to a spray of cooling liquid, and the carbon black is sepd. from the gases. The carbon black is freed from moisture by conveying it along a conduit in a direction counter to the passage of a mixt. of heated gases and carbon black from a decomposing furnace.

Purification of hydrogen. GEWERKSCHAFT DER STEINKOHLENZECHE MONT-CENIS. Fr. 640,069, Aug. 26, 1927. See Brit. 276,687 (C. A. 22, 2445).

Purification of hydrogen. GEWERKSCHAFT DER STEINKOHLENZECHE MONT-CENIS. Fr. 639,935, Aug. 23, 1927. See Brit. 276,668 (C. A. 22, 2445).

Fixation of nitrogen. GASINDUSTRIE AKT.-GES. Ger. 468,728, Dec. 16, 1925. A compact highly porous alkali coke for the fixation of atm. N is prepd. by intimately mixing an alkali phenolate with charcoal and heating. A catalyst such as Fe may be added.

Iodine solutions. KARL JUNGMAHN and OSWALD KOLBERT. Ger. 468,710, Sept. 22, 1926. Solid alc. I solns. are stabilized by the addn. of substances which form metastable compds. with I, such as an iodide, preferably NaI. Cf. C. A. 22, 2639, 3020.

Extraction of lead. NORDDEUTSCHE CHEMISCHE FABRIK IN HARBURG. Fr. 640,816, Sept. 13, 1927. Substances contg. Pb and S are treated to convert the Pb into sulfate, and then heated to about $140\text{--}150^\circ$ under 4 to 5 atm. pressure with concd. NaCl soln.

Separating tin and lead. HUTTENWERKE TROTHA A.-G. and W. WITTER. Brit. 290,628, May 18, 1927. A mixt. of oxidic Sn- and Pb-bearing materials is fused with caustic alkali, such as NaOH, for about 2 hrs., with const. stirring, and preferably with addn. of about 5% of granular wood charcoal. The melt contains most of the Sn as stannate and a small quantity of Pb as plumbite. The residue contains mainly undissolved Pb oxide and a small quantity of Sn. The melt is treated with a small quantity

of water or lye which removes free NaOH and most of the dissolved Pb and leaves most of the Sn salts undissolved. The Sn compds. are separately recovered.

Litharge and minium. SALLENAVE, SOSSON ET C^{IE}. Fr. 640,519, Feb. 17, 1927. Spongy Pb, obtained in an extremely fine state by electrolysis in a soln. of a Pb salt, is macerated in such a way that while still impregnated with the electrolyte it is transformed into a complex mixt. of oxides of Pb and oxidized by baking in a closed vessel.

Mining deposits of boron compounds containing kernite. HENRY BLUMENBERG, Jr. U. S. 1,696,075, Dec. 18. The deposit is treated with an alk. soln. of an alkali metal compd. such as Na_2CO_3 to convert the kernite to an easily sol. metaborate and the latter is dissolved and removed from the deposit. Cf. C. A. 22, 484.

Decomposition of water. PIERRE A. J. M. BÉNÉZET. Fr. 32,955, July 10, 1926. Addn. to 615,465. H and O are obtained by spraying water into a tube heated to above 1000° .

Detecting leakage of halogens or their volatile compounds. T. S. LANYON and BARON WOLDEMAR GEORGE NOLCKEN. Brit. 290,324, Jan. 11, 1927. Leakage of Cl or other halogens or their volatile compds. is detected by drawing the gas from the vicinity of the leak to a visual indicating device such as a lamp with a clear Bunsen burner flame which draws the air contg. the gas by suction through a chimney of Cu or Cu alloy. A flame vibration is produced as in Beilstein's test.

Salt evaporating pans. VEREINIGTE SCHWEIZERISCHE RHEINSALINEN. Ger. 468,729, Sept. 21, 1926. The scrapers are mounted on a reciprocating axle and are raised for the return stroke.

Purification of brine. I. G. FARBENIND. A.-G. Fr. 640,237, Aug. 29, 1927. Brine for use in electrolytic tanks is freed from salts of Mg and Ca by satg. it with NaF and the pptd. MgF_2 and CaF_2 are removed.

Evaporating Searles Lake brine. GEORGE B. BURNHAM (to Burnham Chemical Co.) U. S. 1,696,542, Dec. 25. The brine is pumped from its normal subterranean position and is exposed in an open pond of sufficient extent and depth to be conductive to wave action in the brine under the influence of the wind so that the formation of a salt crust is prevented.

Crystallizing solid substances from supersaturated solutions. ISAK ISAACHSEN (to Alkelselskapet Krystal). U. S. 1,693,786, Dec. 4. In effecting crystn. of substances such as NaCl from supersatd. solns. with cyclic circulation of a suspension of granules of the material, the soln. and suspension are circulated as a stream of relatively small cross-sectional area so that the granules are normally positively carried along by the stream, and the no. of granules is regulated before they have materially increased in size, and granules are removed from the circulating stream at definite places.

Magnetic materials. ADOLPH F. BANDUR (to The Western Electric Co., Inc.). Can. 285,214, Nov. 27, 1928. Fe-Ni alloy in finely divided form and contg. more than 25% Ni and the remainder principally Fe is treated with a flux of boric acid and kaolin in colloidal suspension, whereby the alloy particles are individually insulated, after which they are compressed into cores of the desired shape and size. The cores are then impregnated with a soln. of $\text{Zn}(\text{OH})_2$, are heated to expel moisture and finally are heated to the optimum temp. for the particular alloy of which the cores are constructed to stabilize the insulator and to give the required permeability, low hysteresis losses, high specific resistance, hence, low eddy current losses of the rings. The magnetic material is used especially as magnet cores for loading coils for telephone circuits.

Compact magnetic agglomerates from magnetic powders. V. I. VOLUINKIN. Russ. 4676, Feb. 29, 1928. The powdered magnetic material is mixed with a binder, pressed and heated in forms laid out with adsorbent material such as sand, cardboard, etc.

Extracting and drying inorganic jellies. WOLF J. MÜLLER, HANS CARSTENS and JULIUS DECKER (to I. G. Farbenind. A.-G.). U. S. 1,696,358, Dec. 25. Ertg. and drying of inorg. jellies such as silicic acid gel is effected in the form of plates or sheets.

Adsorbent gels. E. B. MILLER and G. C. CONNOLLY (to Silica Gel Corp.). Brit. 289,890, May 6, 1927. Small particles of hard adsorbent gels formed during the manuf. or handling of these substances are added to hydrosols and remain in the hydrogel which forms from the sol, and in the final dried product. Reference is made to the prepn. of gels of silica and of oxides of Al, Sn, Ti and W.

Catalytic and adsorbent gel. WALTER A. PATRICK (to Silica Gel Corp.). U. S. 1,696,644, Dec. 25. A hard stable material having a porous structure substantially the same as silica gel contains Cu oxide and a colloidal oxide such as silica gel and is suitable for use as a catalyst. U. S. 1,696,645 specifies Ni instead of Cu oxide, and the gel contg. Ni may be used as a catalyst.

Thermoplastic composition. CAMILLE DREYFUS and GEORGE SCHNEIDER (to Camille Dreyfus). Can. 285,231, Nov. 27, 1928. Thermoplastic molding powders are manufd. in the absence of volatile diluents, by grinding 80 lbs. of cellulose acetate in a pebble mill for 6-8 hrs., adding 24 lbs. of triacetin and 4 lbs. of diethyl phthalate and grinding the mixt. for an additional 8 hrs., then adding 75 lbs. of ZnO to the mixt. and further grinding for several hrs. until a homogeneous mass is obtained.

Hardened solid artificial masses. KARL OTT, HERIBERT SCHUSSLER, MARTIN LUTHER and CLAUD HENCK (to I. G. Farbenind. A.-G.). Can. 284,967, Nov. 20, 1928. Artificial masses are produced by hardening casein together with dimethylolurea thoroughly mixed therewith under a high pressure at temp. of about from 80° to 120°. E. g., 500 parts of casein and 500 parts of dimethylolurea are thoroughly mixed, and the mixt. is subjected to a pressure of 200 atms. for 3.5 hrs. in a block-press, which is maintained at a temp. of 100°. An artificial mass of yellowish color is obtained.

Condensation products from aldehydes and phenols. MAX WEILER, BERTHOLD WENK and HERMANN STOTTER (to I. G. Farbenind. A.-G.). Can. 284,773, Nov. 13, 1928. An aldehyde is treated with a *p*-halogenated phenol that contains a free ortho position and which may be substituted in the nucleus by indifferent substituents, in the presence of H₂SO₄ of a suitable concn. at temps. of 15-70° and for a time ranging from 3 hrs. to 3 days. E. g., 16.3 parts by wt. of 2,4-dichlorophenol is dissolved in a mixt. of 60 parts of glacial AcOH and 40 parts of H₂SO₄·H₂O and 5.5 parts of an aq. 29% CH₂O are added. After heating several hrs. to 50-70° C. the mass is poured into water and filtered from the ppt. Unattacked dichlorophenol may be removed by blowing steam through or may be dissolved in NaOH soln., from which it is pptd. by pouring into dil. acid. The product of condensation is a nearly colorless powder easily sol. in alkali and ligroin.

Shaped articles from urea-aldehyde condensation products. FRITZ POLLAK Austrian 109,532, Nov. 15, 1926. Manipulative details.

Formation of porous castings from carbamic-formaldehyde condensation products. SOCIÉTÉ ANON. POUR L'INDUSTRIE CHIMIQUE À BÂLE. Swiss 126,827, Dec. 4, 1926. White or ivory-like castings of great strength and high *insulating power* against heat and electricity and capable of being ground and polished are prepd. by pouring a soln. of the condensation products into a mold in the presence of a catalyzer, such as H₂SO₄, which effects further condensation.

Sulfur and silica composition suitable for use as an acid-proof coating or cement, etc. WM. H. KOBBE (to Fleuron, Inc.). U. S. 1,693,714, Dec. 4. About equal quantities of S and SiO₂ are used together. The SiO₂ is comminuted so that approx. 7.2% is held on 80-mesh, 5.6% on 100-mesh, and through 80-mesh, 25% is held on 200-mesh and through 100-mesh, 19% is held on 320-mesh and through 200-mesh and 43% passes 320-mesh screens. This compn. may be used for coating tanks.

Colloidal solutions of silica for coating stone, brick, wood or other surfaces or for impregnating fabrics. G. KING and R. THRELFALL. Brit. 290,717, Feb. 16, 1927. Water (not in excess) is added to a soln. of an alkyl silicic acid ester (or mixt. of such esters) in a solvent such as alc. which is capable of carrying water in soln. or suspension. Preferably the quantity of water is such as not to decomp. all of the ester. Pigments may be added preferably in admixt. with solvents such as cyclohexanol which do not interfere with hydrolysis of the ester. Setting may be retarded by addn. of substances such as CCl₄, turpentine, bromonaphthalene, fatty oils, shellac, synthetic resins or essential oils and the soln. may be added to *pyroxylin lacquers* as a stiffening or fireproofing agent.

Utilizing waste gases of the iron-steam process of making hydrogen. BAMAG-MEQUIN A.-G. Ger. 466,109, Dec. 24, 1926. The waste gases from each phase of the process are collected in a common container and used as heating gas. Small quantities of the reducing gases used in the process may be added.

Rust-removing compositions. ZOELLNER-WERKE A.-G. VORM. S. H. COHN. Ger. 466,077, Nov. 8, 1925. Naphthalenesulfonic acids or their condensation products with formaldehyde are used as ingredients of rust-removing compns.

Removing iron mold. BYK-GULDENWERKE CHEM. FAB. A.-G. Ger. 466,130, April 13, 1926. Bilactates are used, particularly Ca bilactate.

Dispersing agents. BRITISH DYESTUFFS CORP., LTD., JAMES BADDILEY, ARNOLD SHEPHERDSON and ANTONY J. HAILWOOD. Fr. 640,776, Sept. 12, 1927. Dispersing and solubilizing agents, particularly for dyes, are obtained by oxidizing sulfite cellulose pitch with HNO₃, H₂O₂, chromic acid, permanganates or ammoniacal Cu sulfate. When dried, the product forms a friable non-hygroscopic mass.

Cleaning agents. BRITISH DYESTUFFS CORPORATION, LTD., JAMES BADDILEY and ERNEST CHAPMAN. Fr. 640,777, Sept. 12, 1927. See Brit. 284,367 (C. A. 22, 4741).

Cleansing compositions. IGNAZ KREIDL. Austrian 109,387, Dec. 15, 1927. Cleansing compns. comprise an alkali bicarbonate, an alkali carbonate and a fat solvent. A typical compn. comprises NaHCO_3 250 parts, K_2CO_3 20 parts of a 30% soln. and turpentine oil 60 parts.

Cleaning compositions for walls, carpets, etc. ALBERT HEUSSER. Swiss 126,154, Jan. 3, 1928. Meal is stirred into a hot soln. of a metal sulfate in sufficient amt. to give a tough pasty mass. Wheatmeal and CuSO_4 or alum are the preferred ingredients.

Detergent for use on wood, metal, glass, leather, varnished surfaces, etc. HENRY R. LADISLAUS. U. S. 1,695,693, Dec. 18. HCl 4 oz., glycerol 4 oz., pulverized antimony 16 oz., oil of mirbane 4 oz., vinegar 1 gal. and machine oil 1 gal. are mixed together with water $\frac{1}{2}$ gal.

Paint remover. BORIS N. LONGOVY (to The Chadeloid Chemical Co.). Can. 285,351, Dec. 4, 1928. A paint and varnish remover compn. free from any large percentage of water comprises denatured alc., acetone, benzene, wax and a benzoate. It is free from chlorinated hydrocarbons and the benzoate is present in quantity sufficient to give a substantial thickening effect. An example is a compn. made by mixing 450 parts of acetone, 140 parts of the alc. soln. of BzONa and 400 parts of benzene, the latter contg. about 10 parts of ceresin wax. Cf. C. A. 23, 532.

Composition for cleaning drain-pipes. EDWARD A. TAYLOR (to Grasselli Chemical Co.). U. S. 1,693,678, Dec. 4. A mixt. of caustic alkali such as NaOH 95, finely divided Al_2 and "goulac" 1 part.

Separating and cleaning plates or leaves of mica by gravitation against upward air currents. LOUIS MCCARTHY (to Macallen Co.). U. S. 1,695,383, Dec. 18. An app. is described.

Polishing composition. J. MAS. Brit. 290,295, May 12, 1927. See Fr. 634,291 (C. A. 22, 3791).

Polishing pad for lenses. JOHN D. GAMBLE (to Continental Optical Corp.). U. S. 1,693,598, Dec. 4. A pad of felt or the like is impregnated with pitch material and a portion of the latter is then extd. from one side of the pad, e. g., by contact with an absorbent pine board.

Sound records. E. NOACK. Brit. 290,801, April 19, 1927. Material such as artificial phenolic resins or cellulose ester or ether compns. after being formed into pressed blocks and ground to a fine powder is freed from all traces of volatile solvent and moisture, mixed with asphalt as a binder, rolled into sheets or strips and molded under heat and pressure. Various auxiliary ingredients may be added.

System (employing light beams and sensitized films carrying light-restraining dyes) for producing combined sound and picture records. A. C. HARDY (to British Thomson-Houston Co., Ltd.). Brit. 290,668, May 20, 1927.

Loud-speaker diaphragms of thin aluminum-manganese alloy, etc. V. A. SCHLENKER (to Electrical Research Products, Inc.). Brit. 290,235, May 11, 1927.

Viscous composition for dampening vibrations of sound recording and reproducing styli. H. C. HARRISON (to Electrical Research Products, Inc.). Brit. 290,264, May 13, 1927. A mixt. may be used comprising polymerized castor oil 75 and PhNO_2 25%.

Vibration-dampening materials. MARTIN HAHN and KURT B. EISENBERG. Ger. 466,022 Sept. 16, 1926. Materials for suppressing acoustic, mech., elec. or thermal vibrations or oscillations comprise mixts. of viscous liquids with powdery mineral fillers. A typical mixt. comprises oil, loam and alumina.

Dynamo brush. NELSON A. HAAS (to the Dayton Engineering Laboratories Co.). Can. 285,164, Nov. 27, 1928. A mixt. of graphite and phenolic condensation product is heated in a mold to 250–300° F., under a pressure of 3000 lb. per sq. in. for about 6 min.; the mold is cooled by running water for about 3 min. while the pressure is maintained and the briquet is heated in a non-oxidizing atm.

Dielectric material from wood. ANDRE MOUILLEFARINE. U. S. 1,696,501, Dec. 25. Wood is first dyed to resemble ebonite by immersing it in a bath comprising "basic black," HOAc and NaCl for about 24 hrs., during the first 4 hrs. of which the material is heated to about 100° and during the remainder of which time it is permitted to cool, and is thereafter heated and submitted to the action of an insulating mass of bituminous shale and to temps. of 150–300° or higher and is then dried and finally coated with a varnish contg. shellac.

Composition for honing razors and knives. WILHELM HAFNER. U. S. 1,693,697, Dec. 4. A mixt. formed of glue 17 g., glycerol 25 drops, powd. emery 4 g., tripoli 3–5 g., beet juice 7 g., sugar 0.5 g. and gelatin 0.5 g. is applied to wood or other support.

Waterproofing composition. EDWIN C. E. LORD. U. S. 1,693,718, Dec. 4. A compn. suitable for water-proofing walls, cisterns, etc., comprises a mixt. of water-gas tar and paraffin wax dissolved in coal-tar naphtha, having a sp. gr. of about 1.02.

Foam-producing composition suitable for various purposes. ERICH M. A. STHAMER. U. S. 1,696,507, Dec. 25. Saponin and milk sugar are used together in fire-extinguishing or other compns.

Foam fire extinguisher. S. D. BOGOSLOVSKII. Russ. 4658, Feb. 29, 1928.

Foam fire extinguisher. V. V. GESHELIN. Russ. 4207, Dec. 31, 1927.

Fireproofing various combustible materials. DUPONT VISCOLOID Co. Brit. 289,936, Feb. 1, 1927. The material is treated with a hydrated Mg carbonate either as a coating or impregnating substance which may be mixed with rubber soln., varnishes, paints, etc., for application to fabrics, wood or cellulose esters or ethers, and various compns. of these substances contg. hydrated Mg carbonate may be used for making molded articles.

Destroying vermin. KARL SCHNEIDER. Ger. 466,232, Mar. 22, 1925. Vermin, particularly bugs, are destroyed with solns. in benzine of cresol or like substances by atomizing the solns. with compressed air and blowing them into the infested places.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

Handwork and machinery in glass manufacture. O. KNAPP. *Chem. Rundschau* (Budapest) 5, 67-69(1928).—The following are described: modern glass factories, the continuous process used by Henry Ford, Owen's bottle-making machine, Westlake's flask-blowing machine and Danner's tube-producing app. S. S. DE F.

The effect of solarization on the ultra-violet transmission of window materials. W. W. COBLENTZ AND R. STAIR. *Trans. Illum. Eng. Soc.* 23, 1121-52(1928). The transmission for 302 millimu was measured for various glasses before and after exposure to ultra-violet. Three classes are established: (1) Fused quartz, Corex and Locke glass. Transmission is initially over 85%, and there is little or no decrease on solarization. (2) Vitaglass and Helioglass. Transmission is initially 45-55%, decreasing to about half on exposure. (3) Common glass and Quartzlite. Transmission is initially 0-1.5%; there is no change with exposure. The original, and a previous paper (*Ibid* 23, 247), should be consulted for a discussion of ultra-violet therapy. BENJAMIN MILLER

The relation between moisture content and contraction of clay molds (dough) and its mixtures with sand. V. T. SAPEGO. *Trans. State Exptl. Inst. Silicates* (Moscow) 21, 41-52(1927).—Expts. were conducted on mixts. of a clay with 10 to 70% sand. Water was added to make them all of uniform consistency. Test bricks were weighed and measured daily until shrinkage ceased. The bricks were then dried at 110° to det. hygroscopic moisture. The data are presented in 8 tables. J. S. JOFFE

The contraction of fire bricks. I. V. SMIRNOV. *Trans. State Exptl. Inst. Silicates* (Moscow) 21, 29-39(1927).—S. tested a series of 12 samples of different clays for the linear and cubical decrease and porosity due to contraction when heated to 120°. These measurements were correlated with the plasticity of the respective clays. It was found that clays with a high contraction are the most plastic. J. S. JOFFE

The microstructure of Dinas. N. N. SMIRNOV. *Trans. State Exptl. Inst. Silicates* (Moscow) 18, 5-24(1926).—Quartz changes in Dinas brick proceed as follows: (1) The first influence of the heat causes a breaking up of the quartz grains. (2) A change takes place from the quartz uniaxial to the biaxial. (3) The quartz gradually changes into amorphous glass. (4) Cristobalite is formed from the glass. (5) The cristobalite gradually changes into tridymite. J. S. JOFFE

The microstructure of refractory bricks. N. N. SMIRNOV. *Trans. State Exptl. Inst. Silicates* (Moscow) 18, 25-32(1926).—Considerable recrystn. takes place in most bricks. Slender, long prismatic crystals appear, but they are poorly differentiated. The newly formed crystals resemble very closely the crystals of sillimanite. J. S. J.

Roman potteries. The composition of ancient Roman pottery and terra sigillata fragments found in the exhumed kiln between Nied and Höchst, 1890-1893. ADOLF JACQUET. *Keram. Rundschau* 36, 511-3(1928).—Analyses were made of fragments of pottery associated with an ancient Roman kiln situated between Nied and Höchst and discovered during excavation to det. whether fragments showed dissimilarities in compn. and whether it could be assumed that some clay was imported from Italy over the promi-

nent highway that passed near the spot where the excavation was made. Two general types of ware were distinguished: (1) pitchers, bowls, etc., made from heavy, unwashed clays; (2) bowls and cups made of washed and purified clays, either unglazed or with a thin glaze. Analyses of these two types are given. J. concludes that both types of ware used the same clay, that the clay was dumped into pits, weathered, and washed, and two kinds of clay were obtained. One of these, with the lower SiO_2 content, was used for terra sigillata ware and to it was added a short CaO-rich clay, probably to obtain a glaze-like surface. The clay with the high SiO_2 content and CaO content were used for the lower-grade ware. H. I.

Recent investigations on the system: alumina-silica and their importance in the study of ceramic materials. G. MALQUORI. Reale Univ. Roma. *Ann. chim. applicata* 18, 352-61(1928).—A review and discussion, with 21 references. C. C. DAVIS

Constitution of gold resinate. F. CHEMNITZ AND R. BARFUSS-KNOCHENDÖPPEL. *Chem.-Ztg.* 52, 857-9(1928).—Complete instructions are given for preparing pure Au resinate (used in ceramics to give a golden glance). Complete analysis of such pure samples gives: Au, 63.2, S, 10.0, H, 2.2-2.4, C, 17.95-17.99. ALBERT L. HENNE

The wet process of vitreous enameling. W. MARSHALL. *Foundry Trade J.* 39, 863-4(1928).—M. discusses factors affecting the quality and economy of enameling. Enamels consist of borosilicates to which varying percentages of fluxes and colors are added. Factors contributing to successful enameling are: (1) Careful control of temp. and length of heating period; it is desirable that the heating take place as rapidly as possible and for a short time. (2) Protection from certain products of combustion. (3) Careful cleaning and prepn. of the product to be enameled. (4) The thinner the enamel coat, the higher the quality. Types of furnaces and character of fuel oil are discussed. Fuel cost is a minor factor in general. L. B. MILLER

The production of color in glass by x-rays and radium rays (REINHARD, SCHREINER)
3. Fusing metal caps on to vessels or tubes of glass (Ger. pat. 466,049) 1.

Taschenbuch für Keramiker, 1928. In 2 parts. Berlin: Keramische Rundschau. Pt. I. 40 pp. Pt. II. 360 pp. Reviewed in *Trans. Ceram. Soc.* (England) 27, abstract Sect., 25(1927-28).

Tonindustrie-Kalender, 1928. In 2 parts. Berlin: H. Seger and E. Cramer. Chemisches Laboratorium für Tonindustrie und Tonindustrie-Ztg. Pt. I, 40 pp. M. 1.20, Pt. II, 160 pp. M. 3.50. Reviewed in *Trans. Ceram. Soc.* (England) 27, abstract Sect., 25(1927-28).

Apparatus for feeding molten glass. C. H. RANKIN. Brit. 200,083, Aug. 24, 1927.

Device for feeding mold charges of molten glass. PAUL G. WILLETTTS (to Hartford-Empire Co.). U. S. 1,696,661, Dec. 25.

Furnace and associated apparatus for supplying molten glass and heating it just before forming it into sheets. JOHN L. DRAKE (to Libbey-Owens Sheet Glass Co.). U. S. 1,695,538, Dec. 18. Structural features.

Distributor for feeding glass-making machines. ALFRED BOUCHER. Fr. 640,854, Feb. 22, 1927.

Apparatus for forming blown molded glass articles. R. F. HALL. Brit. 290,685, Nov. 18, 1926.

Apparatus for the production of blown glass articles. CORNING GLASS WORKS. Fr. 610,604, July 11, 1927.

Sheet glass. WM. K. BROWNLEE (to Libbey-Owens Sheet Glass Co.). U. S. 1,695,528, Dec. 18. A furnace and assocd. app. are described in which glass for drawing is supplied through a refining and cooling chamber and the lower strata and side portions of the glass are simultaneously heated.

Sheet-glass drawing apparatus. LAWRENCE A. GROLEMUND (to Libbey-Owens Sheet Glass Co.). U. S. 1,695,547, Dec. 18.

Draw-table-heating unit for sheet-glass manufacture. WALTER O. AMSLER (to Libbey-Owens Sheet Glass Co.). U. S. 1,695,265, Dec. 18.

Leer for annealing glassware. PERCY Q. WILLIAMS (to Owens Bottle Co.). U. S. 1,695,788, Dec. 18; Can. 284,598, Nov. 6, 1928.

Leer and conveying apparatus for annealing glassware. O. SHACKELFORD (to Thermal Engineering Corp.). Brit. 289,790, April 29, 1927.

Laminated glass made with a film of transparent substantially colorless rubber. JAMES W. H. RANDALL (to Libbey-Owens Sheet Glass Co.). U. S. 1,693,729, Dec. 4.

Fixing designs on glass surfaces. KALMAN WARGA (to Clarence W. Bickford and Mary Bickford). U. S. 1,693,735, Dec. 4. Designs are formed with color films, each contg. a mineral pigment and a vitreous binding material, all the films being fusible at the same temp., and the designs are placed in a mold fitting the glass object to be decorated, the latter is inserted while hot into the mold contg. the design and into contact with the design, and heating in a leer is effected to fix the design. Cf. C. A. 22, 308.

Recuperating circular furnace composed of many chambers for baking Dinas bricks. V. E. GRUM-GRZHIMAILO. Russ. 4322, Sept. 15, 1924.

Press for making brick, tiles, etc., from dry clay. J. YLLA Y CONTE. Brit. 290,243, May 11, 1927. Structural features.

Refractory material. VICTOR M. GOLDSCHMIDT and ROLF KNUDSON (to Borgestad Fabrikker). Can. 285,503, Dec. 11, 1928. Olivine rock fashioned, cut, sawn, etc., into the desired shape is used as a refractory for metallurgical purposes, stoves, chimneys, crucibles, etc., or it may be utilized in finely disintegrated form or in coarser pieces with a binder such as colloidal magnesium silicate, MgO , $Mg(OH)_2$, talc, materials contg. lime or other Ca compds., clay, tar, pitch, asphaltum. The olivine rock and binding agent may be shaped and burned at suitable temp. between 1000° and 1500° before use.

Fusing and purifying alumina and other refractory substances. J. SKAPPEL. Brit. 290,586, May 13, 1927. Substances such as cryst. Al_2O_3 , spinel, TiO_2 , titanite, zirconia and beryl are obtained from impure raw materials contg. them by sintering or fusing with halogen salts such as fluorspar, cryolite or $NaCl$ or $CaCl_2$, or with oxidic alkali or alk. earth metal compds. such as aluminates, removal of impurities by reduction, electrolysis or conversion and cooling of the reaction mass to obtain crystals and a eutectic mixt. which is then mech. sepd. from the desired crystals. Numerous details and modifications are described.

Apparatus for heat treatment of refractory materials. THOMAS S. CURTIS (to Vitrefrax Corp.). U. S. 1,696,794, Dec. 25. Structural features.

Abrasive composition for sharpening razors. W. E. COMERFORD. Brit. 290,123, Nov. 26, 1927. Rollers of razor-sharpening devices are treated with a mixt. formed with equal quantities of finely powd. carborundum and graphite, made into a paste with a hard drying size, applied while hot and, when set, polished by steel burnishers.

Coating ceramic objects. GERHARD KALLEN. Ger. 468,703, Mar. 31, 1925. Addn. to 402,020. The fire resisting coating contg. ZrO_2 described in Ger. 402,020 is applied to ceramic objects before baking or when half baked.

Composition to be added to cement mixtures for cold glazes or the like. JOHN LANGBEIN. U. S. 1,695,808, Dec. 18. A mixt. of polymerized linseed oil 25, ammoniacal water 66, milk of lime 575 and infusorial earth 100 parts is used for rendering cold glazes suitable for gilding.

Furnaces for drying and baking ceramic materials. ALFRED DELECOURT. Fr. 32,840, July 19, 1926. Addn. to 623,441.

Withdrawal indicator for ceramic furnaces. TUILERIES A. BISCH (S. A. R. L.). Fr. 640,799, Sept. 13, 1927. The contraction of the article being baked is measured and recorded on an indicator.

Closed-circuit fine grinding and what it should accomplish in the cement industry. A. ANABLE. *Rock Products* 32, No. 1, 66-72 (1928). RAYMOND WILSON

The Lehigh Portland Cement Company plant at Mitchell, Indiana. ANON. *Pit and Quarry* 17, No. 7, 33-44(1928).

Asbestos-cement products used in construction. CHARLES QUILLARD AND PIERRE DESNOS. *Ciment* 33, 422-9(1928).—A general description of the manuf. and application of asbestos-cement products. F. O. A.

Thermal constants and the strength of light aggregates. MINORU HAMADA. *J. Faculty Eng. Tokyo Imperial Univ.* 17, 201-12(1928).—Thermal cond. consts. were detd. by measuring the rate of rise in temp. in the centers of 6-by-12-in. cylinders heated from the surface and calcg. the diffusivity by the mathematical theory of heat conduction. The proportion of cement to aggregate has little effect on heat cond. Concretes made from various Japanese light-weight aggregates have $\frac{1}{2}$ to $\frac{1}{3}$ the heat cond. of those made from common sand and gravel. An approx. relation between heat cond. (k) and voids (v) is $k = 0.005/0.5^v$. RAYMOND WILSON

Protecting concrete. A. W. RICK. *Tonind. Ztg.* 52, 1861-3(1928).—A general discussion of admixtures, impregnators and coatings. F. O. A.

The mechanism of the decomposition of rotary kiln clinker on long storing. ADOLF SPENGLER. *Tonind. Ztg.* 52, 1939-40(1928).—Clinker after 7 years of storage in contact with the air underwent spontaneous pulverization, not shown by similar clinker in a bottle. The former was sepd. by sieves into fractions. On analysis it was found that as the change progressed, the decompd. fractions contained more lime and less SiO_2 than the original. The larger, more poorly burned clinker balls suffered much more than the hard-burned pea-sized pieces. Therefore hard burning tends to prevent this decompn. F. O. A.

The properties of breeze and clinker aggregates and methods of testing their soundness. F. M. LEA. Dept. of Sci. and Ind. Research (British), *Building Research Bull.* No. 5, 17 pp.(1928).—The effect of breeze and clinker aggregates on the properties of concrete are dependent on the amt. and nature of the combustible material in the aggregate. Aggregates having large moisture movements and therefore likely to prove unsound in concrete have high capacities for absorption of moisture, O or dye (methylene blue). A pat test and a dye-absorption test for soundness of such aggregates are described. RAYMOND WILSON

Nomenclature of materials and processes used in the construction of roads, and the standardization of testing methods for tars, bitumens and asphalts. PERCY E. SPILLMANN. *J. Inst. Petroleum Tech.* 14, 774-9(1928).—Definitions of the following terms as agreed upon by the Intern. Comm. on Nomenclature are given: bitumen, asphaltic bitumen, asphalt, asphaltite, tar, pitch. Test specifications are described as follows: tar (water content, consistency, free C, distn. test, density, acid-oil detn., detn. of mixts. contg. naphthalene); pitch, bitumen and asphaltic bitumen (penetration, softening point, loss on heating, soly. in CS_2 , ductility, density, penetration at low temp., flash point, free C and ash, soly. in $(\text{C}_2\text{H}_5)_2\text{O}$); emulsions (water content, sepn. of water and bitumen). D. F. BROWN

Tentative standard methods of sampling and testing highway materials. H. S. MATTHEW, F. H. JACKSON, et al. U. S. Dept. of Agr., *Bull.* No. 1216, 128 pp.(1928).—Methods are described which were adopted by the American Assocn. of State Highway Officials and approved by the Secretary of Agr. for use in connection with federal-aid road construction. RAYMOND WILSON

New testing laboratory of the National Crushed Stone Association. ANON. *Pit and Quarry* 17, No. 7, 45-9(1928). E. H.

Structural materials testing laboratory of the Melbourne University. R. R. BLACKWOOD. *Commonwealth Eng.* 16, 141-8(1928). E. H.

Testing plaster of Paris for quality. WILHELM SCHAPER. *Tonind. Ztg.* 52, 1923-4(1928).—Certain simple tests are very convenient for detg. the quality of plaster of Paris. Put a little plaster in a third of a glass of water and pour out the excess so that a few drops of thin paste flow out also and the plaster has acquired its max. content of water. Stir gently and slowly with a glass rod and invert over a clean glass plate. On removing the glass, plaster from a rotary kiln is level, while from a kettle it will stand higher in the middle. The remainder of plaster in the glass should be divided between the sides and bottom and let stand. After it has set, rinse with water and the whole may be readily removed, if the quality is good. The walls may be only 0.1 mm. thick, but strong and elastic. If poor, the walls and bottom crack. After the temp. of the test piece has just reached that of the room, pieces broken from the side should not chalk on rubbing between the fingers. An improperly burned plaster does not take up the water smoothly and evenly, requiring much working. For dental plaster a burning temp. of 15 to 25° higher is required than for ceramic plaster. Some

of the plaster burned in a shaft kiln has a slow pouring rate and is suitable for making forms. Plaster burned slowly at a temp. const. to $\pm 3^\circ$ is often desired. F. O. A.

Differentiation of green woods from seasoned woods. F. CHARRIER. *Intern. Congress Testing Materials* 1927, II, 539-50.—This is a description of the different characteristics of green and seasoned woods when examd. under the microscope with the use of stains. Ash, fir, poplar, beech, oak and elm were examd. Conclusion: Artificial aging, by air-drying, steam kiln, or ozone treatment does not confer the same characteristics as natural aging.

PAUL J. CULHANE

The effect of electric current on wood. B. F. SCHWARZ. *Inst. du Pin, Bordeaux. Bull. inst. pin* No. 52, 215-20 (Sept.), No. 53, 239-44 (Oct.), No. 54, 251-8 (Nov., 1928).—After a brief review, with bibliography of 25 references, and a description of 3 different forms of app. for studying the effects of an elec. current on wood (test pieces in horizontal and vertical positions, wood in the form of chips), the results obtained in expts. on treatment with H_2O , K_2CrO_4 and $Pb(NO_3)_2$, I , H_2SO_4 , HCl , $NaOH$, $ZnCl_2$, $CaCl_2$, $HgCl_2$, $MgSO_4$, $CuSO_4$, pinewood creosote and tannin are given in detail. Conclusions: Wood can be impregnated with various substances without application of pressure by proper utilization of elec. phenomena. Impregnation takes place throughout the whole of the test piece, but not uniformly in all parts. A partial removal of the sap can be effected by means of electroosmotic pressure. The direction of electroosmosis varies with the impregnating substances used. The elec. cond. varies irregularly during the treatment, generally increasing with time.

A. PAPINEAU-COUTURE

Ca compounds (DONATH) 6. Treating Zn waste [recovery of hydraulic cement] (Brit. pat. 290,035) 9. Apparatus for electrodeposition of Cu or other metals on non-metallic roofing (U. S. pat. 1,693,683) 4. Waterproofing composition (for walls) (U. S. pat. 1,693,718) 18. Sulfur and SiO_2 composition for use as cement (U. S. pat. 1,693,714) 18. Bituminous compositions for paving, building construction, etc. (Brit. pat. 290,886) 22. Colloidal solutions of silica for coating stone, brick, wood or other surfaces (Brit. pat. 290,717) 18. Aluminosilicates of Ca, P and KOH (Fr. pat. 639,893) 18. Kilns for lime, cement, etc. (Ger. pat. 466,191) 1. Shaft kiln for lime or cement manufacture (Ger. pat. 466,190) 1. Phosphorus and aluminous cement (Can. pat. 284,772) 4. Waterproof teredo-repelling paint (Can. 284,580) 26. Porous materials [cements] (Fr. pat. 640,473) 28.

Cement. LUDWIG ZINSSER. Swiss 126,992, April 23, 1927. Pegs are formed by encrusting fibrous or granular vegetable matter with a mineral coating such as cement.

Cement. INTERNATIONAL CEMENT CORP. Brit. 290,890, Sept. 26, 1927. See Can. 281,304 (C. A. 22, 3031).

Cement manufacture by the wet process. WERNER P. ECKDAHL. U. S. 1,693,644, Dec. 4. Setting of a slurry of finely divided siliceous material having a basic reaction, such as blast-furnace slag and limestone, is prevented by passing gases high in CO_2 into contact with the slurry.

Refractory cement. JOHN W. MARDEN and HENRY K. RICHARDSON (to Westinghouse Lamp Co.). U. S. 1,695,812, Dec. 18. A compn. suitable for use with furnace linings or crucibles comprises thoria or zirconia together with a double halide salt such as cryolite adapted to act as a binder and suspender on the addn. of a liquid such as water and also comprises a dry ingredient such as NH_4 phosphate which is adapted to ppt. any colloids present in the compn. and cause them to coagulate.

Machine for making pipes or tubes from asbestos cement. "ETERNIT" PIETRA ARTIFICIALE. Austrian 108,504, Aug. 15, 1927. Constructional details.

Aluminous cements. LOUIS G. PATROUILLEAU (to SOCIÉTÉ ALUMINE ET DERIVES). U. S. 1,694,338, Dec. 4. In the manuf. of aluminous cements from a mixt. comprising baukite and lime, there are added to the mixt. S or compds. of S such as a sulfide or sulfate capable of releasing SO_2 when the mixt. is heated.

Cement and concrete. G. N. WHITE, E. G. BECKETT, J. THOMAS and SCOTTISH DYES, LTD. Brit. 290,309, Nov. 10, 1926. In order to prevent lime incrustation on cement and concrete and to improve its setting properties, com. NH_4 carbonate is added in an available proportion of at least 5%. Coloring substances also may be added.

"Asphalt concrete." KONINKLIJKE STEARINE KAARSENFABRIEK GOUDA. Fr. 640,058, Aug. 26, 1927. An "asphalt concrete" is made by mixing a bituminous emulsion and large stones and then adding powd. stone.

Mortar. ROBERT CACCIA. Ger. 468,778, July 14, 1928. Mortar or artificial stone is made from chalk and sand to which 3 to 5% of dil. H_2SO_4 is added.

Road material. LOUIS FITTE. Fr. 640,387, Sept. 2, 1927. Hard pitch is incorporated in hot tar and used for roads or as a binding agent.

Road material. VERKAUFSGESELLSCHAFT FÜR TEERERZEUGNISSE G. M. B. H. Fr. 640,398, Sept. 2, 1927. See Brit. 278,679 (C. A. 22, 2650).

Compositions for treating roads, roofs, tennis courts, etc. G. A. WELLINGS and E. JOHNSTONE. Brit. 289,737, Nov. 1, 1926. A soln. of bitumen in a solvent such as gasoline and a soln. of S or suspension of S in CS_2 or other liquid is applied, with or without other ingredients such as gold size and before drying granulated cork or other material may be spread on the surface.

Paving-blocks. FREDERICK MORTON. Ger. 468,873, April 8, 1927. See Brit. 261,260 (C. A. 21, 3443).

Bituminous compositions for roads, etc. A. C. BROWN. Brit. 290,725, Feb. 17, 1927. Cold mineral aggregate is first moistened with a liquefier such as kerosene contg. bituminous material in soln. and is then coated with heat-liquefied bitumen and lime and grit are then added. Cf. C. A. 22, 3032.

Bituminous compositions. F. W. VALLE-JONES. Brit. 290,323, Jan. 10, 1927. In prepg. mixts. for road-making, etc., an aggregate such as broken stone, slag or granite is heated and cleansed by steam and then coated with an emulsion or colloidal mixt. of bituminous material.

Bituminous emulsions. SOCIÉTÉ DE RECHERCHES ET DE PERFECTIONNEMENTS INDUSTRIELS. Fr. 640,834, Feb. 21, 1927. A soln. of a neutral salt such as $NaCl$, Na_2SO_4 or $CaCl_2$ is sprayed on to or mixed with a bituminous emulsion to accelerate its drying on the road.

Preserving stone, wood, metals or other surfaces. H. SCHMID. Brit. 290,331, Feb. 7, 1927. The surface is coated with a waxy material such as beeswax which is heated and quenched in a freezing mixt. to raise its m. p. and is burned into the surface by a blow-lamp, electric grid or the like. An acid-proof material such as a protecting layer of kieselguhr also may be applied.

Argillaceous clinker. RICHARD BÖHLIG. Swiss 126,755, June 30, 1927. Thick layers are prepd. by mixing porous calcined clay with bituminous dust and burning the mass to clinker.

Floor covering material. W. F. MARVIN. Brit. 290,488, Sept. 7, 1927. A textile or woven base carries a felted coat of paper or paper pulp and the material is impregnated with a bituminous or other suitable waterproofing compn. after the felted compn. is applied.

Hardened-plaster material. WM. H. KOBBE (to Texas Gulf Sulfur Co.). U. S. 1,693,715, Dec. 4. Articles such as wall tiles or radio panels are formed of dehydrated et gypsum impregnated with S. U. S. 1,693,716 specifies a composition plaster board having an interior including hardened plaster covered in part at least by fibrous material such as a paper, textile or asbestos product which is bonded to the interior of the board by crystals of S.

Coated asbestos board suitable for wall or table surfaces, etc. HENRY C. FLOHR and LEON ORNSTEIN. U. S. 1,695,276, Dec. 18. An asbestos board is treated with a penetrating and adhesive soln. comprising nitrocellulose, a gum such as dammar, Congo or shellac and linseed oil or other suitable vegetable oil; the material is permitted to dry and a filling soln. is then applied which contains an amorphous substance such as kaolin, silic, $CaCO_3$, $CaSO_4$ or $MgCO_3$ incorporated with a boiled vegetable oil such as linseed oil and with nitrocellulose; this is permitted to dry, and a finishing soln. is then applied contg. a pigment together with nitrocellulose, a gum, and a vegetable oil.

Impregnating and preserving wood. CHARLES B. LIPMAN and AARON GORDON (to Regents of the Univ. of Calif.). U. S. 1,693,930, Dec. 4. Salts of Cu, As, Zn or Pb, creosote or other suitable toxic substance of bactericidal and fungicidal character which is capable of distribution by the sap flow is injected into a living tree a few days before cutting and the toxic material may be afterward reduced (suitably by injection of a dextrose soln. if an acid soln. of Cu arsenate is first used).

Water- and fire-proofing composition for wood. FERNANDO S. VIVAS (to The International Fireproof Products Corp.). Can. 284,582, Nov. 6, 1928. A compn. to be used for impregnating wood contains Na tungstate 6, alum 40, borax 40, H_2BO_3 20, $Na_2Cr_2O_7$ 6, isinglass 12, tannic acid 2, $NaHSO_4$ 16, and water 850 parts. Cf. C. A. 22, 2825.

Controlling lumber drying or similar operations. MORITZ L. MUELLER (to Northwest Blower Kiln Co.). U. S. 1,695,738, Dec. 18. In drying material such as lumber which is subject to shrinkage or swelling during the treatment, the treatment is regulated in accord with the movement of a lever which is actuated by variations in dimensions of the material under treatment. An app. is described.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

Progress in fuel utilization in 1928. VICTOR J. AZBE, WM. G. CHRISTY, E. C. SCHMIDT, JOHN VAN BRUNT, R. T. HASLAM AND GEO. A. ORROK. *Mech. Eng.* 51, 61-4(1929). E. H.

Relative cost and value of fuels. E. A. W. JEFFERIES. *Iron Age* 122, 1446-8, 1453(1928).—Data comparing the relative value of various fuels against their cost show the advantages of producer gas in open-hearth and heating-furnace operations. Producer gas reaches the checkers of the open-hearth furnace at about 425°, and its sensible heat at that temp. must be added for comparison with other fuels which reach the checkers cold. After making full allowance for all expenses of gasification and paying \$3.75 per ton (909 kg.) for coal, the av. fuel cost in a heating furnace using 150 lbs. (68.2 kg.) of coal per net ton of steel heated is 33¢, which corresponds to using 12 gals. of oil costing in the furnace \$1.03 and the equiv. amt. of coke gas is 3270 cu. ft. (92.6 cu. m.) costing (at 26¢) 85¢. W. H. BOYNTON

Preliminary information on practical characteristics and equivalents on fuels from European Russia. L. K. RAMZIN. *Bull. Inst. Fuel Research (Russia)* 1924, No. 1, 97-103.—Classification of coal according to moisture and ash-free volatile matter and character of coke is proposed. Formulas are given for calcg. coal analysis to a moisture- and ash-free basis and for calcg. net heating values. A. A. BOEHTLINGK

Characteristics and qualifications of Russian fuels for 1927. L. K. RAMZIN. *Izvestiya Teplolekhn. Inst. (Trans. of the Thermo-Tech. Inst.) (Russia)* 1928, No. 2, 3-7.—Complete thermal data are given on 49 fuels such as fire wood, peat, brown coal, hard coal, anthracite, shale, coke, wood charcoal and mazout, from various parts of Russia. A. A. BOEHTLINGK

Elementary composition of Russian fuels. L. K. RAMZIN. *Izvestiya Teplolekhn. Inst. (Trans. of the Thermo-Tech. Inst.) (Russia)* 1926, No. 8, 25.—Analyses are given of wood, peat, brown coal, coal and petroleum. A. A. B.

The influence of fuel characteristics on engine acceleration. DONALD B. BROOKS. *Bur. Standards. J. Soc. Automotive Eng.* 23, 235-48(1928).—A method enabling precise and detailed measurement of engine acceleration is described, together with results obtained thereby. The effect of fuel volatility on engine acceleration was studied, 6 fuels being used. It is shown that the relative values of these fuels for acceleration depend upon the amt. of vaporization in the manifold. M. B. HART

Status of substitute motor fuels. G. A. BURRELL. *Oil & Gas J.* 27, No. 22, 56 (1928).—A review of various types of compds. which are used as motor fuels. M. B. HART

Artificial motor fuels. W. DAVIES. *Chem. Eng. Mining Rev.* 21, 29-30(1928).—The most important modern developments in the prepn. of artificial motor fuels are briefly reviewed and the economics of their development discussed. DOWNS SCHAAP

Spontaneous combustion of fuels. J. HUDLER. *Brennstoff-u. Wärmewirt.* 10, 419-21(1928).—Experience is cited showing that spontaneous combustion originates in the accumulations of fines resulting from segregation in pouring the coal into the bins. The following remedy proposed by H has proved successful in practice. Bins, of the silo type, are provided with covers contg. 12 trap doors arranged in 3 equal rows. The coal is poured into the bins through these doors, one row at a time. This distribution has the effect of minimizing segregation. F. S. GRANGI

The use of Parr's calorimeter for the determination of the heating value of solid fuels. A. WINKELMANN. *Z. tech. Physik* 9, 422-5(1928).—The Parr calorimeter, improved by Lunge and Offerhaus, is described; it consists of a double-wall fiber vessel and lid contg. a new silver calorimeter (2000 g. water) provided with stirrers and combustion cartridge (0.5 to 1.0 g. coal with oxidizing agent). The coal is mixed with 0.5 g. tartaric acid and 1.0 g. $K_2S_2O_8$ and about 10 g. Na_2O_2 ; it is ignited with a 0.400-g. steel pencil; the heat evolution is finished in 5 mins. From the temp. rise, the water weight and a coeff. (1400 for lignite, 1500 for 1.0 g. coal) the heating value is found. For convenience a calcd. table of coeffs. to be used for temp. rises of 2.30 to 3.90° by 0.01° steps is given. Corrections for the reagents and the ignition material are made; an example of the calcn. method is included. The method is considered to be useful. Previous drying of moist fuels is advised to prevent premature auto-combustion. Approx. detns. with petroleum samples are also possible. B. J. C. VAN DER HOEVEN

Wood-room mill-waste fuel. E. V. AHARA. *Combustion Engineering Corp., New*

York. *Paper Trade J.* 87, No. 19, 61-5(1928); cf. *C. A.* 22, 3278.—A discussion of the factors affecting the economical utilization of wood-room waste as a fuel, showing the conditions required for efficient burning of various types of waste. A. P.-C.

The problem of burning wood waste. I. H. A. HATFIELD. *Pulp Paper Mag. Can.* 26, 1811-4(1928).—A brief discussion of the economic advantages gained by collecting and prep. pulpwood refuse and bark for boiler fuel, together with a review of the particular problems which are met in designing equipment for the prep. and burning of such refuse. A. PAPINEAU-COUTURE

Coppée washing plant at the Loanhead Colliery. WM. MACLAREN. *Colliery Guardian* 137, 2251-5(1928). E. H.

Coal—Cinderella of chemical industry. H. J. ROSE. *Chemistry and Industry* 47, 1301-4(1928). E. H.

Classification of coal. CLARENCE A. SEYLER. *Am. Inst. Mining Met. Eng., Tech. Publ.* No. 156, Class F, *Coal and Coke* No. 19, 4-14(1928).—Correlation of the classifications of Parr, Seyler and Ralston is discussed, with emphasis on the necessary study of other properties disclosed by caking and microscopic characteristics. Parr's unit coal basis is recommended with the modifications that the pyritic S should be cor. by an estd. av. figure for org. S, and the H equiv. of the H_2O as hydrated mineral matter must be deducted from the org. H. II. **Classification of coal from proximate analysis and calorific value.** W. T. THOM, JR. Princeton U. *Ibid* 15-9.—Relationships are graphically shown with the variables being calorific value and volatile constituents (including moisture) on an ash-free basis. Cf. *C. A.* 20, 275. III. **Classification of coals by ultimate analysis.** H. J. ROSE. Koppers Co. *Ibid* 20-4. —The heterogeneous nature of run-of-mine illustrates the phys. peculiarities of coals of which the coking properties cannot be predicted from ultimate analysis. The application of triaxial diagrams ($C + H + O = 100\%$) is demonstrated. IV. **Classification of coal from the viewpoint of the geologist.** M. R. CAMPBELL. U. S. Geol. Survey. *Ibid* 25-7. V. **Classification of coal from the viewpoint of the paleobotanist.** REINHARDT THIESSEN. Pittsburgh Expt. Sta., U. S. Bureau of Mines. *Ibid* 28-46. The geological periods and plant growth are reviewed with relation to various coals; a classification is suggested based on the flora contributing to the coal (bibliography). VI. **Classification of coal in the light of recent discoveries with regard to its constitution.** W. FRANCIS. *Ibid* 47-67; cf. *C. A.* 22, 4760.—The chem. properties of the *ulmins* are subject to measurable changes with the carbonization of coal during formation; hence measurements of these properties furnish a new classification system. Ease of oxidation of the *ulmins* and estn. of the percent present is used as the working basis to measure the reactive constituents and the residue after oxidation gives the inerts. Coals extd. with C_2H_5N and $CHCl_3$ to remove resins and hydrocarbons were ground to 150-mesh; 10 g. samples were oxidized under a stream of dry air at 150° . H_2O , CO_2 and CO were detd. in the exit gases and change in wt. of the sample was noted. From this the O-absorption was calcd. and placed on a unit oxidizable basis by measuring the oxidizable material as that portion of the product sol. in KOH . Parallel samples were oxidized in air at 150° and from time to time the *ulmin* was extd. with 1% KOH , pptd. with HCl , filtered, dried and weighed, giving the periodic formation of sol. *ulmins* formed and the total oxidizable material. This was repeated, oxidizing for 8 hrs. at 100° in dil. HNO_3 varying from 0.083 to 1 N, giving a more rapid method closely checking air oxidation. Sixteen coals have been classified on this basis. VII. **Pure coal as a basis for classification.** F. V. TIDESWELL AND R. V. WHEELER. Sheffield U. *Ibid* 68-72. See *C. A.* 22, 1838. VIII. **Commercial classification of coal.** F. R. WADLEIGH. *Ibid* 73-4. —In reviewing 171 comm. classifications, 11 single and 16 combination bases were found. H. FULWEILER. *Ibid* 81-6.—Discussion of the A. S. T. M. gas coal specifications and operating factors. XI. **Classification from the standpoint of the by-product coke industry.** W. H. BLAUVELT. *Ibid* 87-90. XII. **Classification of coal from the standpoint of the steam-power consumer.** S. B. FLAGG. *Ibid* 91-4. XIII. **Classification of coal from the standpoint of the coal statistician.** F. G. TRYON. *Ibid* 95-9.—Classification in the records of production and distribution of coal in the Bur. of Mines. A. S. CARTER

Researches on the chemistry of coal. V. **The maturing of coal considered from the standpoint of its benzene-pressure-extraction.** WM. A. BONE, LAWRENCE HORTON AND LOUIS J. TER. *Proc. Roy. Soc. (London)* A-120, 523-45(1928); cf. *C. A.* 18, 2593.—Previous expts. using C_6H_6 -pressure-extn. under "Soxhlet" conditions on coals are reviewed. Some criticisms of conclusions then published are answered by comparative

examn. of results obtained by other investigators using different kinds of coals and by the further expts. of the authors. Descriptions, geological and geographical sources, chem. analyses and the results of C_6H_6 -pressure-extns. are given for: a Morwell brown coal from Australia; a Tertiary brown lignite, 4 black lignites (sub-bituminous) and one semi-bituminous coal, all of Cretaceous origin from the Western Canadian coal field; weakly coking (Shafton) and hard-coking (Busty, Durham) bituminous coals from England; and for a non-coking (Witbank) coal from S. Africa. Contrary to all previous tests with well-matured sub-bituminous and bituminous coals the dried Morwell brown coal when subjected to C_6H_6 extn. at 40–8 atm. pressure (corresponding with temps. between 250° and 280°) yielded a small quantity of water and of gas (85% CO_2 , 15% CO) and about 15% of C_6H_6 -sol. material of which 50 to 60% was phenolic in character and a'kali-sol. Its compn. was approx. 60% phenol, 25% *p*-cresol, a small quantity of catechol and some unidentified phenolic substances. After these acidic and some basic constituents were removed from the C_6H_6 ext. the remaining 40% of the total ext. consisted of a dark reddish brown neutral oil. This was resolved into 4 portions: (1) a very small portion volatile in steam—largely diphenyl and mesitylene, (2) saponifiable phenolic esters, (3) a dark brown vaseline-like substance, non-nitrogenous, sol. in light petroleum and equal to 60% of the neutral oil and similar to fraction I of the C_6H_6 -pressure-ext. from bituminous coals and (4) a non-nitrogenous, amorphous, chocolate-brown powder insol. in light petroleum making about 25% of the neutral oil, and resembling fraction II from bituminous coals. All the Western Canadian coals were comparatively lean in their yields of C_6H_6 -extractable constituents, which were only from 4.5% to 1.35% of the dry coal substance, and each was absolutely devoid of coking properties. Phenols and phenolic esters were obtained in the ext. from the Tertiary brown coal, but not from the other Canadian coals. Total crude C_6H_6 ext. from the Shafton coal was 10.6%; from the Busty coal 15.6%; and from the S. African coal 7.5%. The % of fractions I, II, III and IV obtained from the different coal exts. and also the quant. analyses for many of the fractions are tabulated. Conclusion: (1) Broadly speaking the results of their earlier work have been confirmed and extended, except that it has now been shown that in some cases fraction II as well as III and IV may contribute to the coking propensities of bituminous coals, which while chiefly bound up with their yields of fraction IV are quite unrelated to their yields of "neutral oils" comprised in fraction I. (2) The coal residues left after C_6H_6 -pressure-extn. never have any coking propensities. (3) The substances removed from coal by C_6H_6 -pressure-extn. are preëxistant in (either as such, or in some loose mol. assocn. with) the original coal complex, and are not derived from it by thermal decompn. in the sense of any real breakdown in the essential structure of the coal substance. (4) Both fractions I and II of the C_6H_6 ext. from bituminous and sub-bituminous coals have their similitudes and counterparts in corresponding fractions obtained from both brown coals and lignites. (5) Materials similar to fractions III and IV of the C_6H_6 exts. of bituminous and sub-bituminous coals were obtained from the laminated black lignites examd. but not from the Morwell brown coal nor the Saskatchewan brown lignite (6) In these last 2 coals the places of fractions III and IV found in the maturer coals were taken by phenolic esters and phenols, resp. (7) Therefore, it seems probable that fractions III and IV which are invariably extd. from the laminated black lignites, sub-bituminous and bituminous coals examd., and which are closely related in the coking propensities to bituminous coals, have originated in the phenols and phenolic esters found in the brown coals tested. (8) The general effect of "maturing" has been progressively to diminish the O contents of the substances comprised in each and all of the various fractions of the C_6H_6 -pressure exts. and of the C_6H_6 -extd. residue. W. W. HODGE

Studies in the composition of coal. Oil-yielding constituents. RONALD HOLROYD AND RICHARD V. WHEELER. *J. Chem. Soc.* 1928, 2669–77.—Slow destructive distns. in a vacuum (1 to 3 mm.) were carried out with several bituminous coals whose chem. and solvent characteristics were known. Detailed results obtained with the bright coal (mixed vitrain and clarain) from the Wigan Six Foot seam are given. Charges of 250 g. of undried coal ground to pass 20-mesh and remain on a 50-mesh sieve (I. M. M.) were put in a cylindrical Jena glass retort fixed vertically in an electrically heated tube furnace. The retort was connected through a series of 3 condensers to an automatic Hg Sprengel pump. The "heavy oils" were collected at atm. temp. in the 1st condenser; the "light oils" in the 2nd and 3rd condensers which were immersed in solid CO_2 dissolved in Et_2O . Thermocouples were placed in the center of the coal and on the outer wall of the retort. Two drawings show the placed retort and the 1st condenser with its specially designed oil-collecting tube. Approx. 12 hrs. elapsed before the inside thermocouple recorded the same temp. as the outside one; thereafter

both records remained const. and identical. After evacuation of the app. the charge was slowly heated to 100° and maintained there continuously for 120 hrs., the liquid and gaseous products being collected. The coal was then slowly heated (48 hrs.) to the 2nd desired temp. and again held at this temp. for 120 hrs. while the products evolved were collected. Yields of gas, water, light oils and heavy oils obtained by distns. carried out at 100°, 200°, 250°, 300°, 320°, 350° and 500°, also the results of fractionation of each of the heavy oils with the % C and % H of these fractions are tabulated and discussed. The ultimate analysis of the coal used and the solvent analyses (C. A. 21, 2780) using pyridine, CHCl_3 , light petroleum and Et_2O (α , β , γ , γ_1 , γ_2 , γ_3 + γ_4 , fractions), are given for the coal and coal residues remaining from each of the expts. up to 350°. These results are also shown graphically. The main conclusions are: The hydrocarbons and resins extractable from coal by org. solvents yield a high proportion of the oils obtained on distn., the former being distd. quant., and the latter partly distd. and partly decompd. The coal has a definite decompn. point, 318°, for the Wigan coal used, and this is not much affected by changes in exptl. conditions, since heating this coal at 310° for one month caused no appreciable decompn. A large increase in the evolution of gases, water and oils and the appearance of phenolic compds. in the distillate are noted when the decompn. point of the coal is reached. These substances come from the break-down of the ulmin constituents in the coal and its character as evinced in behavior toward solvents, caking power and its reactivity in general, undergoes a sudden and marked change.

W. W. HODGE

Study of the transformation of cellulose and lignin into coal. FRIEDRICH BERGIUS. *Mining J.* 163, 1067-8(1928).—From cellulose heated at 340° with water (to absorb the heat of reaction) for 24 hrs. under pressures up to 200 atms., an "end coal" contg. C 84% and H 5% (ash- and moisture-free) can be obtained. This coal is closely related to natural coal; it is aromatic in nature; its berginization products are very similar to those from natural coal; it is $1/3$ sol. in benzene, etc., which B. interprets to mean a similar origin for both coals. The gases evolved include CO_2 , 27.9, CH_4 , H and CO 13 and H_2O 31.6%. The H_2O carries 6% sol. matter, largely AcOH . A. H. E.

Absorption of pyridine vapors by certain grades of Upper Silesian coal. W. SWIETOSLAWSKI AND M. CHORAZY. *Przemysl Chem.* 12, 526-34(1928).—The study of absorption of pyridine vapors at 17-20° by Upper Silesian coals showed that the coking coals absorb markedly more pyridine vapors than the non-coking coals. Further, after mechanically classifying the coals it was found that vitrain absorbs over 70%, durain 54%, and fusain 12% of its weight, figuring on dry, ash-free basis of the coal. (cf. Stopes, C. A. 13, 1755). Under similar conditions the pyridine ext. of the coal as it is usually prepd. absorbs pyridine to over 100% of its weight. These coals absorb only slightly such other org. solvents as C_6H_6 , $\text{C}_6\text{H}_5\text{NH}_2$, dimethylaniline, quinoline, etc.

A comparison of the acidity of waters from some active and abandoned coal mines. R. D. LEITCH AND W. P. YANT. Pittsburgh Expt. Sta. Bur. Mines. *Repts. Investigation*, No. 2895, 8 pp.(1928).—Mine water samples from the Lower Kittanning and Upper Freeport coal beds were analyzed for dissolved O, acidity, Fe^{++} and H ion. From the total acidity cor. for free acid, Fe^{+++} was calcd. from the Fe^{++} detn. on the assumption that acidity was due to FeSO_4 and $\text{Fe}_2(\text{SO}_4)_3$. From these analytical data it was shown that drainage from abandoned and sealed mines was lower in acidity than from active mines, frequently similar to natural springs. There has been found no relation between total Fe, Fe^{++} and Fe^{+++} , but dissolved O approaches zero within exptl. accuracy and with the decrease in dissolved O, the amt. of Fe^{++} was greater.

A. S. CARTER

The determination of naphthalene in solid, liquid and gaseous coal-distillation products. P. SCHLAFER AND R. FLACHS. Eidgen. Materialprüfungsanstalt E. T. H., Zurich. *Monats-Bull. schweiz. Ver. Gas. Wasserfach.* 8, 224-8, 250-7, 283-9, 302-12(1928). The various other proposed methods are reviewed and discarded in favor of that of Glaser, as modified by Metzger (C. A. 15, 3201). In it, purified illuminating gas is passed through the sample in a glass-stoppered vessel heated in a water bath to volatilize the naphthalene, which is caught in a picric acid soln. This method is further improved as follows, making it more rapid, accurate and generally applicable. The ten bulb absorption tube is replaced by a wash bottle of simpler but efficient design, eliminating the condensation of naphthalene which collected in the pear of the former tube, out of contact with the stream of gas, and permitting easier emptying and rinsing out of the tube by means of a cock at the lower extremity. Ground-glass connections

are installed throughout. Loss of naphthalene by diffusion through rubber was considerable. The sample wts. of various materials that could be handled in $1/2$ hr. distn. with a water-bath temp. of 70° and a gas velocity of 25 l. per hr. were detd. and ranged from 0.02 to 0.5 g. Oxidizable interfering impurities volatilizing with the naphthalene are removed by 2 *N* KMnO_4 soln. in the cold. The picrate can be completely sepd. from excess picric acid by Jena glass filters and titrated with 0.02 *N*, 0.01 *N*, or thiosulfate after decompn. with water. The application to a variety of materials is illustrated. It is shown that cold methods are unsuitable even for the approx. detn. of naphthalene in tar oils and tar. The soly. of naphthalene at various temps. in benzene, toluene, xylene and various tar oils was detd.

Treatment of montan wax without acid. V. TOKMANOV. *Neftyanoye Khozyaistvo* 15, 224-5(1928).—Montan wax was treated (1) with H_2SO_4 (6% free monohydrate), (2) with absorbents and (3) with a black powder (by-products from $\text{K}_3\text{Fe}(\text{CN})_6$). The acid treatment consumes 20% acid, yielding about 82% of ceresin of high quality. (2) Adsorbents give a much higher yield and the product obtained has a good appearance; the chemical resistance is low because of the presence of unsaturated compds., naphthenes, etc. (3) Treatment with the black powder is expensive, consuming about 120% of the absorbent compared with final product obtained and the operation has to be repeated 3 times, increasing the cost in labor. T. recommends the acid method as the cheapest and giving the best final product.

A. A. BOEHLINGK

The desulfurization of lignite oils. I. B. SALADINI. Reale Politecnico, Torino. *Ann. chim. applicata* 18, 337-52(1928).—The S of lignite oils is in the form of cyclic compds., particularly thiophene, and because of this no com. process has been developed to reduce the S in lignite oils to a point where they are of general use. A systematic investigation was therefore made of various methods for removing S with a view to finding a process which would render lignite oils utilizable for motors. A representative lignite oil, which was golden yellow, had a disagreeable odor, d_{15} 0.8, a distn. range of $55-185^\circ$ (the greater part at $95-145^\circ$), gave an 85% yield after purification with H_2SO_4 and contained 0.5% phenols and 1.40% S, was used in the expts. The 1.40% S was reduced to the following % values after the particular treatments (all known already) which follow: H_2SO_4 (d. 1.30), 1.10; H_2SO_4 (d. 1.50), 0.92; H_2SO_4 (d. 1.84), 0.65; fuming H_2SO_4 , 0.25; NaClO , 0.55; $\text{AcCl} + \text{P}_2\text{O}_5$, 0.80; anhyd. ZnCl_2 , 1.10; SnCl_2 , 0.62; $\text{Fe} + \text{concd. HCl}$, 1.30; AlCl_3 (2.5-20%), 0.52-0.08; NaOH , 1.10; $\text{NaOH} + \text{PbO}_2$, 0.95; CuO , 1.10; $\text{CuO} + \text{PbO} + \text{Fe}_2\text{O}_3$, 0.90; anhyd. CuCl_2 , 0.80; calcined mixt. of CuCl_2 , NaOH , PbO_2 and pumice, 0.64; Cu (shavings), 0.98; Cu (powder), 0.80; PbO , 0.83; Hg , 1.30; Na , 0.92; Na-Hg , 0.68; Pb soap, 1.18; Pb soap + Na , 0.33. Though individual lignite oils differ somewhat, the results are probably indicative of the difficulties inherent in the removal of S from any of the oils without resorting to processes which alter profoundly the desirable properties of the oils. Methods which are effective with petroleum are ineffective, even the Frasch process (CuO) and that using alk. plumbites failing badly. Concd. H_2SO_4 , AlCl_3 and Pb soap reduced the S to the lowest values (0.25, 0.08 and 0.33%, resp.), and were the only processes which were considered worthy of further investigation. Too severe treatment with H_2SO_4 reduces the yield of purified oil, but since treatment with this acid appears to be necessary to remove unsatd. compds., it is probably advisable to employ H_2SO_4 for partial desulfurization, and then to remove the more stable S compds. by successive treatment with a Pb soap, or AlCl_3 in unusually difficult cases. Phys. treatment, such as filtration through an adsorptive agent, is probably also necessary.

Use of marine animal oils as motor fuels. HENRI MARCELET. *Chimie et industrie* 20, 829-36(1928).—The consts. of the oils previously referred to (*C. A.* 22, 4759) are given in detail.

A. PAPINEAU-COUTURE

Influence of steam and of hydrogen on the burning of carbon monoxide. H. B. DIXON. *Nature* 122, 805(1928).—The ignition temp. of CO -air mixts. with varying quantities of steam and H is largely influenced by the pressure of the atm. When H is added to CO and the air is dry, the ignition temp. falls as the pressure is reduced from 1000 mm. to 200 mm. When the CO is H -free and steam is added to air the ignition temps. increase during pressure reduction from 1000 mm. to 600 mm. and then decrease from 600 mm. to 200 mm. D. briefly discusses past work on the rate of explosion waves in CO -air mixts. and the effect of steam and H on such rates.

ALDEN H. EMERY

Improved efficiency in working of internal producers. F. C. SYLVESTER. *Gas World* 89, 505-6(1928).—The proportion of CO in a producer gas for heating retorts is of greater importance than the total calorific value of the gas because of the high calorific intensity of CO . The use of screened fuel is justified by higher CO content

in the gas, longer periods possible between attentions to the fire, less fuel losses in the ashes, less dust carried into the flues and more const. vol. of gases formed. The limit to the use of steam, for cooling the base of the producer, is approx. 25% of the wt. of coke used. Above this figure, excessive endothermic reaction takes place with a reduction of the CO content of the gas formed. Air satd. with water vapor is a powerful absorber of radiant heat. Thus the use of primary air satd. with steam presents advantages over the use of primary air with the bars cooled by water only. The solid-fuel loss in the pan ash is reduced by working with the front of the producer dry, and it should be possible to work the producer so that the combustible matter in the ash does not exceed 20% by wt.

Report of Committee on Coördination of Research. H. C. ABELL. *Am. Gas Assoc. Monthly* 10, 801-11(1928).—Discussion of the magnitude and importance of the problem of coördinating research in the gas industry. A large no. of problems are suggested for study.

A. WHITE

Measuring gas at high pressures. v. SCHÜTZ. *Gas u. Wasserfach* 71, 1166-71 (1928).—Methods of measuring gas at higher pressures such as are encountered in long-distance transmission of gas are given. In general, these methods depend on the use of an orifice or similar devices. Methods of measuring widely fluctuating gas vols. are discussed, as well as compensators for pressure and temp. of the gas. R. W. R.

Protection of gas holders against corrosion by mineral oil. J. H. STREINKAMP. *Gasbedrijf, Haarlem. Het Gas* 48, 406-8(1928).—By lab. and semi-plant expts. it was shown that a mixt. of $\frac{3}{4}$ transformer oil and $\frac{1}{4}$ cylinder oil protects iron as well against corrosion by water as the special prepn. "Imunol." After 3 months with daily up and down movement of iron sheets half immersed in water with a 1-cm. oil layer no trace of corrosion could be found in either one. A possible fire hazard of the use of mineral oils covering the water in a gas holder is created by progressive absorption of light hydrocarbons in the oil and consequent lowering of the ignition point. B. J. C. v. D. H.

Heat balance of the central producer plant (Julius Pintsch system) at the gasworks "Keilehaven," Rotterdam. J. G. DE VOOGE. *Het Gas* 48, 418-28(1928); cf. C. A. 22, 4776. During the test one producer of the 5 present was run at full capacity. For a first period of 48 hrs. a coke mixt. without breeze was used, for a second period of 48 hrs. breeze was added. The gas produced was calcd. from the coke consumption; it was mixed in with that of two other producers; all normal precautions were taken. Heats and gas vols. were all reduced to 0° and 760 mm.; the sensible heat of coke and ashes was neglected. During the first test the coke size was 59.5% between 20 and 40 mm., 34.8% between 10 and 20 mm., 4.8% between 5 and 10 mm., 0.9% through 5-mm. screens, for the second test the sizes were 49.0%, 33.8%, 7.7%, 9.5% with 6.3% through a 1.5-mm. screen. The coke consumptions per day were 17,525 and 16,257 kg., resp., moisture 0.28 and 0.36%, ash content 10.44 and 10.72%, C content 86.7 and 86.5%, H content 0.4 and 0.5%. The carbon loss in flue dust per day was 200 and 300 kg., the loss in ashes 9.4 and 18.2% carbon. The gas analysis was CO₂ 5.8 and 6.25%, CO 26.1 and 26.0%, H₂ 12.6 and 13.25%, calorific value (upper, detd.) 1192 and 1208 cal. per cu. m., the gas production per kg. coke (calcd.) 4.94 and 4.81 cu. m. or per day 86,500 and 78,300 cu. m. The gas temps. at the outlet of the producer were 561° and 535°, gas temps. at the outlet of the evaporators 140° and 140°. The air used per day was 122,000 and 108,000 cu. m., satn. points of moist air mixt. 60.2° and 63.5°. The percentage decompn. of the steam was 87.8 and 74.5%. The efficiencies of the gasification calcd. from upper calorific value were 82.6 and 82.5%, from lower value, 78.9 and 78.6%. Per kg. coke 7.2 and 6.2 kg. water were consumed in the jacket, 1.02 and 0.95 in the evaporator, evaporated 0.52 and 0.65 kg. resp., surplus of hot water 7.7 and 6.5 kg. per kg. coke. For the scrubber were used per kg. coke 17.3 and 14.7 kg. water, the cooled gas was of 17° and 18° temp. Relative to the total heating value of the coke per day (100%) (123,500 × 10³ cal.) the heat items (all upper values) on the balance for the producer are as follows: for the first expt. (no breeze) sensible heat air 1.0%, steam 4.6%, cold water 1.4%, hot water -9.3%, heating value gas -82.6%, sensible heat gas -13.1%, undecomposed steam -0.8%, flue dust -1.1%, carbon in ashes -1.3%, radiation -0.9%. The corresponding values for the breeze test were (114,500 × 10³ cal. in coke) 1.0%, 5.7%, 1.2%, -7.8%, -82.5%, -12.1%, -2.0%, 1.8%, -2.5% and -0.9%. Separate balances are calcd. for the evaporators and a graphical representation is given of the heat distribution. The discrepancies in the balances are relatively small. The large surplus hot water from the cooling jacket of this type producer was employed for heating the plant. The dust content of the scrubbed producer gas after boosters was for both expts. 12 mg. per cu. m. The "disadvantage" of using cool gas for underfire of the battery is offset by better utilization

of the waste heat in the regenerators. The use of some breeze lowers the capacity of the producers slightly, does not influence the efficiency and requires a little more operating attention. -

Cleaning plant makes obnoxious gas usable. JACK LOGAN. *Refiner Natural Gasoline Mfr.* 7, No. 8, 65-6(1928).—The Koppers soda ash process is used for treating natural gas from the Big Lake field, Reagan and Crane Counties, Texas, by the Gulf Production Co.

M. B. HART
Improvements in methods of manufacturing illuminating gas from brown coal. KARL SCHMIDT. *Gas u. Wasserfach* 71, 1153-61(1928).—The methods of mfg. illuminating gas from brown coal by the (1) K. V. G. oven (of which 32 are in use), (2) Saurerbrey oven, (3) Heller-Bamag oven, are reviewed and illustrations and comparative analyses given. At Halle, attempts have been made to prep. gas from brown coal in vertical retorts designed for bituminous coal. The vertical retorts were partially filled with coke to crack the tar and steamed for varying times. Tables of analyses and calorific value of the gas are given for varying conditions, as well as cost data. In most of these processes CO₂ must be removed from the gas. It is possible to prep. a mixt. of brown-coal gas and water gas (high in H) that can be used in gas systems. R. W. R.

Recent developments in the production of illuminating gas from brown coal. A. SANDER. *Gas u. Wasserfach* 71, 1181-5(1928).—The use of the K. V. G. oven for the production of illuminating gas from brown coal is reviewed. Details are given of the installation at Gölsau. The purification problem has been solved at Edderitz by washing with water at 12 atm. pressure. At 15°, with 9 to 10 cu. m. water for each 100 cu. m. of unpurified gas, the CO₂ content was reduced from 33-34 to 6-7% and the H₂S content from 3.5-3.9 to 0.05-0.08%. Further dry purification was used to remove org. S compds. 100 vols. of the unpurified gas gave about 65 vols. of purified gas with a calorific value of about 660 B. t. u. per cu. ft. Gas from the wash water was burned in a Claus oven, so as to recover S. Mixing brown-coal gas with H produced electrolytically or by the thermal decompn. of the gas is suggested as a means of lowering the gravity and calorific value of the gas so that it can be used in ordinary burners.

R. W. RYAN
The use of illuminating gas for industrial firing. FRANZ MUEHLERT. *Apparatebau* 40, 268-9(1928).—This is not economical for large and medium ovens except with good utilization of waste heat, for which a regenerator is shown.

Volumetric method of determining phenols by means of glycerol in distillation tars of brown coals. B. P. LUGOVKIN. Ural Polytechnicum. *J. Chem. Ind. (Moscow)* 5, 98-9(1928).—The method is based on the observation of Fr. Fischer and Gluud (cf. *Abhandl. Kenntnis Kohle* 4, 215 (1919)) that glycerol dissolves phenols to the exclusion of hydrocarbons. The method is rapid and gives exact results, but can only be used when paraffins are not present in the distillates. The presence of the usual amounts of moisture (8-15%) does not interfere; only when the water content reaches 30-70% is the extn. of phenols incomplete. The distn. tar is introduced into a 35-cc. graduated cylinder, an approx. equal vol. of glycerol (sp. gr. 1.2459 at 25°) is added, the cylinder is stoppered, thoroughly shaken and, after standing 2-3 min. (or on being immersed in a hot water bath), the contents sep. into 2 layers, the upper layer consisting of neutral substances, the lower layer consisting of a glycerol soln. of phenols. In operating with viscous distillates the glycerol should previously be diluted with kerosene. The percentage contents of phenols is calcd. by the decrease of the vol. of the tar layer. The extd. phenols may be recovered by pptn. from the glycerol soln. by dilg. the latter with water. BERNARD NELSON

Modern by-product coke-oven practice. K. BUTLER. *Chem. Eng. Mining Rev.* 21, 49-56(1928). E. H.

Dry-quenching of coke. D. W. WILSON. *Fuels and Furnaces* 6, 1705-12(1928).—The sensible heat in coke upon discharge represents 40% of the heat in the gas required for carbonization. Steam production conserves this heat in a dry-quenching process either by radiation to boilers, by heating gases circulated through boiler tubes or by combinations of these. Through the medium of circulating gases (20,000 cu. ft. per min. for a 530 ton-per-day plant), 74.6% of the heat output has been recovered as steam at 361° F. (1005 lbs. per ton coke). Dust is removed from this gas flow in chambers of decreased gas velocity; sprinkling upon discharge with a small and controlled quantity of H₂O eliminates dust and gives standard moisture content. Dry-quenched coke is cleaner, shows less tendency to shatter upon cooling, possesses greater phys. resistance to handling, is more uniform in size though smaller and gives 5% better fuel economy upon use than wet-quenched coke. A. S. CARTER

Improved method for the determination of porosity of coke. G. A. BRENDER A BRANDIS AND P. VAN'T SPIJKER. Techn. Hoogeschool, Delft. *Het Gas* 48, 390-4 (1928). The true porosity p_1 of coke is defined as the vol. of all pores divided by the total vol., it equals $1 - (d_a/d_w)$ when d_a is the apparent d. and d_w the true d. To det. d_w place 5 g. finely powdered coke in a 25-cc. pycnometer half filled with distd. water and evacuate to a 20-mm. vacuum 4 times for 15 min.; then fill up and weigh. Pulverization to 50 mesh per linear cm. is sufficient. The accuracy is 10 in the third decimal place. The entire pulverized sample must be rubbed through the sieve; otherwise there may be differences in d. of 0.05 between coarser and finer particles. Apparent porosity of coke p_1 is the vol. of the open pores divided by the total vol. It is found from $(P_b/P_c)/(P_b/P_a)$, P_a being wt. of the dry pieces of coke, P_b wt. after impregnation with water, P_c wt. of impregnated pieces under water. The apparent d., d_a , equals $P_b/(P_b/P_c)$. Five to 10 pieces coke dried at 110° of about 2 cm. size are weighed, then impregnated with water *in vacuo* (desiccator) for an hr. and P_b is detd. by weighings in a tared beaker. For 6 carbon species the values were detd.: (1) vertical-chamber coke from Bismarck nut coal $d_w = 1.848$, $d_a = 0.86$, $p_1 = 46\%$, $p_2 = 54\%$; (2) Yorkshire coke, Woodall Duckham, 1.858, 0.69, 55 and 63%; (3) Emma foundry coke 1.930, 0.88, 47 and 54%; (4) Friedrich Heinrich foundry coke 1.824, 0.89, 47 and 51%; (5) retort graphite 2.040, 1.38, 24 and 32%; (6) charcoal 1.438, 0.46, 66 and 68%. It appears that p_1 and p_2 are actually different; the individual differences between detns. are up to 2% on account of heterogeneous samples, showing that porosity must be detd. on more than one piece of coke and ought never to be given as 0.1% accurate. Methods for weighing coke under water to find d_w are obsolete; water is taken up in the pores. Several photographs are given of coke sections treated with emery and kaolin. The greater regularity of the pores of foundry coke is evident. B. J. C. VAN DER HOEVEN

Industrial viewpoint of the phenol waste disposal problem. FRANK F. MARQUARD. *J. Public Health* 18, 1497-1500(1928).—At Clairton and Farrell, Pa., waste from coke quenching is reused to avoid discharge into a stream where it would produce taste.

Large settling basins for sepn. of coke dust and a mixing tank for adding make-up water are required. Redesign of pumps to reduce abrasion was necessary. Because of the hot water, pumps were relocated to assure 5 ft. head. NH_3 -still wastes added contain large amts. of CaCl_2 , building up to 2.5% in the quenching water. The coke has a pronounced odor, interfering to some extent with its domestic use. CaCl_2 interferes with obtaining low water contents. Abnormal rusting results from CaCl_2 carried mechanically by the steam, or HCl produced. By the direct system of NH_3 recovery, plants yield 20 gals. of still waste per ton of coal; with washed coal this is 28 gals.; by indirect recovery 90 gals. About 70-80 gals. of water is evapd. per net ton of coal. At Clairton 10 gals. of benzene-plant waste water per ton is also so disposed of. It is not profitable at present to ext. phenols from the NH_3 liquors. Such recovery at 90-95% efficiency is possible but not economical. If it were, CaCl_2 free from phenol could go to the stream and eliminate much corrosion. A table of vols. and analyses of water from each source is given.

Fuel. AMERICAN COALINOIL CORP. Fr. 640,278, Aug. 30, 1927. A fuel is prepd by eliminating impurities from a powd. coal, coke, etc., and suspending it in a liquid fuel to which an emulsion of soap has been added to retain the coal, etc., in suspension.

Briquetted fuel. HERBERT E. WETHERBEE (one-third each to Richard F. Grant and Howard M. Hanna). U. S. 1,696,511, Dec. 25. Before briquetting materials such as fine coal or lignite the particles of the material while in a moistened condition are subjected to the action of a moisture-displacing filming oil binder such as linseed or corn oil. The treatment may be effected in a rotating drum. Cf. *C. A.* 22, 3978.

Fuel briquets. KNUT H. R. TILLBERG. Ger. 466,035, Aug. 25, 1925. Molasses or like mixts. caramelized by heating to about 200° are used as the binding agent.

Heating briquets of fuel or ores, etc. R. LESSING. Brit. 289,932, Jan. 31, 1927. Briquets which may or may not contain a binder such as pitch are heated while embedded in granular or coarsely powd. material such as metal shot, iron ore, coke breeze, coarse sand, anthracite duff or granular Al. Steam or gas may be passed into the retort to equalize the temp. in its different portions. Various examples and details are given.

Pretreatment of fuel containing water, particularly lignite. HANS FLEISSNER. Austrian 109,406, Dec. 15, 1927. The fuel, before distn. or gasification, is treated with steam in a closed container and then traversed by the hot distn. gases. The treatment with steam may be given in a chamber arranged above and connected to the retort.

Fuel for internal-combustion engines. GES. FÜR INDUSTRIEGASVERWERTUNG. Brit. 289,891, May 6, 1927. Highly compressed gases for use as fuel for internal-combustion engines are obtained by intensely cooling coke-oven gases to liquefy certain constituents such as CH_4 or C_2H_4 and then vaporizing the liquid products thus obtained. O which has also been liquefied and then vaporized may be admixed with the fuel.

Motor fuel. AVENARIUS GEBRÜDER. Fr. 640,311, Aug. 31, 1927. See Brit. 277,326 (C. A. 22, 2455).

Fuel from coal and oil. PIERRE H. LEVEQUE (to Société de recherches et de perfectionnements industriels). U. S. 1,693,790, Dec. 4. A mixt. of coal and oil obtained in the "oil purifying" of coal is mixed with "close burning" coal in pulverized state, and the mixt. is pressed and then distd. to obtain a fuel somewhat similar to anthracite in burning properties.

Apparatus for powdering fuel and mixing it with air. JACK ARNOUL DE GREY and LEON PELLEGRIEN. Fr. 640,125, Feb. 7, 1927.

Destructive distillation of solid fuels. P. GIRARD, F. PETIT and A. CHARBONNEAU. Brit. 290,606, May 16, 1927. Light hydrocarbons are obtained in destructive distns. by use of a halogen, halogen acid or substance such as CaCl_2 or $\text{Ca}(\text{OCl})_2$ which will dissoc. in the process. The reaction may be facilitated by use of high-frequency elec. discharges. Solid or liquid catalysts may be placed either in the fuel or in the gas current. A distn. temp. of $400\text{--}450^\circ$ is suitable.

Low-temperature distillation. IMPERIAL CHEMICAL INDUSTRIES LIMITED. Fr. 640,559, Sept. 5, 1927. Powd. carbonaceous materials are heated to above the temp. of condensation of steam and showered through steam entering at a temp. of 450° in a horizontal rotary retort, the temp. of the steam at the exit being 300° . The mixed steam and distillates are cooled to 150° and scrubbed with oil. Catalysts such as Fe oxide with or without alkali may be added to the charge.

Plant for low-temperature distillation of bituminous fuels. KAROLINE DOBBELSTEIN NÉE BUSSMANN, ROLF DOBBELSTEIN, ALINITA DOBBELSTEIN, OTTO DOBBELSTEIN and IRMGARD DOBBELSTEIN. Ger. 466,087, Jan. 7, 1926. The fuel is treated with hot gases in a series of annular chambers arranged one above the other and supported in a casing by a central column between which and the casing there is relative rotation.

Two-stage low-temperature carbonization of fuels. A. ABRASSART. Brit. 290,205, May 9, 1927. Fuel such as coal is mixed with semi-bituminous coal and after the first stage of distn. is ground, mixed with pitch, briquetted, and distd. at $550\text{--}580^\circ$ to leave a product contg. 7-8% volatile matter. An app. is described. The briquets obtained after the first distn. stage are suitable for use as a semi-bituminous fuel.

Feeding device for low-temperature carbonization plants. CHEMISCHE-TECHNISCHE G. M. B. H. Ger. 466,086, Oct. 28, 1925. The charge is fed in by a side-discharge helical conveyer between which and the carbonization chamber there is relative movement.

Method for sorting coal by flotation. E. P. SLEPTZOV. Russ. 4643, Feb. 1928.

Flotation of coal, graphite, ores, etc. W. SCHAEFER and ERZ- UND KOHLE-FLotation G.m.b.H. Brit. 289,848, May 4, 1927. Flotation seps. are carried out in the presence of polythionates or other derivs. of polythionic acids (suitably polythionates of multivalent metals). Substances such as acids or alkalies may also be added to adjust the H or OH concn. in the pulp and these substances may be applied successively to effect differential flotation of various constituents of the material treated.

Washing coal, ores, etc. LEON HOVOIS. U. S. 1,696,767, Dec. 25. An app. is described and various mech. features of manipulation are specified.

Continuous distillation and grinding and coking of coal in a ball-mill retort which is externally heated. HARRY S. REED and RALPH D. LAMIE. U. S. 1,696,731, Dec. 25. Mech. features. An app. is described.

Briquetting coal. R. LESSING. Brit. 290,380, Feb. 21, 1927. To incorporate catalytic materials such as FeCl_3 , Al sulfate and spent liquor from pickling iron or steel, in anthracite or bituminous coal, the coal is sepd. in a flotation process which is described and the last portion of the liquid used in the flotation is displaced with a soln. of the metal compds. used as catalysts.

Estimating the ash of coal, etc. K. KEGEL. Brit. 290,913, Nov. 19, 1927. An app. is specified provided with means for detg. the vol. as well as the wt. of the specimen and with a computing scale on which the ash content can be read off when the wt. and vol are known.

Tank, filter and circulating system for filtrate suitable for thickening or dewatering coal slimes, etc. WALTER L. REMICK. U. S. 1,696,014, Dec. 18.

Oil-impregnated firewood. DEUTSCHE ÖLHOLZWERKE HÜLSTER & Co. Ger. 466,036, Sept. 24, 1927. Oil-impregnated firewood is subjected to reduced pressure in order to prevent subsequent exudation of oil.

Treating peat to obtain soluble carbohydrates and a combustible product. PAUL DUTOIT AND LOUIS FRIDERICH. Swiss 126,185, Feb. 8, 1927. Peat contg. 15-35% dry matter is malaxated with concd. H_2SO_4 and heated under pressure to 110-120°. The soln. of carbohydrates is sep'd. and the residue, after washing, compressed into briquets.

Apparatus for drying and screening peat or other similar materials. EDWARD P. DECKER. U. S. 1,693,747, Dec. 4. The app. is suitable for treating various "light chemical substances."

Gas. BAMAG-MEGUIN A.-G. Fr. 640,216, Aug. 29, 1927. A gas of high calorific value is made by using superheated water gas for degasifying coal. Large quantities of tar are produced which are used for carbureting the gas.

Lighting and heating gas. SOCIÉTÉ INTERNATIONALE DES COMBUSTIBLES LIQUIDES. Fr. 639,959, Aug. 24, 1927. The calorific power of gas is increased by passing the gas under pressure through a liquid having a greater power for dissolving hydrocarbons than H in the manner described in Ger. 394,497, using the gas enriched in H for hydrogenation of coal, etc., and adding the gas liberated from the solvent, by reducing the pressure, to the ordinary gas supply.

Carbureted water gas. PAUL DVORKOVITZ. Can. 285,091, Nov. 27, 1928. Oil having a sp. gr. of 0.85 to 0.9 may be gasified by subjecting it to a regular temp. of 600 to 700° and the oil gas so produced is mixed with water gas to form a carbureted water gas of high calorific value.

Producer gas. V. P. IZHEVSKII. Russ. 4307, Sept. 15, 1924. The gases are withdrawn and the producer is charged at the lower end. The gases are produced on the upper end and the solid and still hot material (ashes) left, is used to preheat air.

Producing gas. LINUS P. BURROWS. U. S. 1,695,914, Dec. 18. Coal is agitated in a rotating drum retort which is externally heated in a furnace. Steam is led through iron pipes embedded in the furnace walls at a temp. which will produce H and O from a portion of the steam. The O combines with the iron and the H and undecompd. superheated steam are passed into the retort and the resulting gases are taken off from the retort. The app. is described.

Apparatus for producing gas from fuel and for using the gas for heating. JOHN MACKENZIE (one-half to Walter Heynacher). U. S. 1,695,854, Dec. 18.

Gas producer construction and valve control devices. WELLMAN SMITH OWEN ENGINEERING CORP., LTD., and A. V. KEMP. Brit. 289,963, Feb. 5, 1927.

Gas-producer plant with an annular boiler and heat-exchange devices. POWER-GAS CORP., LTD., and N. E. RAMBUSH. Brit. 290,970, July 20, 1927.

Apparatus for charging gas producers with fuel. THE POWER GAS CORP., LTD. Fr. 640,613, July 28, 1927.

Safety flap for preventing access of gas to the air conduits of gas producers. STORCH & SCHÖNEBERG A.-G. Ger. 466,228, Nov. 8, 1925. Constructional details.

Shaft-like gas generator for fine coal. G. K. ZAITZEV. Russ. 4660, Feb. 29, 1928.

Treatment of hot coke-oven gases. STUART P. MILLER (to the Barritt Co.). Can. 285,502, Dec. 11, 1928. Hot coke-oven gases are subjected in the collector main and the goosenecks leading therefrom to intimate contact with oils derived from the condensation of vapors from the coke-oven gases in the condensing system. The intimate contact of the oils with the gases results in the partial cooling of these gases from the temp. at which they normally escape from the coke ovens to that desired, that temp. being ordinarily such that the major portion of the oil vapors in the gases and those derived from the vaporization of oils supplied to the collector mains are retained in the gases, while substantially all the tarry materials are thrown down in the collector main and are washed therefrom by the residual oils which flow through the bottom of the main.

Separating constituents of coke-oven gases, etc., by liquefaction. GES. FÜR LINDE'S EISMACHINEN A.-G. Brit. 289,817, May 2, 1927. In order to prevent formation of explosive or resinous compds. of C_2H_2 or other triple-linkage hydrocarbons in the sep'n. of coke-oven and similar gases at low temps., the C_2H_2 or similar hydrocarbon is removed before entering the separator to a degree sufficient to prevent deposition in solid form. The sep'n. may be effected by passing over heated catalysts, with hydrogenation or decompn., by polymerization over heated Cu, or by soln. in water or acetone. Other constituents likely to cause explosion or resinification such as NH_3

or NO may be removed, *e. g.*, by use of concd. H_2SO_4 . Parts of the app. made of Cu may be coated with Sn or Pb or their alloys.

Purifying gases. F. W. SPERR (to Koppers Co.). Brit. 290,660, May 19, 1927. H_2S is removed from fuel gas by use of an ammoniacal liquid, which is subsequently aerated in the presence of a metallic compd. such as oxide or hydroxide of Fe, Co or Ni to oxidize sulfide to thiosulfate without liberation of H_2S or S. The treatment is preferably effected prior to complete removal of NH_3 from the gas. An app. is described. Cf. C. A. 23, 455.

Apparatus for purifying exhaust gases from internal-combustion engines by charcoal from nut shells, etc. LEONARD MARKELS. U. S. 1,695,554, Dec. 18.

Ammonia from coal gas. CARL OTTO. U. S. 1,696,446, Dec. 25. Distn. gases are passed into a cooler in which they are cooled to obtain fresh condensate; part of the condensate is fed to a hydraulic main, thus replacing the portion of liquid evapd. therein and another part of the condensate is fed to the pipe leading to the cooler so as to irrigate the gases, and the condensate is returned to the cooler with a fresh supply of gas. An app. is described.

Rectifying columns and associated apparatus for continuous preliminary purification of crude benzenes. EMILE A. BARBET. U. S. 1,693,774, Dec. 4.

Montan wax. I. G. FARBENIND. A.-G. Brit. 289,621, April 8, 1927. Fr. 640,264, Aug. 30, 1927. See U. S. 1,690,876 (C. A. 23, 504).

Montan wax. FRIEDRICH W. GUTHKE and WILHELM PUNGS (to I. G. Farbenind. A.-G.). Can. 285,530, Dec. 11, 1928. An improved bleached montan wax is produced by converting at least part of the free org. acids present in the bleached montan wax into a mixt. of salts by the action of an alkali or an alk. earth metal hydroxide. *E. g.*, 100 parts of montan wax, bleached with chromic acid, is treated at 110–120° with a soln. of 2 parts of Na_2CO_3 or KOH in 5 parts of water, until all the water has evapd. The wax obtained shows no tendency to crystallize and forms homogeneous preps. when used, for example, in shoe creams and floor polishes. Cf. preceding abstract.

Distilling tar. S. P. MILLER (to Barrett Co.). Brit. 289,832, May 3, 1927. The hot gases produced in part of a battery of coal retorts are cleaned and freed from tar by passage through an elec. precipitator and the ptd. tar is distd. by contact with hot gases from the remainder of the battery; vapors thus produced are passed through another precipitator and finally condensed to obtain oils. Various details of the app. are described. Cf. C. A. 23, 693.

Resolving emulsions of tar oils. HERBERT W. ROBINSON and DERIC W. PARKES. U. S. 1,696,057, Dec. 18. The emulsion is rendered faintly acid and there is added to it a quantity greater than 10% by wt. of the oleaginous phase of naphthalene or like solid hydrocarbon which is sol. in the oleaginous phase and which has a m. p. below 100°, the mixt. thus formed is heated to a temp. above the m. p. of the added solid hydrocarbon and the mixt. is then rapidly cooled to ppt. the hydrocarbon in a finely divided state, and the water is settled out from the resulting stiff agglomerate of the oleaginous phase and hydrocarbons. Cf. C. A. 22, 1419.

Apparatus for separating tar from gas. J. BECKER (to Koppers Co.). Brit. 289,768, April 30, 1927. Foraminous baffles are placed in the path of the gas and the latter is given a whirling motion to deposit globular tar.

Coke. S. W. PARR and T. E. LAYNG (to Urbana Coke Corp.). Brit. 290,575, May 12, 1927. In a 2-stage carbonization process, the coal is first heated in a closed container to below the crit. temp. at which the coal becomes plastic and then heated to 650–850°; the coke produced contains 4–5% volatiles, is easily ignitable, resists crushing about the same as high-temp. coke and has smaller pores than high-temp. coke. An "improved" tar high in cresylic acid is obtained. An app. is described.

Plant for cooling coke by leading in cool gases. GEBRÜDER SULZER A.-G. Swiss 126,761, May 10, 1927.

Coking oven. O. HELLMANN. Brit. 290,838, June 2, 1927. An oven as described in Brit. 2,2,193 (C. A. 22, 1843) is modified in various details.

Extra high gravity of Cat Creek oil. ANON. *Oil & Gas J.* 27, No. 21, 113(1928).—Crude oil from Cat Creek Field, Fergus County, Mont., shows an av. gravity of 47.4, a naphtha content of 56.8%, kerosene 29.6%, wax distillate 10%, fuel oil 1.6%, S 1.0%. The oil runs as high as 54 gravity and the naphtha content as high as 64%.

M. B. H.

Synthetic crude oil from cholesterol and from Lycopodium clavatum. N. A. ORLOV. *J. Applied Chem. (Russia)* 1, 117-8(1928).—Cholesterol (50 g.) and 3 g. of a mixt. of Al_2O_3 and Fe_2O_3 were charged in an autoclave (Ipat'ev) and H_2 was admitted under 75 atm. pressure; the app. was then heated to 440-450° for 14 hrs. and a max. pressure of 175 atm. obtained. This dropped to 64 atm. at room temp. The gas so obtained contained, including H_2 , 7% of saturated compds. (calcd. on CH_4) and 43 g. of a liquid was left in the app. Under similar conditions 47 g. of cholesterol heated for 17 hrs. gave 11.5% of CH_4 , the quantity of gas depending evidently on the duration of heating; the liquid amounted to 38 g. or 83.5% of the original product. The liquid combined from the two expts. has a specific crude-oil odor, is transparent, of a yellow tint, and characteristic green fluorescence, $[\alpha]_D^{25} 1^\circ 54'$. It loses 7% in vol. after treatment with a 4-fold quantity of H_2SO_4 at 40-50°. Sixty g. of the treated oil was washed with caustic, dried with $CaCl_2$ and distd., yielding 16 g. at 60-150°, 15 g. at 150-300°, 10 g. at 300-330° and 14 g. at 330-370°. The first two fractions have a pronounced gasoline and kerosene odor, do not react with H_2SO_4 or $KMnO_4$, are colorless and not fluorescent. Fractions 3 and 4 have a yellow tint, are slightly attacked by H_2SO_4 and decolorize $KMnO_4$ slowly. Their d_4^{25} was 0.7067, 0.8600, 0.9653, 0.9783, the n_D^{20} 1.414, 1.473, 1.529 and 1.542. Fraction 2 contained C 86.93, H 13.07%. The residue left after the distn. could not be distd. over without decompn. Under similar conditions 50 g. lycopodium heated for 16 hrs. gave 16% of H_2 and CH_4 , 26 cc. of a brownish liquid and 11 cc. of H_2O . The oil had a petroleum and NH_3 odor and gave the pyrrole reaction. Twenty cc. could be distd. over below 300°; the rest decomposes when heated. H_2SO_4 reacts very little. The oil was further neutralized and washed with water. A distn. over Na yielded 3 g. at 50-150° and 10.5 g. at 150-300°. Neither fraction reacted with H_2SO_4 or $KMnO_4$ and both had a very weak and pleasant odor; d_4^{25} 0.7081 and 0.7878 and n_D^{20} 1.400 and 1.441. Analysis of both fractions gave C 85.94 and H 14.26%. The saturated compds. prevailed in the gasoline fractions of the cholesterol and the character of other fractions indicated paraffin compds.

A. A. BOEHLINGK

Recent progress in oil refining. C. K. FRANCIS. *Oil & Gas J.* 27, No. 22, 128 (1928).—A review of developments in 1927.

M. B. HART

Capillary phenomenon in (oil) production. FREDERICK G. TICKELL. Stanford Univ. *Oil & Gas J.* 27, No. 22, 172, 175-6(1928).—The mechanics of fluid movement as it pertains to the oil pool are discussed.

M. B. HART

Effect of varying temperature on absorption efficiency of oil. A. J. L. HUTCHINSON. *Oil & Gas J.* 27, No. 21, 155, 162(1928).—In liquid absorption of natural gasoline the most stable product is produced by lowering the oil temp. and the oil rate

M. B. HART

Motor-oil characteristics. R. E. WILKIN, P. T. OAK AND D. P. BARNARD, 4TH. *J. Soc. Automotive Eng.* 23, 380-4(1928).—A discussion of the annual meeting paper. Cf. *C. A.* 22, 1675.

M. B. HART

Treating heavy oils by acid sludge. N. GRAMENETZKII. *Neftyanoye Khozyaistvo* 15, 212-6(1928).—Heavy bottoms are treated with acid sludge at 70-80° without a preliminary diln. or a subsequent distn. About 10-12% of acid (from the sludge) or 6-8% of monohydrate is required and the capacity of the treating plant should be about one-half of the usual size. In using kerosene and oil sludge for treating, only 10% must be distd. off to prep. "vapor M" oil. The sludge obtained ppts. in flakes after a comparatively short time and is collected on the bottom, forming a solid mass when cold. (A soviet patent application covering this method was filed by A. Vorob'ev on March 17, 1927 under the No. 13,695.)

A. A. BOEHLINGK

Separating and concentrating acid sludge. H. L. KAUFFMAN. *Refiner Natural Gasoline Mfr.* 7, No. 9, 78-84, 86, 88, 90(1928).—The method of sepg. acid from acid sludge, and the Simonson-Mantius vacuum and "geyser action" processes of H_2SO_4 concn are described.

M. B. HART

The hydrogen-ion test applied to acid sludge emulsions. L. J. CATLIN. Standard Oil Co. of Kansas. *Refiner Natural Gasoline Mfr.* 7, No. 8, 77(1928).—In the neutralizing of acid sludge emulsions with caustic solns., including spent caustic from the treating system, the breaking of the emulsion occurs most readily at the neutral point or within a range pH 6.4 to 7.6. A method of detg. the pH of the mixt. consists in adding a few drops of the emulsion to about 10-15 cc. of acetone in a separatory funnel, shaking for a few min. and adding 20-30 cc. H_2O , again shaking, withdrawing some of the H_2O and testing with H-ion detn. indicators and color standards as sold by the La Motte Chem. Products Co.

M. B. HART

Developments of the cracking process. G. EGLOFF. Universal Oil Products Co. *Oil & Gas J.* 27, No. 22, 255, 259, 262, 360, 362(1928).—A general paper on the present status of cracking processes. A typical Dubbs installation is described with tabulated data on yields from various charging stocks.

M. B. HART

Cracking plants will have to make fuel for 75 million cars by 1938. G. EGLOFF. *Natl. Petroleum News* 20, No. 47, 88, 91, 93, 97-8(1928).—A general discussion of the motor fuel demand, cracking processes, refining methods and anti-knock fuels from the American point of view.

M. B. HART

Fundamental factors of liquid-phase cracking. A. N. SACHANEN (SAKHANOV) and M. D. TILICH'EV. *J. Inst. Petroleum Tech.* 14, 761-7(1928).—The 4 fundamental factors affecting cracking are time, temp., pressure and the character of the oil used. Results of expts. carried out on 7 different fractions obtained from Grozny crude oil indicate that cracking begins immediately after the necessary temp. conditions are reached, i. e., there is no "induction period" during which gasoline is not formed. Velocity of cracking depends greatly on the nature of the cracking stock, being lowest for the lightest fractions. Cracked oils decompose more slowly than straight-run oils. The velocity of cracking doubles for every 10° but is not dependent upon pressure. High pressure, however, produces the best conditions for heat transfer and absence of local overheating with economy of fuel. Condensation appears to take place readily in the heavier fractions but is almost absent in the lighter fractions. The velocity of coke formation increases with increasing time of cracking. Because of the accelerated velocity of coke formation and the decreased velocity of gasoline formation after a time, it is economically advantageous to stop cracking in the first cycle when coke formation begins and recycle those fractions which do not form great quantities of coke during cracking.

D. F. BROWN

Liquid-phase cracking processes show modern developments. E. OWEN. *Chem. Met. Eng.* 35, 677-81(1928); cf. *C. A.* 23, 267.—The capacity of a cracking unit should be based on the basis of either the charging stock (gas oil) charged to it or the gasoline produced by it per 24 hrs. Brief descriptions of the following processes are given: Burton, Coast, Fleming, Jenkins and Isom.

D. F. BROWN

Indian Refining Co. has singular operation of cracking units. ANON. *Refiner Natural Gasoline Mfr.* 7, No. 11, 60-2(1928).—At the Indian Refining Co.'s Lawrenceville, Ill. plant, gas oil is charged to 4 Dubbs and 3 Cross units, from which 35% of finished gasoline is obtained. The recycle stock from these units is charged to a new double Cross unit where it is re-cracked to give 33% of gasoline. Reflux from the bubble towers

of the double unit is redistd., bottoms from the distn. are sent to fuel oil after being centrifuged with Dubbs residuum, while the gas oil cut is cracked in a third bank of Cross units at higher temp. and pressure. The gasoline is treated while fresh in 9 treating columns, part filled with NaOH and the rest with H_2O . The finished product has 440° end point and has 40% benzene equiv. M. B. H.

The analysis of cracked spirits. Determination of aromatic, olefin, naphthene and paraffin hydrocarbons. F. H. GARNER. *J. Inst. Petroleum Tech.* 14, 695-732(1928).—A method of detg. the relative amts. of olefin, aromatic paraffin and naphthene hydrocarbons in cracked gasoline is described. This consists in removing the olefin and aromatic hydrocarbons simultaneously by means of fuming HNO_3 and detg. the percentages of paraffins and naphthenes in the remaining mixt. by aniline point detns. The method is modified somewhat, depending upon whether the I no. of the original sample is above or below 25. The value of the method is questioned in the discussion of the paper. D. F. BROWN

Yield of unsaturated hydrocarbons in pressure distillates. ANON. *Refiner Natural Gasoline Mfr.* 7, No. 8, 90, 92(1928).—Lab. Hempel distn. tests using fire, steam, and fire and steam, on treated and untreated pressure distillate from the Dubbs process were carried out and the yield, color and % unsatd. hydrocarbons detd. for each fraction. Results indicate that 22.5% is about the max. yield of +25 color gasoline from Dubbs raw distillate. In order to obtain a max. yield of gasoline of good color, 400-430° F. end point, the raw pressure distillate must be treated with H_2SO_4 . M. B. HART

Design visible distillation apparatus. RALPH H. ESPACH. *Oil & Gas J.* 27, No. 24, 120-1, 131(1928); cf. *C. A.* 23, 1.—A continuous distn. app. for the lab. study of fractionation is described. The app. comprises a pipe-still and a bubble tower, having stainless steel plates sepd. by Pyrex glass sections, which is supported on an evaporator. Reboilers are provided on the side of the tower and in the evaporator. Results of distn. tests with and without the use of the reboilers indicate that the latter are effective in producing better fractionation, one reboiler replacing 4 or five bubble trays. M. B. H.

Results of study of adsorptive power of clay. R. O. MEADER. *Refiner Natural Gasoline Mfr.* 7, No. 9, 61-4(1928).—The various explanations are reviewed as to the reaction that takes place when constituents in a hydrocarbon oil that give color to it are removed by an absorbent material. Four clays have been investigated to det. whether the adsorptive power toward a typical base such as Ba varies with the decolorizing values of the clay. No direct ratio between decolorizing values and Ba adsorption value of clays was noted. Conclusion: If comparative figures obtained under mutually identical conditions were obtained a definite conclusion as to the nature of the relationship between decolorization and adsorption could be reached. M. B. H.

Economical recovery of valuable products from "spent" doctor and caustic solutions. F. J. MECHLIN. *Ind. Eng. Chem.* 20, 1352-3(1928).—Spent doctor soln. from mineral-oil-treating processes may be reclaimed by evapn. and oxidation by heating and air blowing. The Pb is reconverted to plumbite while colloidal org. material forms as a top layer and Na sulfate forms a distinct layer of crystals on settling the concd. mixt. A Pb recovery of 80-90% is claimed. D. F. BROWN

Specifications for suitable mixing tank for contact filtration. H. L. KAUFFMAN. *Refiner Natural Gasoline Mfr.* 7, No. 11, 68, 75(1928). M. B. HART

Inert gas used to reduce fire hazards on tanks. GEORGE REID. *Oil Weekly* 50, No. 6, 67-8, 130(1928).—The use of CO_2 in the protection of tanks is described. M. B. HART

Firefoam apparatus. B. MILLS. *Refiner Natural Gasoline Mfr.* 7, No. 9, 76-8(1928).—The asbestos extension tube for the application of fire foam to oil tank fires has proved to be one of the most efficient contributions to fire extinguishing equipment. It is owned by the S. O. Co. of Calif., and may be used by any company. Complete directions for its use are given. M. B. HART

Spectrograph study of fuels and analysis of detonation theories. GEORGE L. CLARK. *J. Soc. Automotive Eng.* 23, 167-73(1928).—The data obtained from the ultra-violet spectrum study of the detonation flames of 13 com. gasolines are discussed. Twelve theories of the action of knock suppressors are outlined with the pro and con evidence for each. Conclusion: No single theory yet propounded seems entirely satisfactory. M. B. HART

Bureau of Standards investigations. CHARLES E. KERN. *Oil & Gas J.* 27, No. 22, 136, 212, 215(1928).—Tests conducted by the Bur. of Standards on motor fuels, oils and motor-fuel-combustion problems are reviewed. M. B. HART

Natural Gasoline Association adopts motor-fuel specifications. ANON. *Refiner*

Natural Gasoline Mfr. 7, No. 10, 116(1928).—The tentative grades and specifications adopted by the Natural Gasoline Asscn. for blended natural gasoline fuels effective Oct. 1, 1928 are as follows:

	Grade 90	Grade 50	Grade 10
Vapor pressure at 90° F. (lb./sq. in.)	6.5	9.0	11.5
Initial b. p.	95° F.	90° F.	82° F.
Temp. at 5% point	120° F.	120° F.	120° F.
Temp. at 50% point	200–220° F.	180–200° F.	160–180° F.
Temp. at 90% point	380–410° F.	360–410° F.	340–410° F.
End point	425–450° F.	425–450° F.	425–450° F.

M. B. HART

Present tendencies in motor-fuel quality. GEORGE G. BROWN. Univ. of Mich. *1. Soc. Automotive Eng.* 22, 559–64(1928).—The present tendency in automotive fuels is away from misleading values such as color and gravity and toward high partial volatility upon which ease of starting and good acceleration depend, and toward a relatively high end point upon which max. power and high fuel efficiency depend. Methods of improving motor car performance from the mech. point of view must come from an increase in compression ratio. If an engine having a compression ratio of 5.5 to 1 can be operated satisfactorily on ordinary gasoline, no advantage is obtained by the use of anti-knock premium fuels.

M. B. HART

Contributions to the knowledge of the oxidation process in motor fuels. E. BERL, K. FEISEL AND K. WINNACKER. *Z. physik. Chem. Abt. A, Haber Bd.* 139, 453–81(1928).—A discussion of the peroxide and dehydrogenation theories of the combustion process in motor fuels followed by a presentation of the authors' own theory. The influence of anti-knock materials on the oxidation process of knocking fuels is studied by means of compounds in which self-ignition temps. are detd. and intermediate oxidation products are identified, for various constituents of motor fuels. An explanation is advanced as to the cause of the action of these anti-knock agents.

A. WHITE

Amly conducting important tests. CHARLES E. KERN. *Oil & Gas. J.* 27, No. 22, 136(1928).—Tests being conducted on gasoline and lubricating oils are outlined.

M. B. HART

The importance of analysis in the natural-gasoline industry. W. W. ROBINSON, JR. *Calif. Natural Gasoline Co. Refiner Natural Gasoline Mfr. 7*, No. 6, 85–9(1928).—A general review of the methods for natural gas and natural gasoline is given contg. 14 references.

M. B. HART

Use of controls as aid to rectification in natural-gasoline plant. EMBYRE KAYE AND A. H. JAMES. Skelly Oil Co. *Natl. Petroleum News* 20, No. 42, 138, 140(1928).—The necessary equipment for stabilizing natural gasoline in a two-column rectification plant is described.

M. B. HART

Sweetwater plant operation minimizes sulfur trouble. ANON. *Refiner Natural Gasoline Mfr. 7*, No. 8, 63–4(1928).—The distn. system of the Sweetwater Refg. Corp., Sweetwater, Texas, for operation with Crane and Winkler county crudes is described.

M. B. HART

Sulfur compounds and natural gasoline. HENRY COONEY. *Refiner Natural Gasoline Mfr. 7*, No. 9, 92, 96(1928).—A summary of properties of S compds. present in gasoline and methods of detecting them, from the operator's point of view.

M. B. HART

Cross hot oil-recirculating unit makes finished gasoline. GORDON GRANGER. *Barnsdale Refineries Natl. Petroleum News* 20, No. 42, 82, 84, 86(1928).—Hot-oil-recirculating pumps have been incorporated into the Cross cracking installation at the Barnsdale Refinery of Barnsdale Refineries, Inc. The Cross process as it is now carried out, with the recycle feature and Gray vapor-phase gasoline-treating app., these pumps making it possible to produce finished gasoline in one operation.

M. B. H.

Detonation of olefins. P. S. SMIRNOV. *Neftyanoye Khozyaistvo* 15, 217–21(1928).—Olefins in cracked gasolines are detd. with liquid NO. The gasoline is added by drops to the NO with const. cooling (–15° to –20°) and stirring, after which a 10% soln. of FeSO_4 is added until the liquid becomes alk.; this is followed by steam distn., sepd. from water, drying over Na_2SO_4 and repeated filtration through silica gel. The silica gel is washed out with ether from gasoline adsorbed and the soln. centrifuged. The ether is then carefully evapd. and the top layer consisting of gasoline is sepd. and added to the gasoline left after the Na_2SO_4 treatment. The total vol. of gasoline left after treatment is subtracted from the vol. of the original gasoline and the difference represents the amt. of unsatd. compds. contained in the gasoline.

A. A. B.

Refractometry of liquid mixtures with a Zeiss butyrorefractometer and investigations on motor fuel. I and II. P. FUCHS. *Chem.-Ztg.* **52**, 921-2, 942-4(1928).—A butyrorefractometer is used to det. the % of benzene in gasoline. An empirical curve: concn. of benzene vs. graduation of the instrument is to be constructed first. Results are very reliable. Only a rough degree of accuracy can be expected. A. L. H.

Anti-knock tests in laboratory. H. J. ROBERTSON AND R. G. BOWERS. *Pierce Petroleum Corp. Oil & Gas J.* **27**, No. 22, 139, 234, 237(1928).—The anti-knock-fuel-testing engine and grease-testing equipment in use at the Pierce Petroleum Corp.'s Sand Spring, Okla., plant are described. M. B. HART

Fuel knocking test. N. A. BUTKOV. *Izvestiya Teploekhnicheskogo Instituta (Trans. of the Thermo-Techn. Inst. (Russia))* **1928**, No. 1, 9-10.—A study was made of the effects of β -C₁₀H₇OH, of β -C₁₀H₇NH₂, and of PhNH₂ on the oxidation by air at 230° of heptane, of aviation gasoline and of toluene. β -Naphthol is an antioxidant at low temps., but loses this characteristic at higher temps. Detonation is attributed to low resistance of the fuel against oxidation. β -C₁₀H₇NH₂ and PhNH₂ retard the oxidation and are good antiknock agents. The addition of toluene decreases the oxidizability of aviation gasoline. This method of testing is recommended for the detn. of knock values in gasolines. A. A. BOEHLINGK

The danger of using gasoline containing lead compounds. CH. SCHWEIZER. *Mitt. Lebensm. Hyg.* **19**, 392-4(1928).—A discussion of the findings and recommendations of the commission appointed at the time in the U. S. when tetraethyl lead was introduced as an anti-knock compd., as well as those of the Brit. commission. J. C. JURRJEES

Stopcock lubricants for high vacua and other purposes. F. PETZOLD. *Chem. Fabrik* **1928**, No. 47, 667-8.—The prepn. of the following 7 varieties of stopcock greases is described:

	High vacua	General purposes		Buret	Travers	Ostwald Luther	Vanino
		#1	#2				
Pale crepe rubber	31 parts	6	2	10	16 (para)	?	70
White vaseline	24 parts	7	1	18	8	3	—
Paraffin (m. 36°)	5 parts	1	1/8	1	1	1	—
White wax	—	—	—	—	—	?	30

J. H. PERRY

Oxidation test for lubricating oils. TYPKE. *Petroleum Z.* **24**, 874-6(1928).—The extension of the oxidation test now used for transformer oils and insulating oils, etc., to the testing of all kinds of lubricating oils is recommended. M. B. HART

New process for the filtration and dehydration of transformer and circuit-breaker oils. R. E. DENNIS. *Industr. ital. olii trasf.* **9**, No. 7, 4-7(July 1927); *Chimie et industrie* **20**, 867(1928).—The app. consists of an autoclave contg. filtering tubes, which are built up of rings 0.01 mm. apart (this sepn. is obtained by electrolytically depositing on the rings small spots 0.01 mm. thick). The oil is forced to pass between these rings and deposits all its impurities; the H₂O is removed on account of the great difference in surface tension. A. PAPINEAU-COUTURE

Volatile acids formed during the oxidation of transformer oils. H. VON DER HEYDEN AND K. TYPKE. *Industr. ital. olii trasf.* **9**, No. 7, 8-10(July 1927); *Chimie et industrie* **20**, 867(1928).—By titration of the acidity of oxidized transformer oils in presence of methyl orange and of phenolphthalein, it is shown that this acidity is due chiefly to volatile acids. A. PAPINEAU-COUTURE

New considerations on transformer oils. ANON. *Industr. ital. olii trasf.* **11**, No. 12, 4-13(Dec., 1927); *Chimie et industrie* **20**, 867(1928).—The n of oil treated with H₂SO₄ was plotted against time. The greater the difference between this curve and that of the original n of the oil, the more oxidizable the oil. A. PAPINEAU-COUTURE

Unique methods produce French transformer oils. G. W. CUPIT. *Refiner Natural Gasoline Mfr.* **7**, No. 7, 63-6(1928).—The French specifications for transformer oils require a high degree of refining. Crude oils are topped to 31.0-31.5 gravity or 145° viscosity (Saybolt at 100° F.) and treated with acid (1 lb. 60° Bé. H₂SO₄ per gal.) followed by a caustic treatment below 180° F. The neutral stock is fire- and steam-distd., the 34-28° Bé. fraction of the distillate pressed, re-run with acid and alkali and treated with clay. The French method of applying the acid is described. M. B. HART

Insulating oils. N. A. BUTKOV. *Neftyanoye Khozyaistvo* **15**, 222-3(1928).—Among various causes for the deterioration of transformer oils are soaps which might have been left after treatment with caustics. These soaps are liable to absorb moisture.

Sulfonic acids increase the formation of sludge and the sulfur reacts on the metallic parts of transformers. Insulating oils are tested in an autoclave at 15 atm. pressure in the presence of pure O_2 . A weighed amount of oil is placed in test tubes together with copper strips and the app. heated for 4 hrs. at 150° . The oil is then taken out and dild. with a ten-fold quantity of petroleum ether and the sediment detd. after 24 hrs.; the acidity of the filtrate is also checked. To det. the acidity of the sludge, it is dissolved in hot benzene or in a mixt. of benzene and alc. This method was compared with the usual method (heating for 70 hrs. at 120° and blowing O_2 through the oil). A. A. BOEHTLINGK

Oils, greases and vacua. C. R. BURCH. Metropolitan-Vickers Elec. Co., Manchester. *Nature* 122, 729(1928).—B. has prepd. by distn. a quantity of oil with satn. pressure about 1 dyne/sq. cm. at 118° , which is about the pressure of Hg at room temp. This oil can be heated to 100 dynes/sq. cm. without decompn., and when used as the working fluid in a condensation pump without artificial cooling, gives a performance comparable with that of a Hg condensation pump with a cold trap 100° below room temp. Pressures of 10^{-3} – 10^{-4} dynes/sq. cm. are reached. A grease (petroleum jelly residue) was prepd. with a vapor pressure less than 10^{-3} dynes/sq. cm. at 70° ; it may be used for lubrication of joints in high-vacuum work. R. J. HAVIGHURST

Proper raw materials essential to successful grease making. H. L. KAUFFMAN. *Refiner Natural Gasoline Mfr.* 7, No. 7, 86, 88(1928).—General properties of the raw materials, e. g., alkalis and oils, which enter into grease compns. M. B. HART

Composition and properties of wax. G. A. BURRELL. *Oil & Gas J.* 27, No. 22, 130(1928).—A review of recent investigations relating to crystn. of wax, contg. 22 references. M. B. HART

Cracking Rangoon paraffin wax with aluminum chloride at temperatures below 330° . H. I. WATERMAN AND L. L. W. VAN SOEST. *J. Inst. Petroleum Tech.* 14, 756–60(1928).—Rangoon paraffin wax (mol. wt., Rast method 414; setting point, Shukoff method, 57.7°) was heated in a lab. distn. flask with $AlCl_3$. Gasoline began to form at 180° . Paraffin began to form in the condenser at 300° . The yields of gasoline were between 18 and 23%. The residual paraffin wax varied from 50 to 62% of the original material. It is assumed that the $AlCl_3$ works in 2 ways, 1st it causes the cracking at a lower temp. and 2nd the unsatd. products eventually formed are attacked by $AlCl_3$ to form satd. products. The action of the $AlCl_3$ is very limited, as shown by the amt. of unchanged paraffin. D. F. BROWN

Asphalts their origin, manufacture and use. G. W. CUPIT, JR. *Refiner Natural Gasoline Mfr.* 7, No. 8, 81, 83, 86, 88; No. 11, 76–8, 80, 82(1928).—The history of asphalt products, methods of manuf. and types of asphalts are described in detail. M. B. HART

Water gas and the oil industry (GWOSDZ) 21. The origin of mud volcanoes and their significance with regard to oil products (OSWALD) 8. Breakdown of oil and high-tension cables (GYRMANT) 13. Generation of electricity in benzine pipes (MÜLLER) 13. Analyses of the waters of the Salt Creek field applied to underground problems (ROSS, SWEDENBORG) 14. Oil filter (U. S. pat. 1,696,735) 1. Cleaning agents (Fr. pat. 640,777) 18. Purification of oils (Fr. pat. 640,022) 13. Textile oils (Can. pat. 284,807) 25. Apparatus for separating oil, gas, sand and water by settling and scrubbing (U. S. pat. 1,693,849) 1. Alcohols and aldehydes from hydrocarbons (Brit. pat. 290,613) 10. Heater (for use in the oil industry) (Austrian pat. 109,213) 1. Filter for oils (Fr. pat. 639,923) 1. Polymerization of hydrocarbons (Fr. pat. 640,534) 10.

LOCKHART, I. B.: **American Lubricants.** 3rd ed., revised and enlarged. Easton: The Chemical Publishing Co. 408 pp. \$5. Reviewed in *J. Phys. Chem.* 32, 1892 (1928).

Distilling petroleum. HENRY H. HEWETSON (to Standard Oil Development Co.). U. S. 1,694,259, Dec. 4. In the continuous distn. of petroleum, a series of bodies of petroleum are maintained at successively higher temps., vapors formed are led away and condensed, and a continuously flowing stream of petroleum is maintained from each body to that of the next higher temp. (each stream having an up-flowing and a down-flowing section) and there is introduced into the stream a quantity of liquid such as steam or water having a b. p. lower than the temp. of the stream, to produce by vaporization a gas or vapor in the form of bubbles commingled with the liquid in the up-flowing section. An app. is described.

Converting petroleum oils by heat and pressure. WALTER M. CROSS (to Gasoline Products Co.). U. S. 1,696,030, Dec. 18. After raising oil to a conversion temp. in a heating stage (which may be effected in a pipe coil) it is passed to a reacting stage (suitably an insulated chamber) and a pressure of 400-750 lb. per sq. in. is maintained in both these stages. A combustion-supporting gas such as air or O is introduced to the reacting stage to raise the temp. above that which is employed in the heating stage. the converted product is passed from the reacting stage to a distn. stage maintained under reduced pressure, evolved vapors are refluxed in sep. stages of dephlegmation, and the sepd. products are collected. An app. is described.

Refining petroleum oils. A. M. NASTYUKOV Brit. 289,920, Jan. 28, 1927. In producing lubricating oils, the oil is treated with CH_2O in the presence of strong H_2SO_4 to form a hardened condensation product and the material is heated, dild. with water, treated with steam to remove light volatile hydrocarbons, filtered, neutralized and washed and the adsorbed satd. heavy hydrocarbons are extd. by cold solvents such as C_6H_6 or gasoline. Illuminating oil may be obtained by heating the filtered condensation product at atm. pressure to 350° to effect cracking of adsorbed oil without decompg. the condensation product itself. Various details and modifications are given.

Cracking hydrocarbons. MILON J. TRUMBLE U. S. 1,696,658, Dec. 25 Hydrocarbon material is caused to flow downwardly in a film over the surface of an internally heated flue within a pressure chamber at a temp. sufficiently high to cause cracking; residual carbonaceous products of the cracking are removed from the heating surface by combined mech. action and washing and vapors produced by the cracking are led off and condensed. An app. is described.

Cracking hydrocarbons. I. G. FARBERIND. A.-G. Fr. 639,994, Aug. 25, 1927 Hydrocarbons of low b. p. are obtained from hydrocarbons of high b. p. by treating the latter with HCl at temps. above 100° , with or without pressure in the presence of metals or alloys activated by treatment with salts of metals of a higher potential. Several examples are given.

Purifying hydrocarbons. JOHN C. BLACK and WILSON H. LOW (to Pan American Petroleum Co.). U. S. 1,696,377, Dec. 25. Hydrocarbon material such as gasoline produced by cracking is treated with $\text{Cd}(\text{OH})_2$ suspended in an aq. soln. of NaOH or other suitable aq. soln., to combine with S-bearing substances to be removed from the hydrocarbon material, and sepn. is then effected, suitably by filtering after adding fuller's earth. A system of app. is described.

Cracking hydrocarbon oils. JOHN E. BELL (to Sinclair Refining Co.) U. S. 1,693,946, Dec. 4. A pressure still system is specified in which vapors from the still are subjected to a refluxing action in a zone sep. from the vaporizing zone in direct contact with fresh charging stock to the still and the reflux and unvaporized charging stock from the refluxing operation are introduced into a portion of the still stock which is immediately subjected to high temp. Vapors from the refluxing are passed successively through a series of sep. condensing chambers maintained at progressively lower temps. and fresh charging stock is passed to the still in indirect heat-interchanging relation with the vapors in the condensing chambers. Part of the condensate from condensing chambers of lower temp. is refluxed to chambers of higher temp. and preheated charging stock from the condensing chambers is introduced directly to the pressure still. Various details of app. are described. Cf. C. A. 22, 3288; 23, 273.

Cracking hydrocarbon oils. FRANK A. HOWARD (to Standard Oil Development Co.). U. S. 1,694,262, Dec. 4. A stream of light gas oil is fed into a heating passageway at a temp. of about 480 - 540° to effect a material cracking in vaporous condition; the products are then passed into a passageway which is protected against heat loss, and a heavy gas oil is introduced and vapor and liquid materials are contacted and conversion in liquid phase is effected solely by the heat already taken up; liquid products together with any vapors are passed from a point substantially above the bottom of the passageway protected from heat loss into a vapor-sepg. zone and lighter are sepd. from heavier hydrocarbons. An app. is described.

Cracking hydrocarbon oils. FRANK A. HOWARD (to The Standard Oil Development Co.). Can. 284,608, Nov. 6, 1928. Hydrocarbon oils are indirectly heated by mercury vapor at 700 - 1000° F. The hydrocarbons are cracked, and the vaporous cracked products are taken off and condensed.

Converting hydrocarbon oils. OSWALD C. BREWSTER (to Standard Oil Co. of Ind.). U. S. 1,694,092, Dec. 4. A body of oil is maintained under pressure at a conversion temp. by supplying into the body of oil quantities of air or other O-contg. gas, vapors evolved from the body of oil are removed, fresh oil is preheated to conversion

temps. and is contacted with the vapors evolved from the body of oil undergoing conversion and is then fed into such body of oil. An app. is described.

Treating residues from hydrocarbon-oil distillation. RAYMOND E. POWELL (to Standard Oil Development Co.). U. S. 1,694,280, Dec. 4. A distn. residue contg. water-sol. constituents such as is obtained in redistg. naphthenic lubricating stocks is mixed while hot with a fluxing agent such as gas oil and the hot mixt. is discharged on to the surface of a stream of water, and after stratification is effected the oil and water contg. dissolved constituents are separately withdrawn. An app. is described.

Cracking oils. SOC. ANON LE CARBONE. Brit. 290,060, May 14, 1927. Vegetable or mineral oils are passed through heated activated porous C in block form, *e. g.*, gas oil contg. 75% of material distg. above 250° may be passed through activated block C heated to 350° to obtain a mixt. of gases and hydrocarbons b. 110-250°, with 6% of liquid hydrocarbons b. under 110°.

Distilling oil shale. HARRY S. REED and RALPH D. LAMIE. U. S. 1,696,730, Dec. 25. An externally heated sealed tumbling-barrel ball-mill retort is used; various details of app. and procedure are specified. The shale is progressively ground to successively smaller sizes as it passes from chamber to chamber of the retort through foraminous partitions with progressively smaller openings, and distd. products are flushed from the retort with steam.

Gasification of heavy oils. CONSTANTIN CHILOWSKY. Fr. 640,686, Sept. 8, 1927. In the gasification of heavy oils by partial combustion with air, the air is heated to 500-1000°. Details of the app. are described. Cf. C. A. 23, 697.

Crude-oil filter made from pipes. N. I. RODNENSKII. Russ. 4344, Jan. 31, 1928.

Apparatus for dehydrating crude oils by heating and centrifugal action. WM. L. PALMER (one-half to Regan Forge & Engineering Co.). U. S. 1,696,859, Dec. 25. Structural features.

Apparatus for separation of gas from crude oil. A. G. KHARNASON. Russ. 4347, Jan. 31, 1928.

Removing petrolatum from oils. CHARLES ZWEIG (to Standard Oil Co. of Ind.). U. S. 1,694,090, Dec. 4. Oil contg. petrolatum is dild. and subjected to settling at a low temp. at which the wax seps., after a preliminary agitation of the dild. oil before the settling. An app. is described.

Trap for separating gas and liquid at oil wells. FRED A. LANGHERST. U. S. 1,696,192, Dec. 25.

Oil-storage tank with water-jacketed tubes extending vertically above its top. BOYD K. APPLEMAN. U. S. 1,695,358, Dec. 18. The water-cooled vertical tubes serve to check evapn. of volatile substances.

Hardening paraffin waxes and the like. WILHELM PUNGS and MICHAEL JAHRTORFER (to I. G. Farbenind. A.-G.). Can. 284,971, Nov. 20, 1928. Solid or semi-solid org. substances of low melting point such as hydrocarbons, esters, fatty acids and their glycerides, or alcs., such as occur for example in various kinds of paraffin, ozocerite and ceresin, in waxes of vegetable and animal origin, in stearin, tallow and the like, are hardened and have their melting point raised by adding thereto small quantities (*i. e.*, up to 10%) of montan wax bleached with oxidizing agents such as chromic acid, or by the anodic action of the elec. current or other oxidizing means. It is generally sufficient to add 2 to 4% of the oxidation-bleached montan wax.

Lubricant. ROSCOE F. CLOUGH (to The Castorlube Refining Co.). Can. 284,562, Nov. 6, 1928. Castor oil is gradually heated to a temp. of 540° F. until 4.1% of the contents of the still has passed over. The product of the heat treatment is a modified castor oil having a viscosity of 1000 at 100° F. and 121 at 210° F. This product is mixed with 2-20 parts of good mineral oil. The proportions may be varied, as the blend remains in permanent suspension. This blend constitutes a good lubricant for internal-combustion engines.

Lubricants. KLEMENS BERGL. Ger. 406,104, Nov. 18, 1925. Known solid lubricants, such as graphite or talc, are dispersed in a medium forming a dry solid film, such as cellulose esters, celloid, artificial resin solns., lacquers, or varnishes. Rust-preventing substances, such as PbO, may be included.

Lubricant (for refrigerating apparatus) containing a glycol. ROBERT F. MASSA (to Carbide & Carbon Chemicals Corp.). U. S. 1,696,642, Dec. 25. Trimethylene glycol or a similar glycol may be used.

Viscous lubricating mixture for shock absorbers, etc. ARTHUR W. SWANBERG (one-half to B. P. Higby). U. S. 1,696,152, Dec. 18. A viscous stable suspension of castor oil is formed with an admixt. of approx. 25% as much finely divided plaster of Paris as castor oil.

Lubricating oils from distillation of solid fuels. H. NIELSEN and B. LAING. Brit. 290,551, Dec. 4, 1926. An oil contg. heavy lubricating bases having over 9% of H and having a sp. gr. of 0.95–1.08 at 15° is obtained by condensing the oil vapors obtained by passing a controlled vol. of heating gases, at a predetd. temp. gradient, in counter-flow to and in direct or indirect contact with pieces of carbonaceous material not exceeding 2-in. cube. The evolved oil vapors, in the case of internal heating are carried to cooler zones with the heating gases, and in the case of external heating are withdrawn from the retort at about the temps. at which they are produced so as to avoid excessive cracking. Some free O may be supplied to effect polymerization of resinous substances, and a method is specified for refining the primary tar oils obtained by use of NaOH, H₂SO₄ and filtration to obtain the lubricating oils in purified form. Various details and modifications are described.

Filter for lubricating oil of engines. CHARLES F. LIENESCH (to Charles L. Stokes). U. S. 1,693,717, Dec. 4. Structural features.

Filter for lubricating oil, etc. ROBERT P. F. LIDDELL (to Central Union Trust Co.) U. S. 1,696,313, Dec. 25. Structural features.

Filter for lubricating oil, etc. ELTON S. STEPHENS. U. S. 1,696,367, Dec. 25.

"Magazine filter" for lubricating oil, etc. FRED W. MANNING (to Stewart-Warner Speedometer Corp.). U. S. 1,695,811, Dec. 18. Structural features.

Treating used lubricating oil from internal-combustion engines. R. WISCHIN. Brit. 290,923, Nov. 3, 1927. Used oil is mixed with 5–7% of concd. H₂SO₄, gradually heated (over a period of several hrs.) to 50–60°, passed through a sludge separator and filtered (suitably with fuller's earth) and treated with steam. An app. is described.

Gasoline. NATHANIEL E. LOOMIS (to Standard Oil Development Co.). U. S. 1,694,272, Dec. 4. A light condensate such as is obtained from oil stills or natural gas, which contains some hydrocarbons that are normally gaseous, is introduced into the intermediate region of an absorber tower and vaporizing constituents are passed up through progressively cooler zones while maintaining a pressure of 100–300 lb. per sq. in. and supplying a counter-current flow of heavy naphtha; a "balanced" gasoline is drawn off from the bottom of the tower (which is described).

Purification of gasoline, benzene, etc. KENNETH COX and PERCIVAL J. McDERMOTT (to Refiners Ltd.). Can. 284,602, Nov. 6, 1928. Gasoline or benzene is treated with Fe₂(SO₄)₃, filtered and the filtrate is neutralized by alkali and distd. in the ordinary manner. Cf. C. A. 22, 1233.

Lead tetraethyl. CHARLES A. KRAUS and CONRAL C. CALLIS (to Standard Oil Development Co.). U. S. 1,694,268, Dec. 4. An alloy contg. Na 20 and Pb 80% is subjected to the action of water in substantially equimol. proportion to the Na, in the presence of EtI (and without use of any org. catalyst) while maintaining the mass at approx. its b. p.

Oil-injecting valve for asphalt mixers. WALTER A. SMITH. U. S. 1,695,722, Dec. 18.

Bituminous compositions for paving, building construction, electrical insulation, etc. AUSTRALIAN BITUMINOUS COMPOUNDS, LTD. Brit. 290,886, Sept. 20, 1927. Oil shale and tar are used together and may be mixed with various specified filling materials.

Carbonizing wood. VERLASSENSCHAFT NACH DR. HUGO STRACHE & GÜNTHER POLCICH. Austrian 109,397, Dec. 15, 1927. A furnace for the continuous carbonization of wood is described in which provision is made for spraying water into the carbonization zone so as to adjust the compn. of the gaseous products.

Furnace for carbonizing wood. PIERRE PÉREY. Fr. 640,845, Feb. 22, 1927. The hearth of the furnace slopes toward the center for recovery of the tar.

Dismountable furnace for carbonizing wood. ÉMILE TRIHAN. Swiss 126,997, April 22, 1927.

Refining wood rosin. GEORGE E. JENKS (to Hercules Powder Co.). U. S. 1,694,179, Dec. 4. Wood rosin is vaporized under a high vacuum by the concurrent action of an external heating medium and of superheated steam which is injected into the rosin and a portion of the distillate is condensed at a temp. not less than about 175°. An app. is described.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Chemistry of the cellulose determination. C. E. PETERSON and M. W. BRAY. *Ind. Eng. Chem.* 20, 1210–3(1928).—The Cross and Bevan method of detg. cellulose applied to spruce wood shows the reaction to be similar to an ordinary pulping reaction

but a higher yield contg. less lignin results. Oven-dried residues yield less cellulose than the original wood. Protracted chlorination does not remove all the lignin. Pentosans in the cellulose are removed slowly over the entire period of isolation while those not in the cellulose are removed very rapidly. Furfural-yielding substances are not formed by decompn. of the cellulose during chlorination. The sample should contain its own wt. of water evenly distributed for max. reactivity. F. A. SIMMONDS

X-ray investigations on cellulose and its derivatives. J. J. TRILLAT. *Rev. gén. colloïdes* 6, 57-68, 89-95(1928); cf. C. A. 22, 3043.—A review. The principal results obtained to date may be summarized as follows: (1) Natural cellulose (cotton, flax, ramie, straw, etc.) seems in all cases to have a cryst. structure; moreover, the microcrystals can exhibit a general orientation in the direction of the fiber, which is revealed by a characteristic appearance of the diagrams. (2) By making certain hypotheses, it is possible to det. the cryst. network of cellulose, which seems to be rhombic, with an elementary unit contg. 4 to 6 hexose groups. (3) The transformation of cellulose under the influence of various reagents (acids, alkalis) can easily be followed by means of x-ray diagrams; in this way, the combination of alkalis with cellulose (formation of alkali-cellulose), the phenomena of swelling, and hydra-, hydro-, and oxycellulose can exist in 2 forms, (a) native cellulose, and (b) mechanically deformed cellulose (hydracellulose), which is the form under which it is generally found after being subjected to treatments causing swelling. (4) Cellulose acetates and nitrates are amorphous, but in certain particular instances they may present a cryst. character. (5) The dimensions of the cellulose crystallites have been detd., and found to correspond practically to the av. dimensions of colloidal micellas. A. P.-C.

Copper and silver numbers as factors for the evaluation of cellulose products. J. RINSE. *Ind. Eng. Chem.* 20, 1228-30(1928).—The reducing impurities of 3 bleached sulfate pulps were measured by detg. the copper values by the Braidy and Fehling soln. methods and the Ag value. Possible improvements are indicated. A comparison of the methods shows that the Ag no. is nearer the true value of the reducing impurities and that the technic of the method is simpler. The caustic used in the Cu no. methods attacks the cellulose. F. A. SIMMONDS

Action of alkalis on cellulose. GALO W. BLANCO. *Ind. Eng. Chem.* 20, 926-30(1928). A portion of the literature published during the last 80 yrs. is summarized. The views of various investigators on the action of NaOH on cotton cellulose are reviewed. According to some authors the published data show that cellulose and NaOH react to form a true chem. compd., while others take the view that the combination is merely phys. A brief review of the use of alkalis other than NaOH is given. A bibliography of 66 references is appended. E. R. SCHAFER

Action of fatty acids on cellulose. C. J. MALM AND H. T. CLARKE. Eastman Kodak Co. *J. Am. Chem. Soc.* 51, 274-8(1929).—Native cellulose is esterified on heating with AcOH, the reaction coming to an end when the resulting product contains 6-7% Ac (100 hrs. boiling under atm. pressure); this corresponds to the compd., $C_{24}H_{40}O_{20}Ac$. An analogous effect is produced with $EtCO_2H$ and $PrCO_2H$. Hydrated cellulose, prepd. by regeneration of cellulose from its nitrate, from viscose, from its soln. in Schweitzer's reagent or from dissolved cellulose acetate, on heating with AcOH, yields esters having a limiting compn. expressed by the formula, $C_6H_9O_5Ac$. Mercerized cellulose behaves in the same way as hydrated cellulose, while cellulose regenerated from cellulose acetate, which has preserved its original fibrous structure, behaves, in this reaction, more like native cellulose. In view of the definite limit of esterifiability of native cellulose by acids alone, it is concluded that the constitution of cellulose must be expressed as a multiple of the unit, $C_{24}H_{40}O_{20}$. C. J. WEST

Action of ultra-violet rays in the bleaching of cellulose. RENÉ ESCOURROU. Société des papeteries Navarre. *Pulp Paper Mag. Can.* 26, 1549-52(1928).—See C. A. 22, 1791. A. PAPINEAU-COUTURE

The use of liquid chlorine for the preparation of bleach liquors. J. NAIMAN. *Papier* 31, 1155-7(1928).—A brief illustrated description of a plant installed in a German paper mill (not specified) which has been found satisfactory. A. PAPINEAU-COUTURE

Multiple-stage bleaching. ANON. *Pulp Paper Mag. Can.* 26, 1657-8(1928).—A brief discussion of the merits of the Thorne bleaching system. A. P.-C.

Testing the quality of cotton cellulose. A. J. HALL. *Ind. Chemist* 4, 376-9(1928).—The agents causing the degradation of cellulose, and the behavior of degraded cellulose toward cuprammonium soln., alk. $Cu(OH)_2$ soln., and methylene blue, are discussed. Methods for detg. the degree of degradation by means of these reagents are described. The relation of the strength quality of cotton and of viscose and cellulose acetate lacquers and filaments to the viscosity and the Cu. no. is presented by curves and data. The

Cu no. is a reliable measure of degradation provided the detn. is not preceded by alk. treatment, and when it is employed to reveal a high degree of degradation. The methylene blue absorption test, while not affected by previous alk. treatment, gives low results if the degradation has been caused by HCl and high results if caused by H_3PO_4 or H_2SO_4 . The cuprammonium viscosity test is the most reliable since it responds to all types of degradation. The Cu no. and methylene blue tests are serviceable if the cause of the degradation and other previous treatment the material may have received are known.

E. R. SCHAFER

Relations between carbon, hydrogen and oxygen contents in cotton cellulose under thermal decomposition, and its weight loss. TAKEO AKAHIRA. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 9, 165-80(1928); cf. *C. A.* 19, 2094.—Deterioration and compn. of cotton cellulose heated at const. or varying temp. from 200° to 300° in air or N_2 under ordinary or reduced pressure and in a high vacuum were detd. on about 70 samples. Drawings of the app. are given. The equation $\log t = Q/T - F(w)$, in which t is the time, T the abs. temp., Q the material const., and $F(w)$ a term depending on the loss in wt. w , formerly derived for const. temp., is applicable for varying temp. Plotting the % C, H and O contents of the residues against the % wt. loss gives straight lines. The equations for these lines are: $x = a - pw$, $y = b - qw$, $z = c - rw$, in which x , y and z represent C, H and O, resp., and $a = 44.4\%$, $p = 0.286$, $b = 6.2\%$, $q = 0.08$, $c = 49.4\%$, $r = 0.635$, $w = \%$ wt. loss. At the point $w = 50\%$ the values show some deviation. The relations are independent of the heating conditions and thus the % compn. of samples carbonized to the same wt. loss are comparable. The wt. decrease is, therefore, a definite measure of the thermal deterioration. The ratio of H to O is const. and equal to that of the original cotton. The straight line for C retains a value as residual C after H and O have vanished at the point $w = 77.8\%$. F. A. S.

Lignin. KARL KÖRSCHNER. *Cellulosechemie* 8, 5-7(1927).—Polemical with Th Lieser (*C. A.* 21, 821). Lignin as isolated by ordinary chem. processes or by means of a fungus is not like the natural compd. in the tree. For instance, as a result of acid treatment, lignin may polymerize, resinify, condense or carbonize and become somewhat changed as a result of the loss of water.

J. L. PARSONS

The sulfonation of pine-wood lignin. I. ERIK HÄGGLUND AND TORSTEN JOHNSON. *Inst. Holzchemie Akad. Åbot. Biochem. Z.* 202, 439-52(1928).—Lignin isolated from pine wood by means of concd. HCl was boiled with NaHSO_3 . The soly. was found to be greater the more carefully the lignin was treated in the isolation process. It was possible to prep. lignins of the same soly. as those present in the wood. The presence of cellulose or sugar had no influence on the reaction velocity. In the sulfonation process insol. salts of ligninsulfonic acid are produced which in the presence of acid are converted to sol. ligninsulfonic acid. The resolution stands in direct relationship to the H-ion concn. of the boiling soln. Solns. of lignosulfonic acid display strong fluorescence of violet color under the influence of the Hg lamp, provided the lignin is carefully prepd. Certain groupings of the lignosulfonic acid mol. responsible for the fluorescence are extremely sensitive to acids.

S. MORGULIS

Observations on Lilienfeld rayon. ROBERT HAZARD. *Russa* 3, 1135-7(1928).—The new product which is about to be marketed by the Nuera Artsilk Co., Ltd., is a modified viscose. It can be manufd. with existing viscose equipment (with a few minor modifications). It has a much better resistance to the action of water, acids and alkalis than ordinary viscose. On treatment with 6-8% NaOH solns. at temps. down to -25° , with or without addn. of catalyzers (sol. Cr, Ni or Fe salts or peroxides), it undergoes little or no maturing. It is coagulated by strongly acid solns. (55% H_2SO_4 and over).

A. PAPINEAU-COUTURE

Spent soda liquors in the manufacture of viscose. A. HELLE-STAUZ. *Russa* 3, 259-65(1928).—A discussion of the possibility of regenerating spent NaOH liquors from the manuf. of viscose by dialysis, and of the merits of the process.

A. P.-C.

Determination of sulfur in viscose. T. VITALE and T. MARESCA. *Ann. chim. applicata* 18, 461-4(1928).—S can be detd. precisely by burning in a Parr bomb a soln. of viscose in absorbing carbon (whose S content must be known); Eschka mixt. is used as oxidizing agent. Results accurate to 1% can be obtained by oxidation with H_2O_2 in NaOH soln. and subsequent ppt. with BaCl_2 . Results to $\pm 3\%$ can be obtained by the Parr photometric method.

A. W. CONTIERI

A brief contribution to the chemistry of sulfite pulping. ANON. *Papier-Fabr.* 26, 707-9(1928).—The lignin-chlorine compds. formed when sulfite pulp is treated with dil. $\text{Cl}_2 \cdot \text{H}_2\text{O}$ (Rys, *C. A.* 22, 3526) have been sepd. and tested in a preliminary way. Apparently lignin after sulfite pulping exists in 4 forms: (a) a highly sulfonated, H_2O -sol. compd., (b) a less sulfonated compd., insol. in H_2O but giving a H_2O -sol. chloride,

(c) a slightly sulfonated compd. giving a chloride insol. in H_2O but sol. in dil. alkalies, (d) unchanged lignin, behaving like c. The compd. or group of compds. a goes to the waste cooking liquor; b, c and d remain in the pulp. R. H. DOUGHTY

The question of the construction of a straw-pulp mill. WILLI SCHACHT. *Wochbl. Papierfabr.* 59, 581-8(1928).—A general discussion of the economics of several processes in use. R. H. DOUGHTY

Maize (corn stalk) pulp. A. ST. KLEIN. *Wochbl. Papierfabr.* 59, 1175-7(1928).—A review of early patents, and summary of an article by Hulbert (*C. A.* 22, 4810). R. H. D.

A Diesel-driven ground-wood mill in Roumania. ANON. *Wochbl. Papierfabr.* 59, 917-8(1928).—An engine is directly connected to each grinder, with special control devices; a sep. engine furnishes the other power needed. The arrangement has proved very satisfactory. R. H. DOUGHTY

The penetration of wood chips with liquids. E. RICHTER. *Pacific Pulp Paper Ind.* 2, 66; *Papier-Fabr.* 26, 734; *Wochbl. Papierfabr.* 59, 1115-7(1928).—A known wt. of chips, of known moisture content, is treated with a measured amt. of cooking liquor. The liquor is analyzed at intervals until the concn. no longer changes markedly. It is assumed that penetration is practically complete at this point. By this method penetration with acid or alk. liquors was complete in $1/2$ hr. at about 40° with several woods, which is much faster than is generally supposed. Free acid of sulfite liquor penetrates faster than the base. A continued slow change in concn. over several days indicates adsorption or reaction with the wood. It appears that under-cooked chips are due to heated conditions unfavorable to the reaction between cooking agent and non-cellulosic components of the chips rather than to poor penetration. R. H. DOUGHTY

Stensson chip filler for sulfite digesters. ANON. *Pulp Paper Mag. Can.* 26, 158-1; *Paper Trade J.* 87, No. 25, 58(1928).—The app. consists of 2 concentric steel pipes connected by a cross-pipe, each pipe having a separate valve. These 2 valves are connected by means of intermediate gears in such a way that when one valve is closed the other one opens slowly. The steam from the outer pipe effects a straight downward motion of the chips, and the other one spreads the chips sideways. By opening the valve either by hand or automatically, the filling is taken care of in such a way that the chip lies flat and form an almost horizontal surface. The chips are blown by means of steam at about 60-75 lbs. The charge in the digester is thus increased, with resultant increase in output per digester, averaging about 16-20%, and going as high as 28% in some cases. A. PAPINEAU-COUTURE

Effect of temperature on sulfite cooking. ERIK HAGGLUND. *Pulp Paper Mag. Can.* 26, 157-58(1928). See *C. A.* 22, 4801. A. PAPINEAU-COUTURE

Sawmill waste for manufacturing pulp. W. B. GREELEY. *West Coast Lumbermen's Assn. Paper Mill* 51, No. 46, 24-5(1928); *Paper Trade J.* 87, No. 25, 57-8(1928).—A brief discussion of the possible use of sawmill waste as pulpwood on the Pacific Coast. A. PAPINEAU-COUTURE

Pulping eastern hemlock by the sulfite process. I. The effect of varying the time and temperature of impregnation. W. H. MONSSON AND G. H. CHIDESTER. Forest Products Lab., Madison, Wis. *Paper Trade J.* 87, No. 20, 45-7(1928).—Pulp yield decreased with an increase in temp. during the penetration period, the amt. of screenings remaining practically const. Increasing the time of the penetration period increased the yield for temps. of $115-20^\circ$, but failed to do so at 110° . Increasing the time of penetration decreased the amt. of screenings. Increase in temp. of the penetration period reduced the bleach requirements of the pulp. With a penetration period of 1 hr. the bursting strength factor decreased as the temp. was increased from 110° to 120° . When the time of penetration was increased for 115° and for 120° , resp., the bursting strength factor was increased. A. PAPINEAU-COUTURE

Ball mill for the strength testing of wood pulp. W. F. MOORE. U. S. Testing Co., New York. *Paper Trade J.* 87, No. 21, 59-60(1928).—In order to overcome the disadvantages inherent in the use of the ball mill with the ordinary porcelain jar, comparative tests were carried out using a machined bronze jar with bronze balls, cast non-buckoids and steel rods, resp. Conclusions: The results using the bronze jar are exactly reproducible, while those with the porcelain jar are not. Samples treated in the bronze jar do not show any increase in ash content after treatment; while in a porcelain jar the ash content increases in proportion to the time of treatment in the jar. Bronze balls are unsatisfactory for use in the bronze jar because of the small area of contact. Small and large buckoids are more satisfactory than bronze balls, but are unsatisfactory for com. strength testing because of the time consumed in hydrating pulp to max. strength. Steel rods are satisfactory; they are easily reproducible,

are uniform in structure, and give the greatest possible area of contact which is essential to rapid hydration. It is believed that it is possible to tell when a pulp has reached a max. strength by means of the freeness test; when this test is expressed as % degree of beating, the point of max. strength lies between 45 and 55%. The use of stainless steel instead of ordinary steel rods will improve the accuracy for com. testing; a slight ash content found in one of the tests proved to be entirely Fe rust which was caused by the rods rusting between runs. The work done to date shows that in using the bronze jar all freeness curves are of the same type, but with different slopes, while using the porcelain jar the freeness curves differ considerably in shape. A. PAPINEAU-COUTURE

Bleaching of wood pulp. VI. The effect of bleach ratio on the color, reaction rate and chemical composition in bleaching sulfite pulp. P. K. BAIRD. Forest Products Lab., Madison, Wis. *Paper Mill* 51, No. 45, 9-16, 44; *Paper Trade J.* 87, No. 22, 39-44(1928); cf. *C. A.* 21, 2187.—In a study of the effects of the variation of the bleach ratio and independent factors in the bleaching of sulfite pulp, a const. temp. of 35° and const. agitation of 5.66 r. p. m. of the bleaching app. being used, it was found that within the range of variables studied: (1) With respect to the effect of variations of bleach ratio on color: (a) the higher the bleach ratio the whiter and higher the final color by either the complete exhaustion or the excess chem. method; (b) color-removing efficiency is higher in the complete exhaustion method. (2) With respect to the effect of variations of bleach ratio on the reaction rate: (a) in all cases the chem. consumption of chemicals is a function of the log of the time up to 90% consumption of chemicals; (b) the rate of reaction is approx. proportionally higher for higher bleach ratios. (3) With respect to effects on chem. compn.: (a) the higher the bleach ratio the greater the degradation of the cellulose as indicated by the lower α -cellulose value, the higher Cu no., the higher 1% NaOH soly., and the higher β - and γ -cellulose values, especially beyond the point of bleachability; (b) the best guides to proper bleaching of a pulp are the α -cellulose value, the 1% NaOH soly. and the Cu no., in the order given. (4) In general, relative to bleaching: (a) the "consistency effect" is probably the result of increased chem. ratio and concn., assocd. with accentuated surface action caused by the rubbing together of the fibers; (b) the excess chem. method of bleaching may be the more economical in practice, if it is properly controlled, and if proper conditions, chosen through a careful economic study after technical data are available for the particular pulp, be maintained. **VII. The effect of agitation on the color, reaction rate and chemical composition in bleaching sulfite pulp at several consistencies.** P. K. BAIRD AND R. H. DOUGHTY. Forest Products Lab., Madison, Wis. *Paper Mill* 51, No. 44, 18-22(1928); *Paper Trade J.* 87, No. 22, 44-6(1928).—Bleaching expts. carried out at consistencies of 2, 5 and 7% and with rotational speeds of 1.04, 5.66 and 8.00 r. p. m. of the bleacher showed that: (1) The total time of bleaching is unaffected, but the rate of bleach consumption may show irregularities in consequence of insufficiently rapid initial mixing of bleach liquor and pulp. (2) The final whiteness of the pulp is slightly lowered by an excessive rate of agitation. (3) The 1% NaOH soly. of the pulp bleached at the lower consistencies is slightly decreased at higher rates of agitation. (4) The effects noted in (2) and (3) may be ascribed to a purely mech. action on the fibers. (5) The various effects of change in consistency already established in previous investigations have been substantiated. Conclusion: A min. amt. of agitation during bleaching is apparently necessary for optimum results and, within the limits of the exptl. conditions, the less the agitation above that necessary to maintain fairly uniform concn. in the liquid phase the better the results, especially as regards color. Thus, a satisfactory bleaching process would be one in which the bleach and the pulp were rapidly and completely mixed at the beginning of the reaction, and then agitated very little or not at all. A. P.-C.

Chemistry of the alkaline pulp process. II. Effect of temperature on the rate of delignification and hydrolysis of spruce wood with sodium hydroxide. MARK W. BRAY. Forest Products Lab., Madison, Wis. *Paper Trade J.* 87, No. 24, 64-70 (1928).—The data obtained indicate that increasing the temp. of digestion within the range between 140° and 180° increases the velocity of the pulping reaction, but has little effect on the chem. properties of the resulting pulps when the reaction is carried to the same yield. The rates of removal of lignin, of pentosans and of substances other than cellulose do not materially change relatively to one another with change of temp.; so that, within the temp. range of the expts., pulping to the same yield gives pulps of similar chem. properties regardless of the digestion temp. employed. When the data for the lignin content are plotted against yield of pulp, all conditions except temp. being kept const., the relationship is linear. The "velocity consts." for lignin, calcd. as though the reaction were monomol., decrease with time of digestion in a manner similar to that of those obtained from the yield data. With a rise of 10° in the pulping temp., approx.

the same yield, the same chem. properties of the resulting pulp and the same chem. consumption are obtained in half the cooking time. Under the conditions set forth in the article, the order of the reaction appears to be above that of a monomol. reaction, since const. values are not obtained, either for yield or for lignin, when the proper values are placed in the formula of the monomol. reaction. The velocity consts., K , calcd. as though a first order reaction obtained, decrease with time of pulping. The mathematical relationships of these K values, however, indicate that a logarithmic function expresses the reaction within the limits of the exptl. work, and that the formulas thus derived may be used for predicting from a single expt. (within the temp. range studied) the yields obtainable at any given total time of reaction (all variables other than time remaining const.).

Hardwoods for pulp and paper. C. E. CURRAN. Forest Products Lab., Madison,

Wis. *Paper Mill* 51, No. 46, 12-4, 38-40(1928).—An outline and discussion of the work done at the Forest Products Lab. on the pulping of hardwoods by the mech. and sulfite processes (cf. Osborne, C. A. 21, 2797; Monsson, C. A. 22, 3294), particularly from the standpoint of their utilization for the manuf. of news print. The work, carried out chiefly on 2 species of New Zealand woods, *viz.*, insignis pine (identical with California Monterey pine) and "tawa" (similar to American maple), showed that a satisfactory sheet could be made from the following furnish: 15% insignis pine sulfite, 50% tawa sulfite, 35% tawa groundwood. Though this furnish differs considerably from that of so-called "standard" news print (25-30% softwood sulfite and 75-70% softwood groundwood), it could probably be produced at a cost slightly lower than the av. cost of production of "standard" news print in the U. S. on account of the lower cost per cord and greater d. and wt. (resulting in higher yield) per cord of hardwoods as compared with softwoods.

Recording the history of pulpwood. C. C. HERITAGE AND W. H. MONSSON. Forest Products Lab., Madison, Wis. *Paper Trade J.* 87, No. 18, 52-5(1928).—Various available descriptive and testing procedures have been selected and organized into a tentative scheme for evaluating pulpwood as a preliminary step necessary to the correlation of the properties of the wood with pulping variables and pulp quality. This tentative scheme, which is subject to change as experience may dictate, is in force at the U. S. Forest Products Lab., and is published to permit other establishments to exam. it and to criticize it or to adopt it if such action seems desirable. The procedure comprises (1) identification of species, (2) description of forest and growth data, (3) description of pulpwood, (4) com. evaluation, (5) tech. evaluation.

A. PAPINEAU-COUTURE

The microstructure of a wood-pulp fiber. GEO. J. RITTER AND G. H. CHIDESTER. Forest Products Lab., Madison Wis. *Paper Trade J.* 87, No. 17, 131-7; *Pulp Paper Mag. Can.* 26, 1617-24(1928).—The location in the wood of the 2 forms of lignin is described, and the 2 forms are shown in photomicrographs. The possibility of obtaining a yield of 60% of lignin-free fibers for paper making is suggested. The cell wall of wood fibers is composed of several layers, which can be sepd. into fibrils by chem. means. The fibrils in the outer layer are oriented at approx. right angles to the fiber's axis, while those in the remaining layers are from 0° to 30° thereto. The fibrils can be sepd. into regularly shaped "fusiform bodies" with optical properties similar to those of the fibrils. When either lignified or delignified wood fibers are treated with swelling reagents, the fiber wall thickens outwardly and also inwardly. The polygonal shape of the cross section of undelignified fibers is unaltered, but the cross section of delignified fibers is limited by the outer layer of fibrils which are oriented at 90° to the fiber's axis. The optical phenomenon, when bordered pits are observed between Nicol prisms, is explained on the basis of the ring-like structural arrangement of the cellulosic material of the cell wall. The effect of H_3PO_4 on pulps obtained from 2 series of cooks of spruce and hemlock is described. Its effect is more severe on the pulps from the more drastic cooks, both in the raw and refined condition. The effect increases as the period of milling increases. The swelling and dissecting action of the H_3PO_4 on the fibers is explained on the assumption that part of the outer layer and more of the binding material between the fibrils in the various layers of the cell wall are removed by the more drastic cooking conditions. Milling has the mech. effect of progressively rupturing the outer layer of fibrils and of loosening the inner fibrils. Such an effect permits a more rapid attack by the H_3PO_4 . It is suggested that the H_3PO_4 treatment developed in the study discussed in the article may be further standardized to provide a new method for the evaluation of pulp quality.

A. PAPINEAU-COUTURE

The deterioration of rosin in sizing due to heating the moist paper sheet. E. ÖMAN. *Pulp Paper Mag. Can.* 26, 1651-6(1928).—It has been observed that in some cases the degree of sizing of the sheet decreases as it passes through the driers; *e. g.*, a sample taken before the first drier and then air-dried is better sized than the paper as it comes off the machine after having been dried thereon. This occurs only if the paper is heated to a relatively high temp. while it still contains a considerable amt. of H_2O but if the paper is heated to a relatively high temp. after having been first dried at a low temp., the sizing is not affected. With paper contg. about 55-60% H_2O , this occurred quite sharply at a crit. temp. at about 73° (which also happened to be the m. p.

of the rosin used in the expts.), irrespective of the time or p_H value of the stock, provided the sheet was heated sufficiently long to give it time to reach the temp. of the expt. The crit. H_2O content, below which deterioration does not occur, seems to be in the neighborhood of 50%. The influence of H_2O on the phenomenon is explained by assuming that, when it is present in sufficiently large amt., it gives greater freedom of motion to the rosin particles which, on heating above the crit. temp. (the m. p. of the rosin), readily coalesce into much larger particles having a much smaller covering power; below the crit. H_2O content there is no free H_2O film on the fibers and the rosin particles, being in direct contact with the fiber surface, will not readily coalesce, even when heated above the m. p. With sheets contg. more than the crit. H_2O content and heated for 15-30 sec. at 85° , optimum sizing was obtained with a p_H value of 5.0; deterioration was greater at both higher and lower p_H values, from which the author concludes that the presence of $Al(OH)_3$ is not only of no importance for the sizing but is actually detrimental. It is suggested that in practice sizing trouble may appear on changing pulp, because of differences in the p_H value of different pulps. A. PAPINEAU-COUTURE

The rosin sizing of paper. II. Experimental. S. R. OLSEN AND ROSS A. GORTNER. Univ. of Minnesota. *Paper Trade J.* 87, No. 16, 47-50(1928); cf. C. A. 22, 4811. The curve obtained when the amt. of rosin adsorbed by cellulose fibers is plotted against the time of contact between the stock and the rosin resembles the adsorption isotherm of known colloidal reactions and is considered to be a colloidal phenomenon and not a classical chem. reaction between the rosin, alum and fibers. The amt. of residual ash in the pulp influences the optimum H-ion concn. as well as the amt. of rosin adsorbed. Under the conditions of the expts., the optimum H-ion concn. for max. adsorption or rosin was p_H 4.5-6.5 for com. pulp and 4.0-4.5 for the purified pulp. Under com. conditions, the optimum p_H for the best sizing is probably about 4.5-6.5, depending on the type of pulp used. The results of the expts. indicate that no universal optimum p_H value for the rosin sizing of paper can be used, but rather that this optimum p_H varies with such factors as the kind and quality of pulp and its degree of washing, the kind and amt. of filler used, the amt. and hardness of water used, as well as the quality of paper being manufd. It is therefore recommended that each mill work out its own standards for the sizing of paper, basing its exptl. work on the fundamental principles of the process. A neutral Et_2O extn. does not give a true value for the amt. of rosin adsorbed. A. PAPINEAU-COUTURE

A contribution to the theory of [rosin] sizing. HELLMUTH SCHWALBE. *Papier-Fabr.* 26, 738-40(1928).—Sizing phenomena are divided into those connected with (I) the nature of rosin, rosin size and milk of rosin, (II) pptn. and fixation in the beater, (III) fritting and formation of films in the paper sheet. The preponderance of exptl. work on II gives the impression that this is the most important, whereas S. believes I and III are actually more important. It is pointed out that different lots of rosin even of the same grade behave very differently, and that proper control of sapon. and emulsification in size manuf. may lead to large savings. Such control is still mostly empirical, and research on I should be profitable. In studying III, S. has dried samples taken from the last press of a paper machine by pressing with an elec. iron, the temp. of which was detd. with a Cambridge surface pyrometer. The sizing strength (Klemm, modified by S, C. A. 22, 4811) increased regularly with drying temp. One sample varied from 866 sec. at $95-110^\circ$ to 6540 sec. at 250° , the machine-dried sheet giving a value of 246 sec. only, other samples gave proportionate values. Partial drying at high temp. and finishing at a lower temp. gave lower values than complete drying at high temp. These results are contradictory to those of Klemm (C. A. 2, 2449). As a new theory of sizing mechanics, S. suggests that the rosin forms films closing the pores near the paper surface, rather than covering the fibers as is generally assumed (cf. Edge, C. A. 22, 1084). This is based mainly on the fact that a more hydrated pulp requires less size. R. H. D.

R. H. DOUGHTY

Surface characteristics of paper. JANATA. *Papier-Fabr.* 26, 728-31(1928).—Next to color, the most noticeable property of paper is surface texture and finish. J. gives a non-technical discussion of the behavior of paper-making fibers in the beater and on the paper machine, with the effects of this behavior on the surface of the paper sheet. *E. g.*, groundwood has a short, raw, rather incompressible fiber, which does not hydrate or felt well; it has little tendency to take wire or felt marks, or to take a high finish. This leads to a highly diffusing or mat surface, and an opaque sheet. Chem. pulp or textile fibers, on the other hand, tend to give a paper of better finish and of greater gloss and translucence. The final nature of the surface depends much on the beater treatment as well as on the machine operation.

Chlorinating for prevention of slime. V. M. COATES. Mathieson Alkali Works. *Paper Mill* 51, No. 45, 2, 45(1928).—Experience obtained from numerous installations now in operation in various mills has shown that trouble from slime can be completely eliminated by judicious chlorinating treatment. A careful analysis of the stock and water flow of each mill is necessary to det. the most effective points of application; these vary in different cases (raw water, white water, paper machine head box, etc.). In most cases application at 1 point is sufficient; but in exceptional cases application at 2 points may be necessary.

A. PAPINEAU-COUTURE

Opacity determinations with the Ives tint photometer. R. H. DOUGHTY. Forest Products Lab., Madison Wis. *Paper Trade J.* 87, No. 19, 66-9(1928).—The contrast-ratio method as described by Sammet (*C. A.* 19, 3161) gave values of 0.88-0.95 (av. 0.91) for 40 samples of com. news print. A few of the more important factors that might influence the values obtained by this method have been investigated. The effect of varying thickness followed a mathematical law. The character of the paper surface affects the results. It is advisable to use one color filter (preferably green) for all measurements that are to be compared directly. Exact comparison of the opacity values of differently colored papers is not advisable. The results obtained were in satisfactory agreement with those of other methods, including that using the Bur. of Standards instrument, when a suitable black background was employed. The contrast-ratio method is simple, reproducible, and accurate provided proper care is exercised in making the measurements. Through the mathematical relationship detd. between the log of translucency and the thickness, it is possible, with other factors such as color and finish nearly const., to study opacity as a property of the material of which a sheet is made rather than of the sheet itself.

Cellulose. BELA DORNER (to W. Jule Day to Euromerican Cellulose Products Corp. to Cornstalk Products Co., Inc.). Can. 284,755, Nov. 13, 1928. Pulp is produced from straw-like materials by subjecting the uncooked material to a combined washing and disintegrating process, the disintegration being carried to a point where the cell structure is sufficiently opened up to permit ready access of wash waters, but insufficient to form a pulp which substantially retains dirty water, further disintegrating the material and further subjecting it to a chemical pulping process by two alk. cooks, the first with an amt. of alkali just sufficient to unite with silica present, and the second with a larger amt. of alkali sufficient substantially to remove non-cellulosic material, both cooks being carried out at temps. which are not high enough to effect far-reaching decomposition of the non-cellulosic org. materials, such as caramelization of carbohydrate materials. Cf. *C. A.* 23, 277.

Cellulose. PAUL KRAIS. Ger. 468,715, April 26, 1925. In the prepn. of cellulose by the action of dil. HNO_3 on vegetable substances, air is introduced into the boiling vessel, so that the NO formed is oxidized to NO_2 and used again.

Cellulose free from lignin. RUDOLF MÜLLER and KARL HORST (to I. G. Farbenind. A.-G.). Can. 284,055, Oct. 16, 1928. Wood wool (4 kg.) is treated with 0.5% NaOH lye at 95°, washed free from alkali, and mixed in moist condition with 65 l. of a soln. of $\text{Ca}(\text{OCl})_2$ contg. 2.8% by wt. of available Cl and 0.15% of $\text{Ca}(\text{OH})_2$. Milk of lime contg. a total of 200 g. of $\text{Ca}(\text{OH})_2$ is gradually added during the reaction, the temp. being kept at 20–45°, in such a manner that, during the whole of the resolution, free $\text{Ca}(\text{OH})_2$ can just be detected in the liquor. As soon as a sample of the solid matter shows no lignin reaction when tested with phloroglucinol, the cellulose is sepd. from the liquor, washed with water until neutral, freed completely from lime by washing with acid, and again washed until neutral. The yield of dry cellulose is about 55% calcd. on the wt. of the parent material.

Films and the like of cellulose. WOLFF & CO. KOMMANDITGESELLSCHAFT AUF AKTIEN, EMIL CZAPEK and RICHARD WEINGAND. Fr. 640,066, Aug. 26, 1927. Films, etc., of viscose which are made by flowing on to a support which then dips into a pptn. bath are detached from the support after coagulation in the interval of time during which the support remains dry. The support may be used again without cleaning.

Conditioning cellulosic material. GEORGE A. RICHTER, MILTON O. SCHUR and ROYAL H. RASCH (to Brown Co.). Can. 284,944, Nov. 20, 1928. A tissue of cellulose fiber, more especially one of high α -cellulose wood fiber, if subjected to great pressure as in calendering or supercalendering and then nitrated will give a higher yield of nitro-celluloses and lower acid retention, irrespective of whether or not the tissue is composed of beaten or unbeaten, or mercerized or unmercerized fiber.

Treatment of cellulosic material. HENRY DREYFUS and CLIFFORD I. HANEY (to Henry Dreyfus). Can. 285,051, Nov. 20, 1928. Cellulosic material dried or contg. 5–6% of moisture is moistened with about 20 parts of a mixt. contg. 30–40% of HCO_2H and (a) 70% of AcOH . After the desired degree of reactivity has developed the cellulose is acetylated.

Treatment of cellulosic material. HEINRICH HEIMANN, IRNFRIED PETERSEN, ALFONS BAYERL and HERMANN SEEFRIED (to I. G. Farbenind. A.-G.). Can. 284,973, Nov. 20, 1928. Material contg. cellulose is opened up by impregnating with dil. HNO_3

at usual, raised or diminished pressure. The material is then boiled in the known manner with an alk. agent to obtain a cellulose of high degree of purity. *E. g.*, small bits of wood are digested with 20% HNO_3 at 50° , until they are impregnated completely. The wood is then freed from excess of acid by decantation and allowed to stand until a sample is completely disintegrated, when it is boiled with dil. Na_2CO_3 . The opened up material is worked up in known manner by boiling it with an alk. agent. Cf. *C. A.* 22, 2464.

Cellulose derivatives. HENRY DREYFUS. Can. 284,876, Nov. 20, 1928. In the manuf. of cellulose acetate or cellulose esters, after the acetylation or esterification is complete, the resulting product is subjected to a ripening treatment which if prolonged beyond the usual stage of soly., for example beyond the stage at which the acetates become sol. in alcohol-benzene mixts., a gradual diminution in the viscosity takes place, so that products showing a viscosity less than 100, say 50 can be obtained, the cellulose mol. being nevertheless substantially preserved. *E. g.*, 100 parts by wt. of cellulose is treated with 900 to 1000 parts of glacial AcOH , 200 to 250 parts Ac_2O , and 3 to 10 parts of H_2SO_4 at an initial temp. of $0-5^\circ$; this may be allowed to rise to 10 to 15° , or even higher toward the close of the acetylation. When the acetylation is complete, the excess of acetylating agent is destroyed by the addn. of H_2O and the mixt. is allowed to stand at about 20° until a product is obtained which is sol. in acetone contg. about 3-10% of water or more according to the degree to which the viscosity is to be reduced. The cellulose acetate resulting from the ripening treatment above described can be dissolved in mixts. of acetone and water to form spinning solns. contg. from 10 to 25% of cellulose acetate and capable of being spun into filaments of substantially greater strength than any artificial filaments previously known.

Cellulose derivatives. HENRY DREYFUS. Can. 284,877, Nov. 20, 1928. Cellulose acetates are produced by preheating cellulosic material with HCO_2H , freeing the material from HCO_2H and then acetylating substantially in absence of liquid solvents and diluents, as benzene, by subjecting them in presence of a condensing agent, as H_2SO_4 , to the action of vapors of the acetylating agent, and an indifferent gas, particularly air.

Sulfonated cellulose derivatives. I. G. FARBENIND. A.-G. Fr. 640,687, Sept. 8, 1927. See U. S. 1,682,382 (*C. A.* 22, 3988).

Cellulose esters. H. T. CLARKE and C. J. MALM (to Eastman Kodak Co.) Brit. 289,853, May 4, 1927. See U. S. 1,690,620 (*C. A.* 23, 512).

Cellulose esters. H. T. CLARKE and C. J. MALM (to Kodak, Ltd.). Brit. 290,570, May 14, 1927. The process described in Brit. 289,853 (preceding abstract) is modified in order to produce cellulose esters contg. both nitrate groups and halogen-substituted acyl groups; *e. g.*, a nitrocellulose (suitably contg. about 11% N) is first treated with an esterifying agent contg. an acyl group having an ethylenic linking and the unsatd ester thus obtained is then treated with a halogenating agent such as Br or Cl. Esterifying baths contg. an anhydride such as monochloroacetic anhydride as described in Brit. 287,880 (*C. A.* 23, 512) are preferable, and among the esterifying agents which may be used are crotonic acid, undecylenic acid and higher acids of the same series and substituted acids such as cinnamic acid. An example is given of the prepn. of and subsequent halogenation of cellulose nitrocrotonate to obtain a product suitable for making transparent films. Brit. 290,571 specifies a modification of the process described in Brit. 287,880 (*C. A.* 23, 512) for producing cellulose esters contg. both aryl radicals having less than 10 C atoms and also aryl radicals with more than 10 C atoms, in order to produce esters contg. a higher proportion of higher acyl radicals, by use of an esterifying bath prepd. by mixing the fatty acid anhydride corresponding with the lower acyl radicals with the acid corresponding with the higher acyl radicals and then removing, at least in part, the lower aliphatic acid formed in the bath and if necessary adding a non-esterifying solvent. Various details and examples are given.

Cellulose esters. I. G. FARBENIND. A.-G. Brit. 289,973, Feb. 8, 1927. Acidylation of cellulose or of its conversion products is effected by use of an acid anhydride such as Ac_2O together with a halogenide of sulfurous acid such as thionyl chloride and a heavy metal salt such as ZnCl_2 or Cu_2Cl_2 , suitably in the presence also of a diluent. The product obtained, such as cellulose acetate, may by addn. of water be converted into products sol. in acetone or in EtOAc .

Solvent for nitrocellulose. GUY H. BUCHANAN (to the American Cyanamid Co.). Can. 285,149, Nov. 27, 1928. Solvents for nitrocellulose consist of the esters of hydroxy-isobutyric and similar acids. These esters may be prepd. from acetone cyanohydrin and other cyanohydrins by treatment with HCl and the desired alc.

Cellulose nitrate solution. MARION B. HOPKINS and HYMAN E. BUC (to Standard Oil Development Co.). U. S. 1,694,097, Dec. 4. A solvent mixt. contg. nitro compds.

of aliphatic hydrocarbons (such as those derived from gasoline hydrocarbons) together with EtOH and C_6H_6 is used for dissolving cellulose nitrate. Various other solvents may also be used.

Cellulose ethers. OTTO LEUCHS and EDUARD DÖRR (to I. G. FARBENIND. A.-G.). U. S. 1,694,127, Dec. 4. In making ethers such as ethyl cellulose ether, water is removed during the etherification and caustic alkali is added to the alkylation mixt. which may be formed from alkali cellulose and EtCl. The H_2O may be absorbed by solid NaOH. Cf. C. A. 23, 513.

Digester system and associated apparatus for boiling cellulose. CARL HANG-LEITER and ADOLF SCHNEIDER (to Zellstoffabrik Waldhof), U. S. 1,693,983, Dec. 4.

Introducing sulfite solution into cellulose boilers. HANS CLEMM (to Zellstoffabrik Waldhof). U. S. 1,693,999, Dec. 4. Liquid of such a concn. that it can be immediately used for the digesting operation is forced, while heated, into a closed boiler by a pressure pump.

Horizontal press for treating boards of alkaline cellulose, etc. WILHELM DÜTZMANN. U. S. 1,696,474, Dec. 25. Structural features are specified of a press suitable for treating boards of alkali cellulose for use in artificial silk manuf. or for treating other materials in corrosive alk. or acid liquids.

Depolymerizing or degrading cellulose and starch. I. G. FARBENIND. A.-G. Brit. 290,377, Feb. 15, 1927. Depolymerization or degradation is effected by heating with ethylene glycol or monochlorohydrin or their mixts.

Artificial filaments from cellulose xanthate, etc. NAAMLOOZE VENNOOTSCHAP: BOUWONDERNEMING KETAGANG IV. Brit. 289,976, Feb. 9, 1927. Viscose filaments extruded from a nozzle are passed through a coagulating bath of such extended length that the coagulation process is completely finished by the time the filaments leave the bath, and the filaments are then immediately wound on a ring-spinning or flyer-spinning device. An app. is described.

Spinneret for making filaments from cellulose solutions. JACQUES DELPECH. U. S. 1,695,155, Dec. 18. Structural features.

Spinning funnels for manufacture of "cuprammonia silk." OSCAR FREIHERR VON KÖRN (trading as O. Kohorn & Co.) and A. PERL. Brit. 290,560, May 14, 1927. A method is specified for removing deposits which form at the mouths of the spinning

Ultrafilter membrane. JACQUES DUCLAUX. U. S. 1,693,890, Dec. 4. In forming a cellulose acetate filter a nonmetallic cloth is immersed in cellulose acetate dissolved in H_2O until the yarns are impregnated and the interstices are filled; the acetate is then eliminated by water and surplus water is washed out with a liquid such as alc. or acetone which is miscible with water and the substance, e. g., C_6H_6 , which is to be treated by the filter.

Filament from viscose. I. G. FARBENIND. A.-G. Brit. 290,231, May 10, 1927. In producing filaments, bands, etc., having a finely indented cross-section from viscose, there is added to the coagulating bath a trace of a Zn salt such as 0.1% or less of $ZnSO_4$. The bath may contain an org. sulfonic acid.

Threads from viscose. HORACE J. HEGAN and EDWARD HAZELEY (to Courtaulds, Ltd.). Can. 284,960, Nov. 20, 1928. Viscose contg. 1-3% Na_2CO_3 is projected into a bath of 1-11% H_2SO_4 , 10-14% Na_2SO_4 , 8-14% $MgSO_4$ and 0-8% $ZnSO_4$, the said metallic sulfates being used in such proportions that the bath contains 25-28% of total metallic sulfates.

Apparatus (with banks of rollers) for washing or other treatments of viscose films after coagulation. FELDMÜHLE PAPIER- UND ZELLSTOFFWERKE A.-G. Brit. 290,232, May 10, 1927. Brit. 290,233-4 also relate to app. for similar purposes.

Heated drum and associated apparatus for drying films made from viscose and other cellulosic products. FELDMÜHLE PAPIER- UND ZELLSTOFFWERKE A.-G. Brit. 290,290, May 10, 1927. Structural features.

Viscose capsules. KALLE & CO. A.-G. Fr. 639,937, Aug. 23, 1927. Viscose capsules are sep'd from their molds by plunging the mold contg. the viscose into a bath of $(NH_4)_2SO_4$ contg. a small quantity of H_2SO_4 and heated to about 80°, and afterward spraying with cold water.

Artificial silk. COURTAULDS, LTD., and W. H. STOKES. Brit. 290,693, Jan. 15, 1927. Addition of substances such as oil, coloring agents or solids such as C black or china clay are made to material for forming artificial silk (as from viscose) after the spinning soln. has been filtered and decerated and sep'd from the main bulk of soln. on its way to the spinning app. Occlusion of air is avoided and various details of the operation are described.

Artificial silk. OSCAR KOHORN & CO. AND ALFRED PERL. Austrian 109,552, Jan. 15, 1928. Deposits forming at the mouth of a spinning funnel used for the manuf. of cuprammonium silk are removed during the idle periods of the plant by bringing below the mouth a trough fed with liquid for removing the deposits, and operating the cocks so that the liquid is drawn into the funnel.

Artificial silk. GUSTAV BONWITT. Fr. 649,644, Sept. 7, 1927. See Brit. 285,066 (C. A. 22, 4816).

Artificial silk. NAAMLooZE VENNOOTSCHAP NEDERLANDSCHE KUNSTZIJDEFABRIEK. Fr. 640,446, Sept. 5, 1927. A silk having a dull surface is made from acetylcellulose or other ether or ester of cellulose by carrying out the "dry" or "evaporation" process in the presence of steam by passing steam into the spinning chamber or leading the thread not completely freed from solvent into a chamber contg. steam. A little water may be added to the spinning soln.

Artificial silk. ANTON HUWILER. Swiss 126,780, Mar. 12, 1927. The spinning chamber is maintained at a fixed temp. and humidity.

Artificial silk from ammoniacal-copper cellulose solutions. I. G. FARBENIND. A.-G. Brit. 289,942, Feb. 2, 1927. See U. S. 689,895 (C. A. 23, 279).

Artificial silk thread. JOHN BRANDWOOD. Fr. 640,554, Aug. 31, 1927. An app. is described for treating artificial silk in skeins with liquor and removing excess moisture.

Method of spinning artificial silk. COMPTOIR DES TEXTILES ARTIFICIELS and HENRI CHAVASSIEU. Swiss 126,779, Jan. 29, 1927.

Spinning "fine counts" of artificial silk. O. SINDL. Brit. 289,861, May 4, 1927. In operation of a centrifugal spinning app. the filament is moistened with water by a jet nozzle as it passes to a draw-off roller to overcome its tendency to adhere to the roller. An app. is described.

Nitrocellulose and other compositions suitable for use as lacquers or for molding, etc. JOSEPH G. DAVIDSON (to Carbide and Carbon Chemicals Corp.). U. S. 1,693,746, Dec. 4. Triethyleneglycol or other suitable polyethylene glycol having a plurality of ether linkages is used as a solvent and plasticizer.

Pulp. LINN BRADLEY and EDWARD P. MCKEEFE (to Bradley-McKeeffe Corporation). Can. 285,597, Dec. 11, 1928. Residual liquor from the production of pulp with a cooking liquor contg. essentially Na_2SO_3 with or without caustic alkali is treated either before or after concn., and while alk. in reaction, with CaSO_4 to give a ppt. of CaSO_3 and Na_2SO_4 in soln. The resulting soln. is concd., Na_2SO_4 crystd. therefrom and a soln. of the Na_2SO_4 is caused to react with the pptd. CaSO_3 in the presence of a sufficient quantity of acid to give a ppt. of CaSO_4 and a soln. of sodium sulfite for reuse in the pulp-making process.

Conical refiner for pulp. EMIL A. RYBERG. Fr. 640,282, Aug. 30, 1927. Construction details.

Pulp board containing finely ground material of the "ti-tree." HERBERT T. PRICE. U. S. 1,696,896, Dec. 25.

Calcium bisulfite cooking liquor for digesting wood chips. GEORGE A. RICHTER (to Brown Co.). U. S. 1,694,231, Dec. 4. A suspension of finely divided limestone in water is passed in counter-flow contact with SO_2 through a confined mass of limestone rock. An app. is described.

Paper. ALBERT L. CLAPP (to Bennett Incorporated). Can. 284,745, Nov. 13, 1928. A paper having a high finish or glaze may be produced if a dispersion comprising a glazing or polishing wax, such as carnauba, and a wax of lower melting point such as paraffin, is applied to the paper prior to or during the usual calendering operation, after the paper has been dried. The dispersion melts readily at the temp. of the calenders, penetrates the surface of the paper and permits the paper to be highly polished after the drying operation, by the usual calenders, without the necessity of a subsequent super-calendering or friction-calendering operation. A typical dispersion may be composed of 90 parts of paraffin and 10 parts of carnauba dispersed in Na_2SiO_3 soln.

Paper pulp. GASTON A. MOURLAQUE. Fr. 639,900, Aug. 22, 1927. Vegetable material is transformed in a boiler into paper pulp by oxidation with ozone and potash lye obtained from the ash of vegetable substances used for heating the boiler.

Apparatus for screening paper pulp. ANTON J. HAUG. U. S. 1,696,354, Dec. 25.

Paper making. F. W. VICKERY. Brit. 290,326, Jan. 12, 1927. An app. is specified in which the friction between the wire cloth or felt and the suction box is lessened by maintaining a fluid layer (such as may be supplied by a jet of water) between the ends of the suction box and the edges of the wire or felt.

Paper-making apparatus. ERIK A. ÖHLIN and FRANS O. CARLSSON. U. S. 1,695,972, Dec. 18.

Paper-making apparatus. J. WHITE. Brit. 289,938, Feb. 2, 1927. Structural features.

Paper-making apparatus. HARRISON R. WILLIAMS. U. S. 1,695,873, Dec. 18.

Paper-making apparatus. LEON M. YOERG (to American Writing Paper Co.). U. S. 1,695,448, Dec. 18.

Feed control for paper-making apparatus. AUGUST KOLITSCH. U. S. 1,695,380, Dec. 18. Feed of stock to the app. is controlled by variations in the vacuum in the suction devices.

"Doctor" for paper-making apparatus. RALPH F. HEISEL (to Mead Pulp & Paper Co.). U. S. 1,696,119, Dec. 18. Structural features.

Apparatus for controlling the drying operation in paper machines. GEORGE S. WITIAM, JR. U. S. 1,694,349, Dec. 4.

Drying paper on steam-heated cylinders. RUDOLF DOCEKAL. Austrian 109,635, Jan. 15, 1928. The water vapor evolved from the paper is withdrawn by suction, compressed, and returned to the cylinder.

Felt sheet for paper-making machines. HUTTER & SCHRANZ A.-G. Austrian 108,798, Oct. 15, 1927. The sheet is made from compd. threads, each comprising a strong thread with 2 or more loosely twisted woolen yarns.

Apparatus for calendering paper. F. W. LODDING (to Rice, Barton & Fales). Brit. 290,188, May 9, 1927. Elec. devices are provided for controlling the position of each doctor with respect to its roll.

Tracing paper, etc. H. FRIEDLANDER (to Spicers, Ltd.). Brit. 290,625, May 18, 1927. An emulsion of hard wax is incorporated with loose fibers such as cotton, linen, silk, wool or artificial silk in the pulp from which paper or cardboard is made and agents which ppt. the wax on the fibers are added. When the emulsion is added to paper pulp a substitute for "press-spahn" or vulcanized fiber may be obtained. Org. solvents such as CCl_4 may be used, with or without substances such as casein, fats, oils or soaps, resins or their mixts.

Waterproof paper. GEORGE A. BROWN (to Bennett Incorporated). Can. 284,746, Nov. 13, 1928. A furnish comprising 70 parts of waste paraffin paper, together with 30 parts of other fiber is placed in a beater engine with sufficient water to ensure circulation. The furnish is heated to about 170°F . and beaten $\frac{1}{2}$ hr. to disintegrate the paper. About 5 to 20 parts of rosin is then added and disseminated throughout the furnish. A 42° Bé soln. of Na silicate, heated to 210°F ., is added in amt. to produce the desired dispersion, about 3 or 4 parts of silicate to 1 part of rosin being satisfactory. The silicate soln. is beaten into the furnish for $\frac{1}{2}$ hr. and a dispersion of paraffin and rosin into fine, discrete particles is effected. The furnish is then preferably cooled to about 120°F . Alum (about 30-40% based on the wt. of the dry Na silicate) is added. The alum reacts on the Na silicate to produce a voluminous flocculent ppt. of Al silicate, which carries down and fixes the dispersed particles of waterproofing material on the fibers. The furnish is run off on a paper machine. Cf. C. A. 22, 3046.

De-inking printed newspaper, etc. WM. LEWIS. U. S. 1,696,639, Dec. 25. The printed paper is satd. with an alk. soln. and reduced to a pulp and the pulp is then subjected to pressure between opposing surfaces such as those of a beater which are impervious to the pulp but permit passage of the ink and soln. An app. is described.

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

Explosion temperatures of gaseous mixtures at different pressures. A. B. SAGULIN. Phys. Tech. Lab., Leningrad. Z. physik. Chem., Abt. B, 1, 275-91(1928).—The relation between the min. pressure at which explosion occurs and the temp. has been studied with the following gases: $\text{H}_2 + \text{Cl}_2$; $\text{H}_2 + \text{Br}_2$; $\text{CS}_2 + \text{O}_2$; Cl_2O ; $\text{CH}_4 + \text{O}_2$; $\text{C}_2\text{H}_6 + \text{O}_2$; $\text{C}_2\text{H}_4 + \text{O}_2$; $\text{CO} + \text{O}_2$; $\text{H}_2 + \text{O}_2$. In every case, the relation can be expressed by: $\log(P_m/T) = A/T + B$, where $A = \text{const.}$ peculiar to the reaction. In the majority of the reactions, B shows a min. for a 06% concn. of one of the reagents. B increases when the diam. of the explosion vessel decreases. The values of A were found to be: $\text{H}_2 + \text{Cl}_2$: 2500; $\text{H}_2 + \text{Br}_2$: 4000; $\text{CS}_2 + \text{O}_2$: 4000; $\text{CH}_4 + \text{O}_2$: 7000; $\text{C}_2\text{H}_6 + \text{O}_2$: $A_1 = 7000$, A_2 4200; $\text{C}_2\text{H}_4 + \text{O}_2$: $A_1 = 7000$, $A_2 = 3800$; $\text{C}_2\text{H}_6 + \text{O}_2$: $A_1 = 7000$, $A_2 = 2200$. A discussion detts. which of these reactions is to be regarded as true thermic explosions.

ALBERT L. HENNE

Explosive limits of technical gas mixtures. K. BUNTE AND A. STEDING. Gas Institut. Gas u. Wasserfach 71, 821-2(1928); cf. C. A. 23, 262.—Explosive mixts.

of air with pure coal gas and coal gas contg. from 9.1 to 71.4% CO_2 , 9.1 to 82.0% N_2 and 16.7 to 91.0% water gas, resp., have been tested by the method of Eitner (*J. Gasbel*, 1902) slightly modified. The dried gas and air were measured by capillary flow meters and mixed in a gas buret arranged for ignition at the top of the buret only. The buret was supplied with a manometer which indicated whether an explosion had occurred. Curves and data are given for the explosive limits of the above mixts. The addn. of water gas considerably increased the explosive limits. Among the inert gases the explosive range is greater with the gases to which N_2 had been added than the corresponding gas to which CO_2 had been added. Theoretically, the explosive limits correspond to the base of the curve of rate of flame propagation vs. percent gas curve, where the rate of flame propagation is zero. While this is approx. true for the lower explosive limit the rate of flame propagation is still large at the upper explosive limit, which may be due to radiated heat bringing the layer of gas just inside the inner cone to the ignition temp. R. W. RYAN

The decomposition of explosives. J. P. KOERTNITZ. *Z. Elektrochem.* **34**, 768 (1928).—The thermodynamics of the most important explosives are recalcd., regarding the explosive reaction as an evapn. of liquids or a sublimation of solids, with simultaneous or rapidly following dissoen. with the usual evolution of heat. Mainly a mathematical discussion. E. M. SYMMES

Testing primers for sensitiveness to impact and for flame effect. LUDWIG METZ. Chem.-Tech. Reichsanstalt, Berlin. *Z. ges. Schiess-Sprengstoffw.* **23**, 260-3, 305-8, 353-4 (1928).—M. describes an original app. for testing the sensitiveness of primer caps, wherein the cap is ignited by a firing pin struck by a free-falling wt. of 250 or 500 g. This app. is free from most of the objectionable features of other impact test app., and can be used for testing caps having larger charges (up to 0.24 g.). A tabulation is given of the results of tests with this app., using a no. of types of military and sporting primers, and also a no. of *initial detonating explosives*, the latter being loaded into primer caps for the purpose of testing. Photographs of the flames are shown. Sensitiveness tests of the detonating explosives gave the following results for min. height of drop of 500 g wt.:—tetrazene 10, $\text{Hg}(\text{ONC})_2$ 10.5, hexamethylene triperoxydiamine 10, K dinitrodinitrosobenzene 25, N_4S_4 28, tricycloacetone superoxide 35, PbN_6 (4 different samples) 30-40 cm. Sensitiveness to impact decreases as ignition temp. increases. A method of testing primers is described in which the above app. is used for detg. the distance at which a strip of nitrated paper will be ignited by the flash from a given primer. C. G. STORM

Phosphorus necrosis in the manufacture of fireworks. EMMA FRANCE WARD. *J. Ind. Hyg.* **10**, 314-30 (1928).—P poisoning in the fireworks industries develops more rapidly than in the match industry. The poisoning was mostly by actual contact in the processes of molding and wrapping. No precautions can eliminate the danger. The purchase for resale of fireworks contg. white P was to end in 1927. H. C. HAMILTON

The influence of steam and of H on the burning of CO (DIXON) **21**. Heater [for use in the explosives industry] (Austrian pat. 109,213) **1**.

Explosives. LIGNOZA SPOLKA AKCYJNA. Fr. 639,938, Aug. 23, 1927. Explosives such as black powder are rendered safer by the addn. of inorg. salts such as chlorides, sulfates, etc., while their sensitiveness is maintained by the addn. of org. substances such as toluene, nitroglycerin, etc.

Explosives. DYNAMIT-ACTIEN-GESELLSCHAFT VORMALS ALFRED NOBEL ET CO. Fr. 640,291, Aug. 30, 1927. Gelatinous explosives and gelatinized smokeless powders are prepd. by gelatinizing nitrocellulose with explosive oils formed by solns. of nitrated multivalent alcs. such as nitrosorbitol in nitroglycerin, nitroglycol or similar explosive oils or their mixts. An example of a dynamite-gelatin contains explosive oil 62, cotton-collodion 3, wood dust 8 and NaNO_3 27%, and a smokeless power-explosive oil 40, centralite 1 and nitrocellulose (12.75% N) 59%. The explosive oil used in the above is prepd. by nitration of sorbitol in glycol or glycerol.

Explosive cartridges. ALEXANDER C. SCOTT (to Mexico, Ltd.). U. S. 1,695,932, Dec. 18. Can. 285,000, Nov. 20, 1928. A liquid "spreading agent" such as kerosene or xylene is used to facilitate impregnation of cartridges contg. KClO_3 , KClO_4 or NH_4NO_3 or similar substances with liquid nitro compds. such as PhNO_2 . Castor oil and other ingredients also may be added.

Cartridge case annealing apparatus. HERBERT V. LUCKIE and SAMUEL A. NORTH (to Remington Arms Co.). U. S. 1,096,886, Dec. 25. A screw conveyor moves the cartridge cases through the app. and the cases are locally heated.

Detonator caps. AKTIENGESSELLSCHAFT LIGNOSE (Friedrich Thomas and Julius Dyckerhoff, inventors.). Ger. 468,935, Jan. 8, 1922. One part of Hg fulminate in detonator caps is replaced by the addn. product of more than 3 mols. of PbO and the neutral Pb salt of picric acid, trinitroresorcinol, hexanitrodiphenylamine, trinitrobenzoic acid or nitranilic acid.

Cleaning fire arms. JOSEF WAGNER. Fr. 640,294, Aug. 30, 1927. To remove the deposits of Pb or oxide of Pb from fire arms, esters of hydroxy fatty acids such as ethyl lactate are added to the known cleaning agents. Cf. C. A. 22, 3501.

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Progress of the heavy organic industry and technology of dyes. JOZEF TURSKI. *Polynest Chem.* 11, 357-64, 543-52(1927). A. C. Z.

Dye-house notes. J. DELACHAIRE. *Tiba* 6, 1381-5(1928).—Practical notes on the dyeing of wool fabrics, woolen velvets, wool-rayon fabrics, rayon-cotton fabrics, cotton fabrics and pure wool skeins. A. PAPINEAU-COUTURE

Scientific dyestuff color synthesis. L. BLIN DESBLEDS. *Textile Recorder* 46, No. 45, 613(1928).—The use of the photoelec. photo-calorimeter in detg. directly the proportion in which 2 colors, A and B, must be mixed to obtain a desired color, C, is described. RUBY K. WORNER

Reserves under sulfur dyes. F. VOZNESENSKII. *Bull. soc. ind. Mulhouse* 94, 657-60(1928).—Sealed notes 1920 (Aug. 3), 1926 (Sept. 2), 1945 (Oct. 30), 1951 and 1952 (Nov. 19, 1909).—No. 1920 *Illuminated reserves*.—Khaki reserve color: nitroso- β -naphthol paste 220, 23° Bé. Cr aceto-nitrate 120, 50% ZnCl₂ soln. thickened with gum senegal and kaolin 600. More or less greenish shades of khaki can be obtained by adding Fe or Co salts to the above color paste. Using only Zn as mordant gives a yellow which can be toned with basic or substantive dyes. Green reserve color: nitroso- β -naphthol paste 130, 38° Bé bisulfite 65, 38% CH₂O 30, 19° Bé. Fe aceto-nitrate 100, malachite green 15, PhOH 60, thickened 50% ZnCl₂ soln. 600. Preferably print on fabric which has been mercerized or prepd. with β -naphthol, so that they may be associated with para red reserves. Steam 5 min., dye, rinse, acidify, rinse and wash with soap. No. 1920 *Reserves illuminated with thioindigo red B, thioindigo scarlet R and brominated indigo*.—Printing color: leuco deriv. corresponding to 40 g. of thioindigo dye 180, glycerol 80, solid hyposulfite 20, thickened 50% ZnCl₂ soln. 720. Steam 2-3 min., oxidize in the air overnight, dye with S dye. Printing can be carried out on fabrics prepd. with β -naphthol and associated with diazotized base reserves. The above vat dyes can be replaced by certain S dyes, such as Schwefelblau BASF toned with a basic dye. Prepn. of the thioindigo red B leuco deriv. can be avoided as follows: thioindigo red B 20, glycerol 80, rongalite (1:1) 50, thickened 50% ZnCl₂ soln. 650, AcONa 200. No. 1945 *Indigo reserve*.—A—indigo powder 50, glycerol 100, rongalite gum (1:1) 150, anthraquinone paste 50, grind together; B—to 550 of thickened ZnCl₂ soln. slowly add 100 of 38° Bé NaOH with cooling, and screen the ppt. Mix A and B. The same formula can be used for thioindigo. Acetates can be used instead of NaOH. No. 1951 *Red and deep blue reserves*.—Deep blue reserves under S dyes cannot be obtained by means of diamidate on β -naphthol, as the Cu lake which must be formed is affected on acidifying after dyeing, this can be overcome by using β -hydroxynaphthoic acid instead of β -naphthol. Prep bath: β -hydroxynaphthoic acid 15, H₂O 760, 20° Bé. NaOH 30, 24% NH₄ 20, ricinoleic acid 100, AcONa 75. Printing color (blue): diazodianisidine soln (5 g. of base) 200, ZnCl₂ soln. thickened with gum senegal and kaolin 800. To obtain a bluish red, use 200 of diazochloroanisidine soln. (contg. 20 g. of base). No. 1952 *S blue reserve*.—Printing color: leuco deriv. of S blue BASF 140, glycerol 80, hyposulfite 20, thickened ZnCl₂ soln. 760. General formula for the prepn. of leuco derivs.: dye 40, 40° Bé. NaOH 40, hyposulfite powder 50, H₂O at 56° (45° for thioindigo) 850, after soln. is complete cool and add: ice 100, 6° Bé. AcOH 90; giving a yield of 140 g. of drained material. Report. PIERRE BINDER. *Ibid* 660-1.—While the principle of reserves under S dyes (printing metallic salts, generally ZnSO₄ or ZnCl₂, and kaolin and dyeing in a vat with S dyes) is well known, no anteriority was found for the modifications proposed by V., which, however, are somewhat difficult to carry out. Only certain vat and S dyes lend themselves to the process, as the Zn salt added to the printing paste interferes more or less with the fixation of the vat or S dye with which it is mixed. A. PAPINEAU-COUTURE

Dyes from the true holly plants. C. D. MELL. *Textile Colorist* 51, 53-4(1929).—Although dyes are obtained from these plants, none of the known species of *Ilex* furnishes a dye-yielding material of any great economic importance. RUBY K. WORNER

Dyes from quinoline-2-aldehyde. AMARENDRA NATH DEY AND SIKHIBHUSHAN DUTT. *J. Indian Chem. Soc.* 5, 535-7(1928).—Quinoline-2-aldehyde (I) condenses very easily with mono- or di-N-substituted anilines in the presence of concd. HCl or $ZnCl_2$, giving colorless leuco compds. which can be oxidized to the coloring material (II) by means of MnO_2 or PbO_2 . II can also be prepd. directly without the intermediate formation of leuco compds. by heating quinaldine tribromide with substituted anilines in the presence of $ZnCl_2$ or ZnO , or without condensing agent. The dyes thus obtained are all green or bluish green in color, very stable toward light, and practically devoid of all photosensitizing properties. Dimethyl-, diethyl-, methylbenzyl-, and ethylbenzyl-anilines were condensed in the foregoing manner with I. The color bases obtained m 196-8°, 144-5°, 172-4°, and 252-4°, resp. FREDERICK C. HAHN

The chemistry of indigosols. WLADYSŁAW KIELBASINSKI. *Przemysł Chem.* 11, 342-7(1927).—A review of the theoretical chemistry of indigosols together with a brief bibliography. A. C. Z.

Formation of lakes of basic dyes. WACŁAW KACZKOWSKI AND T. KOZŁOWSKI. *Przemysł Chem.* 11, 303-7(1927).—Lakes formed of *m*-digallic acid, emetic and basic dye in the proportion of 1:1:1 are insol. in H_2O , C_6H_6 , ethyl acetate, very slightly sol. in $CHCl_3$, readily sol. in C_2H_5OH , $(CH_3)_2CO$, CH_3OH , and dil. CH_3COOH . It is evident that in the formation of lakes of *m*-digallic acid the carboxylic group is active. A. C. Z.

Dyeworks oxalates from waste. E. T. ELLIS. *Dyer, Calico Printer* 60, 148 9 (1928).—Waste products suitable for transformation into oxalic acid include sawdust, strawboard from drapery establishments, and waste paper from offices and book-binding establishments. The acid can then be treated with NH_3 , also prepd. from waste products, or with NH_4Cl to form $(NH_4)_2C_2O_4$; with $Sn(OH)_4$ to form $Sn(C_2O_4)_2$; or with $Sn(C_2H_3O_2)_2$, also prepd. from waste products, to form SnC_2O_4 . $(NH_4)_2C_2O_4$ can be used as a starting product for $NH_4HC_2O_4$ or for $Cr_2(C_2O_4)_3$. RUBY K. WORNER

Action of light on anthracene. EVA HIBBERT. *J. Soc. Dyers Colourists* 44, 377 (1928).—Anthracene exposed to daylight or to fadeometer light becomes yellow or brown on the side toward the light, and this colored portion gives a pos. reaction for anthraquinone. L. W. RIGGS

Gases emitted in the manufacture of sulfur dyestuffs. G. V. KOGAN. *J. Chem. Ind. (Moscow)* 5, 799 801(1928).—The purpose of K.'s investigation was to det. the quantity of H_2S and NH_3 which come off in definite intervals of time in the course of the manuf. of S dyestuffs, and to find the conditions under which the emission of these gases reaches a max. Fifty g. *p*-nitroaniline, 50 g. dinitroacetanilide and 100 cc. H_2O were placed in a small kettle provided with a stirrer, a thermometer tube and a reflux condenser, and the mass was stirred and heated to 98-100°. At this temp. polysulfide was added, and after the addn. the temp. was raised. The polysulfide was obtained by maintaining 210 g. crude Na_2S , 130 g. S and 250 g. H_2O at 100-105° and allowing to settle. In some expts. the polysulfide was added in small portions (25 cc. out of a total of 400 cc.) every 3-5 min.; in other expts. all the polysulfide was introduced in 3 addns. made at intervals of 30 min. The gases which sep. were passed through the condenser either first into 2 flasks contg. a 33% $NaOH$ soln., then into a flask with H_2SO_4 , or into a gasometer in which their vol. could be detd. at any desired interval of time. In 1 expt. the polysulfide was introduced in small portions every 5 min., the gases began to collect in the gasometer when the kettle temp. reached 128°; in the first 6 min. 12 l. of gas was collected, the temp. reaching 150°, and in the next 10 min., the temp. remaining the same, 7 more l. of gas was emitted, after which the gas emission ceased. As a rule the amt. of gas emission is negligible until the temp. of 113-116° is reached and water begins to distil. If the polysulfide is introduced in larger addns. and at greater intervals of time, the reaction is more uniform and less violent. BERNARD NELSON

Fastness to sulfur dioxide of fabric dyed with azo dyestuffs. A. T. KING. *J. Textile Inst.* 19, 249 53P(1928); cf. C. A. 22, 3781.— SO_2 may be present in fiber that has been stripped with hyposulfite, bottomed with indigo, placed in contact with stoved white yarn, or wrapped in paper made from sulfite pulp. Accordingly fastness to stoving is not a sufficient test for fastness of azo dyestuffs. A thorough knowledge of the reactions of SO_2 with the various dyes, and the nature and fastness of the colors produced by these reactions is necessary. The fastness of a dye to SO_2 , hitherto a somewhat obscure factor of limited scope, promises to rival in importance its fastness to light. Several practical examples are discussed. L. W. RIGGS

Fixation of pigments on textile fabrics. G. E. HOLDEN. *J. Soc. Dyers Colourists* 44, 364-8(1928).—A lengthy series of expts. is reported, "designed to det. the capacity of linseed oil as a fixing agent for various pigments on the industrial scale on textile fabrics, chiefly cotton velveteens." This study included the application of linseed oil raw and boiled, China-wood oil, spermaceti, wax, carnauba wax, beeswax, gelatin, isinglass, cellulose acetate and other products. The pigment studied with these fixing agents was Prussian blue. L. W. RIGGS

Industrial poisoning in the manufacture of coal-tar dyes and intermediates and methods of preventing it. A. HIRSZOWSKI. *Przemysl Chem.* 12, 370-8, 419-29, 481-92, 535-40, 587-604(1928).—Symptoms and illustrative cases are described of poisoning by C_6H_6 , $C_6H_5CH_3$, xylene, naphthalene, anthracene, C_6H_4 derivs., nitro compds., aniline and other amines, Cl_2 and aliphatic compds., mineral acids, Cl_2 , H_2S , AsH_3 , and caustic alkalis. Chem. operations in the manuf. of dyes, and prevention of industrial poisoning are discussed. An extended bibliography is included. A. C. Z.

Dyeing of union yarns. T. COPLEY. *Dyer, Calico Printer* 60, 250-1(1928).—Methods and dyestuffs are suggested for dyeing wool and cotton, cotton and silk, and wool and silk unions. RUBY K. WORNER

The dyeing of union fabrics containing cellulose acetate rayon. A. KUNZE. *Russa* 3, 1149, 1151, 1303, 1305(1928).—In French and German. Practical operating hints are given. A. PAPINEAU-COUTURE

Notes on the dyeing of natural silk fabrics. RAFFAELE SANSONE. *Textile Colorist* 50, 164-8, 382-6, 458-60, 526-7, 674-6, 740-1(1928).—A continuation of C. A. 22, 1240. RUBY K. WORNER

Notes on dyeing wool and fur soft hats. E. MEISSNER. *Leipzig. Monatschr. Textil Ind.* 43, 356-7(1928).—The various components of the fiber mixt. used for making felt hats frequently dye differently with the various different colors of the dye mixt. The finer fibers take more mordant and more dye for equal shades than the coarser fibers, the difference being especially marked when fur and wool are used together. Since any traces of vegetable fiber will cause specks, carbonizing should be practiced. In this operation incomplete treatment is a common fault. The H_2SO_4 should be used at 4-5 Be, and the drying should be prolonged over 1-1.5 hrs. at 70-80°. Leonil S is a desirable wetting agent. Subsequent beating and dusting should be very thorough. The dyer can hardly be expected to produce fashionable light shades on hat bodies contg. naturally dark fur fibers, but the darkening of fur fibers in boiling operations can be decreased by use of Feltron C. To avoid a darkening tendency, steam in finishing operations should be dry and the hat bodies should be first given a drying treatment. Among the dyes that are available, preference should be given to the newer Supramin, Radio, Palatine Chrome, and Palatine Chromate series. Over-chroming injures the strength and durability of the felt and should be avoided. Hat dyers are likely to overlook the possibility of variations in shade of certain dyes under artificial light and this should be given more attention in the dyeing of women's hats. E. R. CLARK

Dyeing cotton fast to bleaching. HORACE FLEMING. *Textile Colorist* 51, 38-9(1929). Kier boiling and selection of dyestuffs are considered in particular. R. K. W.

Effects produced by the singeing operation on the dyeing properties of cotton. G. E. HOLDEN. *J. Soc. Dyers Colourists* 44, 368-9(1928).—Singeing imparts a lessened affinity of cotton toward substantive colors during subsequent dyeing. Five to 6 times the quantity of dyestuff is required for thoroughly singed cotton to produce the same depth of color as on non-singed cotton. L. W. RIGGS

Electric color-matching. DAVID PATERSON. *Dyer, Calico Printer* 60, 226-7(1928). The Toussaint photoelec. colorimeter is briefly described. R. K. W.

Progress in textiles. JAMES W. COX, JR., E. H. MARBLE, W. L. CONRAD, McREA PARKER, E. R. STALL AND H. M. BURKE. *Mech. Eng.* 51, 52-4(1929). E. H.

Distinguishing tests for yarns and fabrics. CLIFFORD R. CARTER. *Dyer, Calico Printer* 60, 212-3(1928). Some usual tests are described for distinguishing the ordinary textile fibers, including New Zealand hemp or flax, jute, true hemp, true flax and Manila fiber. RUBY K. WORNER

Stains, dirt and oil spots in yarns and fabrics. H. D. MARTIN. *Textile Colorist* 51, 28, 34(1929). A general discussion is given of the cause and prevention of such troubles. RUBY K. WORNER

Some remarks on drying [textiles]. R. J. WATSON. *Textile Colorist* 51, 52-3(1929). RUBY K. WORNER

Luster in finishing woolens and worsteds. ALEX. J. BENNETT. *Textile Colorist* 51, 35-7(1929). The development of modern crabbing, steaming and cooling machines from the "Roll boiling" process is traced. RUBY K. WORNER

Relation of moisture content of wool to that of air. V. LÖHRMANN. *Kísérlet Közlemények* 30, 472-482(1927).—The moisture content of wool does not depend on the quality. If the moisture content of the air becomes greater, then the moisture content of the wool increases, even after the moisture content of the air is diminished. A dry wool acquires normal moisture in 5-6 hrs. Dirty wool contains 0.5% less moisture than the washed wool if the air contains 40-50% moisture but no difference can be observed in an air contg. more than 65% moisture. S. S. DE FINÁLY

Absorption of acids by wool. II. III. An examination of the experimental data. H. WILKINSON AND A. G. TYLER. *J. Soc. Dyers Colourists* 44, 369-76(1928); cf. C. A. 22, 3783.—In agreement with several other workers it was found that the equil. between the acid absorbed by the wool and the acid remaining in the liquor was represented by the equation $y = a \log bx$, in which y = the percentage of acid absorbed by the fiber (C_f), x = the percentage concn. of the acid left in the bath (C_b), and a and b were consts. These findings and those of other workers are shown in charts of curves. In this study the observations were made on the absorption (or combination) in wool phase when immersed in the liquid phase, in which the concn. of the acid in the liquid phase was gradually diminishing until equil. was reached. In part III the attempt was made to obtain conditions in which the wool phase would be relatively large and the liquid phase small. The results indicate that under these conditions of equil. between absorbed acid and acid concn. the same equation holds. The absorption of acids by wool is a chem. reaction similar to those discussed by Loeb (cf. "Proteins and the Theory of Colloidal Behavior" p. 42 et seq. (C. A. 19, 996)). L. W. RIGGS

Wool lubrication in relation to scouring. F. T. SYKES. *Dyer, Calico Printer* 60, 120-1, 168-9, 204-5, 237, 254-6(1928).—A general discussion is given of the oiling and scouring processes and of the attendant difficulties. The requirements of suitable oils and soaps are especially considered. RUBY K. WORNER

Experiments show how to eliminate barre-marks from broad silks. H. E. WENRICH. *Textile World* 75, 231-9(1929). RUBY K. WORNER

Successful prewinding boil-off for silk skeins to be used in glove-silk fabric. T. P. SHERIDAN. *Textile World* 74, 3248, 3261(1928).—The process is described RUBY K. WORNER

Rayon rain proofs. FRED. GROVE-PALMER. *Textile Colorist* 50, 742-5, 843-5 (1928); 51, 23-6(1929).—A general discussion is given of the theory of waterproofing light cloths, methods of application of various processes, and methods of testing the finished materials. RUBY K. WORNER

Finishing linen cloth and toweling. T. WOODHOUSE AND A. BRAND. *Cotton* 92, 239-40, 1013-6, 1120-2(1928).—The processes and equipment used in handling these goods in the finishing plant are described. RUBY K. WORNER

Many defects appearing in cotton fabric after finishing are fault of weaving mill. ALFRED SCHMIDT. *Melliand Textilberichte; Textile World* 74, 3489-91(1928). RUBY K. WORNER

The starches used in the sizing and finishing of cotton. S. R. TROTMAN. *Dyer, Calico Printer* 60, 136-7, 160-1, 179(1928).—A general account is given of the principal starches used for this purpose, their prepn., general and comparative properties, and methods of analyzing com. starches for chem. compn., stiffening power and viscosity. RUBY K. WORNER

New Zealand hemp. CLIFFORD R. CARTER. *Textile Recorder* 46, No. 546, 44-5 (1928).—A general account is given of its cultivation and conversion into fiber. Tests are described for distinguishing it from jute, true hemp and true flax. R. K. W.

The bleaching of animal fibers. JAMES MOFFAT. *Dyer, Calico Printer* 60, 164-5, 206-7, 236-7(1928).—A general discussion is given of the S and peroxide bleaching processes as applied to wool and silk. RUBY K. WORNER

Resistance of textile oils to magnesium sulfate. H. RUSSINA. *Leipzig. Monatschr. Textil. Ind.* 43, 392-3(1928).—The use of such prepn. as Prestabitol, Gencucol and Appret-Avirol, should be according to rational interpretations of test results. The concn. of sol. oil needed to prevent turbidity is proportional to the concn. of $MgSO_4$. With Appret-Avirol, both low and high concn. gave turbidity with an intermediate concn. which gave clarity. E. R. CLARK

Floranit. ANGELE. *Leipzig. Monatschr. Textil. Ind.* 43, 352(1928).—Floranit is a desirable wetting-agent for bleach baths. When it is used, thorough preliminary wetting of the fabric is not essential, and even paraffin-stained portions are bleached. E. R. C.

Prestabitol. HANS FRIEDRICH. *Leipzig. Monatschr. Textil. Ind.* 43, 352-3 (1928).—This is a wetting-agent for mercerizing baths. Its use enhances the effects of the caustic and increases the uniformity of the treatment. E. R. CLARK

Device for identifying colors (HOLMES) 1. Influence of sulfonic groups and other substituents on the color of trisazo dyes (DINNER) 10. Constitution of delphinin (KONDON) 10. Azo dyes from acetoacetanilides (FIERZ-DAVID, ZIEGLER) 10. Use of halogen-substituted sulfonic acids and their salts as protective agents (Brit. pat. 289,898) 18. Wetting agents [halogen-substituted sulfonic acids] (Brit. pat. 289,863) 18. Colloidal solutions of silica for impregnating fabrics (Brit. pat. 290,717) 18. Dispersing agents [for dyes] (Fr. pat. 640,776) 18. Sulfonated cellulose derivatives [for impregnating cloth] (Fr. pat. 640,687) 23. Sulfonic acids [in the textile industry] (Fr. pat. 640,617) 10. Inclined rotary drying apparatus for treating cotton (U. S. pat. 1,695,652) 1. Artificial threads from chlorinated rubber (U. S. pat. 1,695,643) 30. Dyeing leather (Can. pat. 285,054) 29.

BALLS, W. LAWRENCE: *Studies of Quality in Cotton*. London: Macmillan & Co., Ltd. 376 pp. 20s., net. Reviewed in *Nature* 122, 641 (1928).

REINTHALER, F.: *Artificial Silk*. Revised and enlarged. Translated from the German by F. M. Rowe. London: Chapman & Hall, Ltd. 276 pp. 21s.

Dyes. I. G. FARBENIND. A.-G. Brit. 289,980, Feb. 14, 1927. Green vat dyes are made by fusing with caustic alkali, "under mild conditions," the aminobenzanthrone obtained by reducing the nitrobenzanthrone described in example 2 of Brit. pat. 12,518 of 1906 or substitution products of this aminobenzanthrone which contain exchangeable substituents in the Bz-1 position, or their *N*-acyl derivs. The products can be converted into brown vat dyes by treating them with oxidizing agents either in substance or on the fiber, or the nitrobenzanthrone may be fused directly with caustic alkali to obtain a brown vat dye. Several examples are given.

Dyes. I. G. FARBENIND. A.-G. Brit. 290,230, May 10, 1927. Monoazo dyes which give clear greenish yellow dyeings on wool, fast to light and to water, are made by coupling a diazotized anilinemonosulfonic acid with 1-(2'-chloro-5'-sulfo phenyl)-3-methyl-5-pyrazolone. Among various specified components are the diazo compds. of sulfanilic acid and of aniline-*o*-sulfonic acid.

Dyes. I. G. FARBENIND. A.-G. Brit. 290,408, March 24, 1927. Vat dyes of the anthraquinone series are made by treating a bis-(2'-carboxy-1'-anthraquinonyl)-2,6- or 2,7-dimercaptoanthraquinone with a dehydrating agent to effect ring closure. Examples are given of dyes producing yellow shades and of the manuf. of some of the intermediates used.

Dyes. I. G. FARBENIND. A.-G. Brit. 290,636, May 18, 1927. 1-Aminoanthraquinone-2-sulfonic acids, substituted in the 4-position by an amino residue of a cyclic paraffin, are obtained by replacing the halogen atoms of the corresponding 2-halogen derivs. by sulfonic groups, *e. g.*, by heating with a neutral sulfite preferably under pressure. Dyes as described in examples 1 and 2 of Brit. 276,408 (*C. A.* 22, 2470) and Brit. 282,452 (*C. A.* 22, 3787) may be thus obtained.

Dyes. I. G. FARBENIND. A.-G. Brit. 290,733, Feb. 18, 1927. Insol. disazo dyes are made by coupling the tetrazo compd. of 2,7-diaminocarbazole or an unsulfonated deriv. with a suitable component other than a naphthol, *e. g.*, with a 2,3-hydroxynaphthoic arylide, a hydroxynaphthocarbazole or with a diacetoacetic arylide. The dyes may be formed on a substratum or on the fiber and dyes are obtained (according to examples given) which give blue, bluish black, violet, black or yellowish brown shades. 3,6-Dichloro-2,7-diaminocarbazole (which may be used as a starting material) is made by heating 2,2'-diamino-3,3'-dichlorobenzidine (obtained by nitrating 3,3'-dichlorobenzidine and reducing) with dil. HCl or H₂SO₄ in an autoclave.

Dyes. I. G. FARBENIND. A.-G. Fr. 639,859, Aug. 20, 1927. Sulfurized dyes are prepd. by heating with alkali polysulfides and a Cu salt the indophenols or leucoindophenols obtained by the joint oxidation of *p*-hydroxyaryl-1-naphthylaminesulfonic esters with *p*-aminophenol and its derivs. and reducing if necessary. In an example, 1-*p*-anisylamino-4-*p*-hydroxyphenylaminonaphthalene-8-sulfonic acid (by oxidizing *p*-anisyl 1-naphthylamine-8-sulfonic acid and *p*-aminophenol and subsequently reducing) is refluxed in alc. with S and CuSO₄. The product dyes cotton in a bath contg. Na₂S in pure greenish yellow shades. The product obtained from the leucoindophenol prepd. from *p*-phenethylamino-4-*p*-hydroxyphenylaminonaphthalene-8-sulfonic acid and *p*-aminophenol dyes cotton in greenish yellow shades. The product obtained from 1-*p*-anisylamino-4-*p*-hydroxyphenylaminonaphthalene-6- or 7-sulfonic acid dyes cotton in bluish green shades.

Dyes. I. G. FARBENIND. A.-G. Fr. 639,975, Aug. 24, 1927. Vat dyes are prepd. by treating benzoylaminodiphtaloylacridones with hydrazine. In an example 1,2,5,6-

diphthaloylacridone (by condensing 1-chloroanthraquinone-2,2-dicarboxylic acid with 2-aminoanthraquinone and treating with H_2SO_4 to close the acridone ring) is nitrated and reduced and boiled with $BzCl$ to obtain benzoylamino-1,2,5,6-diphthaloylacridone, which is boiled in pyridine or toluene with hydrazine hydrate. The new product dyes cotton from the vat in fast green shades. Anisoylamino-diphthaloylacridone or halogen derivs. of these acridones may be used as starting materials.

Dyes. I. G. FARBENIND. A.-G. Fr. 640,262, Aug. 30, 1927. Black trisazo dyes are prepd. by diazotizing the *p*-aminoazo compd. *p*-aminobenzeneazo gamma acid (from diazotized *p*-nitroaniline and gamma acid) and coupling with gamma acid, diazotizing again and combining with *m*-phenylenediamine, any one of the 4 org. mols. used for the synthesis of the dye may also contain an extra sulfonic acid group. Examples are given, in one of which gamma acid is used, which is replaced in the second by 2-amino-8-naphthol-3,6-disulfonic acid.

Dyes. I. G. FARBENIND. A.-G. Fr. 640,726, Sept. 9, 1927. Org. dyes contg. acid salt-forming groups are combined with org. bases which will yield stable salts insol. or slightly sol. in water. Such bases are dicyclohexylamine, guanidines, trisubstituted melamines, and diethyl- β -naphthylamine. The products are mixed with hydrate of alumina, heavy spar, blanc fixe, etc., or they may be prepd. in the presence of these substances. In examples: (1) Na 1-amino-4-anilinoanthraquinone-2-sulfonate is treated in aq. soln. with a HCl soln. of dicyclohexylamine. (2) *p*-Nitrophenylazosalicylic acid is similarly combined with quinoline. (3) Sulfonated diphenyldiaminophenolphthalein is combined with ethenylphenylenediamine. A long list of dyes which may be combined is given.

Dyes. I. G. FARBENIND. A.-G. (Karl Zahn, Paul Ochwat and Hans Josef, inventors). Ger. 468,957, Aug. 25, 1925. Vat dyes giving a greenish blue on cotton are obtained by oxidizing isodibenzanthrone with oleum at 0-5° and alkylating the oxidation product. Isodibenzanthrone, prepd. by melting *Bz*-1,*Bz*-1'-dibenzanthronyl sulfide with potash, is oxidized by oleum and boric acid or MnO_2 and afterwards methylated.

Dyes. B. WYLAM, J. R. G. HARRIS, J. THOMAS and SCOTTISH DYES, LTD. Brit. 290,690, Dec. 17, 1926. Various vat dyes are heated with alkyl halides such as $EtBr$ or org. carboxylic halides such as benzoyl chloride or anhydrides such as acetic or phthalic anhydride in the presence of a metal such as Zn and an org. base such as pyridine. Stable products are obtained which are sol. in pyridine and other org. solvents and generally insol. in water and suitable for use in various dyeing processes on vegetable or animal fibers. Examples are given of the treatment of dimethoxybenzanthrone, indigo, flavanthrone and indanthrone.

Dyes, intermediates. FELICE BENSA. Fr. 640,239, Aug. 29, 1927. *Diacetyl- or dipropionyl-dichloroperylene*, which is prepd. by treating dichloroperylene with $AcCl$ or propionyl chloride in the presence of anhyd. $AlCl_3$ in CS_2 , is heated with metallic cyanides giving new vat dyes, the former a fiery red on cotton which passes to reddish violet on exposure to the air, the latter a red which becomes bluer on exposure to air than the former.

Azo dyes. I. G. FARBENIND. A.-G. Brit. 290,253, May 11, 1927. Azo dyes which dye wool yellow fast to light are made by coupling an aromatic diazo or tetrazo compd. with a 1-(*o*-sulfo-halophenyl)-3-methyl-5-pyrazolone. Several examples are given.

Azo dyes. I. G. FARBENIND. A.-G. Swiss 127,169, and 127,170, Mar. 21, 1927. Addns. to Swiss 126,823. Sulfanilic acid is diazotized and coupled with 1-*p*-(carbethoxymethylamino)-, or 1-*p*-(carbethoxyamino)phenyl-3-methyl-5(4)-pyrazolone. Both dyes are yellow powders and dye mixts. of silk and wool with an even tone.

Azo dyes. HEINZ EICHWEDE (to Grasselli Dyestuff Corp.). U. S. 1,694,117, Dec. 4. Diazotized 5-nitro-2-amino-1-phenol or 5-nitro-4-chloro-2-amino-1-phenol is combined with 1-(2'-hydroxy-3-carboxy-5'-sulfophenyl)-3-methyl-5-pyrazolone, 1-(2'-hydroxy-3'-carboxy-5'-sulfophenyl)-5-pyrazolone-3-carboxylic acid or a 1-(2'-hydroxy-2'-carboxy-5'-sulfophenyl)-5-pyrazolone-3-carboxylic acid ester. The dyes thus formed dye wool yellowish to brownish red tints which by after-chroming change to bluish red to claret-red shades of good fastness to fulling, potting and light. The dyes may be printed on cotton with Cr salts to obtain bright red shades fast to washing and to Cl.

Azo dyes. HERMANN WAGNER, HEINZ EICHWEDE and ERICH FISCHER (to Grasselli Dyestuff Corp.). U. S. 1,694,568, Dec. 11. The disazo dye formed from aniline and *p*-phenylenediamine as end components and *m*-phenylenediamine as middle component or other similar disazo dye of the general formula $R-N:N-X-N:N-R-NH_2$, in which R represents a non-sulfonated phenyl group and X a non-sulfonated residue of the group including the benzene and naphthalene series being substituted by at least 1 auxochromic

group, is further diazotized and coupled with an arylamide (e. g., the 5-chloro-1-methyl-2-anilide) of 2-hydroxynaphthalene-3-carboxylic acid. The coupling may be effected either in substance, on a substratum or on the fiber. The dyes obtained are in the dry state black powders insol. in water and yield dyeings of good fastness. Several other examples are given, with details of prepn. of the dyes.

Azo dyes. HERMANN WAGNER (to Grasselli Dyestuff Corp.). U. S. 1,695,164, Dec. 11. Dyes of good fastness to kier-boiling are obtained by the combination of any diazo compd. with an arylamide of 2,3-hydroxynaphthoic acid, halogenated in the aryl residue and substituted by an alkyl or alkyloxy group in the *p*-position to the amino group or by coupling halogenated diazo components contg. an alkyl or alkyloxy group with arylamides of 2,3-hydroxy-naphthoic acid not halogenated in the aryl residue but contg. in the *p*-position to the amino group an alkyl or alkyloxy group. The dyes may be formed to obtain pigment dyes or the coupling may be effected on the fiber in printing as well as in piece and yarn dyeing. Numerous examples and details are given.

Preparation of azo dyes on the fiber. HANS BUCHERER. Ger. 466,033, Nov. 26, 1922. Diazo-hydroxy compds. obtainable from 2,1-naphtholsulfonic acid or its derivs. are brought on to the fiber and treated with a dil. mineral acid, without applying heat, to convert them into insol. and stable hydroxyazo dyes. In an example, the use of the diazonium salt from 2,1-naphtholsulfonic acid and *p*-nitrodiazobenzene is described.

Production of azo dyes on the fiber. I. G. FARBENIND. A.-G. (Wilhelm Acrzberg and Heinrich Ohlendorf, inventors). Ger. 467,634, May 19, 1926. The fiber is treated successively with an alk. soln. of hydroxy compds. of the *p*-diazine series and with a diazo compd. The hydroxy compds. may be employed in the form of their reduction products. In examples describing the treatment of cotton, viscose silk, or cuprammonium silk, the hydroxy compds. employed are (1) 6-hydroxynaphthophenazine obtained as described in Ger. 398,484; (2) the products obtained by reducing 6-hydroxynaphthophenazine with $\text{Na}_2\text{S}_2\text{O}_4$; (3) 4-hydroxynaphthophenazine, obtained as described in Ger. 398,484; (4) 6,6'-dihydroxy-1,2,2',1'-dinaphthazine, obtained as described in Ger. 398,484, with or without a reducing agent; (5) the products obtained by alkali fusion from 1,2,2',1'-dinaphthazone-3,8,6'-trisulfonic acid, obtained by condensing 1,2-naphthoquinone-3,8-disulfonic acid with 1,2-diaminonaphthalene-6-sulfonic acid, (6) 4-hydroxy-1,2-naphtho-2,3-anthraquinoneazine, obtained from 4-hydroxy-1,2-naphthoquinone and 2,3-diaminoanthraquinone; (7) the products obtained by reducing with $\text{Na}_2\text{S}_2\text{O}_4$ the alkali melt from 4,8-disulfo-1,2-naphthophenazine. The diazo compds. specified are diazotized *p*-nitroaniline and 5-nitro-2-diazo-1-methoxybenzene.

Monoazo dye. WINFRED HENTRICH (to Grasselli Dyestuff Corp.). U. S. 1,695,554, Dec. 18. The diazo compd. of 4,6-dinitro-2-amino-1-hydroxybenzene is coupled with 1-amino-8-hydroxynaphthalene. The dye thus formed dyes "acetate silk" fast black.

Vat dyes. WALTER MIEG and ALBERT JOB (to Grasselli Dyestuff Corp.). U. S. 1,696,499, Dec. 25. Monoaminodiphtaloylacridones obtainable by reducing the corresponding mononitrodiphtaloylacridones are blue powders dyeing grayish blue shades from a hyposulfite vat. Cf. C. A. 23, 526.

Vat dyes. I. G. FARBENIND. A.-G. Ger. 466,103, Dec. 29, 1925. Naphthalene-carboxylic acids or their anhydrides obtainable by oxidation from 6-nitro-5-acylacenaphthene and its substitution products are condensed with aromatic bases, particularly with *o*-diamines. In an example, the products obtained by oxidizing 6-nitro-5-acetylnaphthalene, for instance with dichromate, are boiled with *o*-phenylenediamine or with 4-nitro-2,1-diaminobenzene. The use of the products in dyeing cotton is referred to.

Vat dye derived from 2-halo-1,9-pyrazoleanthrone. ROBERT BERLINER, BERTHOLD STEIN and WILLY TRAUTNER (to Grasselli Dyestuff Corp.). U. S. 1,695,631, Dec. 18. A disazo dye is prepd. from 2-bromo-1,9-pyrazoleanthrone by heating with K and Cu acetates which is in the dry and purified form a reddish brown powder only slightly sol. in the usual org. solvents, sol. in boiling PhNO_2 with a green fluorescence, and dyes cotton from a blue vat blue shades changing on oxidation into a "powerful" clear red shade of good fastness.

Benzanthrone dyes. I. G. FARBENIND. A.-G. Ger. 467,697, Dec. 23, 1925. Benzanthrone substituted in the *Bz*-2- or *Bz*-3- position, or in both positions, with an aryl, alkyl, or aralkyl group are converted into dibenzanthrones or isodibenzanthrones by suitable methods. In the examples, (1) *Bz*-2-methylbenzanthrone (obtained by the action of α -methylacrolein on anthrone) is fused with alkali at 230–240°; *Bz*-2,*Bz*-2'-dimethyldibenzanthrone is obtained; (2) *Bz*-2-tolylbenzanthrone may be treated in the same way; (3) *Bz*-2-methylbenzanthrone is treated with SO_2Cl_2 and the *Bz*-1-chloro-*Bz*-2-methylbenzanthrone so obtained is fused with alkali at 130–135°; the product

is *Bz*-2,*Bz*-2'-dimethylisodibenzanthrone; (4) a mixt. of *Bz*-2-methylbenzanthrone and *Bz*-1-chlorobenzanthrone is shaken at 5° with a suspension of Na anilide in aniline; the product is *Bz*-2-methyl-2,*Bz*-1'-dibenzanthronyl, which yields *Bz*-2-methylisodibenzanthrone by heating with alc. KOH; (5) a mixt. of *Bz*-3-methylbenzanthrone (obtained by condensing crotonaldehyde with anthrone) and *Bz*-1-chloro-*Bz*-2-methylbenzanthrone (cf. example 3), treated as in example 4, yields *Bz*-2,*Bz*-3'-dimethylisodibenzanthrone.

Triphenylmethane dyes. ROBERT M. COLE. U. S. 1,694,057, Dec. 4. An aromatic amine such as diphenylamine (in the manuf. of diphenylamine blue) is oxidized with air in the presence of CH₂O, a condensing agent such as HCl and a catalyst, *e. g.*, CuCl₂. An app. is described, in which continuous operation may be effected.

Tetrakisazo dyes. I. G. FARRENIND. A.-G. Fr. 640,225, Aug. 29, 1927. Two mols. of the diazo compd. of *p*-aminoacetanilide are reacted with 1 mol. of the disazo dye obtained by combining the tetrazo compd. of benzidine first with 1 mol. of H-acid in an acid medium and then with 1 mol. of *m*-phenylenediamine in alk. medium, and the tetrakisazo dye thus formed when saponified with an alkali gives a greenish black on chrome-tanned leather.

Dye compositions. BRITISH DYESTUFFS CORP., LTD., J. BADDILEY, A. SHEPHERDSON and A. J. HAILWOOD. Brit. 290,542, July 22, 1927. Products obtained by oxidizing sulfite cellulose pitch with aq. HNO₃, H₂O₂, chromic acid permanganates or air in the presence of ammoniacal Cu sulfate or the like are used in making powder or paste dye preps. to keep the dye in easily dispersible form and to prevent coagulation and settling of dye pastes. Pastes thus formed may be dried at moderately high temps without losing their capability of dispersion. An example is given of the treatment of 1-methylaminoanthraquinone.

Bluish sulfurized indophenol dyes. HERMANN BOTS and ANDRE CATINEAU (to Soc. anon. pour l'ind. chim. à Bâle). U. S. 1,695,756, Dec. 18. Indophenols made from nitrosophenols and carbazole are reduced and the leuco compds. thus obtained are sulfurized in the presence of PhNH₂, *o*- or *p*-toluidine or other aromatic amino compds. corresponding to hydrocarbons having less than 12 C atoms, at a temp. of about 180°.

Anthraquinone derivatives. I. G. FARRENIND. A.-G. (R. E. Schmidt, inventor) Ger. 467,496, Dec. 10, 1924. See Brit. 244,463 (C. A. 21, 329).

Anthraquinone-1,5-dinitrile. I. G. FARRENIND. A.-G. Swiss 126,964, Nov. 8, 1926. Addn. to Swiss 125,469. CuCN is heated with 1,5-dihaloanthraquinone in the presence of a compd. in which a nitrile group is linked with an aliphatic residue, and treated with dil. HNO₃. The substance is a green vat dye m. 380.

Benzanthrone derivatives. I. G. FARRENIND. A.-G. Brit. 288,666, Dec. 10, 1926. Benzanthronecarboxylic acids are made by treating 1,1'-dinaphthyl-8,8'-dicarboxylic acid or its derivs. or nuclear substitution products with an acid condensing agent under "moderate conditions" until the reaction product is sol. in glacial HOAc. By treating the benzanthronecarboxylic acids with alk. condensing agents, highly colored products are obtained which are sol. in alkalis and which are probably of the violanthrone or isoviolanthrone type and these are converted by acid condensing agents into new compds. insol. in alkalis, dyeing cotton from the vat in blue to gray shades fast to washing, Cl and light. Several examples are given.

A derivative of chloro-2-naphthindole-2-anthraceneindigo. MARCEL BADER, CHARLES SUNDER and DURAND & HUGUENIN SOC. ANON. Swiss 126,968, Sept. 28, 1926. Addn. to Swiss 102,540. A fast, sol. deriv. suitable for dyeing and printing is formed by treating the leuco compd. with SO₃ to obtain the ester.

A derivative of monobromoindigo. MARCEL BADER, CHARLES SUNDER and DURAND & HUGUENIN SOC. ANON. Swiss 126,972, Nov. 15, 1926. Addn. to Swiss 102,540. A fast sol. deriv. suitable for dyeing and printing is formed by treating the leuco compd. with SO₃ to obtain the ester.

A derivative of tetrachloro-4,4'-dimethylthioindigo. MARCEL BADER, CHARLES SUNDER and DURAND & HUGUENIN SOC. ANON. Swiss 126,971, Nov. 15, 1926. Addn. to Swiss 102,540. A fast sol. deriv. suitable for dyeing and printing is formed by treating the leuco compd. with SO₃ to obtain the ester.

A derivative of 2-naphthionic phenylchloromethyl-3-indolineindigo. MARCEL BADER, CHARLES SUNDER and DURAND & HUGUENIN SOC. ANON. Swiss 126,970, Sept. 30, 1926. Addn. to Swiss 102,540. A fast, sol. deriv. suitable for dyeing and printing is formed by treating the leuco compd. with SO₃ to obtain the ester.

Derivatives of 2-naphthionic phenyl dichloride-3-indoleindigo. MARCEL BADER, CHARLES SUNDER and DURAND & HUGUENIN SOC. ANON. Swiss 126,969, Sept. 30, 1926. Addn. to Swiss 102,540. A fast sol. deriv. suitable for dyeing and printing is formed by treating the leuco compd. with SO₃ to obtain the ester.

A derivative of dibromo-2-naphthindolechloro-2-naphthaleneindigo. MARCEL BADER, CHARLES SUNDER and DURAND & HUGUENIN SOC. ANON. Swiss 126,966, Sept. 28, 1926. Addn. to Swiss 102,540. To obtain the substance a in fast, sol. condition, suitable for dyeing and printing, the leuco compd. is first obtained by the condensation of dibromo-2,1-naphthisatin, formed by direct bromination; with 4-chloro- α -naphthol. This is then converted into the H_2SO_4 ester by SO_3 .

A derivative of dichloro-2-indolechloro-2-naphthaleneindigo. MARCEL BADER, CHARLES SUNDER and DURAND & HUGUENIN SOC. ANON. Swiss 126,967, Sept. 28, 1926. Addn. to Swiss 102,540. The deriv. is obtained in a fast, sol. form, suitable for dyeing and printing, by treating the leuco compd. of dichloro-2-indole-2-naphthaleneindigo with SO_3 to obtain the ester.

A derivative of dichloro- β,β -naphthylthioindigo. MARCEL BADER, CHARLES SUNDER and DURAND & HUGUENIN SOC. ANON. Swiss 126,973, Nov. 15, 1926. Addn. to Swiss 102,540. A fast, sol. deriv. suitable for dyeing and printing is formed by treating the leuco compd. with SO_3 to obtain the ester.

Bz-Methylbenzanthrone. ARTHUR WOLFRAM and HEINRICH GREUNE (to Grasselli Dyestuff Corp.). U. S. 1,695,626, Dec. 18. Anthracenes contg. an O atom in the meso position, such as anthrones, anthranols or oxanthranols, can be condensed, by use of condensing agents, with crotonic aldehyde, to form *Bz*-methylbenzanthrone. H_2SO_4 is a suitable condensing agent and an oxidizing agent such as arsenic acid or HgO of $HgSO_4$ may be added as may also a diluent such as $HOAc$ and H_2O . The reaction is effected in 2 stages in the first of which it is assumed that there occurs an addn. of the aldehyde on the anthranols, while ring closure is effected in the second stage. In the final product it is uncertain whether the Me group is in the *Bz*-2- or the *Bz*-3- position. The 2 steps can be carried out separately or in a single operation. Condensation with bases may be effected by heating anthrone and crotonic aldehyde in the presence of pyridine and piperidine. The intermediate products thus formed may then be converted into the *Bz*-methylbenzanthrone either by use of H_2SO_4 or of $AlCl_3$, which apparently produce the *Bz*-2- and *Bz*-3- methylbenzanthrone, resp. These products may be used as intermediates in the manuf. of dyes. Numerous details and examples are given.

Benzoyldiaminoanthraquinones. I. G. FARBENIND. A.-G. Fr. 640,236, Aug. 29, 1927. Diaminoanthraquinones are benzoylated with $BzCl$ in org. solvents with the addn. of an acid-binding agent. Examples are given of the prepn. of 1,4- and 1,5-monobenzoylaminoanthraquinone. They are *intermediate products for dyes*.

Dyes for cellulose acetate, etc. I. G. FARBENIND. A.-G. Brit. 289,807, May 2, 1927. Hydroxyalkylaminoanthraquinones are prepd. by the action of hydroxyalkylamines on quinizarin or leuco-quinizarin or their substitution products or on a negatively substituted anthraquinone; the products may be sulfonated, or esterified with H_2SO_4 . The bases are dyes for cellulose acetate and their sulfonic acids are acid wool dyes. When the anthraquinones are used, hyposulfite may be added. Examples are given.

Color lakes. I. G. FARBENIND. A.-G. Swiss 126,121, 126,124, Dec. 23, 1925. Color lakes are obtained from the Et ester of tetraethylrhodamine by treating its salts, in the presence of a substrate, with substances contg. phosphoric and molybdic acid residue, e. g., with NH_4 molybdate and Na_2HPO_4 , together or in either order (Swiss 126,121). The same treatment may be applied to salts of tetraethylrhodamine (Swiss 126,122), to salts of the Et ester of diethylrhodamine (Swiss 126,123) and to salts of tetraethyldiaminodiphenyl- α -monoethylaminonaphthylcarbinol (Swiss 126,124).

Stripping dyes. CHARLES S. HOLLANDER (to Röhm & Haas Co.). U. S. 1,696,164, Dec. 18. In stripping dyes from fibers such as rags the material is soaked in a heated bath contg. dissolved substances in equil. comprising Na sulfoxylate formaldehyde and a sol. Zn salt such as $ZnSO_4$ or $ZnCl_2$, together with a sol. Zn sulfoxylate formaldehyde and a sol. Na salt such as Na_2SO_4 or $NaCl$.

Production of dyes on vegetable fibers. I. G. FARBENIND. A.-G. (Leopold Laska and Arthur Zitscher, inventors). Ger. 467,545, June 8, 1924. The fibers are impregnated with the β -naphthalide of 2,3-hydroxynaphthoic acid and then treated with a diazo compd. of an amine substituted in the 2- and 6- positions relatively to the NH_2 group, at least one of the substituents being Cl. The use of the diazo compds. from 4-chloro-1,2-toluidine and 4-chloro-2-aminodiphenyl ether is given as an example.

Hair dye. MAUDE A. MINGUS (formerly Maude A. M. Wheeler). U. S. reissue 17,153, Dec. 4. See original pat. 1,636,341 (C. A. 21, 2989).

Dyeing. I. G. FARBENIND. A.-G. Brit. 289,730, Nov. 30, 1927. Pelts, hairs, feathers and the like are successively treated with an aq. soln. of a salt of a naphthalene deriv. contg. at least one 3-aminoarylamino group of the benzene series and with an acid nitrite soln., e. g., an unmordanted skin may be treated with a soln. of 2-(3'-aminophenyl)-

aminonaphthalene-HCl contg. some alc. and HCl and then with a bath contg. NaNO_2 and HOAc, which produces a dyeing between yellow and rose color. Other examples also are given.

Dyeing. I. G. FARBENIND. A.-G. Brit. 290,126, Nov. 30, 1927. Pelts, hairs, feather, or like materials, with or without preliminary mordanting, are treated with an aq. soln. of a salt of a naphthalene deriv. contg. at least one 4-aminoarylamino group of the benzene series such as 2-(4'-aminophenylamino)naphthalene-HCl and then treated with an oxidizing agent such as $\text{K}_2\text{Cr}_2\text{O}_7$. Several examples are given for producing black, blue-black, blue-gray and other shades. 4-Aminophenylaminonaphthalenes and their substitution products are made by heating the corresponding hydroxynaphthalenes with a *p*-diamine of the benzene series in the presence of an alkali bisulfite soln.

Dyeing. I. G. FARBENIND. A.-G. Brit. 290,177, May 6, 1927. In producing resist effects in dyeing with vat dyes, the material is first printed with a mixt. of an oxidizing agent and an aq. soln. of a cellulose alkyl ether and then dried before placing it in the vat liquor. Several examples are given.

Dyeing. I. G. FARBENIND. A.-G. Fr. 640,746, Sept. 10, 1927. Azo dyes obtained by coupling diazotized aminosulfonic or aminocarboxylic acids or their derivs. with α,γ -diketohydrindenes or their derivs. are used for dyeing cellulose derivs. In an example a fast yellow shade is obtained on cellulose acetate silk, the dye, 4-sulfobenzene-azo- α,γ -diketohydrindene, being used.

Dyeing. I. G. FARBENIND. A.-G. Swiss 126,823, Mar. 21, 1927. A yellow dye for mixed silk and wool is prep'd. by coupling diazotized *o*-anilinesulfonic acid 1-*p*-(carbethoxylamino)phenyl-3-methyl-5(4)-pyrazolone

Dyeing. I. G. FARBENIND. A.-G. Swiss 126,824, April 29, 1927. A light- and oil-fast green-yellow dye is prep'd. by coupling diazotized 4-chloro-2-nitroaniline with acetoacetic-*p*-chloroanilide.

Dyeing. I. G. FARBENIND. A.-G. Swiss 126,825, Mar. 18, 1927. A sulfurous indigo vat dye is prep'd. by condensing the monomethyl ether of 4-mercapto-1-hydroxynaphthalene with 5,7-dibromoisatin halide. In an alk. yellow hyposulfite vat, it dyes a greenish blue.

Dyeing apparatus with rollers and reversing mechanism. C. S. BEDFORD. Brit. 290,138, Dec. 31, 1927. Structural features

Dyeing of cellulose derivatives. GEORGE RIVAT, ERNEST CADGENE and CAMILLE DREYFUS (to Canadian Celanese, Ltd.). Can. 284,751, Nov. 13, 1928. Cellulose acetate is subjected to the action of a 50% soln. of FeCl_3 for approx. 1 hr. at 40 to 60°; the excess FeCl_3 soln. is removed; the acetate is washed with cold water contg. NH_3 ; and the washed material is then treated with the regular logwood black bath in soap for 1 hr. at approx. 70°.

Dyeing cellulose esters. HENRY DREYFUS. Fr. 640,013, Aug. 25, 1927. Cloth of or contg. cellulose acetate, etc., is dyed, printed or stenciled with sulfonated dyes, preferably monosulfonated, contg. 2 or more anthracene or anthraquinone rings, or contg. 1 or more condensed anthracene or anthraquinone rings. The dyeing is carried out in the presence of a high percentage of inorg. salts such as $(\text{NH}_4)_2\text{SO}_4$ or Glauber salt. A long list of substances is given, including 1,2'-dianthraquinonylaminesulfonic acid, 2,6-di- α -anthraquinonyldiaminoanthraquinonesulfonic acid and its 4,4'-dimethoxy deriv.

Dyeing cellulose esters and ethers, etc. I. G. FARBENIND. A.-G. Brit. 290,720, Feb. 16, 1927. Esters and ethers of cellulose and its conversion products such as hydrocellulose are dyed with the azo dyes obtained by coupling a diazotized dinitroaminophenol or substitution product or deriv. with an unsulfonated and uncarboxylated aminonaphthol. Brownish violet to black dyeings are obtained, fast to washing, the fastness of which is improved by diazotizing and developing on the fiber. Several examples are given.

Dyeing artificial silk. I. G. FARBENIND. A.-G. (Erich Fischer and Carl E. Muller, inventors). Ger. 468,981, July 30, 1926. Cellulose esters or ethers are dyed yellow with monosulfoarylazodiarylamine contg. at least 1 nitro group in the diarylamine complex. Examples are given of dyeing acetate silk with 4-benzeneazo-2,6-dinitro-4'-sulfodiphenylamine and 4-benzeneazo-4'-nitro-2'-sulfodiphenylamine. Cf. C. A. 22, 4834.

Apparatus for dyeing hats. VIKTOR BÖHM. Austrian 109,251, Sept. 15, 1927. Constructional details.

Apparatus for dyeing hats. BÖHM BROS. Austrian 108,518, Aug. 15, 1927. Constructional details.

Dyeing hats. ADOLF SINDERMAN. Austrian 108,691, Aug. 15, 1927. The hats

are placed on a cone carrying strips or other pieces of dye-impregnated felt arranged to give the required pattern.

Pattern printing of hats. BOSSI HUTFABRIKS A.-G. Austrian 108,519, Aug. 15, 1927. Printing precedes felting.

Textiles. OWEN D. LUCAS (to Vickers, Ltd.). Can. 285,211, Nov. 1928. Fibrous vegetable materials are boiled in a soln. of NaOH of a strength not exceeding 2% and with or without an intermediate washing they are then again boiled in a vat contg. a mixt. of oil and alkali in water. After washing with cold water they are placed in a cold acid bath to whiten them or to produce a finer fiber, or for both purposes. All the processes are carried out in open vats. *E. g.*, 100 lb. of scutched flax is boiled for approx. 1 hr. in a soln. contg. 30 lb. of NaOH to 300 gallons of water, then boiled for 15 min. in a similar soln. to which 3 lb. of linseed oil has been added. The flax is then washed in cold soft water. It is then immersed in a cold bath of 300 gal. of water contg. 6 lb. of HCl, then washed and dried again. The duration of each step varies according to the amt. of degumming necessary and fineness required in the finished fiber.

Treating fabrics in breadth with liquids, particularly dyeing liquids. JOHANNES P. SCHUSTER. Ger. 467,477, Oct. 28, 1926. The fabrics are passed through pressing rollers to remove air and, immediately after pressing, are sprayed on both sides with the treating liquid. They are then passed through the bath as usual.

Wetting agents for use in treating textiles. H. T. BÖHME A.-G. Brit. 290,256, May 11, 1927. Wetting agents suitable for use with mercerizing, carbonizing, bleaching or dyeing baths, etc., are prepd. by treating oils or fats or their free acids with concd. H_2SO_4 in the presence of org. or inorg. acid anhydrides or chlorides, org. acids or excess H_2SO_4 with cooling agents.

Treatment of vegetable fibers in the presence of organic derivatives of cellulose. CAMILLE DREYFUS, ROBERT G. DORT and HERBERT PLATT (to Camille Dreyfus). Can. 285,047, Nov. 20, 1928. Mixed fabrics of cellulose acetate, wool and vegetable fibers are treated with 6-13° Bé. soln. of $AlCl_3$ at 90° F., whereby the vegetable fibers are removed, the fabric is soaped to restore the luster of the cellulose acetate fibers, and the fabric is subsequently dyed in a dyebath contg. 50 to 300 g. of Na_2SO_4 per l. of dyebath to prevent the delustering of the cellulose acetate fibers.

Preserving the luster of organic derivatives of cellulose. CAMILLE DREYFUS and HERBERT PLATT (to Camille Dreyfus). Can. 285,048, Nov. 20, 1928. The luster of filaments and fabrics of org. esters of cellulose is preserved by adding to the bath in which delustering of such material is apt to occur 0.1-10% of $Ca(CNS)_2$.

Bleaching textile fibers with ozonized air. EMILIO CRESPI. Ger. 466,220, Feb. 12, 1925. The fibers are first given a mild acid treatment, *e. g.*, with dil. HCl, and are then treated at a low temp. with a stream of ozonized air laden with water vapor.

Mercerizing fabrics. C. G. HAUBOLD A.-G. Ger. 467,678, Nov. 29, 1925. The materials are treated in stages with lyes of increasing concn. at a diminishing temp.

Treating cellulose derivatives. HENRY DREYFUS. Fr. 32,978, Jan. 28, 1927. Addn to 627,072. Org. derivs. of cellulose are dyed, printed or stenciled with compds. (other than azo compds. and urea or thiourea derivs.) contg. one or more ω -amino groups, *i. e.*, compds. in which an aryl dye nucleus is connected to an amino group or aliphatically substituted amino group through a side chain comprising a C atom or atoms, with or without other atoms such as N or O. Such compds. may be produced by the reduction of nitrites or by treating a phenol or amine with an aminoalkyl halide or by treating amino compds. with an alkylenediamine in the presence of a sulfite. In examples 1-methylamino-4 aminomethylantraquinone dyes cellulose acetate red shades. The product obtained by condensing anthrapyrimidone with epichloramine dyes cellulose acetate in yellow shades. Other examples are given.

Apparatus, with rollers, for finishing fabrics by treatment with solutions, hot or cold air, steam, etc. H. MALY. Brit. 290,217, May 10, 1927.

Device for dyeing, steaming and conditioning tubular fabrics. MAURICE M. KASANOJ. U. S. 1,696,682, Dec. 25.

Apparatus for sizing, starching, dyeing or finishing yarns or fabrics. SLASHER ROLLS Co. Brit. 290,706, Jan. 22, 1927.

Emulsion. COMPAGNIE FRANÇAISE DE PRODUITS CHIMIQUES ET MATIÈRES COLORANTES. Swiss 126,796, Mar. 14, 1927. An aq. emulsion for *sizing textile fibers* is prepd. by first dissolving the substance to be emulsified in a hydrocarbon. Thus, *o*-dichlorobenzene, linseed oil and wax are mixed and then emulsified in water.

Treating textile fabrics to produce imitation fur. G. ROMANE. Brit. 290,650, May 19, 1927. Various mech. features, watering, dyeing, etc., are specified.

Fibers from skins of fishes, etc. R. TANDLER. Brit. 290,154, May 7, 1927.

Skins of fishes, intestines, bladders, etc., are softened, treated with milk of lime or with NaOH or Na_2SO_4 , as in tanning, pickled in a 20% soln. of NaCl, $\text{Al}_2(\text{SO}_4)_3$ or Na_2SO_4 to which 10% of H_2SO_4 or HCl is added, milled and mashed and then subjected to a 2-bath chromization and mechanically worked to obtain a fiber which may be formed into yarn, thread, felt, etc.

Protecting animal fibers from acids and alkalis. RONALD S. HORSFALL and LESLIE G. LAWRIE (to British Dyestuffs Corp., Ltd.). U. S. 1,693,926, Dec. 4. See Brit. 285,554 (C. A. 22, 4837).

Artificial yarns and threads. GUILLAUME LARDY (to Société pour la fabrication de la soie "Rhodiaseta"). U. S. 1,693,759, Dec. 4. A fugitive and temporary coloration is imparted to filaments and threads obtained by dry spinning of cellulose derivs. such as esters or ethers (suitably by "Carmine blue" or "Brilliant carmine") in order to serve as a distinguishing characteristic in various operations.

Deforming and drying cakes of artificial silk after washing, sulfiding or bleaching. COURTAULDS, LTD., C. F. TOPHAM, E. HAZELEY and E. A. MORTON. Brit. 290,833, May 23, 1927.

Treatment of acetate silk. CHARLES W. PALMER and STEPHEN M. FULTON (to Henry Dreyfus). Can. 285,049, Nov. 20, 1928. Delustered filaments or fibers of cellulose acetate can have the luster restored by treatment with a soln. of 1 to 5% concn. of one of the following agents $(\text{NH}_4)_2\text{SO}_4$, Na_2SO_4 , K_2SO_4 , $\text{Al}_2(\text{SO}_4)_3$, chromates of K, Na, NH_4 or Al, chlorides of NH_4 , Na, K and Ca and like neutral salts. *E. g.*, acetate silk in fabric or other form, which has become partially or entirely delustered, for instance by steaming for about 10 min., is boiled with a 2-3% soln. of $(\text{NH}_4)_2\text{SO}_4$ or a 1-6% soln. of Na_2SO_4 , whereby the relustering is gradually effected. The normal luster can be substantially restored by about 10-40 min. boiling or longer at lower temps. The goods may be rinsed in water to remove the salt after removal from the bath.

Treatment of cotton fibers. PAUL KARRER. Ger. 467,585, Dec. 16, 1925. Addn. to 438,324. The method of Ger. 438,324 (see Brit. 249,842, C. A. 21, 1019) is modified by effecting the treatment with NH_3 , etc., at ordinary temp. for a longer time.

Treating cotton and flax. MARTHA AUGUSTE SCHWEITZER. Ger. 468,974. Cotton or flax is improved by a short treatment of the disintegrated fibers with hot alkali and then a short treatment with an oxidizing agent, particularly hypochlorous acid in the cold.

Treating wool to prevent shrinking, etc. J. A. CRAVEN and YORKSHIRE DYEWARE & CHEMICAL Co., LTD. Brit. 290,805, April 23, 1927. Tendency of wool to shrink when washed with alk. soap solns. is diminished by treatment with basic salts of Cr, Fe or Al or with a weak and slightly alk. soln. of CH_2O . A preliminary treatment of the wool with an alkali such as lime water or a weak soln. of Na sulfide is desirable, and this may be followed by bating with a natural or artificial bate to remove the outer scales of the wool fiber. Numerous details and modifications are described.

Wool-like fibers from jute. P. CELLI. Brit. 290,071, July 21, 1927. Fibers of jute or similar material are carded and then treated with a 30° Bé. NaOH soln. at a temp. of 25-35°, and subsequently washed with soap, rinsed, bleached and dried.

Forming wool felts by use of air currents. EMIL BRECHT and RUDOLF FUGMANN. U. S. 1,694,032, Dec. 4.

Painting-ground for artists, etc. CHARLES F. CROSS, THE VISCOSE DEVELOPMENT Co., LTD. and WINSOR & NEWTON LTD. Fr. 640,064, Aug. 26, 1927. A painting-ground for artists, decorators and others is prepd. by filling and coating a cellulose textile material with cellulose, a part of which is introduced as such and a part as viscose which is then reverted to cellulose. Cf. C. A. 22, 4816.

Textile oils. AUSSEL M. KINNEY (to The Standard Oil Co.). Can. 284,807, Nov. 13, 1928. Ninety to 50% of a purified mineral oil of low viscosity (say 50 to 60 sec. Saybolt) is mixed with from 1 to 20% of oleic acid and from 1 to 50% of alkali metal soaps of the sulfonic acids derived for example by the treatment of mineral lubricating oils with strong sulfuric acid, such as fuming acid. With the resulting mixt. may be incorporated if desired, from 5 to 15% of lard oil. A predetd. mixt. may contain about 70% of 55 sec. Saybolt oil; 15% of oleic acid and 15% of Na soaps of sulfonic acids. Another suitable mixt. contains 82% of 55 sec. Saybolt oil; 3% of oleic acid; 10% of lard oil and 5% of Na soaps of sulfonic compds. The lard oil may be employed or omitted as desired.

"Dry lubrication" of textile machines. JOHN SPALDING (to Albert T. Otto & Sons). U. S. 1,694,148, Dec. 4. Bobbins and other parts of textile machines subject to contact with the textile product are lubricated with Zn stearate or other suitable metal salt of a fatty acid insol. in water, in dry powd. form.

Driving and conveying belts of woven fabric and rubber. SOC. ANON ÉTABLISSEMENTS FLINOIS, COLMANT ET CUVELIER, COLMANT ET CUVELIER SUCCESEURS. Brit. 289,828, May 3, 1927. Mech. or structural features.

Composition (containing chlorinated rubber) for coating straw hats. CARLETON ELLIS (to Chadeloid Chemical Co.). U. S. 1,695,639, Dec. 18. Chlorinated rubber contg. over 66.7% Cl is used with a solvent such as C_6H_6 and with oil-sol. orange dye or other suitable coloring material which is also sol. in the solvent used.

"Mothproofing" composition containing a quinidine salt and a soap. LLOYD E. JACKSON and HELEN E. WASSELL (to Mundatechnical Products Co.). U. S. 1,694,219, Dec. 4.

Apparatus for disposal or reconditioning of liquids used in laundry operations. A. STERN Brit. 290,247, May 11, 1927.

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

Testing paint films with the rusting apparatus. H. *Farben-Ztg.* 34, 614-5(1928).—The app. consists of 2 electrodes, one of Hg and the other of the metal upon which the film is prepd. These are immersed in water or suitable salt soln. and the cond. of the system is measured as time elapses. The system is enclosed in a gas-tight bell jar so that the partial pressure of O or other gas may be controlled. G. G. SWARD

Medical and industrial findings among spray painters and others in the automobile refinishing trade in Manhattan, Greater New York. JEROME MEYERS. Dept. of Health, New York City. *J. Ind. Hyg.* 10, 305-13(1928).—The results of phys. blood and urinary examinations among spray painters show that Pb and C_6H_6 have the most important effects. C_6H_6 is a vehicle or thinner. It causes a marked diminution in the leucocytes and polymorphonuclear cells and great reduction in the no. of red blood cells and the % of hemoglobin. Even 1:10,000 may be dangerous. Close medical observation and examns. are recommended in conjunction with improved ventilation, also elimination of C_6H_6 . H. C. HAMILTON

Black and the color circle. CURT KÜHN. *Farben-Ztg.* 34, 560-1(1928).—K. points out that many artists carry no black on their palettes but obtain the same by mixing other colors. Black results when 3 pigments sepd. by 120 on the color circle are mixed. G. G. SWARD

Measurement of specific gravity of varnishes, paints, etc. H. L. HAZELTINE. *Instruments* 1, 515-8(1928).—The use of the hydrometer with a range of 0.650 to 1.000 for detn. of sp. gr. of varnishes, etc., is discussed. A temp. correction of 0.0007 on the sp. gr. scale per degree is given for varnish. Sp. gr. should not be used as a means of comparing varnishes unless the solvent is the same in each case. C. Z. ROSECRANS

Some methods of testing paint and varnish materials. PERCY H. WALKER. *Intern. Congress Testing Materials* 1927, II, 603-24; cf. C. A. 22, 4838.—This is a review of the methods used at the Bur. of Standards. Brushing and flowing tests are made on a glass plate and the paint is allowed to dry in a vertical position and then examd. by transmitted light. Paints are also spun on a rotating clear glass disk. The Bruce method of detg. hiding power and the swinging beam method of detg. hardness of varnish films are used, though W. prefers the Pfund method of measuring the diam. of the circle of contact between the varnish and a small sphere. From the results of exposure tests W. recommends for these tests: small panels facing south and at an angle of 45° with the vertical, with backs and edges protected with 3 coats of Al paint. The panels are to receive 2 or 3 coats of the material to be tested and are best examd. with the microscope. The accelerated exposure procedure is described. PAUL J. CULHANE

The manufacture of clear nitrocellulose lacquers. FRITZ KOLKE. *Farben-Ztg.* 34, 561-3(1928).—K. recommends the following procedure: The resins are first dissolved in the non solvents. The nitrocellulose is then treated with this soln. until complete swelling has taken place. The solvents are then added. Plasticizers may be added at the beginning. If 2 types of nitrocellulose are used, the more viscous type should be swollen first. G. G. SWARD

Soligen-Trockenstoffe. MEIDERT. *Chem.-Ztg.* 52, 859-60(1928).—Soligen-Trockenstoffe is the trade name of a siccativ agent manufd. by the I. G. Farbenindustrie. It is an org. acid capable of incorporating a metallic cation in oils. Its drying properties are emphasized: 0.25% should be sufficient in some cases. Its properties on various types of finished works are enumerated. Its constitution is not revealed. A. L. H.

Metallic soaps (LAURO) 27. Cellulose esters [for making varnishes] (Brit. pat. 289,853) 23. Abietic acid esters of polyglycol [for use in varnishes] (U. S. pat. 1,696,337) 10. Ferric oxide [for use as a pigment] (Brit. pat. 290,421) 18. Nitrocellulose and other compositions for use as lacquers (U. S. pat. 1,693,746) 23. Colloidal solutions of silica [for stiffening or fireproofing pyroxylin lacquers] (Brit. pat. 290,717) 18.

HEATON, NOËL: **Outlines of Paint Technology.** LONDON: Charles Griffen & Co., Ltd. 387 pp. 24s., net. Reviewed in *Chem. Trade J.* 83, 303(1928).

Paint. HERBERT A. SCOLLAN Can. 285,136, Nov. 27, 1928. A paint comprises 1 pint of boiled linseed oil, 2 lb. of portland cement, a little turpentine or drier and a color pigment.

Water paints. W. W. TAYLOR. Brit. 290,700, Jan. 20, 1927. A water-paint or wood finish comprises a drying oil such as raw or boiled linseed oil or tung oil contg. free fatty acid, and an aq. soln. of a single or primary alginate or a mixt. of alginates such as those of Na, K, NH_4 or Mg, with or without pigments.

Waterproof teredo-repelling paint. FERNANDO S. VIVAS (to The International Fireproof Products Corp.). Can. 284,580, Nov. 6, 1928. A fireproof teredo-repellent paint contains sardine oil 450, fireproof drying oil 80, rosin 150, powd. sea shells 220, and ZnO 100 parts.

Fireproof paint. FERNANDO S. VIVAS (to The International Fireproof Products Corp.). Can. 284,576, Nov. 6, 1928. A fireproof paint contains drying oil 75, zinc white 40, PbSO_4 20, PbCO_3 20, SiO_2 or kaolin 10, borax 10, alum 10, H_3BO_3 5, Na tungstate 5, thinner (described in following pat.) 5 parts.

Thinner for paints. FERNANDO S. VIVAS (to the International Fireproof Products Corp.). Can. 284,577, Nov. 6, 1928. A thinner for paints contains "near turps" 40, turpentine 10, ZnSO_4 5, C_2Cl_6 1, drying oil 4 and CCl_4 40 parts. The oil is preferably linseed oil, but tung oil or other known paint oils may be used.

Fireproof structural paint. FERNANDO S. VIVAS (to The International Fireproof Products Corp.). Can. 284,578, Nov. 6, 1928. A fireproof structural paint contains fireproof Chinese wood oil or tung oil 3, ester gum 2, thinner (cf. preceding pat.) 1, ZnO 2, powd. SiO_2 1.5, Zn stearate 0.3, and coloring matter 0.2 parts.

Fireproof shellac. FERNANDO S. VIVAS (to The International Fireproof Products Corp.). Can. 284,579, Nov. 6, 1928. A fireproof shellac contains shellac 4, abs. alc. 2, borax 1, C_2Cl_6 0.05, and CCl_4 2.5 parts.

Fireproof varnish. FERNANDO S. VIVAS (to The International Fireproof Products Corp.). Can. 284,581, Nov. 6, 1928. A fireproof varnish contains drying oil 45, varnish gum 50, glycerol 5 parts, lime 1, $\text{Co}(\text{OAc})_2$ 1, $\text{Pb}(\text{OAc})_2$ 1, borax 15, H_3BO_3 8, Na tungstate 3, C_2Cl_6 2, and thinner 10 parts.

Preventing thickening of paints. I. G. FARBERIND. A.-G. Brit. 289,968, Feb. 7, 1927. The process described in Brit. 289,153 (*C. A.* 23, 721) of adding a free fatty acid to lithopone and linseed oil is applied also to paints contg. other Zn compds. such as Zn white, Zn yellow, lead yellow or cadmium yellow contg. Zn, Rinmans green, cobalt violet, "metal white" (ZnS), or other pigments.

White lead. HOLZVERKÖHLUNGS-INDUSTRIE A.-G. and J. SEIB. Brit. 290,844, June 9, 1927. White lead of approx. the same compn. as stack white lead is obtained by withdrawing the required quantity of CO_2 from a basic Pb carbonate prepd. in the wet way and contg. more CO_2 than stack white lead.

Lithopone. WALTER G. GRAVES (to the Grasselli Chemical Co.). Can. 284,567, Nov. 6, 1928. Green lithopone contg. usually about 40% water is fed continuously through a furnace where it is subjected to hot gases and dried. The lithopone is fed directly to the calcining chambers in a dry condition and without access of air. The muffles of the furnace are preferably kept under a plus pressure to prevent entrance of air from the outside.

Pigments. I. G. FARBERIND. A.-G. Swiss 126,125, April 30, 1926. Bright green pigments are obtained by the interaction of α -nitroso- β -naphthol, a salt of tetramethyldiaminotriphenylcarbinol, an Fe salt and an alk. compd. The reaction may be conducted in presence of a substrate and (or) of Turkey-red oil. In the example 1116 parts of a 15% paste of α -nitroso- β -naphthol is stirred till dissolved with 650 parts of bisulfite soln. of 38° Bé. and 3000 parts H_2O . The soln. is filtered, dild. with H_2O to 5000 parts and treated in turn with 48 parts FeSO_4 in 5% soln., 24 parts Turkey-red oil in 10% soln., 100 parts calcined Na_2CO_3 in 10% soln. and 40 parts Malachite Green B in 1% soln. A gradual addn. of 260 parts calcined Na_2CO_3 is then made and, after

pptn. of the pigment, 4 parts of a 4% paste of $\text{Al}(\text{OH})_3$ is added. The product is washed and dried.

Pigments: compounds of titanium, etc. JOSEPH BLUMENFELD. Fr. 640,181, Aug. 9, 1927. See Brit. 275,672 (C. A. 22, 2474).

Oiled pigments. HAROLD GROSSMAN (one-fourth to Wm. S. Pritchard). U. S. 1,696,034, Dec. 18. An emulsion is formed comprising an oil and a suitable protective colloid; this emulsion is added to a pigment and the colloid is coagulated to break the emulsion and release the oil.

Titanium phosphate. P. SPENCE & SONS, LTD., and S. F. W. CRUNDALL. Brit. 290,683, Nov. 17, 1926. Pptn. of hydrated basic titanic phosphate by mixing H_2PO_4 or a phosphate with a soln. of a titanic salt is effected with a soln. of the Ti salt contg. free acid in excess of the equiv. of 15% SO_3 . A composite pigment may be obtained by conducting the pptn. in the presence of a paste of BaSO_4 . Various details are given.

Titanium oxide from the phosphate. P. SPENCE & SONS, LTD., and S. F. W. CRUNDALL. Brit. 290,684, Nov. 17, 1926. TiO_2 or a mixt. contg. it, suitable for use as a pigment, is obtained from an insol. Ti phosphate such as basic Ti phosphate by treating the latter with a base such as an oxide or hydroxide or with a salt of a weak or volatile acid such as a carbonate. BaSO_4 and compds. of Fe and Cr may be used to obtain either white or colored pigments of composite character.

Coating composition. GILBERT MICHEL. Can. 285,118, Nov. 27, 1928. A coating composition for easily oxidizable metals is prepd. by adding a certain amt. of free phenol to a lac or varnish, and in particular to one having a base of synthetic resin prepd. by the usual means. The usual conditions of prepn. of the varnishes having a base of synthetic resin, from formol and a phenol (cresol, etc.), may be varied by allowing a sufficient excess of free phenol to remain for the metal to be attacked immediately when it is covered by the substance thus obtained.

Non-livering coating composition. JOHN D. MCBURNEY and EDGAR H. NOLLAU (to E. I. du Pont de Nemours and Co.). Can. 284,964, Nov. 20, 1928. A non-livering coating compn. contg. a drying oil and a preventive substance having a dissocn. const. substantially between 1.0 and 3.4 and compatible with the compn. with which it is to be used, for example tartaric, citric or malic acids, etc., the said substance being present in the proportion of from 0.1% upward, based on the total wt. of the compn.

Prevention of livering in pigmented carbohydrate compounds. JOHN D. MCBURNEY and EDGAR H. NOLLAU (to E. I. du Pont de Nemours and Co.). Can. 284,963, Nov. 20, 1928. A non-livering cellulose nitrate-bronze compn. comprising cellulose nitrate, solvent therefor, bronze powder and an acid of the group citric, malic, tartaric, the acid being from 2% upward, based on the total weight of the untreated compn.

Apparatus for making paints and varnishes. L. M. FRASER and W. S. SMITH. Brit. 290,707, Feb. 8, 1927. The constituents are entirely enclosed in a container while mixing, dispersing or dissolving them and are then forced (suitably by compressed air) through a filter to another container. Vapors are condensed and returned to the app. or prevented from escaping by use of liquid seals. Various details of app. and of the production of pigmented cellulosic lacquers are described.

Varnish containing chlorinated rubber. CARLETON ELLIS (to Chadeloid Chemical Co.). U. S. 1,695,638, Dec. 18. A varnish suitable for use on wood, metal or other surfaces comprises chlorinated rubber together with a drying oil such as tung oil and oilene, solvent naphtha or other suitable volatile solvent and thinner.

Varnish "reviver" containing chlorinated gutta percha. CARLETON ELLIS (to Chadeloid Chemical Co.). U. S. 1,695,642, Dec. 18. Chlorinated gutta percha is used with a resinous homogenizing agent such as rosin or fossil resins, together with C_6H_6 , CCl_4 or other suitable solvent and a phenolic phosphate such as cresyl phosphate.

Lacquer. CARL IMMERHEISER, ERNST KNEBEL and OTTO JORDAN (to I. G. Farbenind. A. G.). Can. 284,969, Nov. 20, 1928. A lacquer comprises a nitrocellulose plastic contg. a coloring matter insol. therein in a practically colloidal condition, a solvent of the type glycol monoalkyl ethers or their esters, or glycol dialkyl ethers, or mixts. of the same, and a diluent selected from the group consisting of benzene hydrocarbons, halogen derivs. thereof, aliphatic and hydroaromatic alcohols.

Lacquers. WILHELM PUNGS and KARL EISENMANN (to I. G. Farbenind. A.-G.). Can. 284,970, Nov. 20, 1928. Plastic masses and solns. thereof which comprise nitrocellulose, a condensation product of urea and formaldehyde, castor oil which has been treated with air at 170–180°, a resin, butyl acetate and butyl alcohol, have good properties of elasticity, adhesion and fastness to light and water.

Lacquers. CARBIDE and CARBON CHEMICALS CORP. Fr. 640,364, Sept. 1, 1927. A lacquer is prepd. by incorporating in a soln. of a cellulose ester, such as nitrocellulose,

a polymerized olefin such as a polymerized vinyl ester, *e. g.*, that obtained by the polymerization of a mixt. of vinyl chloride and vinyl acetate.

Coating composition containing chlorinated rubber. CARLETON ELLIS (to Chadeloid Chemical Co.). U. S. 1,695,640, Dec. 18. A compn. suitable for use on wood, metal or other surfaces and which yields a "flat" or dull finish comprises chlorinated rubber together with a smaller quantity of a drying oil such as boiled linseed oil and a volatile solvent, *e. g.*, toluene. Japan drier also may be added.

Reaction product of cashew-nut shell oil. MORTIMER T. HARVEY (to the Harvel Corporation). Can. 285,183, Nov. 27, 1928. A reaction product is obtained from 1 part by volume of cashew shell oil, 1 part nitric acid sp. gr. 1.42 and 1 part water. The reaction is strongly exothermic and is complete in a few minutes. The reaction product is a gum from which excess acid may be washed out. The I value of the reaction product is zero or very close to zero. The product may be dissolved in any vehicles such as amyl acetate, benzine, gasoline, turpentine, alcohol, naphtha or kerosene. It makes an excellent coating, which dries very quickly and which is useful for paints, varnishes, elec. insulation and molded ware of all kinds, and for impregnating paper and woven fabrics. Cf. C. A. 22, 1863.

Linoleum composition. ALFRED EISENSTEIN (one-half to Georg Schicht A.-G.). U. S. 1,693,917, Dec. 4. Liquid and solid constituents such as varnish, cork and resin are mixed together in a proportion in which the mixt. is pulverulent, subjected to oxidation at a temp. above 70° but below the temp. of carbonization. The temp. and pulverulent condition of the material are maintained during the treatment.

Resins. SCHERING-KAHLBAUM A.-G., ERICH FREUND and HANS JORDAN. Ger. 466,262, Sept. 20, 1928. Halogen addn. compds. of naphthalene, *e. g.*, naphthalene chlorides or dibromotetrahydronaphthalene, are heated below 215° alone or in a solvent with catalytically active metals or metallic compds. with the exception of Ag oxide, metallic halides and surface catalysts. The reaction mass is then heated to higher temps.

Bleaching resins. C. CORDES A.-G. and P. STUHLMANN. Brit. 289,859, May 4, 1927. Resins are dissolved in cold dil. alkalis and treated, while agitated, with bleaching agents, some of which may also serve as hardening agents such as chlorates, persalts, H_2O_2 , Na silicate, $NaHCO_3$, CH_3O or other aldehydes. $Al_2(SO_4)_3$ may be used to ppt. the bleached resin and substances such as Na silicate, casein or vegetable or animal glues may be admixed with the resin and bleached with it.

Resinous material. PAUL KNAPP. U. S. 1,696,490, Dec. 25. The distillate, such as is obtained in the distn. of corn cobs or other substances contg. pentosans and pentoses with inorg. acids, is treated with an amine such as aniline or methylamine in the presence of an acid, *e. g.*, HCl or HOAc, to form an insol. resinous material; the latter is sepd. from the large vol. of assoc. aq. liquid. The resinous product is suitable for use in varnishes or moldable compns.

Resinous and ligneous products. D. GARDNER. Brit. 289,774, April 30, 1927. Resinous plants and woods are steam treated, the resulting material (preferably in finely divided state) is treated with alkali to form a soap soln. in the presence of a reducing agent such as $NaHSO_3$ or Na hyposulfite, and the resinous material is pptd. from the soap soln. A colloid mill may be used in the treatment, and various details are given.

Phenolic resin composition. VICTOR H. TURKINGTON (to Bakelite Corp.). U. S. 1,695,566, Dec. 18. A varnish or impregnating compn. contains a reactive phenol-methylene resin, a volatile solvent such as alc. or acetone and a dialkyl ester of an org. acid, *e. g.*, dibutyl phthalate, which serves to facilitate obtainment of flexible products from which water is readily eliminated. Cf. C. A. 23, 722.

Phenolic condensation product suitable for impregnating wood, paper, cement, etc. LAWRENCE V. REDMAN and HAROLD C. CHEETHAM (to Bakelite Corp.). U. S. 1,693,939, Dec. 4. A potentially reactive phenolic resin, capable of setting free NH_3 during its transformation to the infusible state, is used with at least a sufficient quantity of furfural to combine with the liberated NH_3 .

Rosin. IRVIN W. HUMPHREY (to Hercules Powder Co.). Can. 284,987, Nov. 20, 1928. Low-grade rosin is mixed with gasoline and phenol, the temp. of the mixt. being reduced to a point (say 7°) at which the major portion of the phenol will be insol. in the gasoline. The mixt. is allowed to sep. into two layers, one of which is primarily phenol, water and extd. coloring matter with a small proportion of rosin, and the other is primarily gasoline and rosin with a small proportion of phenol. The layers are sepd. by any convenient method and the gasoline-rosin soln. is preferably washed with water and dil. aq. alkali soln. to remove the small amt. of phenol which it contains. The

purified rosin is recovered from the gasoline by distn. Any rosin in the phenol layer may be recovered by distn. as low-grade rosin, which may be dissolved in gasoline and extd. with phenol as above.

Rosin. IRVIN W. HUMPHREY (to Hercules Powder Co.). Can. 284,986, Nov. 20, 1928. Low-grade rosin is mixed with gasoline and aniline and heated to form a homogeneous soln.; then the temp. is reduced to 0° and the soln. allowed to sep. into the layers. The upper layer primarily contains gasoline and rosin with small quantity of aniline, and the lower layer contains aniline and extd. coloring matter and a little rosin. The layers are sepd. by any convenient method. The gasoline rosin soln. is washed with an acid soln. (H_2SO_4) to remove the small proportion of aniline or it may be recovered with the gasoline which is distd. off to recover the purified rosin. The sepd. aniline, with its small rosin content, may be treated with gasoline to ext. the rosin in a refined state, or the rosin may be recovered as low-grade rosin by distg. off the aniline. This rosin may be treated as above.

Rosin. IRVIN W. HUMPHREY (to Hercules Powder Co.). Can. 284,988, Nov. 20, 1928. Low-grade rosin is mixed with gasoline and ethylene chlorohydrin and agitated, the temp. of the gasoline being reduced to a point (say 8°) at which the major portion of the chlorohydrin will be insol. therein. The mixt. is allowed to sep. into two layers, the lower of which comprises primarily ethylene chlorohydrin and the coloring substances of the original rosin, and a little rosin, and the upper a gasoline-rosin soln. with a little chlorohydrin. The layers are sepd. by any convenient manner. The gasoline-rosin soln. is washed with water to eliminate any chlorohydrin, and the chlorohydrin layer is treated with gasoline to ext. any rosin. The gasoline rosin solns. are then distd. to remove the gasoline and to recover the purified rosin.

Rosin. HARRY E. KAISER and ROY S. HANCOCK (to The Hercules Powder Co.). Can. 284,983, Nov. 20, 1928. Wood rosin is dissolved in gasoline and furfural is added for the extrn. of coloring materials from the rosin. The gasoline-rosin soln. is heated to a temp. at which furfural will go into soln., and the temp. of the soln. is then reduced below $25^{\circ} F$. The furfural and extd. coloring material are sepd. from the soln. of gasoline and rosin, and the refined rosin is recovered from the said soln.

Rosin. HARRY E. KAISER and ROY S. HANCOCK (to Hercules Powder Co.). Can. 284,985, Nov. 20, 1928. Low-grade wood rosin is mixed with gasoline and furyl alc. and the mixt. heated to about $115^{\circ} F$. The soln. is then cooled to 60° , at which temp. more or less of the furyl alc. is thrown out of the soln. A soln. of gasoline and the major part of the rosin and some of the furyl alc. is sepd. from the remainder of the furyl alc. and a smaller quantity of rosin. Feryl alc. is added to the soln. and the temp. is reduced to a point below $25^{\circ} F$. A soln. of gasoline and the major part of the rosin with a smaller part of the furyl alc. is sepd. from the larger part of the furyl alc. and a minor part of the rosin, and the refined rosin is recovered from the soln. of gasoline-rosin.

Rosin. GEORGE M. NORMAN (to Hercules Powder Co.). Can. 284,984, Nov. 20, 1928. Low-grade rosin is mixed with gasoline, liquid SO_2 is added, and the mixt. agitated. The mixt. is then cooled to -10° and allowed to sep. into layers, one of which is primarily SO_2 and extd. coloring substances with a small proportion of rosin, and the other primarily gasoline and purified rosin with a small quantity of SO_2 . The layers are sepd. by any convenient method. The gasoline-rosin soln. may be washed with water, and the gasoline distd. off for the recovery of purified rosin. The SO_2 contains some rosin, which may be recovered as low-grade rosin by boiling off the SO_2 , and this low grade rosin may be refined as above. In the above operation a pressure suitable to prevent appreciable volatilization of the liquid SO_2 should be maintained.

Rosin and turpentine from wood. ABRAHAM A. SPIMER (to Hercules Powder Co.). U. S. 1,996,696, Dec. 25. In extg. resinous products from resinous wood and prep. a residue suitable for *paper pulp*, the wood is disintegrated and crushed to form thin flattened pieces without tearing and destroying the fiber; it may then be treated with steam and then with gasoline. An app. is described.

Hydrophobe resins. KURT RIPPER (to Kunsthartzfabrik Fritz Pollak G. m. b. H.). Can. 284,790, Nov. 13, 1928. A neutral or slightly alk. mixt. of 1500 parts of urea and 4000 parts of a soln. contg. 37.6% CH_3O is heated for a short time in a boiler provided with a reflux condenser; 2 parts of HCO_2H is added and 300 parts of thiourea is introduced into the mixt. by portions, and the heating of the mixt. is continued for about 1 to 1.5 hrs. Then about 2 parts of a fixed alkali is added and the mass allowed to cool. After a short time a white resinous product will begin to be pptd. This product remains unaltered for an extended period of time. For the purpose of perfecting the pptn., preferably 2000 parts of water may be added and well mixed with the resin. The purified

resin can be utilized for making lacquers or hard artificial masses. Instead of 300 parts of thiourea, 200 parts of phenol may be added and the operation be continued as above. In this way a soft, kneadable resin is generated which may be utilized for making glass, clear, transparent artificial masses. Instead of 300 parts of thiourea, 230 parts of urea may be added. The final product obtained therefrom resembles milk glass.

Synthetic resins. C. E. BURKE and H. H. HOPKINS (to Nobel Industries, Ltd.). Brit. 289,794, April 28, 1927. See U. S. 1,667,189 (C. A. 22, 2071).

Synthetic resins. R. ARNOT. Brit. 290,327, Jan. 15, 1927. An aldehyde such as CH_2O is condensed with at least one org. compd. contg. an NH_2 group (in which one or both H atoms may be substituted) and with at least one other org. compd. such as an org. acid or salt, a phenol or a naphthol. At least 5% of the total is used of each reagent. Examples are given of the use of urea, thiourea and substitution derivs., salicylic acid, *o*- and *p*-toluidine, PhNH_2 , β -naphthol, α - and β -naphthylamine, benzidine, gallic acid, cresol and similar compds. in various combinations. In some cases, albumin or the like may be added to the product to form an adhesive mixt. Numerous details and modifications are described.

Treating paper or other fibrous material to permeate it with synthetic resin. ARTHUR L. BROWN (to Westinghouse Elec. & Mfg. Co.). U. S. 1,695,912, Dec. 18. Fibrous material such as paper or asbestos is treated with a catalytic agent such as $(\text{CH}_3)_6\text{N}_4$ and then impregnated with a mixt. comprising a condensation product of CH_2O and cresol or other suitable phenolic substance and a polymerizable oil, e. g., China wood oil, and heated (suitably at a temp. of about 100°) in order to form a material which may be rendered insol. by further heating.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Progress of the chemistry and industry of fat. II. DUBOVITZ. *Chem. Rundschau* (Budapest) 5, 25-7, 33-6(1928).

The methods of investigation and identification of fats and fat mixtures. B. LUSTIG AND G. BOTSTIBER. Chem.-pathol. Lab. der Rudolfstiftung, Wien. *Biochem. Z.* 202, 81-90(1928).—The application of physical methods of analysis (microscopy, ultra-violet investigation) to fats is discussed.

Fat determination in cacao products. A. HEIDUSCHKA AND F. MUTH. Tech. Hochschule, Dresden. *Chem.-Ztg.* 52, 879(1928).—By means of a Schott glass filtering crucible which carries a cover and a small stirring spatula and which can be placed on a sugar funnel, in turn mounted on a 250-cc. distg. flask a complete analysis of cacao products can be rapidly made, including H_2O , fat, crude fiber and starch, the fat detn. requiring only 1.5-2.5 hrs. with 3-20 g. of the sample. The app. is intended for factory control.

The luminescence of oils and fats. A. VAN RAALTE. *Chem. Weekblad* 25, 544-6(1928).—Treatment of rape oil with 50% H_2SO_4 causes luminescence; heating and filtration of linseed oil does likewise; apparently some substance which inhibits luminescence is removed during these refining processes. With the exception of coconut oil, which also luminesces in the crude state, it was found that for butter, lard, sheep fat, horse fat, etc., H_2SO_4 treatment induced luminescence; decolorization with norite had no effect; treatment with fuller's earth also gave luminescence. The anti-luminescent agent is assumed to be a sterol, it can be pptd. by digitonin. In many respects the substance gives reactions attributed to vitamins.

The fluorescence of oils and fats. J. P. CARRIÈRE. *Chem. Weekblad* 25, 632-4(1928).—A. van Raalte (preceding abstract) states that only refined oils are fluorescent. This is incorrect. All oils and fats are fluorescent. Some oils show a greater absorption of ultra-violet light than others. If the former are viewed too far below the illuminated surface, the fluorescence is not apparent. A correct observation must be made close to the illuminated surface. The more absorbent the oil is, the more the fluorescence will be concd. just below the surface.

The fluorescence of oils and fats. A. VAN RAALTE. *Chem. Weekblad* 25, 650(1928); cf. preceding abstract.—van Raalte describes his technic, which consists in observing a thin layer of the oil by transmission as well as by reflection in a horizontal beam of ultra-violet light.

Spontaneous heating of oils. NORMAN J. THOMPSON. *Oil and Fat Ind.* 5, 317-26(1928).—The testing method which gives the most significant results requires the main-

nance of small temp. diff. between the sample and its surroundings. It is expensive to maintain this diff. automatically; and if the regulation is secured manually, the method is laborious. The original Mackey method is not suitable, except to show the hazard of very dangerous oils. By increasing the size of the sample to 30 g., using lean cotton waste carrying an equal wt. of oil, more significant results were obtained with no more attention, though the test time was longer. In testing oils for their tendency to heat spontaneously, it is necessary to take into account the conditions under which the oil may be used. Even a pure castor oil will heat spontaneously to ignition temp. under favorable conditions. In testing unknown samples, the spontaneous heating test should always be made in conjunction with a chem. analysis to det. the presence of agents which serve only to delay oxidation but which may not affect the final result.

E. SCHERUBEL

Olive-oil analytical method. SIDNEY MUSER. *Oil and Fat Ind.* 5, 356-7(1928).—The use of the ultra-violet ray in the detection of refined in virgin olive oil is deemed acceptable because in no less than 10 exptl. labs. where this work has been carried on, the test was shown accurate in every case. Mixts. of refined and virgin oils placed with the Bureau of Standards showed no change in fluorescence. A bibliography is given.

E. SCHERUBEL

Hydrogenation of soy-bean oil. AUGUSTUS H. GILL AND YU M. MA. *Oil and Fat Ind.* 5, 348-51(1928).—An increase of temp., pressure, agitation or amt. of catalyst will increase the hydrogenation rate. In high agitation at 320 r. p. m. or above the change of 10° in temp. between 150° and 180° produces little or no effect. The hydrogenation rate is approx. proportional to the pressure, amt. of catalyst and the speed of agitation. No more than 1% of catalyst is necessary. The course of the reactions of hydrogenation of soy-bean oil is the same as with cottonseed oil. The complete hydrogenation of soy-bean oil, can be a reality; a fat m. 40° was obtained in 1.5 hrs.

E. SCHERUBEL

New method of research and the determination of peanut oil in olive oil. E. JAFFE. *Reale Ist. Com. Gabinetto di Merceologia, Genova. Ann. chim. applicata* 18, 368-86 (1928). The new method for detecting the presence of peanut oil in olive oil depends upon the different solubilities of the Li salts of fatty acids in EtOH. Data in the literature (*cf. Arch. Pharm.* 1903, 552; *Z. angew. Chem.* 1904, 482; *Z. Unters. Nahr- u. Genuss.* 1904, 129) were confirmed and amplified by further expts. of J., which show that the *Li soaps of pure peanut oil and of mixts. of this oil with olive oil* ppt. from their alc. solns. at higher temps. than the Li soaps of pure olive oil, this temp. differential being directly proportional to the quantity of peanut oil present. The fatty acids obtained by decomposition of the Li soaps sepg. at 17-18° ppt. from 90% EtOH only if arachic acid is present, and this temp. of pptn. is proportional to the quantity of peanut oil in the olive oil. From the solid fatty acids sepd. from 90% EtOH can be obtained a crude arachic acid, which m. 72.5-73°. Though the method does not permit the quant. sepn. of crude arachic acid, it is sufficiently precise for industrial analysis, for the lowest proportions of peanut oil ordinarily used for adulteration, e. g., 5%, can be identified as reliably as by the Tortelli-Ruggeri method, considered to be the most precise. The new method offers the advantage of greater ease of manipulation and great rapidity, the procedure requiring not over 2 hrs. **Procedure.**—Add 50 cc. of KOH soln. (90 g. KOH, 62 cc. water, 1000 cc. 95% EtOH) to 10 cc. of oil, reflux until completely saponified, neutralize with 12% aq. AcOH (phenolphthalein), bring to boiling, add 100 cc. of 15% alc. LiCl (in 70% EtOH), put into a water bath at 15-16° and observe the temp. at which crystals first sep. Then cool to 17-18°, filter (suction), wash with 70% EtOH (5 portions of 10 cc. each), transfer the ppt. to a separatory funnel, decomp. the soaps with 50 cc. of HCl (d. 1.10), cooling to aid the sepn. of fatty acids, at 25-30° add 50 cc. of C₆H₆ or petr. ether, agitate violently, sep. the aq. layer, wash with 30 cc. of HCl and then repeatedly with water (50 cc. each time) until neutral, filter the fatty acids, distil off the remaining solvent, add 30 cc. of 90% EtOH and 2 drops of 0.5 N HCl, heat to 60° until a clear soln. is obtained, and cool, observing the sepn. With pure olive oil, the soln. remains practically clear down to 12°. With oil contg. 5% peanut oil, minute crystals appear at 15-16°, the whole liquid becomes turbid and after 0.5 hr. there is considerable deposition. With pure olive oil the liquid is still clear even after 1 month at 15°. To confirm the presence of arachic acid, add 10 cc. of 90% EtOH, dissolve by heating, and cool again. In this case after some hrs. at 13-14° only minute white crystals sep., leaving a clear supernatant liquid. For further confirmation, keep the mixt. for 2 hrs. at 15-16°, filter, wash 3 times with 10 cc. of 90% EtOH, then repeatedly with 70% EtOH, dissolve the residue in boiling 90% EtOH (10-30 cc.), allow to crystallize again, filter, wash as before and dry at 100°. The m. p. should be 72.5-73°. The

following data give the % peanut oil added to pure olive oil and the corresponding temp. of pptn. of the Li salts of the fatty acids and the temp. of crystn. of crude arachic acid from 90% EtOH, resp. 0, 24-6°; —; 5, 25-6°, 15-16°; 10, 26-8°, 17-18°; 20, 29-31°; 21-2°; 30, 32-4°, 25-7°; 40, 36-8°, 29-31°; 50, 41-3°, 33-5°; pure peanut oil, 56-7, 40-3°.

C. C. DAVIS

Basic variations in soy-bean oil from various origins. J. F. CARRIÈRE. *Chem. Weekblad* 25, 630-2(1928).—Detns. are made of d., fluorescence, % unsapon. and I number on samples of extd. and pressed soy-bean oil from Manchuria, Germany and Holland. Pressed oil from Manchuria is lower in d., higher in unsapon. materials, and shows a violet-blue fluorescence. These 2 last properties are due to the presence of about 0.4% unsapon. impurities.

G. CALINGAERT

Analysis of Staphylea oil. A. FERENCZ AND GY. CSERESZNYÁS. *Magyar. Gyógyszerésztud. Társaság Értesítője* 4, 24-9(1928).—*Staphylea* oil has $d_{15} = 0.9355$, $n_D^{25} = 1.47165$, acidity 2.00, sapon. no. 190.28, iodine no. 108.34, Hehner-no. 95.51, Reichert-Meissl no. 2.64, Polenske no. 0.50. Of the acids 90.30% are unsatd. These acids are 94% oleic acid, 5.50% linoleic acid and 0.50% linolenic acid.

S. S. DE FINÁLY

False cola nuts. D. VAN OS AND Y. VAN DER WAL. Univ. Groningen. *Pharm. Weekblad* 65, 1266-71(1928).—A shipment of alleged cola nuts consisted of shea nuts (*Bassia parkii*), which resembled cola nuts in appearance but differed from these mainly in their high fat content and total absence of caffeine. The fat gave the following const.: m. p. 36°, sp. gr. 0.912, n_D^{20} 1.4633, I no. 66, sapon. 198, acid no. 34. Shea nuts have not previously been reported in the literature as adulterants of cola nuts.

A. W. DOX

Thermal analysis of beeswax. J. STITZ. *Magyar Chem. Folyóirat* 34, 18-22 (1928).—The adulteration of beeswax can be easily ascertained by detg. its fusing point. The method of Elser (*Arch. f. Bienenkunde* 8, 177 (1927)) has been simplified. The mixt. is divided into 3 fractions by means of cotton filters, and the fusing points of these fractions are detd. An adulteration greatly changes the fusing point of pure beeswax. On the basis of a series of expts. a practical table has been made, showing fusing points of beeswax adulterated by other waxes, so that percent compn. can be detd.

S. S. DE FINÁLY

Metallic soaps. M. F. LAURO. *Oil and Fat Ind.* 5, 329-32(1928).—The uses of metallic soaps as driers, in pharmacy, in dry cleaning, as emulsifiers and their presence in oils are discussed.

E. SCHERUBEL

Soaps from organic bases. A revolutionary development in the art of organic synthesis. R. B. TRUSLER. *Oil and Fat Ind.* 5, 338-47(1928).—Soaps have been made from fatty acids and org. bases contg. N. The soap-forming bases are alkyl- and arylamines. Alkylamines have been especially considered; and among them hydroxy-alkylamines known as the ethanolamines have outstanding importance. Among the prospective uses are the following: They are excellent emulsifiers for vegetable, animal and mineral oils. They are thickeners for lubricating oils. Incorporated in special compns., they have detergent and cleaning utility. The oleates are efficient dry-cleaning soaps in consequence of their soly. in org. solvents and their sp. detergent action. Their great soly. in almost all liquids will lead to other applications.

E. SCHERUBEL

Determination of the turbidity temperature of textile soaps. W. HERBIG. *Seifensieder-Ztg.* 55, 368-9(1928).—An answer to criticisms by Heilingötter (*Z. ges. Textil ind.* 1928, 565) and Welter (*C. A.* 22, 4851). While it is desirable that all soaps should yield a clear soln. in distd. H₂O, it should be permissible first to filter a soap soln. that is not clear. W.'s explanation that dissolved CO₂ caused a diff. of 10° in the turbidity point of an olive-oil soap, is untenable, since H₂O does not dissolve enough CO₂ to cause any turbidity in a soap soln. as verified by H.'s expts. However, if CO₂ gas is passed into a soap soln., such turbidity does appear. In H.'s opinion the observed differences are probably due to variation in the sampling. A. WELTER. *Ibid* 391-3.—Distd. H₂O which shows absence of Ca and SO₄ by (NH₄)₂C₂O₄ or BaCl₂ may still cause a turbidity in a soap soln., the latter being a more sensitive reagent. W.'s remarks refer mainly to olive-oil soaps used in the silk industry. There should be only 2-3° diff. in the turbidity point of a sample when compared with that of a soap soln. of equal concn. made by neutralizing the liberated fatty acids of the sample; any greater diff. is due to the presence of Ca or Mg in the sample. The present standard for the turbidity point has been lowered to 18-27°, accomplished by proper soap boiling technic and the use of appropriate app. To filter off any turbidity in the soap soln. would nullify the object of the test. The usual soap concn. for the test is 0.2-0.7%. Presence of CO₂ influences the turbidity test considerably; hence the H₂O should be boiled. It

is best to test the distd. H_2O by running a blank test with a soap of known purity. O. E. STEUER. *Ibid* 398.—Comments. P. ESCHER

Alkali determination in soaps. C. BERGELL. *Seifensieder-Ztg.* 55, 327-8(1928).—From expts. B. concludes that anhyd. Na_2SO_4 withdraws from alc. KOH not only H_2O but also considerable alkali, causing erroneous results in the detn. of free alkali in soft soaps. To overcome this, 5 g. of the sample is dissolved in 50 cc. neutral amyl alc. with heat and after cooling is shaken out with 30 cc. neutral 20% NaCl soln. and titration finished as usual. *Ibid* 338-9.—Brine will remove practically all NaOH from a NaOH soln. in amyl alc. Soaps lose much of their free alkali in storage because the slow evapn. of H_2O brings the caustic to the surface where CO_2 gradually neutralizes it. Hot alc. dissolves more Na_2CO_3 than cold and thus the phenolphthalein color diminishes slowly on cooling. P. ESCHER

Utilization of the results of analysis with thiocyanate. M. DIRTMER. *Seifensieder-Ztg.* 55, 337-8(1928).—An answer to Kaufmann's reply to D.'s criticism (C. A. 22, 2476, 4845). P. ESCHER

Glycerol analysis by the International Standard method of 1911. W. PRAGER. Darmstadt, Chem. Testing Station for the trades. *Chem.-Ztg.* 52, 903-4(1928).—Supplement No. 1 of the I. S. M. demands a standardization of the acetin method by means of c. p. glycerol, contg. 9-10% H_2O , furnished by Baird, Tatlock, Ltd. Glycerol of this strength is hygroscopic and there is no good method available for the estn. of its H_2O . It is suggested to use a weaker glycerol as a standard. Another source of error is the CO_2 liberated from contaminated NaOH soln. during neutralization, $\frac{1}{2}$ of the CO_2 remaining dissolved, causing wrong values. A $BaCl_2$ treatment of the NaOH would remedy it. P. ESCHER

The lauric acid content of coconut and palm-kernel oils as a means of detecting these oils in food fat mixtures (GROSSFELD) 12. Detoxicated cottonseed meal (MENAUL) 12. Use of marine animal oils as motor fuels (MARCELET) 21. The glycerides of lauric and myristic acids (BOMER, EBACH) 10. The formation of gels. Vulcanized oils (KNIGHT, STAMBERGER) 2. MELLBOTT, P. B., AND STANISLAUS, I. V. STANLEY: **American Soap Maker's Guide.** A treatise on the art and science of the manuf. of soap, candles and allied toilet preps. New York: Henry Carey Baird & Co., Inc. 750 pp. \$10. Reviewed in *Chemicals* 30, No. 27, 23(1928).

Apparatus for the extraction of water, oil and fatty substances from fish, offal, seeds or other materials by use of solvents. JOHN R. STERLING. U. S. 1,694,361, Dec. 4

Fat extractor. DR. ALEXANDER WACKER GESELLSCHAFT FÜR ELEKTROCHEMISCHE INDUSTRIE G. M. B. H. Ger. 468,772, Apr. 22, 1927. In the extn. of fat or purification by means of an org. solvent, the lower opening of the tube by which the solvent ascends when heated to the wash vessel is so placed that the heating vessel always remains covered with liquid.

Sulfo-fatty-aromatic acids. G. PETROV. Brit. 289,934, Feb. 1, 1927. Fatty acids such as stearic or palmitic are mixed with hydrocarbons such as C_6H_6 or toluene or xylene and the mxt. is treated with fuming H_2SO_4 . The products may be used for hydrolyzing fats, producing emulsions, solid soaps, soap powders and for washing fabrics in the textile industries.

Refining fats and oils. K. F. WILHELM. Brit. 289,801, May 22, 1927. In purifying oils and fats by use of alc. or other suitable solvent which is miscible with water and which dissolves fatty acids, resins and bitter and mucilaginous substances but does not readily dissolve neutral fats, with the addn. of water and NH_3 as described in Brit. 226,767 (C. A. 19, 2140), there is also added a fat solvent such as C_6H_6 or CH_2Cl_2 or trichloroethylene and Na_2SO_4 .

Clarifying and decolorizing vegetable oils. HAROLD E. BIERCE. U. S. 1,696,338, Dec. 25. Substantially neutral vegetable oils such as cottonseed oil are treated with

sufficient alk. soln. such as NaOH to render the oil slightly alk. and then, before removal of the alkali and its reaction products, the oil is treated with an adsorbent earth.

Soap. ÉMILE SAVY. Fr. 640,132, Feb. 8, 1927. Before passing to the machine for pressing it into cylinders, soap is passed through an air drier to form a crust.

Granulated or powdered soap. GEORGE F. DAWES (to F. F. Mason, to The Proctor and Gamble Co.). Can. 285,108, Nov. 27, 1928. To produce granulated or powd. soap, common white laundry soap is soaked in water until it is thoroughly permeated with moisture, and then heated to 350–400° F. at atm. pressure in a vessel or drying chamber. The water vapor or steam escaping causes the soap to swell up so that it is left in an extremely light, porous and spongy condition. This mass may be reduced to a powd. by rolling or kneading or crumbling the soap.

Apparatus for making soap with extraction of glycerol. AUGUSTE C. BERTRAND. Fr. 640,339, Sept. 1, 1927.

Cleaning composition. ALBERT ROBERTS. Can. 284,716, Nov. 13, 1928. A cleaning compn. comprises pure soap powder 100 lb., Na_2SiO_3 50 lb. and commercial borax 50 lb. The compn. is used by dissolving 3 oz. of the mixt. in a gallon of water and brushing the soln. on the article to be cleaned.

Cleansing compositions. SIEGFRIED ZIMMERMANN and FIRMA "HENRY," SEIFEN-, KERZEN- UND FETT-WARENFABRIK G. M. B. H. Austrian 109,404, Dec. 15, 1927. Cleansing compns. comprising soap and a solvent for fat are improved by addn. of small amts. of PrOH or iso-PrOH .

Germicidal cleaning composition. JAMES J. GOODWIN (to Goodwin Laboratories). U. S. 1,696,762, Dec. 25. A compn. for making aq. solns. suitable for washing glassware comprises a mixt. of soap including salts of the fatty acids of coconut and palm nut oils and Na_3PO_4 .

28—SUGAR, STARCH AND GUMS

F. W. ZERBAN

The Indian sugar industry. JAMES MACKENNA. *J. Roy. Soc. Arts* 77, 240–58 (1928). E. H.

Extraction of sugar and potassium salts contained in molasses. T. GASPAR Y ARNAL. *Anales soc. españ. fis. quim. (Técnica)* 26, 73–80(1928); cf. *C. A.* 22, 4001.—The K in beet molasses is pptd. by adding 20% of $\text{Ca}_2\text{Fe}(\text{CN})_6 \cdot 12\text{H}_2\text{O}$ on wt. of molasses, and heating to 70° for 0.5 hr. The ferrocyanide is used in a soln. of 40% concn. The ppt. of $\text{K}_2\text{CaFe}(\text{CN})_6$ is filtered off, and the sugar in the filtrate recovered by the usual methods. The yield is about 64% of the sugar in the original molasses. The final mother liquors from the sugar crystn. may be utilized for the isolation of valuable non-sugars contained in them. The ppt. of $\text{K}_2\text{CaFe}(\text{CN})_6$ is treated with $\text{Fe}_2(\text{SO}_4)_3$, yielding a ppt. of Prussian blue plus CaSO_4 and a soln. of K_2SO_4 with some CaSO_4 and excess $\text{Fe}_2(\text{SO}_4)_3$. This soln. may be dried and sold as a fertilizer, or worked up into high-grade K salts. The Prussian blue is decompd. by heating gently with milk of lime. The ppt. of $\text{Fe}(\text{OH})_3$ is filtered off, and again converted into $\text{Fe}_2(\text{SO}_4)_3$ to be used over again. The soln. of $\text{Ca}_2\text{Fe}(\text{CN})_6$, with a slight excess of $\text{Ca}(\text{OH})_2$, is concd. and used again for pptg. K salts. If necessary, the excess $\text{Ca}(\text{OH})_2$ may first be removed by treatment with CO_2 . The only chemicals not recovered are $\text{Ca}(\text{OH})_2$ and H_2SO_4 , and only the operating loss of the others has to be replaced. "The process is simple and very economical, since the equipment is very elementary and the recovery reactions are such as have long been regarded as quant." No data are given on actual factory operation. F. W. ZERBAN

The (cane) disease suspected to be "pokkahboeng" (in Mauritius). H. F. S. SHEPHERD. *Rev. agr. Maurice* 5, 207(1928).—A disease closely resembling "pokkahboeng," if not identical with it, has been observed in Mauritius since 1915. It does not cause serious losses there. F. W. ZERBAN

"Pokkahboeng" of sugar cane. G. ORIAN. *Rev. agr. Maurice* 5, 208–13(1928); cf. preceding abstr.—A detailed description of the symptoms of the disease, with numerous drawings. F. W. ZERBAN

Disruption of the corn starch granule and its relation to the constituent amyloses. T. C. TAYLOR AND C. O. BECKMANN. Columbia Univ. *J. Am. Chem. Soc.* 51, 294–302(1929).—The α - to β -amylose ratio in corn starch as previously detd. by T. and Iddles (*C. A.* 20, 2918) is not dependent upon the method of treatment. Complete rupture of the starch granule may be accomplished also by grinding. The product of this method yields amyloses of high purity. Additional proof is offered that the

viscosity of a starch paste is directly connected with the no. of swollen granules (gelatinized) in that paste. The structure of starch paste is discussed; its characteristic properties in the case of corn are functions more of the phys. nature of the starch granules than of the chem. nature of the amyloses. Before a sepn. of the constituent amyloses in corn starch can be made, all of the granules must be ruptured. This is evidenced by a drop in the viscosity of the pastes. Any attempt at sepn. before this point results in too high results in insol. material. Although a few granules rupture easily, most of them do so only with great difficulty when a paste is made in the ordinary way.

The electroosmotic phenomena applied in the tanning industry. BEPPE BOCCA. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 6, 352-7(1928).—A short survey of electroosmosis is given and its application in the tanning industry is explained. The processes of Worms and Balé (Rémy), of von Kowalsky and of Schwerin are described in detail. G. SCHWOCH

Researches on one-bath tanning: the tannin "Alfa C" in the tanning of sole leather. VITTORIO CASABURI. *Staz. sper. Napoli. Boll. ufficiale staz. sper. ind. pelli mat. concianti* 6, 277-302(1928); cf. *C. A.* 22, 2484, 3800.—C. stresses the advantage of one-bath tanning, which process is still more efficient when the synthetic tannin Alfa C is employed. Alfa C is obtained by interaction of alk. cellulose liquors with aromatic sul-

fonic acids. The product thus prep'd. is sol. in H_2O . In a long series of expts. it was revealed that by substituting sulfite cellulose liquor for the alk. liquor, or by adding the alk. liquor to a com. synthetic tannin, the tanning properties of these mixts. are inferior to those of Alfa C. It was also demonstrated that Alfa C is not a mixt., but a definite chem. comp'd.

G. SCHWOCH

The synthetic tannin "Alfa". ENRICO SIMONCINI. Staz. sper. ind. pelli mat. concianti, Napoli. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 6, 337-51(1928); cf. preceding abstr.—After reviewing history, theory and application in practice of the so-called "synthetic tannins," which can only be used in combination with natural tannins, S. discusses the properties, prepn. and use of Alfa, which is really the only synthetic tannin, because it is capable of producing true leather even when employed alone. In practice, however, it is of advantage to combine it (10%) with chestnut ext. (90%); this mixt. has excellent tanning properties equal, at least, to those of a mixt. of chestnut (70%) and quebracho ext. (30%). Alfa is a reddish brown liquid of 23-4° Bé. and p_H 4.0. It contains, in the av., 23.00% tanning substances, 11.05% non-tannins, 0.00% non-sol. substances, 65.95% H_2O and traces of free H_2SO_4 . It ppts. gelatin and alkaloïds and gives a greenish color with Fe salts. It gives the lignin reaction and therefore ppts. with $PhNH_2 \cdot HCl$. It fluoresces strongly when irradiated with a quartz lamp. Acids have no effect on it, while with alkalies, its color is turned to deep brown. The structure of Alfa is unknown; however, it is shown to be a definite comp'd. formed by the reaction of a sulfonic acid with lignone.

Imitation patent leather (U. S. pat. 1,694,258) 30. Sulfonic acids (in the leather industry) (Fr. pat. 640,617) 10.

SAUER, E.: *Leim and Gelatine*. Dresden and Leipzig: Theodor Steinkopff. 54 pp. Reviewed in *Chem. News* 135, 290(1927); *Chimie et industrie* 20, 400(1928).

Tanning. FRIEDRICH POSPIECH. Can. 285,055, Nov. 20, 1928. Vegetable tanning is accelerated and improved by adding to the tanning liquor sulfonic acids, which are obtained by condensing naphthalene or ring substitution products of naphthalene, or the corresponding sulfonic acids in the presence of condensation or oxidation agents with alcs. of the aliphatic series having more than 2 C atoms.

Tanning emulsions. RÖHM & HAAS AKTIENGESellschaft. Fr. 640,349, Sept. 1, 1927. Freshly pptd. metallic hydrates such as damp $Al(OH)_3$ are used for emulsifying fats or oils used in tanning. Urea may also be added.

Synthetic tanning composition. CLARENCE J. HERRLY and ARTHUR M. MATHESON (to Niacet Chemicals Corp.). U. S. 1,695,655, Dec. 18. A monohydroxy-phenolic comp'd. (such as $PhOH$ or cresols) is condensed with an aldehyde such as paraldehyde or AcH at a temp. of 40-65° in the presence of a small quantity of a condensing agent such as H_2SO_4 and the condensed material is added to an excess of H_2SO_4 at about the same temp. to form a sol. product.

Tanning substances. I. G. FARBENIND. A.-G. Fr. 640,224, Aug. 29, 1927. New tanning substances are prep'd. by condensing with S in the presence of alkalies the products which result from the condensation of phenol, its homologs or derivs. with CH_2O and sulfites. Thus, the condensation product obtained by heating *p*-chlorophenol, CH_2O and Na_2SO_3 is heated with S till no more H_2S is evolved.

Tanning and mordanting pelts in one operation. I. G. FARBENIND. A.-G. Ger. 466,107, Feb. 20, 1927. The defleshed pelts are treated with tanning solns. to which suitable mordant salts have been added, so that the dyeing of the hair can follow immediately after the tanning of the skin. In a typical example, rabbit pelts are treated in a bath contg. specified quantities of $CuSO_4$, Cr alum, H_2SO_4 , $NaCl$ and NH_4Cl ; they are then dyed black in a bath contg. specified quantities of *p*-phenylenediamine, *m*-tolenylenediamine, NH_4OH and H_2O_2 .

Single-bath chrome tanning process. I. G. FARBENIND. A.-G. Ger. 466,111 Feb. 27, 1928. Compds. of aldehydes with NH_2 or its alkyl or aryl derivs. are added to chrome tanning baths in order to neutralize liberated acids. In a typical example, to calfskin, which has been pretreated with dil. $NaCl$ soln., there are added three portions, at 40-min. intervals, of a suspension of 7.3% hydrobenzamide in a 20% soln. of Cr alum. The tanning is complete after 6.5 hours. The reagents used, with Cr alum, in other

examples are hexamethylenetetramine, acetaldehyde-ammonia, trimethyltrimethylenetriamine, benzylidenedianiline and anhydroformaldehydeaniline. The use of hexamethylenetetramine with Cr alum, weakened by addn. of a small amt. of soda, is described also.

Composition for treating leather. MARTIN SEGORIA. U. S. 1,696,867, Dec. 25. In order to render leather smooth, durable and pliable, it is treated with a compn. formed from white pine pitch 25 lbs., linseed oil 2.5 qts. and beeswax 6 lbs.

Treating skins. PROGR. Fr. 640,112, Feb. 4, 1927. For unhairing and preserving, skins are treated with proteolytic diastases of bacterial origin. The residual liquids from the growth of *B. subtilis*, *B. mesentericus*, *B. liquefaciens*, etc., may be used.

Treatment of leather and dried hides. FRIEDRICH POSPIECH. Can. 284,846, Nov. 13. Leather and dried hides are moistened and wetted out by treatment with aq. solns. of the sulfonic acids of compds. which are obtained by condensing naphthalene or the ring-substitution products of naphthalene in the presence of condensation and oxidation agents with alc. of the aliphatic series contg. more than 2C atoms. It is also possible to use the salts of such compds. Compds. of the above-mentioned kind are obtained, for instance, by condensing naphthalenemono- or polysulfonic acids at approx. 100° in the presence of H₂SO₄ with propyl alcs., butyl alcs., cyclohexanol or other higher alcs. The surplus of H₂SO₄ is removed from the condensation products in the usual way.

Treating hides or skins with tanning solutions or other liquids. E. LUCKHAUS. Brit. 290,681, May 19, 1927. The liquid is applied under alternate conditions of vacuum and pressure in an app. which is described and in which the hides or skins are moved and the liquid is stirred.

Tawing. VIKTOR SZIDON. Fr. 640,535, Feb. 18, 1927. An emulsion of pure animal or vegetable oils mixed with sulfonated oils is used in tawing instead of egg yolk. The sulfonated oils may be used in the form of their Al soaps. Glycerol may also be added.

Finishing leather. ABRAM SMALL. U. S. 1,696,815, Dec. 25. Leather is treated with a coating compn. contg. latex to lay the nap, allowed to dry, and then further treated with a coating compn. without latex, which may contain casein and other ingredients. It is allowed to dry again, dusted with comminuted material such as talc and subjected to high pressure between hot plates.

Dyeing leather. FRIEDRICH POSPIECH. Can. 285,054, Nov. 20, 1928. Good and uniform color is obtained by treating leather with wetting-out agents before or during the dyeing process, for instance, with aromatic sulfonic acids or their salts. Especially suitable are the sulfonic acids of alkylated naphthalenes, which are obtained by condensing naphthalenesulfonic acids with higher aliphatic alcs. in the presence of condensing and oxidizing agents. When basic dyestuffs or inorg. salts are used, the treatment must take place before the dyeing.

"Artificial leather." PHILIP MAGNUS. U. S. 1,694,129, Dec. 4. Cleaned scrap-leather is incorporated in a mixt. of glue, glycerol, boiled linseed oil, "carbolic oil," (NH₄)₂Cr₂O₇ and CaCl₂.

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Method of chemical analysis of rubber. MARJA SAGAJLO. *Przemysl Chem.* 11, 331-42 (1927).—These methods are essentially similar to earlier published methods. Cf. Collier and Boggs, *C. A.* 18, 1763. A. C. Z.

The effect of the silent electric discharge on rubber and decalin. GUIDO FROMANDI. *Kolloidchem. Beihefte*, 27, 189-222 (1928).—Theoretical considerations of the effect of the silent elec. discharge on liquid and solid substances and the methods of producing such discharges are first described. Decalin (decahydronaphthalene) was used as the solvent for rubber because it is free from O, which would otherwise be set free by the discharge in a very reactive form, because it is non-reactive to H, and because it has a low vapor pressure. The work includes a study of the effect of silent elec. discharges on decalin, natural rubber and synthetic rubber. The action of the discharge on decalin is manifest by a far-reaching structural change, which is accompanied by sp. chem. reactions dependent upon the gas to which the liquid is exposed during the discharge. The primary effect is a splitting off of H and the secondary effect a polymerization of the unsatd. mols. In an atm. of O the reaction result in the formation ozonides, while in an atm. of N the introduction of N in the decalin mol. is induced. Natural rubber dissolved in decalin undergoes an isomerization under the influence of the dis-

charge; and the I no., viscosity, softening point, and mol. wt. decrease until a powdery material results which has been termed cyclorubber because of its inactivity. Synthetic isoprene rubber, which because of its I no. might be termed cyclorubber, reacted similarly with the exception that the mol. wt. increased at first. It is probable that synthetic rubber could be transformed in this manner to approx. natural rubber in phys. and chem. reactions. The effects of the silent elec. discharge on decalin cannot be explained on the basis of ultra-violet light because of the difference in wave lengths and characteristics of the two discharges.

L. F. MAREK

Cream from latex. II. Rubber prepared from washed cream. O. DE VRIES, R. RIEBL AND N. BEUMÉE-NIEUWLAND. *Arch. Rubbercultuur* 12, 559-71(1928). (In briefer form in English 572-5).—Earlier expts. on the prepn. of centrifuged cream were continued on a larger scale by dilg. the cream again with water contg. NH_3 , and repeating the centrifuging process, dilg. the cream each time. In this way, primary, secondary and tertiary creams were obtained, from each of which the rubber was coagulated with HCO_2H and converted into crepe. The rubber from the original latex was light yellow; that from the primary and from the secondary latex was whitish; that from the tertiary cream was yellow; and that from underlatex was brown. All these rubbers were sticky, indicating that removal of sol. substances tends toward stickiness. The proportion of non-rubber substances in the cream decreased with each successive washing, while that in the underlatex increased, though these changes were not so great as was to be expected. After vulcanization the tensile strength of rubber from cream is lower than that of rubber from the original latex. The rate of vulcanization diminishes with each successive washing. Rubber from rewashed cream is plastic and has a low viscosity. Underlatex from washed cream yields a plastic rubber with a relatively low viscosity, and (when vulcanized) an abnormally high slope of its compression curve. The NH_3 may play a part in these effects (cf. *Arch. Rubbercultuur* 9, 392(1925); 11, 343(1927)). On keeping for a year or more the viscosity of the rubber from cream diminishes, while the d_{30} value does not change, with no evidence of progressive tackiness or resinification. On keeping, the abnormally high slope of the compression curve (*loc. cit.*) for rubber from secondary and tertiary cream disappears, the high viscosity of the primary underlatex also disappears, and d_{30} remain fairly const. Rubber from secondary and from tertiary underlatex becomes weaker on keeping. Centrifuging does not give a particularly uniform rubber (cf. Blommendaal and van Harpen, *C. A.* 22, 509), since a considerable quantity of serum substances remains in the cream the removal of which increases the time of cure by 20%. Non-rubber substances absorbed and held by the rubber may influence the rate of vulcanization. C. C. D.

Accelerator classification with regard to aging properties. ANON. *India Rubber J.* 75, 585-6(1928).—A criticism of the classification of accelerators given by Dinsmore and Vogt (cf. *C. A.* 22, 4273, 4876). In testing the antioxidant power of accelerators, it is misleading to use the same type of mixt. because certain ingredients have a favorable action on some accelerators and an unfavorable action on others. It is claimed that with accelerators present, accelerated aging tests (air or O) often fail to duplicate the results of natural aging.

C. C. DAVIS

Accelerators as antioxidants. R. P. DINSMORE AND W. W. VOGT. *India Rubber J.* 75, 824(1928); cf. preceding abstr.—A reply. A single type formula is justifiable in that there are no ingredients known which influence differently the antioxidant properties of accelerators. Good aging of vulcanizates is often attributed to a beneficial action of the accelerator used, whereas the natural antioxidants of the rubber are responsible. **Reply.** ANON. *Ibid* 824.—Cases are cited to show that certain well-known ingredients influence the aging of vulcanizates when used in conjunction with certain accelerators. Many accelerators give resistance to aging in addn. to that of the natural antioxidants.

C. C. DAVIS

Dispersoidological investigations. XXIII. The dispersoidology of rubber. I. P. P. VON VEIMARN *et al.* *Repts. Imp. Ind. Res. Inst. Osaka, Japan* 9, 9-50(1928); cf. *C. A.* 22, 4029.—The dispersoidological investigation of natural rubber was undertaken as a preliminary to a study of the conditions under which other substances may be obtained in the rubber-like state. *Hevea* latex and Vultex (preserved with NH_3) contain particles of many shapes, including spheres, egg- and pear-shapes and particles with tails. Particles with such shapes may be found in any emulsion whose drops of disperse phase are coated with a plastic membrane. The original form of *Hevea* latex particles is spherical; the secondary shapes are the result of deformation and flowing together during movement in plants. Spherical particles were observed in latex with diams. from several tenths of $\text{m}\mu$ to 3.5μ . The longest particle with a tail was 6.7μ . The particles are believed to consist of "liquid-gelatinous isospherulites" of latex, surrounded

by a transitory envelope composed chiefly of proteins with an admixt. of resins. The existence of an intermediate layer of solid polymer of rubber as postulated by Freundlich and Hauser is questioned. Latex particles can be caused to flow together by squeezing them or by adding satd. aq. LiI soln., which is a powerful dispergator for proteins. No evidence of microscopical inhomogeneity of the contents of *Hevea* latex particles was obtained, though the presence of the Tyndall effects proves them to be ultramicroscopically disperse. During vulcanization, all of the rubber contents of latex particles become vulcanized, but though the viscosity of the contents of the particles becomes very great, the particles are still capable of flowing together under pressure. Latex and Vultex can be coagulated by mixing with equal vols. of very concd. aq. solns. of LiI, LiCNS, Ca(CNS)₂, CaCl₂, Ca(NO₃)₂ or polyphenols and then washing the coagula very thoroughly in water. The consistency of the dispersion during gelatinization passes through 5 stages, characterized, resp., by very high viscosity, gruel-like consistency, sticky elastic threads, plasticity and high elasticity. A coagulum may possess different consistencies in its different parts. Rods of latex coagulated in test tubes can be stretched to more than double their length without breaking and exude a turbid serum contg. uncoagulated particles. The stretched rods possess a silky gloss, because of their fibrous structure. On releasing they retain a residual elongation which decreases slowly with time. Fresh jellies are distinctly vectorial in properties and may be torn apart easily in the longitudinal direction. Rods of Vultex made in the same way are more easily torn to pieces, do not stretch so far, but require more force for stretching them, contain more uncoagulated particles, and are much more porous in structure. Microscopical and ultramicroscopical study of latex in each of its 5 stages of consistency show that in the viscous stage the latex particles are only beginning to flow together, most of them being still free and in Brownian movement. In the gruel-like stage the particles are clotted together but still retain their individuality. In the stage of sticky threads the rubber contents of contiguous particles have flowed together, so that on deforming the mass, long threads of united particles are produced. In the plastic stage the dispersion medium is rubber in which are dispersed pieces of the non-rubber substances formerly constituting the particle envelopes. In the highly elastic stage the rubber mass has a fibril structure resulting from strains in the films. The changes in consistency of rubber, like those in natural silk, are typical of "coagulation or change in consistency by movement." The only essential difference between the gelatinization of Vultex and that of latex is that the flowing together of the contents of the particles is slower in the Vultex. The structures possible in latex or Vultex jellies are exceedingly numerous, and vary greatly with the age of the jellies and their mech. treatment. Fresh jellies are poly-disperse, micro- and ultramicro-cellular (membranous) jellies. Old jellies possess a fibril structure which may be latent, *i. e.*, the jelly may seem to be ultramicroscopically homogeneous. Lamellar structure is also possible in latex and Vultex jellies. The cause of the high elastic properties of rubber lies only in the inner rubber contents of the latex particles, not in the proteins and resins forming the envelopes of the particles. It is assumed that rubber is a mixt. of liquid and solid polymers, the former changing very slowly into the latter, and that the mol. of rubber has a spiral structure. F. L. BROWNE

Composition (containing chlorinated rubber for coating straw hats (U. S. pat. 1,695,639) 25. Varnish containing chlorinated rubber (U. S. pat. 1,695,638) 26. Coating composition containing chlorinated rubber (U. S. pat. 1,695,640) 26. Driving and conveying belts of woven fabric and rubber (Brit. pat. 289,828) 25.

CARLOS, J., AND SOARES, M. Le caoutchouc, étude économique et statistique. Encyclopédie du caoutchouc et des matières plastiques. Paris: A. D. Cillard. 1929. pp. Retrieved in *Ind. Eng. Chem.* 21, 195(1929).

Rubber. WILHELM L. UTERMARCK. Fr. 639,961, Aug. 24, 1927. A very durable rubber is obtained

Rubber from plant materials. WILLIAM H. YEANDLE (to Intercontinental Rubber Co.). U. S. 1,695,676, Dec. 18. Rubber-bearing plant material such as guayule shrub is permeated with steam and subjected to increased gaseous pressure and the pressure is then suddenly released to disrupt the plant cells and liberate their contents and facilitate the sepn. of the rubber. An app. is described. Cf. C. A. 22, 2685.

Treating latex. DUNLOP RUBBER Co., LTD., D. F. TWISS and E. A. MURPHY. Brit. 290,313, Nov. 13, 1926. A gentle continuous mixing action is maintained during the concn. by evapn. of latex to which compounding ingredients and stabilizing agents have previously been added. Several examples and formulas are given.

Treating latex. W. A. WILLIAMS. Brit. 289,965, Feb. 7, 1927. In electrodeposition of rubber from latex or the li'ce, an electrolyte which will not readily cause coagulation but will act as a self-excitant between electrodes, is added to the latex, and externally connected electrodes are introduced to effect rubber deposition on the anode, e. g., NH_4Cl in aq. soln. may be added to the latex which may have been preserved with NH_3 and may also be admixed with ZnO and S , etc. The anode may be of Zn and the cathode may comprise a porous pot contg. C and MnO_2 .

Treating latex. W. A. GIBBONS and J. MCGAVACK (to United States Rubber plantations, Inc.). Brit. 290,242, May 11, 1927. See U. S. 1,673,672 (C. A. 22, 2855).

Rubber compositions. B. W. NORDLANDER (to British Thomson-Houston Co., Ltd.). Brit. 290,602, May 16, 1927. An amorphous compd. of mixt. of S and a stabilizer such as Se or Te is used for vulcanizing rubber. Details are given of prepn. and use of the compn.

Stabilized chlorinated rubber composition. CARLETON ELLIS (to Chadeloid Chemical Co.). U. S. 1,695,641, Dec. 18. Chlorinated rubber contg. not less than about 67% Cl is admixed with PhNH_2 , toluidine, xyldine, urea or other suitable org. amino antacid.

Apparatus for melting paraffin and mixing it with rubber compositions. ELMER S. WHITTIER (to Fisk Rubber Co.). U. S. 1,696,826, Dec. 25. Structural features.

Porous or spongy rubber. F. RINGER. Brit. 290,447, May 26, 1927. See Fr. 634,694 (C. A. 22, 4007).

Coloring rubber. I. G. FARBENIND. A.-G. Fr. 640,036, Aug. 26, 1927. See Brit. 277,034 (C. A. 22, 2493).

Deodorizing rubber. JEAN L. H. DE G. DE BÉARN. Fr. 640,145, Feb. 7, 1927. Rubber is deodorized by allowing it to remain for several days between 2 layers of finely ground dry charcoal, particularly oak charcoal.

Preserving rubber. ALBERT M. CLIFFORD (to the Goodyear Tire and Rubber Co.) Can. 285,541, Dec. 11, 1928. Naphthalene substituted diamines are used as antioxidants in rubber compds. These materials are prepd. by the reaction of the naphthols with an alkylene- or an arylenediamine. The reaction products of β -naphthol with ethylenediamine and with *m*-phenylenediamine are specific examples of the materials which may be used. Cf. C. A. 23, 309.

Rubber articles. EARDLEY HAZELL (to the Dominion Rubber Co., Ltd.) Can. 284,564, Nov. 6, 1928. Rubber articles are manufd. directly from latex to which has been added a Zn compd. (oxide, hydroxide or any sol. Zn salt dissolved in water or in a soln. contg. NH_4OH in excess) and a soln. of sulfides or polysulfides of Na , K , Li or NH_4 , and depositing rubber from the thus treated latex on a porous form in the shape desired.

Rubber articles. GEORGE G. THORNTON (to the Dunlop Rubber Co., Ltd.) Can. 284,962, Nov. 20, 1928. Rubber articles are formed by depositing the material by electrophoresis on an anodic mold, stripping the deposited material from the mold, placing the material between two surfaces, and vulcanizing by immersing the article in a boiling aq. soln. while permitting the surfaces to move relatively to one another.

Rubber articles manufactured by dipping. GEOFFREY W. TROBRIDGE and EDWARD A. MURPHY (to Dunlop Rubber Co., Ltd.) Can. 284,565, Nov. 6, 1928. A porous mold is dipped into a coagulant (CaCl_2 , AcOH or alum), and afterward dipped into a compounded latex including such materials as ZnO , carbon black and other materials commonly employed in the compounding of rubber. Vulcanizing agents such as S and if desired accelerators of vulcanization may be added to the latex. A suction may be applied to the interior of the porous mold or pressure may be applied to the exterior of the mold. After the dipping process there is removed from that part of the mold farthest from the deposited latex, the coagulant and a part of the water and serum by suction on the interior of the mold. Drying and vulcanization may then be effected, and the article removed. Cf. C. A. 22, 4274.

Rubber conversion products. HARRY L. FISCHER (to the B. F. Goodrich Co.). Can. 284,980, Nov. 20, 1928. Rubber (100 parts) is admixed with 10 parts of catechol and 20 parts of $\text{Ph}_2\text{NH}\cdot\text{HCl}$ and after being thoroughly admixed is placed in a suitable heater maintained at 320° for about 20 hrs. or until conversion is complete. A hard tough material is thereby produced. In general a bath consisting of rubber 100 parts by wt., a phenol 10 to 20 parts and one of the compounds selected from the following empirical class, 20 to 30 parts when treated as above described will yield conversion products. The empirical class includes chlorinated rubber, rubber hydrochloride, rubber sulfur chloride, chlorinated rubber hydrochloride, pinene hydrochloride, $\text{Ph}_2\text{NH}\cdot\text{HCl}$, $\text{Cl}_3\text{C}_6\text{H}_2\text{NH}_2\cdot\text{HCl}$, $m\text{-O}_2\text{NC}_6\text{H}_4\text{NH}_2\cdot\text{HCl}$, HgCl_2 , SnCl_4 , naphthalene tetrachloride, Ph_3CCl , ZnBr_2 , HgBr_2 , rubber dibromide, $\text{Ph}_2\text{NH}\cdot\text{HBr}$, CdSO_4 , $\text{Al}_2(\text{SO}_4)_3$, HgSO_4 , $\text{Ph}_2\text{NI}\cdot\text{H}_2\text{SO}_4$ and $\text{PhNH}_2\cdot\text{Cl}_3\text{CCO}_2\text{H}$.

Rubber conversion products. HARRY L. FISHER (to the B. F. Goodrich Co.). Can. 284,981, Nov. 20, 1928. Conversion products of rubber are produced by forming a liquid admixt. of rubber, a rubber solvent, a phenol and a substance selected from a class comprising HCl , HBr , $\text{CCl}_3\text{CO}_2\text{H}$, dil. H_2SO_4 , org. sulfonic acids, and org. sulfonyl chlorides, and heating the admixt. at approx. the boiling temp. for an extended period, preferably under reflux to prevent loss of solvent in the admixt.

Rubber threads. MAX DRAEMANN and MAX BÜHLING. Fr. 640,179, Aug. 9, 1927. An app. is described for making threads of rubber by pressure of the rubber through perforated plates.

Artificial threads from chlorinated rubber. CARLETON ELLIS (to Chadeloid Chemical Co.). U. S. 1,695,643, Dec. 18. A concd. soln. of chlorinated rubber is formed into filaments (suitable by extrusion through as fine orifice) and the solvent is removed. The product may be used for making fabrics.

Increasing the plasticity of rubber. CARLETON ELLIS (to Chadeloid Chemical Co.). U. S. 1,695,636, Dec. 18. Rubber is given an increased plasticity without dissolving it, by incorporating with the unvulcanized rubber a quantity of an aromatic solvent such as C_6H_6 , which is not greater than the quantity of the rubber and then treating the material with Cl under pressure to effect chlorination to a stage above heptachloro-rubber.

Adhesive comprising chlorinated rubber. CARLETON ELLIS (to Chadeloid Chemical Co.). U. S. 1,695,637, Dec. 18. Chlorinated rubber is used with a solvent such as S_2 or C_6H_6 to form an adhesive which is suitable for various purposes.

Splicing ends of rubber tubes to form tire tubes, etc. JOHN P. COE (to G. & J. Foe Co.). U. S. 1,693,636-7, Dec. 4.

Manufacture of rubber tires for vehicles. ERNEST HIBBERT (to Hibbert Pneumatic Cell Tyre Co., Ltd.). U. S. 1,694,260, Dec. 4. Mech. features.

Waste rubber. COGEDEX (COMPAGNIE GÉNÉRALE D'EXPLOITATION) SOCIÉTÉ ANON. Fr. 640,322, Aug. 31, 1927. Waste rubber is powdered and mixed with latex, which acts as a solvent and plastifying agent. S is added and the mass vulcanized.

Rubber substitute. ROGER A. L. SELIGMAN. Fr. 640,147, Feb. 7, 1927. Asbestos is intimately mixed into a soln. of rubber and the solvent evapd. The asbestos is preferably treated with S and heated to about 150° in the absence of O before mixing.

Apparatus for vulcanizing tire casings or similar articles. HENRY WILLSHAW (to Dunlop Tire and Rubber Corp. of America). U. S. 1,695,835, Dec. 18.

Vulcanizing rubber. IWAN OSTROMUISLENSKII (to Revere Rubber Co.). U. S. 1,696,400, Dec. 25. Vulcanization without S is effected in the presence of org. nitro compds. such as 1,3,5-trinitrobenzene by combining the rubber with a nitrobenzene and with C black or other element of the C group and then effecting the vulcanization.

Vulcanizing rubber. SOC. ANON POUR L'IND. CHIM À BALE. Brit. 290,178, May 7, 1927. Vulcanization is effected in the presence of various compds. of the general formula,

in which X and Y are any residues, and Z is a H atom or a radical connected with the C atom by N , O or S .

Vulcanization of rubber. THE INDIA RUBBER, GUTTA PERCHA & TELEGRAPH WORKS Co., LTD. Fr. 640,615, Aug. 1, 1927. In the vulcanization of rubber coverings for rollers, etc., the roller is surrounded with a heating fluid and the interior is independently supplied with a heating fluid. The exterior is treated with hot water under pressure, while steam at a higher temp. is circulated through the interior.

Imitation patent leather. ROBERT C. HARTONG (to Seiberling Rubber Co.). U. S. 1,694,258, Dec. 4. A rubber compn. is calendered upon a smooth surface such as a metal sheet capable of transferring its surface effects to the compn., a textile material frictioned with a rubber compn. is doubled upon the first-mentioned compn., and the product is vulcanized.

Catgut substitutes. DUNLOP RUBBER Co. Swiss 126,171, Nov. 24, 1926. See Brit. 264,640 (C. A. 22, 165).

CHEMICAL ABSTRACTS

Vol. 23.

MARCH 10, 1929

No. 5

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

The chemical tablet. ALBRECHT. *Chem. Fabrik* 1928, 658.—Rectangular tablets of wood, rather than of enameled Fe, 40 × 60 × 5 cm., are recommended for holding laboratory app. that must be transported, as for washing, weighing, etc. W. C. E.

Three laboratory devices: a vacuum stirrer, a pressure alternator and a gage for measuring low pressures of permanent gases in condensable vapors. ROGER K. TAYLOR. Johns Hopkins Univ. *J. Am. Chem. Soc.* 50, 2937-40(1928). J. H. P.

Improved laboratory rectifying column. MELVILLE J. MARSHALL. Univ. British Columbia, Vancouver, B. C. *Ind. Eng. Chem.* 20, 1379(1928).—A modification of the lagged lab. column with reflux for partial condensation is described. The figure given in the paper is self-evident.

ALBERT L. HENNE

Dufton distilling column for the preparation of absolute alcohol. W. A. NOYES. Univ. Illinois. *Ind. Eng. Chem.* 20, 1190-1(1928).—Com. alc. is boiled through a brass Dufton column. A chamber on top of the column contains CaCl_2 and a condensing coil, to cause the alc. to reflux through the salt and wash the vapors rising in the column. Alc. of 98-99% is thus obtained.

ALBERT L. HENNE

Rapid method for calibrating burets. Z. MINDALEV. Moscow Tech. Hochsch. *Z. anal. Chem.* 75, 390-2(1928).—The method described is a modification of the Ostwald method. Three burets are used, the first serving to supply water to the others. The burets are connected by a T joint at the bottom of each buret and buret 2 is placed a little lower than buret 1 and a little higher than buret 3. A definite vol. in the middle buret is detd. by accurate weighing. This vol. of water, say 2 cc., is transferred repeatedly to the third buret and the reading noted. When, after careful checking, the third buret is entirely calibrated, it is used as the middle buret for the calibration of all the other burets in the lab.

W. T. H.

Use of the Mariotte bottle as a constant-rate gas-sampling device. O. W. WEIGHT. *J. Soc. Chem. Ind.* 47, 247-8T(1928).—Liquid flows at a const. rate from a Mariotte bottle, but the same is not true for the gas entering the bottle. Consequently, this device is to be modified if used as a constant-rate sampling app.

ALBERT L. HENNE

Apparatus for microanalysis of gas. C. H. PRESCOTT, JR. California Inst. of Techn. *J. Am. Chem. Soc.* 50, 3237-40(1928).—An app. is described capable of analyzing CO_2 , CO, H and N in a $1\frac{1}{2}$ cc. sample. The analysis is carried out at low pressure, and readings are made of the pressure required to obtain a fixed vol. in the measuring chamber.

ALBERT L. HENNE

Unbreakable explosion pipet. FREDERICK W. ISLES. Standard Oil Co. of New Jersey. *Ind. Eng. Chem.* 20, 1163(1928).—The pipet is a steel pipe fitted with a spark plug.

ALBERT L. HENNE

Apparatus for chromic anhydride oxidations. WALLACE F. SHORT. Univ. College, Auckland, New Zealand. *J. Chem. Soc.* 1928, 2630.—A modification of the Walker EtI app. uses the Soxhlet principle to introduce CrO_3 into the reaction mixt. A. F.

The densi-tensimeter. ANDREAS SMITS. Univ. Amsterdam. *J. Chem. Soc.* 1928, 2409-10.—An app. is devised for the simultaneous measurement of the vapor pressure and vapor density of intensively dried gases.

ARTHUR FLEISCHER

Tantalum as a material for making chemical apparatus. FR. HEINRICH AND F. PERTZOLD. *Chem. Fabrik* 1928, 689-91.—A compilation of data on the phys. and chem. properties of Ta, supplemented by the authors' expts., indicates that although it may serve well for the manuf. of chem. app. because of its great resistance to the attack of acids, yet limitations as to the temp. at which it may be used, especially in the presence of various gases, may prevent it from becoming wholly acceptable for this purpose.

W. C. EBAUGH

"Acid-proof" packing for absorption towers. CHARLES H. BUTCHER. *Ind. Chemist* 4, 446-8(1928).—The desirable features of the ideal packing are given in de-

tail under the following heads: (1) max. of effective scrubbing surface in relation to free gas space, (2) distribution of wash liquor with absence of "channelling," (3) length of path in contact with the wash liquor. Avoidance of spread of gas by the baffling action of the packing, (4) resistance offered by the packing to the flow of gas, (5) durability in construction, weight, adaptability to circular or square towers, (6) prevention of stagnant pools of wash liquors and pockets of gas, (7) shapes and methods of placing packing must not induce accumulation of deposits. Illustrations of the best known shapes of manufd. tower packings are included. A tabulation of the characteristics of 66 different variations of packing (including coke and quartz) is given, together with a graph of these 66 in which "free gas space (percent)" is plotted against "surface (sq. ft. per cu. ft. of tower space)." The points plotted have been projected to cut the "50% of free gas space" ordinate, to place the packings in order of efficiency. New packings may be plotted on this chart and projected in the same manner.

E. G. R. ARDAGH

Organic solvents and rubber-lined plant. A. BRESSER. *Ind. Chemist* 4, 482-3 (1928).—The results are given of the effect of the following org. solvents employed in the varnish industry on test pieces of iron strips coated with rubber and of the effect of the rubber on the solvents: isobutyl alc., propyl alc., softener O, butyl acetate (98-100%), Et acetate, butyl alc., acetone oil A, Me-Et ketone, dichlorohydrin, triacetin, diethyl carbonate. Three grades of rubber coating were examd.; the period of test was 12 weeks and the temp. maintained between 18° and 20°. One grade of rubber (German patent 462,457; more detailed information not available) shows in nearly all cases an excellent resistance to these solvents. Cf. *C. A.* 22, 3320. E. G. R. A.

Power-plant development limited by available materials. T. FARRANCE DAVEY. Long Beach, Calif. *Power* 69, 129-31 (1929).—A diagram shows changes in ultimate tensile strength and effect of creep with temp. for 12 metals and alloys. The uses and characteristics of some of these alloys are discussed.

D. B. DILL

A sensitive reducing valve and overflow valve for steam, air and water. F. SCHLEGEL. *Chem. Fabrik* 1928, 656.—A regulating valve (F. Mattick, Dresden-A. 24) is described briefly.

W. C. EBAUGH

Conveying systems in chemical factories. PAUL JACOBI. *Chem. Fabrik* 1928, 654-6, 666-7.—A general description of various types of cranes, power shovels, loading and unloading machinery, elevators, surface and overhead conveyors, rail and truck systems.

W. C. EBAUGH

Potash and borax from Searles Lake. JOHN E. TREPLE. *J. Soc. Chem. Ind.* 47, 345-7T (1928).—A discussion of the circumstances under which the chem. engineer should select standard equipment for his work and of those under which he is justified in designing special equipment. This is illustrated by examples (a continuous vacuum crystallizer, a continuous vacuum cooler, a continuous salt separator, continuous evaporators, etc.) in which it is pointed out in each case why it was necessary to depart from standard equipment and design what T. calls "unconventional equipment." E. M. S.

Methodology of gas chains. S. V. GORBACHEV. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)*, No. 12, 39-41 (1925).—In part I G. describes and illustrates a simple H electrode which may be used for small quantities of liquid. In part II he describes and illustrates his modification of a capillary electrometer, which is not subject to the well-known phenomenon of going "dead" or becoming poisoned.

J. S. JOFFE

The electrode with glass membrane for measuring pH. GUISEPPE A. BRAVO. *Natl. Inst. for the Leather Ind., Turin. Boll. ufficiale staz. sper. ind. pelli mat. concianti* 6, 329-36 (1928).—A review.

G. SCHWOCH

The potentiometric titration apparatus. ISABURO WADA. *Bull. Inst. Phys.-Chem. Research (Tokyo)* 7, 439-51 (1928); *Abstracts* 1, 40-1.—A new rugged app. has been devised by W. and manufd. by the institute; it is claimed to be an improvement, but is not described in the English paper. Its complete description is given in the Japanese paper.

ALBERT L. HENNE

A method of maintaining constant humidity in closed chambers. R. H. STOUGH-TON. *J. Sci. Instruments* 5, 364-6 (1928).—A carbon-filament lamp is covered with muslin, which dips into a beaker of distd. water. The lamp is inclosed in a tin container with a hole for the muslin in the bottom and two holes for rubber stoppers diametrically opposite near the top. A glass tube projects through each stopper, one tube being drawn out to a jet, and the other being widened like a funnel. Air is blown constantly through the tubes and tin into the chamber. A hair-hygrometer in the chamber operates a relay to turn the lamp on and off.

M. W. SEYMOUR

A sensitive thermoregulator. D. H. BLACK. *J. Sci. Instruments* 5, 376-7 (1928).—For the control of an electrically heated air oven, a bimetallic strip 0.25 in. wide, 0.02

in. thick, and 30 in. long is wound around a rod to form a helix, and when heated receives a twisting movement which is conveyed to a contact arm that makes contact with a screw, closing a relay circuit which cuts off the heating current. Temp. of the oven may be kept const. within 0.04–0.1°.

R. J. HAVIGHURST

Construction and installation of a toluene-mercury thermostat. Wm. ROBINSON. Univ. of Minn. *Ann. Entomol. Soc. Am.* 21, 607–13(1928).—Details of construction and installation of the thermostat, the source of current for the thermostat circuit, type of elec. relay, adjustment of the relay, installation of the relay, and care of the app. are considered. The app. is especially designed for use in const.-temp. cabinets.

C. H. R.

Ferro-silicon alloy chemical plant (TUNGAY) 9. Dialyzer diaphragm (Fr. pat. 641,886) 23. Gas producers and furnaces (Fr. pat 641,904) 21.

FÜRTH, A.: *Die Werkstoffe für den Bau chemischer Apparate.* Chemische Technologie in Einzeldarstellungen. Edited by A. Binz. Leipzig: O. Spamer. 220 pp. Paper, R. M. 18; bound, R. M. 20.

MAWHINNEY, MATTHEW H.: *Practical Industrial Furnace Design.* New York: John Wiley & Sons, Inc. 318 pp. \$4. Reviewed in *Mech. Eng.* 51, 93(1929).

Flameless laboratory crucible smelter. P. A. YERMOLOV. Russ. 3861, Oct. 31, 1927.

Mechanical calorimeter. GEORG ISING. Ger. 469,635, Jan. 22, 1926.

Mechanical calorimeter. HERMANN BUSCHBAUM. Ger. 469,669, Jan. 24, 1926.

Centrifuge. SOC. FRANÇAISE DE CENTRIFUGATION AND JEAN A. L. ROZIÈRES. Fr. 642,164, Oct. 11, 1927. A centrifuge particularly for the wash waters from wool is made so that the space of the bowl occupied by the wool powder and water narrows to the axis on the outlet side.

Clarifying centrifuge. SCHWARZWALDWERKE LANZ KOMM.-GES. Ger. 468,442, April 9, 1925. Constructional details.

Centrifugal apparatus for clarifying liquids in bottles. GEORGES RAY. Swiss 127,026, June 15, 1927. Constructional details.

Measuring funnel. MAX HUYINK. Ger. 468,588, Aug. 6, 1927. The funnel and its closing rod are both graduated.

Funnel for filling or filtering liquids into bottles. JOSEF WEISS. Austrian 110,522, April 15, 1928. The funnel has a fixed or movable bell-shaped support which rests on the neck of the bottle and is perforated to allow escape of air.

Filter. HERMAN HILLINGA. Fr. 641,613, Sept. 28, 1927. A filtering app. particularly for rubber latex but applicable for other substances consists of a number of vessels one inside the other with perforated walls, the perforations being so arranged that the liquid flows up and down through the app. and the perforations are always below the surface of the liquid.

Filter. HENRI L. L. LECLÈRE. Fr. 642,113, Oct. 8, 1927. A filter comprises a cylindrical or conical chamber on a horizontal axis, in which a transporting screw turns so as to move the substance to be filtered from one end to the other, and the wall of the chamber or of the screw form the filtering medium.

Filters. GEROLAMO MUSSINO. Fr. 642,370, Oct. 5, 1927. Porous stone is used as filtering medium for air, gasoline, etc. Fr. 642,371 describes a mounting of such filtering medium in a cylinder, the filtrate passing to the center of the cylinder.

Bevelled bars for screening and filtering apparatus. H. SCHUBERT. Brit. 292,054, March 3, 1927. Structural features.

Rotary filters for filtering liquids. BRINJES & GOODWIN, LTD., and F. TITTERTON. Brit. 291,148, Feb. 24, 1927. Structural features.

Cloth and wire-mesh filters for colloidal liquids, emulsions or suspensions. M. G. W. HUMMELINCK. Brit. 291,810, Dec. 8, 1926.

Filter for milk or other liquids. J. COULTHARD. Brit. 291,213, May 11, 1927. Filtering pads are made from a mixt. of absorbent and non-absorbent cotton wool with a backing of adhesive such as starch, farina or gelatin.

Filter for air or gas. DELBAQ-ENTSTAUBUNG G.M.B.H. Fr. 641,329, Sept. 23, 1927. A filter for air or gas is composed of a number of elements mounted in a frame or on a moving band or cylinder, to superimpose one another in the form of scales or tiles, each element being pivoted at one end. By varying the inclination the density of the filtering wall is varied.

Device for separating entrained particles of dust, etc., from air or other gases. GEORGE C. WEBSTER. U. S. 1,697,743, Jan. 1. A device with baffles and filters is described.

Cleaning device for dust filter. ANTON SEIBERL. Austrian 110,391, Mar. 15, 1928. Constructional details.

Apparatus for separating suspended impurities from gases. HENRI HAEGLER. Swiss 127,029, May 17, 1927. Constructional improvements are described in app. of the type in which the sepn. is effected centrifugally or by abrupt changes in the direction of the gas.

Filter press. SEITZ-WERKE G. M. B. H. Ger. 468,474, Mar. 26, 1925. Structural features.

Magnetic separator. FRIED. KRUPP GRUSONWERK A.-G. Ger. 469,165, May 21, 1927. Details of construction.

Drying apparatus. CHARLES LEMALE. Fr. 641,209, Mar. 3, 1927. A rotating drier for drying products such as *casein* at a low temp. under reduced pressure is described.

Drying apparatus. THE TECHNO-CHEMICAL LABORATORIES, LTD. Fr. 642,047, Oct. 6, 1927. App. for drying materials suspended in a gaseous medium and carried by this medium through a series of tubes, the walls of which are heated.

Combined drying and pulverizing apparatus. SOCIÉTÉ ANON. POUR L'UTILISATION DES COMBUSTIBLES. Fr. 641,057, Sept. 16, 1927.

Drying or moistening apparatus. ADOLF BOLEG. Ger. 469,592, June 12, 1927. The app. is of the kind comprising a no. of trays or hurdles on which the material is conveyed down a treating shaft.

Drum for drying granular materials with hot gases. ERNST FROEHLICH. Austrian 111,043, May 15, 1928. In a rotary drying drum of the kind traversed internally along its length by bars or the like over which the material trickles, the bars are screw-shaped or are formed of a no. of Y-pieces irregularly joined together.

Thermometer with scales in Centigrade, Fahrenheit, Reaumur and absolute degrees. P. L. MARKS. Brit. 291,311, Dec. 19, 1927.

Electrical thermometer with weather-proof leads. HARTMANN & BRAUN A.-G. Swiss 127,063, Sept. 5, 1927. Constructional details.

Combined mercury and gas thermometer. G. M. ASTATUROV. Russ. 3737, Oct. 31, 1927.

"Distant-reading" temperature indicator suitable for use on automobile engines. EDWARD L. FONSECA (to Wilcolator Co.). U. S. 1,699,104, Jan. 15.

Apparatus for the rapid adjustment of temperatures or pressures. ASKANIA WERKE A.-G. formerly CENTRALWERKSTATT DESSAU AND CARL BAMBERG FRIEDENAU. Fr. 641,161, Sep. 20, 1927.

Automatic device for controlling temperature and humidity in incubators, etc. RUSSELL J. HILL. U. S. 1,699,143, Jan. 15.

Temperature safety device of the bimetallic strip type. ÖSTERREICHISCHE SIEMENS-SCHUCKERT-WERKE. Austrian 109,934, Feb. 15, 1928. Constructional details.

Magnetic pyrometer suitable for temperature control. THOMAS SPOONER (to Westinghouse Elec. & Mfg. Co.). U. S. 1,697,148, Jan. 1.

Pyrometer. RUDOLF HASE. Ger. 468,360, Dec. 2, 1926. Addn. to Ger. 466,475. Details of construction.

Optical pyrometer. D. C. GALL. Brit. 291,971, June 29, 1927. Structural features.

Optical pyrometer. RUDOLF HASE. Ger. 466,475, July 24, 1926. Details of construction.

Fixing pyrometers in shaft furnaces. WILHELM SCHUSTER. Austrian 110,867, May 15, 1928. The pyrometer is fixed in a conduit in the masonry traversed by part of the furnace gases.

Vacuum-measuring apparatus. ÖSTERREICHISCHE BROWN BOVERI-WERKE A.-G. Austrian 110,821, May 15, 1928. Constructional improvements are described in app. of the kind in which a heating resistance influenced by the vacuum forms a branch of a Wheatstone bridge.

Oxide cathodes of vacuum tubes. KAREL M. VAN GESSEL. U. S. 1,699,639, Jan. 22. A cathode which may be formed of W is oxidized and then subjected to the vapor of a base such as Ba to form the desired coating on the cathode.

X-ray apparatus. WILLIAM K. KEARSLEY, JR. (to General Electric Co.). U. S. 1,698,334, Jan. 8. Structural features.

X-ray apparatus. SIEMENS-REINIGER-VEIFA GESELLSCHAFT FÜR MEDIZINISCHE TECHNIK M. B. H. Fr. 641,001, Sept. 15, 1927.

Safety device for Röntgen tubes. SIEMENS & HALSKE AKTIEN-GESELLSCHAFT. Fr. 641,408, Sept. 26, 1927.

Neon tubes. RAPHAËL FRAJND. Fr. 642,440, Oct. 15, 1927. Neon tubes are made by cleaning and heating the glass tubes, furnishing large and small electrodes previously freed from occluded gas, making a vacuum in the tube, purging it and the electrodes with pure N, and then introducing Ne purified by passing it over wood charcoal at -80° .

Metallic vapor or luminescent rare-gas lamps or tubes. JULES AUGUSTE FLORIMONT. Fr. 641,701, Oct. 1, 1927.

Evacuating audion tubes. ERNEST A. LEDERER (to Westinghouse Lamp Co.). U. S. 1,699,597, Jan. 22. During preliminary heating to drive out gases, a clean-up agent such as Mg is positioned in a portion of the device which is not strongly heated and is afterward moved into a heated position and heated to exert an active effect in removing residual gases.

Manufacture of electron tubes. RADIOWERK F. SCHIRACK. Ger. 469,686, June 30, 1925. Manipulative details

Electron emitter. ANTON LEDERER. Fr. 639,367, Aug. 1, 1927. An incandescent cathode for electron tubes, etc., is composed of Th (2-50%) incorporated with Os or other metal from crude Pt. A core of W may be used.

Electron discharge apparatus. I.E. MATÉRIEL TÉLÉPHONIQUE (SOCIÉTÉ ANON). Fr. 641,413, Sept. 26, 1927.

"Cleaning up" residual gases in vacuum tubes. DUNCAN MACRAE (to Westinghouse Lamp Co.). U. S. 1,699,112, Jan. 15. A galvanized iron electrode is used which may be heated to cause vaporization of the Zn to effect "clean up" of residual gases.

Sealing vacuum cocks or vessels. MARIE ANNA SCHIRMANN. Austrian 109,897, Feb. 15, 1928. The cock or other closure of a vacuum vessel is sealed by the elec. tension set up between microscopically thin, continuous liquid films adsorptively held on the surfaces to be pressed together. Cf. C. A. 21, 2582.

Thermionic valves. H. M. ELSEY and A. T. KROGH (to Westinghouse Elec. & Mfg. Co.). Brit. 291,400, June 1, 1927. A coating material for a thermionic cathode comprises a mixt. of one or more compds. of the alk. earth metals such as carbonates of Ba and Sr and a vehicle such as EtOH and MeOH which is volatile at temps. below 200° and is capable of producing a reducing atm. when heated. Hydrazide salts also may be used. The core wire is passed through the coating material and then heated in a closed furnace contg. CO, and the process may be repeated to obtain a thicker coating. After mounting in a valve, the wire is heated to convert the coating into oxide.

Multiple electrode discharge tube. ANTON BAMBULA. Austrian 110,111, Feb. 15, 1928. Constructional details.

Electric discharge devices. SIEMENS & HALSKE A.-G. Brit. 291,785, June 10, 1927. In making thermionic cathodes suitable for gas rectifiers as described in Brit. 289,381 (C. A. 23, 552) and in which the cathode surface consists of an alloy of the core metal with a high proportion of electron-emitting metal such as Th, there is used for producing the coating a compd. contg. O such as Th nitrate, with a flux such as borax or other suitable P or B compd.

Electric discharge device. V. K. ZWORYKIN (to Westinghouse Elec. & Mfg. Co.). Brit. 291,763, June 8, 1927. Active surfaces are formed by layers of different materials so thin as to be transparent. A layer of an alkali metal such as K, Na or Rb, or Ca may be deposited on a layer of metal of lower vapor pressure such as W or Mo. A device is described which may be used as a *photoelec. cell*.

Electric discharge vessels. ANTON LEDERER. Fr. 641,418, Sept. 26, 1927. A mixt. of one or more alkali metals with one or more reducing agents is introduced into elec. discharge vessels filled with He, etc., and the alkali metal vapors liberated by heating are pptd. on the interior of the vessel.

Electric discharge vessel with two or more anodes. ERICH F. HUTH G. M. B. H. Ger. 469,595, Feb. 7, 1919.

Retort for destructive distillation. "CARLSHUTTE" A.-G. FÜR EISENGIESSEREI UND MASCHINENBAU. Ger. 469,379, Feb. 26, 1925. Structural modifications are described in a retort of the kind in which the material is distd. in stages while descending a series of superposed containers formed by movable slats obliquely arranged within the retort.

Heat regulator. SIEMENS-ELEKTROWÄRME G. m. b. H. Swiss 127,310, June 27, 1927. A heat regulator comprises a vacuous or gas-filled expansible casing contg. a

member connecting two contacts placed at different points of the casing, one of the contacts being adjustable from outside the casing.

Heat exchange apparatus. JOSEF MUCHKA (Max Muchka, inventor). Austrian 111,325, June 15, 1928. Structural modifications are described in heat exchange app. composed of plate-shaped members connected together at opposite edges by U-shaped edge members.

Heat exchangers. PIERRE EUGÈNE JOSEPH JÉRÔME COURTURAUD. Fr. 639,447, Jan. 24, 1927. To prevent hard deposits on heat exchangers traversed by combustion products they are coated with a paste of graphite, water and a sol. silicate, which hardens on drying.

Heat exchanger. SOCIÉTÉ D'ÉLECTRO-CHIMIE, D'ÉLECTRO-MÉTALLURGIE ET DES ACIÉRIES ÉLECTRIQUES D'UGINE. Fr. 641,914, Mar. 16, 1927. A heat exchanger for reactions under pressure such as catalytic gas reactions is composed of a stack of coils in a cylinder, the coils being wound from the center to the outside in one layer before passing to the layer above.

Heat exchange apparatus suitable for heating air by flue gases. THOMAS H. MURRAY. U. S. reissue 17,185, Jan. 1. Original pat., No. 1,548,158, was issued Aug 4, 1925.

Heat-exchange and pumping apparatus for heating and pumping oils. CHARLES E. LUCKE (to Worthington Pump and Machinery Corp.). U. S. 1,697,605, Jan. 1.

Furnaces. ERNEST FERRARI. Fr. 642,569, Oct. 19, 1927. The flue is automatically shut down when the charging doors are opened.

Furnaces. PAUL LEVÊQUE. Fr. 642,198, Oct. 12, 1927. Construction of hearth bars.

Charging furnaces. JOHANN GMEINDL and KARL MAYER. Ger. 470,074, April 30, 1925. Beneath the loading hopper is a rotary stop device with fins, actuated by an electromagnet for regulating the charging.

Annealing furnace. AUGUST FUCHS (to Westinghouse Elec & Mfg. Co.). U. S. 1,699,784, Jan. 22. Structural features.

Furnace for annealing articles in an inert atmosphere. SIEMENS-SCHUCKERTWERKE A.-G. Brit. 291,437, June 3, 1927. Structural features.

Continuous annealing furnace for heating sheets or plates. THADDEUS F. BAILY. U. S. 1,696,900, Jan. 1.

Muffle furnace. FRIED. KRUPP A.-G. (Lothar Otterstedt, inventor). Ger. 468,653, June 22, 1927. Structural features.

Smoke-consuming furnace. VEREINIGTE CHEMISCHE WERKE A.-G. and PAUL GROCHE. Ger. 468,422, Dec. 22, 1926. In a furnace in which steam is let into the fire space to promote smoke consumption, the steam inlets are in two or more superposed layers so arranged that the steam clouds intersect one another.

Furnace for heat treating, enameling, etc. HARRY F. SMITH (to Gas Research Co.). U. S. 1,697,373, Jan. 1.

Furnace and testing apparatus for testing the compressibility of heated materials which soften when compressed. HANS HIRSCH and HANS HECHT. U. S. 1,699,589, Jan. 22.

Furnace regenerator construction. AKTIEBOLAGET LJUNSTRÖM ANGTURBIN. Brit. 291,402, June 1, 1927.

Burner for dust fuel. TELEX APPARATEBAU- G. M. B. H. and WERNER HEINDORFF. Ger. 469,315, Dec. 22, 1923. Details of arrangement.

Rotating burner for powdered coal. SOCIÉTÉ ANON POUR L'UTILISATION DES COMBUSTIBLES. Fr. 641,478, Sept. 21, 1927.

Apparatus for feeding powdered coal and compressed air to furnaces. EWALD HERMSDORF. Fr. 642,437, Oct. 15, 1927.

Charging device for furnaces. ANTON CHMELICEK. Austrian 111,329, June 15, 1928. Structural modifications are described in furnace-charging means comprising a curved swinging shovel brought beneath the outlet of the fuel container.

Charging device for gas producers and other shaft furnaces. SOC. DES GRILLES & GAZOGÈNES SAUVAGROT. Ger. 469,392, May 15, 1927. The device is of the kind comprising a charging shaft having compartments which can be closed at top and bottom by two disks with oppositely set slits.

Charging device for horizontal and inclined retorts. GRAUE A.-G. Ger. 469,522, Mar. 8, 1928. The charge is placed in tubes, the upper and lower halves of which are relatively movable and which are so constructed that they can be introduced into the retort and then withdrawn, leaving the charge behind.

Charging hopper for shaft furnaces. EMANUEL SOBEK. Swiss 127,321, June 15,

1927. The upper part of the hopper is extended on one side to form a shoot for the charge.

Container for furnace charges. HERAEUS-VACUUMSCHMELZE A.-G. and WILHELM ROHN. Ger. 468,406, Sept. 9, 1928. The container is formed from smooth metal plates to which corrugated metal plates are riveted or welded on the inside, or both inside and outside.

Double closure for furnaces. A. G. BROWN, BOVERI, ET CIE. Swiss 127,085, June 2, 1927. Constructional details.

Regulating cooling of furnace parts. ERICH ROUCKA. Austrian 110,379, Mar. 15, 1928. The supply of cooling agent to the grate or other furnace parts to be cooled is effected periodically through a cam-actuated valve, the extent to which the valve is opened at each actuation being adjustable by means of suitably arranged wts.

Conveyor for passing gear blanks, bolts or other articles through heat-treating furnaces. FRANK T. COPE (to Electric Furnace Co.). U. S. 1,699,955, Jan. 22.

Furnace grate. JOSEF MUCHKA. Austrian 110,062, Feb. 15, 1928. The bars are arranged in 2 independent groups, in each of which the alternate bars are vertically adjustable relatively to the adjacent bars.

Furnace grate. MASCHINENFABRIK ING. HANS SIMMON. Austrian 110,056, Feb. 15, 1928. Constructional improvements are described in a grate of the kind having longitudinal bars, of tapering cross-section, which are bent over at the top so as to deflect the entering air.

Inclined furnace grate. RICHARD BABOUCZEK. Austrian 110,321, Mar. 15, 1928. In an inclined furnace grate constructed in sections, each section is fitted with longitudinal bars adapted to move in an opposite direction both to the adjacent bars and also to the corresponding bars in the adjacent sections.

Inclined furnace grate. PEDRO SALABERRI Y TELLECHEA. Ger. 468,520, Mar. 5, 1927. The overlapping, independently movable, plates of the grate can be fixed in more than one position.

Conveying furnace grate. FABRIK FÜR INDUSTRIEFUEHRUNGEN V. A. KRIDLÖ EISENGESEREI MASCHINEN FABRIK. Austrian 110,325, Mar. 15, 1928. In a furnace grate of the kind having alternate moving and stationary parts, each stationary part constituted by a double inclined plane rising gently from the adjacent moving part to the fuel feed side and falling steeply toward the other adjacent moving part, while the moving parts are of arcuate form and swing to and fro.

Chain guide for traveling grates. OTTO LEISSNER. Ger. 469,545, Feb. 2, 1926.

Swing closure for the discharge end of traveling grates. C. H. WECK COMM.-GRS. et 468,521, Aug. 28, 1926. Constructional details.

Oscillating bar-mover for furnace grates. GEORG PFEIFFER. Austrian 111,005, May 15, 1928. Constructional details.

Shakeable grate-bar frame for furnaces. MIROSLAV STOHR. Austrian 110,622 April 15, 1928. Constructional details.

Ovens heated by shaft-furnace gases. SOCIÉTÉ ANON. DES APPAREILS DE TRAITEMENT ET FOURS STEIN. Fr. 641,976, Mar. 21, 1927.

Oven for low temperatures. A. V. GRUM-GRZHIMAILO. Russ. 4881, Mar. 31, 1928.

Revolving ring-hearth oven suitable for drying, dry distillation, etc. LUDWIG HONIGMANN and FRIEDRICH BARTLING. U. S. 1,697,006, Jan. 1. Structural features.

Drying tunnel for ceramic ware or other materials. CLARENCE L. COLBERT (to Fiske & Co.). U. S. 1,697,556, Jan. 1.

Device for utilizing heat from rotary kilns. FRITZ LUTHER (to the firm G. Polysius). U. S. 1,698,313, Jan. 8. Means are provided for passing air through a cylindrical cooling drum associated with the kiln and the air may thence be passed to the interior of the kiln.

Pipe system for heating liquids flowing over the pipes. OTTO PROLLIUS (to Bergedorfer Eisenwerk A.-G.). U. S. 1,699,919, Jan. 22. Two groups of pipes are arranged in series with the upper group open to the air and the lower group enclosed in a jacket.

Electrical apparatus for heating liquids. V. V. PLOTNIKOV. Russ. 3983, Nov. 30, 1927.

Liquid heater. ALOIS JORDA. Austrian 110,625, April 15, 1928. The circulation of hot gases around the tubes of a tubular liquid-heater is assisted by a fan driven by the incoming liquid.

Preheater for liquids. V. M. ERIMOV. Russ. 4617, Feb. 29, 1928.

Apparatus for heating water or other liquids by combustion gases. JOSEPH SCHNEIBLER. U. S. 1,698,456, Jan. 8. Structural features.

Apparatus for superheating steam. TEODORO LARREY and LUIS GODARD. U. S. 1,697,123, Jan. 1.

Electric water-heater. OTTO GRAETZER. Swiss 127,192, July 5, 1927. Constructional details.

System for heating and supplying air to apparatus for drying paper (as made) or other materials. JOHAN G. OLSSON (to Aktiebolaget Svenska Fläktfabriken). U. S. 1,697,927, Jan. 8.

Apparatus for supplying liquid fuel under pressure to burners. ERNEST A. REID (one-half to Filma Oil Burners, Ltd.). U. S. 1,699,407, Jan. 15.

Burners for gaseous or liquid fuel. ANTOINE FERRACCI. Fr. 641,469, Sept. 16, 1927.

Oil burner. M. G. MALININ. Russ. 5110, April 30, 1928.

Intermixing oil and air to effect complete combustion. JOHN T. COOK (to Adolf F. Haffenreffer). U. S. 1,698,258, Jan. 8. An app. is described in which the oil is dispersed in the form of a rotating cone.

Combustion chamber for powdered and liquid fuels. ERICH VOGT and LUDWIG KIRCHHOF. Ger. 469,546, Dec. 7, 1924. A stack within the chamber carries channels for supplying cooling air to the hot gases, which pass from the combustion space on one side of the stack to an outlet in the cooling space on the other side.

Method for the indirect determination, or regulation, of the air for combustion in a gas furnace. CARL LÖBBECKE. Ger. 469,180, Nov. 9, 1927.

Gas-analysis apparatus. RICHARD H. KRUEGER (to Charles Engalhard, Inc.). U. S. 1,698,887, Jan. 15. An app. is specified which comprises a resistance heating element mounted in a thermal cond. cell having walls adapted for dissipating heat and adjustable means are provided for varying the capacity of the walls for dissipating the heat.

Washing apparatus for gas. MARCEL MALLET. Fr. 641,522, Sept. 27, 1927

Drying gas. W. C. HOLMES & CO., LTD. Fr. 640,961, Sept. 14, 1927. An app. is described for drying gas in which the gas is brought in intimate contact with a liquid hygroscopic agent.

Apparatus for the recovery of gas or vapors by absorbent charcoal. SOCIÉTÉ DE RECHERCHES ET D'EXPLOITATION PÉTROLIFÈRES. Fr. 33,081, Sept. 24, 1926. Addn. to 612,386. Constructional improvements.

Apparatus for bringing a gas in contact with an absorbent reagent. AUGUSTIN AMÉDÉE LOUIS JOSEPH DAMIENS. Fr. 641,864, Feb. 23, 1927. A rotating agitator carrying paddles and plates alternately one above the other is used for bringing a gas in intimate contact with a liquid.

Gas reaction apparatus. ALBERT BERENBRUCH (to I. G. Farbenind. A.-G.). Can. 285,713, Dec. 18, 1928. An app. is specified for carrying out exothermic catalytic gas reactions.

High-pressure gas burner. FRIEDRICH WOLFF. U. S. 1,697,549, Jan. 1. Structural features.

Gas burner construction. FRANK W. SHUELL and ELMER E. LEDBETTER (to Everhot Heater Co.). U. S. 1,699,032, Jan. 15.

Gas burner construction. ROBERT B. TYSON (39% to Ruth C. Berry and 20% to Lowell C. Butler). U. S. 1,699,318, Jan. 15.

Device for controlling gas supply to gas-burner pilots. ELMER E. LEDBETTER (to Everhot Heater Co.). U. S. 1,699,297, Jan. 15.

"Bubbling apparatus" for treating gases or vapors with liquids in counterflow. C. F. BRAUN. Brit. 291,527, March 3, 1927. Structural features.

Automatic gas or liquid shut-off valve. PARREN D. LINDSEY. U. S. 1,697,280, Jan. 1.

Automatic charging device for gas generators, blast furnaces and the like. THEODOR DE FONTAINE. Ger. 470,023, Oct. 31, 1925, and Ger. 470,024, Dec. 19, 1925.

Regulator for maintaining constant proportions in mixtures from gas or liquid currents. DEUTSCHE ROTAWERKE G. M. B. H. Ger. 469,184, April 12, 1927. Details of arrangement.

Device for abstracting an aliquot part of a stream of air, gas, steam, etc. WOLDEMAR ALLNER. Ger. 469,665, Oct. 16, 1925. A valve in the conduit of the secondary stream is automatically adjusted in accordance with the variations in pressure of the main stream.

Automatic acetylene generator. EMIL MENZ. U. S. 1,698,645, Jan. 8. Structural features.

Acetylene generator (in which carbide is fed into water). J. HAWORTH. Brit. 291,897, March 17, 1927.

Acetylene generator (feeding carbide into water). J. HAWORTH. Brit. 291,872, March 10, 1927. Structural features.

Air-removing means for acetylene generators. JAC. KNAPPICHT. Ger. 469,508, Dec. 23, 1926. Connections between the gas holder and the generator are described which operate in such a way that gas is supplied to the generator when either the cover of the charging hopper or the sludge-removing cock is opened.

Apparatus for classifying coal and other minerals. MIGUEL BONGERA. Fr. 642,215, Oct. 12, 1927.

Reciprocating concentrating table. MARTIN J. LIDE. U. S. 1,696,918, Jan. 1, 1928. Structural features.

Eccentric rotating apparatus for intimately mixing substances. ÉTABLISSEMENTS TENCE & COMPAGNIE FRANÇAISE D'APPLICATIONS CHIMIQUES RÉUNIS (Rodolphe Spatz, inventor). Fr. 641,892, Mar. 12, 1927.

Mixing and grinding apparatus. HARTSTOFF-METALL, A.-G. Swiss 127,089, June 17, 1927. Constructional improvements are described in app. of the type in which the material is whirled into two or more eddies which are repeatedly made to impact one on another.

Mixing and grinding apparatus. HERMANN HILDEBRANT. Ger. 469,535, Aug. 16, 1924. Addn. to 440,089. Modifications are described in app. of the kind covered by Swiss 127,088 (C. A. 23, 1188).

Distributor for finely granular or powdered materials. MASCHINENFABRIK GREVENBROICH A.-G. Ger. 469,468, May 19, 1927. A no. of angular bars arranged side by side at the bottom of a hopper are oscillated about their longitudinal axes by common oscillating means. The app. is useful in adding CaO to dild. molasses.

Machine for pulverizing stone. ERNST HJALMAR CARLSSON. Swiss 127,732, Oct. 27, 1927.

Diffusion apparatus. KARL KOMERS. Fr. 642,278, June 8, 1927. In the continuous diffusion of materials, the material passes round a horizontal cylindrical vessel in which the diffusion liquid is maintained at a const. level and is caused to travel counter to the material which is evacuated after treatment above the level of the liquid.

Liquid-distributing apparatus. SOC. ANON. POUR TOUS APPAREILLAGES MÉCANIQUES. Swiss 127,213, May 19, 1927. Constructional improvements are described in app. of the type comprising two measuring vessels, one of which is being filled while the other is being emptied.

Apparatus for determining the distribution ratio of a solute between two miscible solvents, etc. GRINNELL JONES. U. S. 1,699,070, Jan. 15, 1928. An app. is specified having sep. vessels for two different solvents, with communication for gas and vapor between them, which by mere rotation causes a continuous circulation of gas or vapor so that it bubbles through the two solns. for as long as the rotation continues. The const. variation in the level of the liquids in the vessels gives rise to a pulsating effect with a resultant circulation of the gas or vapor. An equality in the vapor pressure of the common volatile constituent is thus ensured between the two sepd. liquid phases. After the desired equil. has been established the liquids may be withdrawn from the system by removing stoppers and inserting siphons into the vessels. The two solns. are then separately available for analysis. The app. is suitable for the study of the distribution of CO₂ between water and any salt of carbonic acid from which conclusions as to the const. of the acid can be computed. Similarly, the distribution of SO₂ between water and solns. of its salts can be studied. Likewise, the amount of free NH₃ formed by the hydrolysis of any of its salts can be found and the const. of the acid detd. Or, the equil. between NH₃ and its complex compds. of the type Ag(NH₃)₂ can be detd. If it is desired to use the app. as an extractor, say of moisture, concd. H₂SO₄ may be placed in one tube and any substance placed in the other tube will have its moisture extracted more quickly than in a desiccator. An example is given of the use of the app. for detg. the distribution ratio of I in the systems NaI-H₂O and KI-H₂O and it may be used with Br, NH₃, CO₂ or other volatile solutes generally.

Device for delivering two different measured quantities of a liquid. KOMMANDIT GES. ROSENTHAL & Co. Austrian 110,231, Mar. 15, 1928. Addn. to 108,102. Constructional improvements are described in app. of the kind comprising two measuring vessels, one of which is in process of filling while the other is emptying.

Siphon for transferring liquids. M. M. MIKAEVYANTZ. Russ. 4739, Feb. 29, 1928.

- Atomizer for liquids.** A. I. KOLYUBAKIN. Russ. 4776, Feb. 28, 1928. Mechanical. Device for the uniform evaporation of liquids, and for the uniform mixing of gases with the vapor. ROBERT MEZGER. Ger. 469,290, Jan. 31, 1928. Description of app.
- Apparatus for making aqueous solutions of carbon dioxide for baths or beverages.** HEINRICH JUNGHANS. Swiss 127,277, July 28, 1927. Structural features.
- Apparatus for producing dispersions of solids in liquids.** WILLIAM H. WHATMOUGH (to Standard Products Corp.). U. S. 1,698,354, Jan. 8. A beater formed of superposed layers of wire gauze is mounted within a liquid-tight casing and may be rotated at high speed.
- Apparatus for treating water or other liquids with proportioned quantities of reagents.** CHARLES B. CUSHWA. J. S. 1,698,537, Jan. 8.
- Pump (with concrete casing and impeller) for handling acid iron chloride solutions or other corrosive liquids.** GEORGE P. FULLER. U. S. 1,698,495, Jan. 8. Structural features.
- Mashing vessel with cooling coils (suitable for treating massecuit from the boiling apparatus or other crystallizable substances).** A. ROLZ. Brit. 291,035, May 24, 1927.
- Device for breaking down foam formed on skimmed milk or other liquids in bulk.** MAGNUS KRISTOFFERSSON. U. S. 1,699,196, Jan. 15.
- Automatic steam escape and pre-heater for distilling apparatus.** GEORG KNOTH. Ger. 469,167, July 30, 1927. Description of arrangement.
- Measuring vessel.** NATHAN LEBOVITS. Austrian 110,057, Feb. 15, 1928. A measuring vessel for liquids is enclosed in a 2nd vessel which receives the overflow, and the space between the 2 vessels is closed at the top except for an opening diametrically opposite to the beak of the measuring vessel.
- Apparatus for measuring ultra-violet radiations.** LUCIEN MALLET and MME. DANNE (née Marie-Thérèse Rouffiac). Fr. 641,721, Oct. 1, 1927.
- Apparatus for transmission, measurement and registration of small pressures.** S. A. NOZDROVSKII. Russ. 3967, Sept. 15, 1924.
- Chemical analysis of liquids.** UNITED WATER SOFTENERS LIMITED AND HENRY STAFFORD HATFIELD. Fr. 641,572, Sep. 20, 1927. An app. is described for indicating the % of a constituent in a liquid, any alteration in elec. cond. due to chem. change, disson. or elimination of the constituent in the liquid being recorded automatically. An application to the *measuring of temporary hardness in water* is described.
- Device for recording sudden accelerations and decelerations.** JOHN B. BASKERVILLE (to Impactograph Corp.). U. S. 1,698,576, Jan. 8.
- Apparatus for colorimetric testing.** R. L. REES. Brit. 291,174, March 11, 1927. Liquid is automatically delivered by a siphon from a mixing vessel to a colorimeter where it is inspected; variations in pressure in the mixing vessel cause movement of a Hg seal so as to entrap a measured volume of indicator and deliver it to the mixing vessel. Various details of construction are specified.
- Colorimetric and photometric apparatus.** A. C. HARDY and F. W. CUNNINGHAM. Brit. 291,397, June 1, 1927.
- Illuminating device for microscopes.** AUGUST KÖHLER (to the firm of Carl Zeiss). U. S. 1,699,667, Jan. 22.
- Apparatus for determining the hardness of materials.** I. N. KLINNIKOV. Russ. 4749, Feb. 29, 1928.
- Apparatus for the determination of the rate of evaporation of water.** V. V. SHULEIKIN. Russ. 5229, April 30, 1928. Lab. app.
- Catalytic apparatus.** THE SELDEN COMPANY. Fr. 642,471, Oct. 13, 1927. Cooling elements, imbedded in the catalyst, consist of external tubes with closed ends imbedded in the catalyst and internal tubes with open ends in the external tubes, and means for causing the reaction gases to pass down the internal tubes, up the external tubes and down through the catalyst. The tubes at the center are nearer one another than those at the outside. The speed of the gases is decreased in going from the central tubes to those at the outside by varying the cross section of the tubes, whereby a substantially uniform cooling is produced in the catalyst. Cf. C. A. 22, 4015.
- Discharging liquids from containers under low pressure into containers at higher pressure.** V. G. SHUKHOV, I. I. YELIN, N. E. BERNZOVSKII and I. N. ACKERMAN. Russ. 4902, Mar. 31, 1928. An intermediate container connected with the low and high pressure containers has the inlet and outlet valves connected to a shaft which opens one valve at a time while closing the other.
- Differential pressure gages.** S. O. MAXIMOVICH. Russ. 4819, Mar. 31, 1928. A U-shaped tube is filled with a liquid, the level of which depends on the heat generated by an elec. heating element immersed in the liquid in one end of the tube. Russ. 4820,

Mar. 31, 1928, specifies a bent tube with 3 bulbs filled with a liquid, the level of which depends on the heat generated by an elec. heating element immersed in the liquid on one or both ends of the app.

Steel digesters with aluminum or other lining resistant to oxidation.. C. HAUTIER. Brit. 291,364, May 30, 1927.

Mercury vapor jet pump for removing air from rectifiers, etc. ALLGEMEINE ELEKTRIZITÄTS-GES. (to International General Electric Co.). Brit. 291,744, June 7, 1927.

Extractor, especially for cellulose manufacture. GEORG PAUL KROPP. Ger. 468,656, May 11, 1926. An extractor of the kind having a false bottom on which the material to be extd. is placed and beneath which is a heating space for the circulating liquid is constructed so that the heated liquid rises up tubes and is sprayed over the material, returning to the heating space through openings not directly above the heating means.

Activating refractory metal filaments. JOHN W. MARDEN (to Westinghouse Lamp. Co.). U. S. 1,698,850, Jan. 15. In activating filaments such as those of W for electron-emission purposes, a mixt. of powdered Al and K Th fluoride is held on the filament by a suitable binding material such as cryolite and the filament is heated in an evacuated enclosure to cause interaction between the Th compd. and the Al with liberation of free Th on the filament.

Air-excluding device for benzene, petroleum and like substances. SIEMENS & HALSKE A.-G. Ger. 469,293, Oct. 18, 1925.

Device for removing scale from bent pipes. A. M. LIPSKII. Russ. 4969, Mar. 31, 1927.

Apparatus for proportioned mixing of soap and water or other substances. KENT W. BARTLETT. U. S. 1,698,183, Jan. 8.

Mill for grinding paint or other wet or dry materials. J. H. J. WOOD. Brit. 291,952, June 7, 1927.

Grinding mill for paints, etc. MACAO-WALZENMÜHLEN-GES. Brit. 291,803, June 9, 1927. Structural features.

Apparatus (with rotary disks) for emulsifying or mixing or grinding inks, paints, dyes or pharmaceutical products, etc. C. P. WALKER. Brit. 291,957, June 13, 1927.

Annealing box and cover of sheet iron. V. DEMMER. Brit. 291,718, March 3, 1927. Structural features.

Apparatus for molding multiple or stack molds. JOHN A. RATHBONE (to Rathbone Machine Co.). U. S. 1,697,022, Jan. 1.

Light-operated device suitable for operating electric switches, etc. IRA E. McCABE. U. S. 1,697,986, Jan. 8. Structural features.

Thermostatic apparatus for control of heating systems. BENJAMIN F. GAINES. U. S. 1,698,191, Jan. 8. Structural features.

Thermostatic control for electric circuits. AXEL O. APPELBERG. U. S. 1,699,940, Jan. 22.

Thermostatic control device for electric circuits. COREL A. STILWELL. U. S. 1,699,317, Jan. 15.

Thermostatic control for fuels supplied to furnaces. HARRY F. SMITH (to Gas Research Co.). U. S. 1,697,209, Jan. 1. Structural features.

Thermostatically controlled apparatus for regulating the temperature of mandrels, etc. THOMAS M. KNOWLAND and HOWARD A. HANDS (to Hood Rubber Co.). U. S. 1,699,296, Jan. 15.

Thermostatically controlled valve. CLARENCE H. MORROW (to Hotstream Heater Co.). U. S. 1,698,413, Jan. 8.

Thermostatic disk for control of electric circuits. JOHN A. SPENCER (to Spencer Thermostat Co.). U. S. 1,697,886, Jan. 8. Structural features.

Thermostatic safety cut-off device for gas burners. T. HERSZLIK. Brit. 291,309, Dec. 16, 1927.

Thermostatic valve for controlling flow of heating or cooling fluids. W. A. VAN BERKEL. Brit. 291,669, Oct. 20, 1927.

Thermostatically controlled electric water heater. ARTHUR J. KERCHER and WILLIAM W. HICKS. U. S. 1,699,738, Jan. 22. Structural features.

Thermostatic and safety devices for control of valves supplied to burners, etc. S. J. LONERGAN and H. E. GINTHER (to Bastian-Morley Co.). Brit. 291,076, May 28, 1927. Structural features.

Interconnected thermostatically controlled valves for controlling proportional flow

- of air and fuels or other fluids supplied through separate passages. CHARLES A. MARTIN. U. S. 1,697,432, Jan. 1.
 Thermostat for controlling the supply of gas to burners. H. J. YATES, M. HOW-
 LETT & Co., LTD., and J. DOLPHIN. Brit. 291,223, May 24, 1927.
 Thermostat suitable for controlling valves of gas burners. JOHN H. GRAYSON.
 U. S. 1,699,468, Jan. 15.
 Thermostat of the bimetallic spring type. SIEMENS & HALSKE A.-G. Swiss 127,-
 062, June 3, 1927. Constructional details.

2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

Evolution of the odd-numbered elements. W. V. HOWARD. *J. Phys. Chem.* 32, 1725-42(1928).—On the basis of the following hypothesis of at. evolution is developed. The first to form were the even-numbered elements between C and Ni, together with H and He; these are the building materials of the universe. Odd-numbered elements whose mass numbers are higher than those of Ni were then formed by the addn. of He atoms and neutrons to atoms already existing. The evolution of heat and activity and the formation of H. This hypothesis of at. disintegration will account for volcanic activity and the formation of the hydrosphere and the atmosphere. LUCIEN MALLARD and HAVIGHURST.

Helium. III. Behavior of helium toward glass and palladium and of helium compounds. FRITZ PANETH AND KURT PETERS. *Univ. Berlin. Chem. Abt. B*, 1, 253-69(1928); cf. *C. A.* 23, 328.—Even at room temp. glass is permeable to He. With He at 0.5 atm. about 10^{-11} cc. He per hr. pass through 1 cm.² of glass wall 0.5 cm. thick. He present in the air will accumulate in a vessel by mere diffusion through the glass walls, at room temp., but the small pressure of He in the atmosphere makes the process so slow that it requires a long time and very sensitive devices to detect the He inside the vessel. The permeability of glass to He increases decidedly with the temp. Since Ne is practically stopped by a glass wall, Ne free He can be prepared from atmospheric air by one diffusion through glass. Glass seps. Ne from He not only by diffusion but also by adsorption and soln. He dissolved in glass can be more easily recovered by heating in an atm. of H₂ than in *vacuo*. Red hot Pd is impermeable to He. A sharp sepn. is obtained in He-H₂ mixt. The ratio of mols. of H₂ to mols. of He in gases passed through hot Pd is 10^{12} to 1. Attempts were made to prepare As, Sb, Pb, Ge, Se, I and Cl helides, but without success. There is no evidence that such compds. exist. ALBERT L. HENNE.

Note on magnetic properties of evaporated films of nickel. K. J. MILLER. *St. Univ. of Iowa. Phys. Rev.* 32, 689-90(1928).—Films of Ni formed by evapn. on foil were tested in fields up to 167 gauss. The coercive force reached a value approx. 3 times that for hard-drawn wire and the retentivity was as high as 65%. Coercive force decreased as the temp. of deposit decreased and as the thickness of the film decreased. A critical thickness was not observed. The films were uniform in thickness and their properties were not influenced by distortion of the deposit. B. L.

Effect of magnetic fields upon the thermal conductivity of iron, copper, gold, silver and zinc. HUGH M. BROWN. *Univ. of Calif. Phys. Rev.* 32, 508-14(1928).—A "bar method" was used to measure thermal cond. and elec. resistivity for Fe, Cu, Ag and Zn in and out of a longitudinal field of 10,000 gauss, and transverse fields of 8000 and 4000 gauss. Cu-constantan thermocouples spot-welded to the bars were used to measure the temps. For Fe, the 10,000-gauss longitudinal field caused a decrease of 1.14% in heat cond. and the transverse field of 4000 gauss a decrease of 0.4%. Elec. resistivity was increased 0.2% by the 10,000-gauss field. For Cu the thermal cond. was decreased 0.23% by the field of 10,000 gauss. In all the other cases the fields produced no effects large enough to detect, although the method would readily show a change amounting to 0.04%. Both ordinary cast Zn and slowly grown crystal Zn were used. The values for elec. and thermal cond. were higher in the crystal bar, but the magnetic fields produced no change in either bar. Thus, the thermal cond. of these metals does not increase in strong fields. BERNARD LEWIS.

The principal types of chemical compounds of the first order, illustrated by the carbides. A. ANTROPFF. *Univ. Bonn. Z. Elektrochem.* 34, 533-6(1928).—All 5

types of compds. of the first order distinguished by Grimm (Handbuch d. Physik XXIV), are illustrated among the carbides. (1) Elements of the lower left-hand portion of the periodic table form carbides, like Na_2C_2 , that are polar, salt-like in character, analogous to NaCl . They have high m. ps., crystallize in ionic space lattices and conduct electrolytically. (2) Elements of the upper right-hand portion of the table form carbides, like CH_4 or CCl_4 , that are non-polar, analogous to H_2O , HCl , ZnS . They have low m. ps. that increase with mol. wt., crystallize in mol. space lattices and are non-conducting. (3) Elements of the upper middle part of the table form carbides, like CSi , that are tetrahedral (diamond-like). They have very high m. ps., and pseudoatomic space lattices which are really single mols. of unlimited size. (4) Elements of the lower middle part of the table form carbides, like Fe_3C , that are non-polar, metallic in character, analogous to compds. between metals. They have true at. space lattices and conduct and reflect like metals. (5) Intermol. compds. are exemplified by the condensed hydrocarbons. Compds. of types 1, 2 and 3 are "valence compds." in which both elements have their normal valences and the force causing combination is the formation of a stable shell by the valence electrons of both atoms. In type 1 the shell encloses the anion only, in types 2 and 3 it encloses the nuclei of both atoms. In type 3 the atoms are all bound together like the C atoms in satd. aliphatic compds. Compds. of type 4 are "atomic compds." or "packing compds." in which the valence of the atoms is abnormal, or if normal only fortuitously so. The force causing combination is a "packing effect" due to van der Waals' forces. F. L. BROWNE

Dipolar momentum of some methane and ethane derivatives. JOHN WARREN WILLIAMS. Univ. Leipzig. *Z. physik. Chem., Abt. A*, **138**, 75-84 (1928).—The dielec. consts. of $\text{C}_2\text{H}_4\text{Cl}_2$, $\text{C}_2\text{H}_4\text{Br}_2$, MeI , EtI , $\text{C}_2\text{H}_4\text{I}_2$, $\text{C}_2\text{H}_4(\text{OH})_2$, MeCN , EtCN , $\text{C}_2\text{H}_5(\text{CN})_2$, and PhCN have been detd. at 25° in C_6H_6 . The values, in electrostatic units $\times 10^{-18}$ are, resp.: 1.75, 1.4, 1.6, 1.7, 1.3, 1.5, 3.4, 3.4, 3.8 and 3.85. The dipolar momentum is attributed to one definite group, and the rest of the mol. is regarded as non-polar. The derivs. resulting from substitution of the same group in C_6H_6 , CH_4 or H_2O , resp., differ in dipolar momentum. In the cases of mols. of the $\alpha\text{CH}_2\text{-CH}_2\alpha$ type, the angle between the vectors and the axis of the mol. is calcd. ALBERT L. HENNE

The dielectric constant and the electric moment of CO , COS , CS_2 and H_2S . C. T. ZAHN AND J. B. MILES, JR. Princeton Univ. *Phys. Rev.* **32**, 497-504 (1928); cf. *C. A.* **20**, 2613.—By the heterodyne null method measurements of the variation of the dielec. const. with temp. were made on a further series of gases. The results are very well interpreted by the Debye equation $(\epsilon - 1)/T = A/T + B$. The values for A are: CO , 0.000670; CS_2 , 0.002798; COS , 0.001970 and H_2S , 0.001223. The values for B are: 0.0078; CS_2 , 0.089; COS , 0.352 and H_2S , 0.722. These values of B give for the electric moment in e. g. s. c. s. units $\times 10^{18}$: CO , 0.10; CS_2 , 0.326; COS , 0.650; H_2S , 0.1. All measurements in the same app. are compared with those of other observers, the important discrepancies are discussed. CS_2 and COS may have a rectilinear structure like that of CO_2 . BERNARD LEWIS

Dielectric constants of aqueous solutions of methyl orange, helianthine and other pholytes. A. THIEL AND E. HORN. Univ. Marburg. *Z. anorg. allgem. Chem.* **176**, 15 (1928).—The results obtained by O. Blüh, on the dielec. const. of methyl orange, *o*- and *p*-aminobenzoic acids could not be duplicated. The ϵ - c curves of these compds. show a steady decrease. The dielec. consts. of aq. solns. of helianthine differ little from that of H_2O to be detected accurately. The soly. of this ampholyte is probably too small to cause any detectable effect. The ϵ - c curves of $\text{H}_2\text{NCH}_2(\text{CH}_2)_2\text{NH}_2$, $\text{Me}_2\text{CHCH}(\text{NH}_2)\text{CO}_2\text{H}$ and $\text{NH}_2\text{CH}_2\text{CONHCH}_2\text{CO}_2\text{H}$ were detd. When c increases, ϵ falls rapidly to a min., then rises regularly to a value higher than the initial ϵ . ALBERT L. HENNE

The electric resistance of alloys under pressure. C. W. UFFORD. Harvard Univ. *Phys. Rev.* **32**, 505-7 (1928).—The av. pressure coeffs. of elec. resistance up to 12,000 $\text{atm.}/\text{cm}^2$ are tabulated for three series of alloys: Li-Sn , Bi-Sn , Ca-Pb and for one Mg alloy of 10% Mg . The variation of the pressure coeff. with concn., the temp. coeff. and the relative change of the temp. coeff. with pressure are as would be expected from the variation in the structures of the alloys as given by the equil. diagrams for the 3 series of alloys. The cond. and the pressure coeff. of a dil. solid soln. of Bi-Sn are the same as those of pure tin under pressure. Since hydrostatic pressure and impurities have the same effect on the pressure coeff., elec. conduction probably depends on the geometrical properties of the conductor. BERNARD LEWIS

The electrical conductivity of dilute liquid amalgams of gold and copper at various temperatures. T. C. WILLIAMS AND E. J. EVANS. Univ. Coll., Swansea. *Phil. Mag.* **16**, 1231-53 (1928).—The conductivities of dil. amalgams of Cu and Au were detd.

at 11.5°, 100° and 300°. At each temp. the cond. was detd. over the max. range of concn. possible at 11.5° in the case of Au amalgams and in the case of Cu amalgams over the max. range of concn. possible at the temp. of measurement. For Au amalgams of concn. 0.1221 and 0.2441, the cond. was also measured at 217.3° and 257.5°. (Concn. is given in gram atoms of metal per 100 gram atoms of Hg.) The av. temp. coeffs. of resistivity between 11.5° and t° were measured for Au amalgam of concn. 0.1221, and for Cu amalgam of concn. 0.0322; in both cases the coeffs. were found to increase as the difference in temp. increased. However, the values were less than the corresponding ones for pure Hg. The av. temp. coeff. of resistivity for Au amalgams of various concns. between 11.5° and 100°, diminished as the concns. increased. In Au amalgams, at 11.5° and 100° the increase in cond. as compared with the cond. of Hg at the same temp. was nearly proportional to the concn., but at 300°, in both Cu and Au amalgams such was not the case. For Cu and Au amalgams, the ratio of the increase of cond. over that of Hg to the concn. was detd. at each temp. and for each concn., and the values compared with the corresponding ones obtained by Johns and Evans (*C. A.* 22, 1892) for Ag amalgams. This value at infinite dilm. was found practically the same at the same temp. for amalgams of Cu, Ag and Au, indicating that, atom for atom, the different metals in Group Ib in the Periodic Table have the same effect on the cond. of Hg.

GEORGE GLOCKLER

Wiedemann-Franz law. E. GRÜNEISEN. *Z. physik. Chem., Abt. B*, 1, 379-84 (1928); cf. *C. A.* 23, 563.—Answer to the criticism of Eucken (*C. A.* 22, 3090). The calcd. and observed values of G . are in better agreement than indicated by E.

ALBERT L. HENNE

The polymerization distance between charged ions in the process of persulfate formation. O. A. ESIN. Ural Polytech. Inst. *Z. Elektrochem.* 34, 758-60(1928).—An equation is derived which gives the distance between charged sulfate ions at which polymerization is possible as a function of the thickness of the layer of ions around the anode and as a function of the time which the mols. so formed can exist. The distance is relatively great, namely 10^{-6} cm.

MALCOLM DOLE

Deformation of ions and molecules based upon refractometric data. K. FAJANS. *Z. Elektrochem.* 34, 502-20(1928).—The 2 limiting forms of chem. combination are: (1) ideal undeformable ions, (2) completely non-polar combination attained with two equal atoms, as in the cases of alkali halides (both as vapor and in crystal lattice), H_2 , N_2 , diamond, Si and gray Sn. The behavior of most substances is intermediate between these extremes, for example, HCl with a known nuclear distance (1.26 A. U.) is shown to have a dipolar length of 0.216 A. U. instead of zero, which the ideal non-polar mol. would show. It is a valid law that cations of the noble-gas type and the H nucleus lower the refractivity of neighboring anions or neutral mols. as a result of the compressive effect of the additional positive charge, the more so the smaller and more highly charged the cation and the larger the deformability, i. e., the refractivity of the anion or mol. There is a distinct diminution of refractivity of ions in soln. as compared to gaseous condition due to the deforming compressive effect of the cations on the mols. of H_2O hydrating the ions. In the majority of cases when ions unite with each other or with neutral mols. or even the latter with each other, larger or smaller deviations of the Lorentz-Lorenz function from additivity occur, which certainly in the case of ions and possibly also in the case of interaction between neutral mols. alone may be considered evidences of an effect on the electron shells of the components of the system by elec. fields of the adjacent particles.

A. P. SACHS

Variation with state of the optical properties of potassium and cesium. J. B. NATHANSON. Carnegie Inst. Tech., Pittsburgh, Pa. *J. Optical Soc. Am.* 17, 343-9 (1928); cf. *C. A.* 22, 4060.—The optical properties of the surface of an alkali metal in the liquid and in the solid state are nearly identical. They were observed by allowing monochromatic light, polarized in a plane at an angle of 45° to plane of incidence, to be reflected from a mirror at an angle of 45°. The difference in phase of the vertical and horizontal components of the reflected elliptically polarized light was detd. by a Babinet compensator while the azimuth of the restored plane polarization was detd. by means of the analyzing nicol in the eye-piece.

A. P. SACHS

Absorption of light by strong electrolytes. H. v. HALBAN. *Z. Elektrochem.* 34, 489-97(1928).—In homogeneous systems the absorption of light by strong electrolytes is assumed to be an additive function of the concns. of the mol. species present and appreciable deviations from additivity are attributed to changes in compn. and to the existence of equilibria. The mol. extinction coeff. ϵ of individual weak electrolytes depends upon the dilm. in the same manner as the mol. cond., μ . This means that the ions absorb appreciably in the spectrum region examd. while undissociated mols.

do not. But Hantzsch and Bjerrum noted that for certain strong electrolytes ϵ is const. in certain ranges of concn. in which μ varies, leading B. to call this behavior characteristic of strong electrolytes and indicating complete dissociation. For solns. more dil. than $M/100$ Beers' Law is obeyed. v. H. examd. solns. contg. NO_3^- as the absorbing ion and various non-absorbing cations, and found that all cations, including those of alkali metals, produce an effect on the absorption spectra. Quant. study of the data shows that in solns. of strong electrolytes we have not only free (hydrated) ions but also a limited no. of particles contg. both anion and cation, which may be united in equiv. or non-equiv. amts. to form either undissociated mols. or complex ions. The anion in these groups has suffered considerable deformation (compared to its free condition) which is, however, less for the nitrates than the deformation of the HNO_3 mol. or its esters.

A. P. SACHS

Color of iodine solutions. FREDERICK H. GETMAN. *J. Am. Chem. Soc.* 50, 2883-90 (1928).—Extinction coeffs. of solns. of I in purified solvents, measured at 10 $m\mu$ intervals throughout visible spectrum, indicated that there are 2 classes of solns.: (1) violet, with max. absorption at 520–540 $m\mu$ and (2) brown, with max. absorption at 460–480 $m\mu$. Solvents giving violet solns. ($n\text{-C}_6\text{H}_{14}$, C_6H_6 , C_7H_8 , CS_2 , CCl_4 and CHCl_3) are satd., while those giving brown solns. ($\text{C}_2\text{H}_5\text{OH}$, $\text{iso-C}_3\text{H}_7\text{OH}$, $(\text{CH}_3)_2\text{CO}$, $\text{C}_6\text{H}_5\text{N}$ and $\text{C}_6\text{H}_5\text{COCH}_3$) are unsatd. Solns. of I tend to change upon standing, the extent of the change depending upon the unsatn. of the solvent.

A. P. SACHS

Interpretation of Laue patterns when the incident bundle of rays does not coincide with any crystallographic axis. J. PALACIOS. *Anales soc. españ. fis. quim.* 26, 215–8 (1928).—In Laue patterns obtained with bundles of rays parallel to a crystallographic axis it suffices to resort to a gnomonic projection to obtain easily the indices of the crystallographic plane to which belong each one of the many which appear in the photograph. However, it often happens that it is convenient or necessary to obtain patterns where the incident rays do not coincide with any crystallographic axis. In such cases gnomonic projection gives points which, since they do not hit the nodes of a rectangular network, cannot be interpreted directly. The Hilton gnomonic model serves to pass from the gnomonometric projection obtained directly to that which would have resulted if the bundle of rays were parallel to a crystallographic axis. It has the inconvenience, however, of serving only for a given distance between the crystal and the plate. A simple geometric method, is described by which is obtained the same result as with the Hilton model and which, moreover, permits interpreting by simple inspection the relations between the gnomonic projection obtained directly and that which would have resulted in the case of incidence parallel to an axis.

E. M. SYMMES

Crystalline structure of praseodymium. P. SCHERRER AND J. PALACIOS. *Anales soc. españ. fis. quim.* 26, 309–14 (1928).—A black and a brown PrO_3 used by Cabrera for magnetic measurements were tested by the Debye-Scherrer method with radiation from Cu rays and a 2.90-cm. aperture. The diagrams were identical, showing a fluorite structure.

E. M. SYMMES

The arrangement of crystallites in multiple crystals (fibers). E. SCHMID. *Z. Metallkunde* 20, 370–7 (1928).—The anisotropy of crystals, and its significance in fibering is discussed. The x-ray method of detg. fibering, especially in metals, is compared with etching and similar methods. The results of studies on fibering due to crystal growth, crystal deformation, and recrystn. are summarized.

R. L. HERSHEY

The crystal structure of solid methane. J. C. McLENNAN AND W. G. PLUMMER. *Nature* 122, 571–2 (1928).—Solid CH_4 was examd. by the powder method at a temp. between that of liquid air and liquid H. A cubic modification, $a = 6.35$ A. U., with 4 mols. to the unit cell, was the only one found. The lattice is apparently face-centered. If it may be assumed that all C atoms are crystallographically identical, and that all H atoms are identical in this sense, the symmetry of the C atom in solid CH_4 is either T or T_d .

R. L. HERSHEY

The crystal structure of silver subfluoride. HENRY TERREY AND HUGH DIAMOND. *J. Chem. Soc.* 1928, 2820–4.— Ag_2F crystals were prepd. by electrolyzing a concd. soln. of Ag_2F at 60° with a low current density. An examn. by the x-ray powder method showed that Ag_2F has a hexagonal unit cell of dimensions $a = 2.989$ A. U. and $c = 5.710$ A. U. There is one mol. to the unit cell. Intensity considerations appear to indicate a CdI_2 type of structure with $\mu = 0.3$.

R. L. HERSHEY

The crystal structure of potassium sulfate. FRANK P. GOEDER. Univ. of Chicago. *Proc. Natl. Acad. Sci.* 14, 766–71 (1928).— K_2SO_4 is known to have 4 mols. to the unit cell, lattice const. as follows: $a = 5.746$ A. U., $b = 10.033$ A. U. and $c = 7.443$ A. U., and the space-group 2 D_6 -13. If K^+ and SO_4^{--} are considered to appear as such in the lattice, and the SO_4^{--} group to have the symmetrical tetrahedral structure generally

assumed, a comparison of exptl. results with the theory of space groups indicates the following positions for K: 000; $\frac{1}{2}$ 0 $\frac{1}{2}$; 0 $\frac{1}{2}$ $\frac{1}{2}$; $\frac{1}{2}$ $\frac{1}{2}$ 0; 00 $\frac{1}{2}$; $\frac{1}{2}$ 00; 0 $\frac{1}{2}$ 0; $\frac{1}{2}$ $\frac{1}{2}$ $\frac{1}{2}$; and for S: 0 $\frac{1}{2}$ $\frac{1}{2}$; $\frac{1}{2}$ $\frac{1}{2}$ 0; 0 $\frac{1}{2}$ 0; $\frac{1}{2}$ $\frac{1}{2}$ $\frac{1}{2}$. The positions of O are tabulated for a structure of K_2SO_4 in which each K is equidistant from two O atoms and the two K's and the S atom lie on the same straight line. The powder diagram predicted for this arrangement agrees exactly with the diagrams found exptly.

R. L. HERSHEY

The space-group of staurolite and its regular parallelism with cyanite. GABRIEL M. CARDOSO. *Ber. Verhandl. sächs. Akad. Wiss. Leipzig Math.-Phys. Klasse* **80**, 165-98(1928); cf. *C. A.* **22**, 2342.—A series of rotating and oscillating crystal diagrams were made, with Lilienfeld and Coolidge tubes with Mo targets, and a Müller tube with a Cu target and Lindemann windows. The unit cell of staurolite contains 2 mols., having the formula $[SiO_6]_4Al_1Fe_2H$; the translation group is Γ'_0 ; the dimensions of the unit cell are: $a_0 = 7.81$ A. U.; $b_0 = 15.69$ A. U.; $c_0 = 5.64$ A. U. The space group is found to be V_{11}^{17} . The cyanite structure is studied by comparison with staurolite, a pseudorhombic cell being assumed for cyanite. On this basis a cell contg. 16 mols., having the dimensions $a_1 = 26.868$ A. U., $b_1 = 7.883$ A. U. and $c_1 = 5.650$ A. U. and having angles, $\alpha_1 = 90^\circ 5' 30''$, $\beta_1 = 90^\circ 5' 2''$ and $\gamma_1 = 90^\circ 26' 55''$ is developed. The direction [411] of cyanite is parallel to the [010] direction of staurolite on this basis. Hence a close similarity of the microstructure of staurolite and cyanite is shown to exist.

R. L. HERSHEY

Molecular theory of crystal growth. F. BRANDENBERGER. *Z. Krist.* **66**, 120-30 (1927).—A mol. theory of crystal growth, in accord with the lattice theory of crystal structure, is proposed.

B. C. A.

Isomorphism, polymorphism and morphotropy. I. Compounds of the ABX_3 type. G. NATTA AND L. PASSERINI. Reale Politecnico, Milano. *Gazz. chim. ital.* **58**, 472-84(1928).—The close relation between isomorphism and polymorphism on the one hand and the dimensions and structure of the lattice on the other shown by Goldschmidt (cf. *C. A.* **20**, 3414) for salts of oxygenated acids (chlorates, nitrates, etc.) of the ABX_3 type suggested a similar study of *alk. halomercuriates and halocadmicates*. The present paper deals with the x-ray examn. of some *halomercuriates and halocadmicates* of Ce by the Laue powder method and by the rotating-crystal method. The cubic forms of $CeHgCl_3$ and of $CeHgBr_3$ have an elementary cell with $a = 5.44$ and 5.77 A. U., resp., and contg. 1 mol. The calcd. densities of $CeHgCl_3$ and of $CeHgBr_3$ are 4.53 and 4.97, resp. They are isomorphic and form solid solns. in all proportions. Neither $CeHgBrCl_2$ nor $CeHgClBr_2$ exists as a chem. individual; they belong to a continuous series of solid solns. passing from $CeHgCl_3$ to $CeHgBr_3$, and have the same lattice as these, though of a deformed character. The unit dimension of the cell for such mixed crystals follows with good approximation the law of Vegard. $CeCdBr_3$, like $CeCdCl_3$, crystallizes in the cubic system and is isomorphic with $CeHgCl_3$ and $CeHgBr_3$. Its elementary cell has $a = 5.33$ A. U. and calcd. d. 5.38. The at. structure of all the compds. described is defined by the coördinates: Ce = (000); (Hg, Cd) = ($\frac{1}{2}$ $\frac{1}{2}$ $\frac{1}{2}$). (Cl, Br) = ($\frac{1}{2}$ $\frac{1}{2}$ 0); (0 $\frac{1}{2}$ $\frac{1}{2}$); ($\frac{1}{2}$ 0 $\frac{1}{2}$). $CeCdI_3$ and $CeHgI_3$ are not isomorphic with the corresponding chlorides and bromides and have a lower cryst. symmetry. $CeCdI_3$ was prepd. by dehydration of $CeCdI_3 \cdot H_2O$. Its d. is 5.48 and it m. 193° . The relations that should obtain among the A, B and X atoms of ABX_3 compds. in order that certain types of cryst. structures should exist were then detd. The value of the expression: $t = (R_a + R_x)/[\sqrt{2}(R_b + R_x)]$, where R_a , R_b and R_x are the at. radii of the A, B and X ions (cf. Goldschmidt, *loc. cit.*) was calcd. for various series of compds. For oxygenated compds. it is less than 0.8 for a rhombohedral structure of the corundum and ilmenite type, 0.8-1.0 for a cubic structure of the $CeHgCl_3$ type, 1.0-1.20 for a rhombohedral structure of the calcite and $NaNO_3$ type, and 1.20-1.30 (1.40) for a rhombic structure of the aragonite type. Dimorphism appears at the limits among the various series. Similar relations hold true within certain limits with double halides of the ABX_3 type. The cubic modification of the $CeHgCl_3$ type appears at values of t greater than 0.830. Compds. having a t value near 0.830 are dimorphic. Compds. with t less than 0.825 possess low symmetry (rhombic or monoclinic). Only 1 derivs. depart from these limits. Though having a t value of 0.840, $CeCdI_3$ is not isomorphic with other halocadmicates of Ce because the I ion is strongly polarizable.

C. C. DAVIS

X-ray and chemical investigation of various oxides of iron and cobalt. B. HENDRICKS AND WERNER H. ALBRECHT. Rockefeller Inst., N. Y. *Ber.* **61B**, 2153-61(1928).— Co_2O_3 shows by x-ray analysis the same crystal structure as Fe_2O_3 , although the at. distances in Co_2O_3 are somewhat smaller. The at. grouping, derived from the

space diagram and expressed by the Wychoff system, is Co^{++} at 8f, Co^{+++} at 16c and () at 32b. Ferromagnetic $\text{CoO} \cdot \text{Fe}_2\text{O}_3$, prepd. by Hilpert's method (cf. *C. A.* 4, 13), showed the same crystal structure as Fe_3O_4 and Co_3O_4 , but had different at. dimensions. The ferromagnetic $\text{CoO} \cdot \text{Fe}_2\text{O}_3$ could be oxidized with $\text{K}_2\text{S}_2\text{O}_8$ without change in crystal structure. The a_0 dimensions for the 3 oxides were Co_3O_4 , 8.04 A. U.; $\text{CoO} \cdot \text{Fe}_2\text{O}_3$, 8.35 A. U. and $\text{Co}_2\text{O}_3 \cdot 2\text{Fe}_2\text{O}_3$, 8.35 A. U. Crystal-structure diagrams are given.

R. L. DODGE

Arrangement of minute crystals in electrolytic bismuth and antimony precipitation.

I. HIDEJU HIRATA. Kyoto Imp. Univ. *Elec. Rev. (Japan)* 16, 651-61(1928).—H. studied röntgenographically the crystal structure of blocks of Bi and Sb made by electrolysis under different conditions and found: (1) The minute crystals of Bi tend to be arranged more regularly, the smaller the current density and the concn. of electrolyte. (2) The black slime or tabular matter having the appearance of Pt black which deposits on the cathode in electrolyzing Bi or Sb, consists mostly of small crystals having the same lattice structure as that of blocks of Bi or Sb. (3) When the small crystals of Bi are arranged in fibers, each crystal tends to orient itself so that the axis [211] is parallel to the axis of the fiber. When the small crystals are arranged in the form of a single pointed crystal, the axis [211] coincides with that of the single crystal. II. *Ibid* 761-7(1928) —From the diffraction line exhibited by a fibrous structure, H. tried to det. which crystal axis was parallel to the axis of the fiber. The distribution with respect to each at. surface of the angles of the small crystals composing the fiber was calcd. by Ono's method. The axis sought was parallel to [211]. The same result was obtained when the index of the at. plane was calcd. from the position of spots appearing in some of the diffraction lines. It was confirmed again by taking the interference figures obtained when the specimen was rotated 22° around the axis in question or when rotated 22° about an axis perpendicular to the axis [211] and to the projected pencil. H. also proved by calcg. from their position that interference figures consisting only of Laue spots were formed when the projected pencil makes angles of 48° , 27° and 18° with the axes [011], [001] and [101], resp., and that their directions are perpendicular to the crystal axis [211]. The reason why the Laue spots appeared somewhat elongated is also discussed.

K. SOMEYA

Joffe's work on electric break-down strength. ADOLF SMEKAL. *Naturwissenschaften* 16, 743 4(1928).—Joffe (*C. A.* 22, 518) considers the difference between low actual and high theoretical lattice strength of crystals to be due to superficial crystal defects. He found that after dissolving the surface of the crystal the strength increased as much as 100-fold. In accord with Ewald and Polanyi, S. attributes this result to a strengthening of the crystals by plastic deformation, not to their inherent strength. On stretching crystals of rock salt colored by x-rays beyond the elastic limit, the colors of plastic deformation were seen. Also cond. measurements seem to confirm the view that water penetrates into the crystal. When rock salt is heated rapidly, slip occurs spontaneously, contrary to J.'s view. Ionic conduction throughout the lattice (Joffe theory) does not play an important role in the elec. breakdown; from the temp. relation of the cond. of solid salts it has been shown that migration of ions takes place only through lattice defects. Reply. A. JOFFE. *Phys. Tech. Lab., Leningrad. Ibid* 744-5.—On the increased elasticity J. maintains his point of view considering slip or strengthening immaterial. The mech. irregularities of crystals are considered to have practically no influence on their elastic behavior. On the relation between work of dissociation and temp. coeff. of cond. no actual controversy exists. B. J. C. VAN DER HOEVEN

Electrical anisotropy of liquid crystals in a magnetic field. M. JEZEWSKI. *Z. Physik* 52, 268 74(1928).—An improved resonance method was used to det. the dielec. const. of *p*-azoxyanisole and *p*-azoxyphenetole while in the nematic state. A magnetic field was applied at the same time. Various shaped vessels were used to avoid the capacity effect of the walls. It was found that the dielec. const. varies with the relative orientation of the elec. and magnetic fields in agreement with the theory of Ornstein, *C. A.* 18, 2827. Also in *Bull. intern. acad. Polonaise* 1928, No. 8A, 397-404. GEORGE GLOCKLER

The Hall effect in galena and molybdenite. C. W. HEAPS. Rice Institute. *Phil. Mag.* [7], 6, 1283-6(1928).—Galena and molybdenite crystals exhibit a very large Hall effect. The magnitude of the Hall coeff. in the cubic crystal of galena does not appear to depend on the orientation of crystal axes. Impurities probably exert a very great influence on the Hall effect in PbS , apparently even changing the coeff. from a large negative to a large positive value. The difference between the adiabatic and the isothermal Hall effects appears to be small in these minerals. It is appreciable in molybdenite but by no means as great as Göttstein has calcd. (*C. A.* 8, 2100). G. G.

Magnetic rotation of a crystal of tysonite. J. BECQUEREL. *Z. Physik* 52, 342-55

(1928).—The magnetic rotation of tysonite $[(\text{La}, \text{Ce}, \text{Ne}, \text{Pr})\text{F}_3]$ was studied in directions oblique to the optical axis. The magnetic rotation decreases as the angle between incident ray and optical axis increases. On the assumption that there exist in a crystal two types of magnetic rotation, one along the optical axis and the other at right angles to it, a generalization of Verdet's law is derived with which the observations are in good agreement.

GEORGE GLOCKLER

The testing of the piezoelectricity of some crystals. W. SCHNEIDER. Tech Hochschule Karlsruhe. *Z. Physik* 51, 263-7(1928).—A series of crystals were tested for piezoelec. properties by a modification of the method of Giebe and Scheibe (*C. A.* 19, 3207). All crystals known to have a center of symmetry showed no piezoelectricity, but some which are known to have no center of symmetry also gave a negative test. The test may, however, be used to supplement information from other sources regarding crystalline structure.

G. CALINGAERT

Electrolytic conductivity of crystal surfaces and conduction by free ions in solid salts. O. BLÜH AND W. JOST. Univ. Berlin. *Z. physik. Chem., Abt. B*, 1, 270-4 (1928).—The electrolytic cond. of good-conducting AgI crystals is not influenced by limiting surfaces, indicating that the cond. of such salts does not depend on internal boundary surfaces.

ALBERT L. HENNE

The entropy and thermodynamic potentials of real gases and mixtures of real gases, and a mass-action law for chemical reaction between real gases. II. Integrated equations. JAMES A. BEATTIE. Mass. Inst. of Technology, Cambridge, Mass. *Phys. Rev.* 32, 691-8(1928); cf. *C. A.* 22, 2509.—The general thermodynamic equations derived in the first paper are integrated by means of a new equation of state for gas mixts. Thus the energy, heat content, entropy and thermodynamic potentials $F_{p,T}$ and $F_{p,T}$ of a mixt. of real gases, and the chem. potential and fugacity of a gas in a mixt. are expressed as integrated functions of V, T, n_1, n_2, \dots , and the consts. of the equation of state of the pure gases composing the mixt. The expression for the thermodynamic potential $F_{p,T}$ is a fundamental equation in the Gibbs sense. A mass-action law for reactions between real gases is given, the "mass-action const." K_p being expressed in terms of the variables $V, T, X_1, X_2, \dots, v_1, v_2, \dots$, and the consts. of the equation of state of the pure gases composing the equil. mixt. The detn. of the various integration consts. is discussed for the following cases: (a) non-isothermal and (b) isothermal variations in the state of a system composed of gases that react chemically, (c) non-isothermal and (d) isothermal variations in the state of a system composed of non-reacting gases. III. Relations for pure gases, and the equilibrium pressure of a gas in a mixture. JAMES A. BEATTIE. *Ibid* 699-705.—By assuming that the pressure of a real gas approaches nRT/V as the vol. approaches infinity, general thermodynamic equations for the energy, heat content, entropy, thermodynamic potentials $F_{p,T}$ and $F_{p,T}$, chem. potential and fugacity of a pure gas are developed in terms of the appropriate independent variables V, T, n , or p, T, n . Each expression contains a definite integral, which can be evaluated by using an equation of state. The integrations are accomplished by means of a new equation of state and all the thermodynamic quantities are expressed in terms of the variables V, T, n and the consts. of the equation of state. From the relations developed in this and a former paper for the chem. potential of a pure gas and of a gas in a mixt., there are obtained general expressions for the d. and pressure at const. temp. of a gas that is in equil. through a semi-permeable membrane with a mixt. contg. the gas in question. The integrations are again accomplished by using an equation of state for gases and gas mixts. The evaluation of the various integration consts. is discussed briefly.

BERNARD LEWIS

The functional form of the constant of mass action and atomic activation. R. D. KLEEMAN. *Science* 68, 462(1928); cf. *C. A.* 22, 4040.—For reactions in the gas phase the law of mass action as usually understood becomes invalid if the volume of gas is increased sufficiently. What happens to 2 mols. in a gas depends not only upon their chance of encounter, but also upon previous encounters with other mols. which may activate them. The changes in the spectra of substances with temp. show that such changes are associated with mol. collisions and their violence. If the pressure changes continually, the av. activation of a mol. at any instant is likely to differ in nature and magnitude from that corresponding to a state of equil.

J. H. PERRY

A new equation of state for fluids. II. Application to helium, neon, argon, hydrogen, nitrogen, oxygen, air and methane. JAMES A. BEATTIE AND OSCAR C. BRIDGEMAN. Mass. Inst. Tech. *J. Am. Chem. Soc.* 50, 3133-8(1928); cf. *C. A.* 21, 3146.—The new equation of state is $p = [RT(1-\epsilon)(V+B)]/V^2 - A/V^2$, where $A = A_0[1 - (a/V)]$, $B = B_0[1 - (b/V)]$, $E = C/(VT^2)$, R is the gas const. and A_0, a, B_0, b , and c are parameters characteristic of the substance under consideration. This

equation is applied to the compressibility data for He, Ne, Ar, H₂, O₂, N₂, air and CH₄. A method is outlined for transforming the exptl. pressure-vol.-temp. data into isometric form and a description is given of the methods used in evaluating the consts. of the equation of state. The observed pressures are compared with those calcd. from the equation at more than 1700 points for the ten gases. The av. deviation for the entire range of pressure and temp. was 0.08 atm. or 0.18%. III. The normal densities and the compressibilities of several gases at 0°. *Ibid* 3151-7.—The above equation of state was used to calc. for several gases the ratio at 0° of the product PV at 1 and at 0 atm. pressure, resp. The ratio was then used to compute the mol. wt. of a normal l of H₂, O₂, N₂, CO₂ and CH₄. The results agree well with similar data detd. by chem. methods.

J. H. PERRY

Viscosity of rare gases. A. G. NASINI AND C. ROSSI. Reale Univ. Firenze. *Gazz. chim. ital.* 58, 433-42(1928).—Research into the viscosity of mixts. of monoatomic gases gave the opportunity to measure the coeff. of internal friction of pure gases. The viscosity of He seems well established, but the only data for Kr and Xe are doubtful. Therefore Kr and Xe, as pure as could be obtained (99.99%), were examd. with a new type of viscometer, the construction and technic of which are described and illustrated. The following data give the mean viscosities measured for the 3 gases at the particular temps. He, 14°, 1943×10^{-7} ; 99.8°, 23.32×10^{-7} ; Kr, 15.2°, 2436×10^{-7} ; 99.4°, 3062×10^{-7} ; Xe, 16.5°, 2250×10^{-7} ; 99.4°, 2871×10^{-7} . From these values the coeffs. of friction are calcd. viz., He, $\eta_{99.8^\circ}/\eta_{14^\circ} = 1.200$; Kr, $\eta_{99.4^\circ}/\eta_{15.2^\circ} = 1.256$; Xe, $\eta_{99.4^\circ}/\eta_{16.5^\circ} = 1.276$. With these data, the values of the Sutherland consts. were recalcd., giving 81.06, 290.0 and 210.4 for He, Xe and Kr, resp., thus agreeing well with those of Rankine (cf. C. A. 16, 668).

C. C. DAVIS

The structure of water. S. W. PENNYCUICK. Univ. Adelaide, S. Australia. *J. Phys. Chem.* 32, 1681-96(1928).—The mol. of H₂O is assumed to be a tetrahedron, with pairs of electrons at two of the corners, and positive H nuclei attached by electron pairs to the other two corners. Thus the mol. possesses 4 points of auxiliary valence, 2 positive and two negative. Such a structure accounts for W. H. Bragg's x-ray analysis of the cryst. structure of ice (C. A. 16, 3016), the mols. being held together by their auxiliary valences in hexagonal 6-oxygen rings, a benzene ring arrangement. Normal H₂O is quasi-associated, the diff. between associated and normal (quasi-associated) liquids being that, though both show mol. combination through auxiliary fields, the compd. mol. in an assoc. liquid presents an abnormally weakened field to the surroundings, while the quasi-compound mol. in a normal liquid possesses a strong field by which it tends to grow and to become immediately incorporated in the whole liquid system. Liquid H₂O consists of associated (H₂O)_n mols. with a benzene-ring structure, in a normal (quasi assoc.) solvent. A ring structure for assoc. acetic acid mols. is suggested. Evidence from the effect of pressure on aq. systems, the addn. of a solute, the max. d. of H₂O, the latent heat, the dielec. const., the self-ionization and the abnormal velocities of the H and OH ions is in favor of the author's view of ring assocn. and of abnormal activity of the auxiliary fields of the O and H atoms. R. J. HAVIGHURST

The general theory of distillation of liquid mixtures of many components and its experimental verification. YOSHIYUKI TSUKAMOTO. Univ. of Tokyo. *Japan J. Chem.* 2, 129-48(1926).—Ideal mixts. of liquids are considered first. Here neither vol. nor heat content changes on mixing. Latent heats are additive and the ratios of $\Delta L/RT$ are assumed to be independent of temp. if the differences in temps. are not too great. For non ideal solns. the partial mol. latent heat of evapn., \bar{L} must be substituted for L . The theory was verified exptly. in the system benzene-bromobenzene. The equations derived may be applied also in calcg. the composition of the vapor phase in equil. with a given liquid mixt. Calcn. is made for the system oxygen-nitrogen as an example of an ideal soln. and for CCl₄-EtOH as a non-ideal soln. R. H. L.

Theory of steam distillation. H. STANLEY REDGROVE. *Perfumery Essent. Oil Record* 19, 453-5(1928).—The theory of steam distn. is discussed, notably in its application to the production of essential oils. W. O. E.

The fluidity of mercury. EUGENE C. BINGHAM AND THEODORE R. THOMPSON. *J. Am. Chem. Soc.* 50, 2878-83(1928).—The fluidity of Hg from 0° to 100° was measured in a glass capillary. Evidence of slipping based on the flow of Hg in metal capillaries is not conclusive, because with Cu, for example, there is a differential soly. due to the slight soly. of Cu in Hg that results in the growth of the large crystals at the expense of the small ones. EUGENE C. BINGHAM

The variability of viscosity with temperature. G. BANDTE. *Erdöl u. Teer* 4, 543-6(1928).—The Herzberg temp. no. (C. A. 22, 3770) and the Vogel formula (C. A.

17, 318, 2661) are compared. The former, the av. viscosity drop per 10° over a given practical temp. range, has the advantage of being simple in calcn. and requiring only 2 detns., but gives only the abs. viscosity drop, which, though often sufficient for practical purposes, does not express the true relative sensitiveness to temp. except in the case of 2 oils having the same viscosity at the initial temp. The Vogel formula shows the true relative sensitiveness in all cases, since it compares not the abs. drops but the variable percentage drops, by means of the consts. of the equilateral hyperbolas, which are obtained when the logs of the viscosities of mineral oils are plotted against temp. The calcns. are complicated. A method of soln. requiring 3 detns. is given. Walther, C. A. 23, 316, accomplishes the soln. with 2 detns. through the linear relationship of the double logs.

F. S. GRANGER

Observations of density streaks in chemical work. FRIEDRICH EMICH. *Monatsh.* 50, 269-83(1928).—A microscopical method is described of observing the streak appearing when 2 liquids of differing optical d. are mixed. Liquids like H_2O and 1% alc. give a streak although differing in d. only 0.002 and in refractive index 0.0003. The method is useful in checking purity of compds., for example.

G. B. TAYLOR

The measurement of the dielectric constants of liquids in electrical fields of high strength. II. J. MALSCH. *Physik. Z.* 29, 770-7(1928); cf. C. A. 22, 3090.—According to the dipole theory of Debye, a decrease in dielec. const. with increase in field strength is to be expected. An exptl. arrangement for measuring this effect is described and the theory of the method is discussed. The dependence of the dielec. const. upon the field strength was investigated for H_2O , $C_6H_5NO_2$ and C_2H_5OH . The effect is greater the smaller the dielec. const. D . The abs. value of the effect, at about 250000 v./cm. amounts to $\Delta D/D = 1.0\%$ for $C_6H_5NO_2$, 0.7% for H_2O , 1.5% for C_2H_5OH . Substantially larger values would be expected on the basis of the simple Debye theory, without considering association phenomena.

E. R. SMITH

The determination of reaction affinity in systems of solid salts. J. N. BRØNSTED AND W. T. RICHARDS. *J. Am. Chem. Soc.* 50, 3028-35(1928).—The equation $nd\pi_0 + n_1d\pi_1 = 0$, where π_0, π_1 indicate chem. potentials of the components K_0 and K_1 , is applicable to homogeneous mixts. of K_0 and K_1 when satd. with pure solid components K_2, K_3, \dots . By means of this equation, the free-energy change during the reaction of solid salts can be calcd. from measurements of the vapor pressure of the solvent. A novel differential tensimeter is described. Vapor-pressure data are given for the solns. $CuCl_2$, $CuCl_2 \cdot 2NH_4Cl \cdot 2H_2O$; NH_4Cl , $CuCl_2 \cdot 2NH_4Cl \cdot 2H_2O$; $NaCl$, $CuCl_2$, $CuCl_2 \cdot 2NH_4Cl \cdot 2H_2O$; $NaCl$, NH_4Cl , $CuCl_2 \cdot 2NH_4Cl \cdot 2H_2O$. The affinity of formation of one g. mol. of dihydrated ammonium chlorocuprate from its solid components is found to be 3560 cal.

FRANK URBAN

The electrical conductivity of mixtures of compressed salts. P. FISCHER. *Polytech. Inst. Kiev. Z. Elektrochem.* 34, 756-8(1928).—This is continuation of F.'s work of measuring the cond. of solid mixts. (C. A. 22, 4343). He investigates different mixts. each contg. 3 of the following, PbI_2 , HgI_2 , KI , CdI_2 and AgI . The temp. ranged from 130° to 165° . Often ternary mixts. give much better conductivity than the same salts in binary mixts. The Ag electrode formed AgI in accurate concordance with Faraday's law; it is also indicated that the mixts. act as purely electrolytic conductors. M. D.

The internal friction and the elastic limit of lead. V. D. KUZNETZOV. *State Univ. Tomsk, Siberia. Z. Physik* 51, 239-62(1928).—The coefficient of internal friction η of solids is a function of the rate of deformation. When expressed without considering the elastic limit, η varies considerably. In expts. with Pb in torsion, for instance it varied from 10^9 to 10^6 grams per cm. per sec. If the elastic limit is introduced into the equation as a function of the rate of plastic flow, η remains practically const. In a series of torsion expts. on Pb, the elastic limit varied from 0.43 to 1.1 kg. per mm.². It can be increased considerably by increasing the load. Under increasing loads for 4 months, the elastic limit of Pb was increased from 0.05 to 0.32 kg./mm.².

G. CALINGAERT

The doctrine of amorphism is in error. P. P. VON VEIMARN AND TOKUTARO HAGIWARA. *Kyoto, Japan. Japan J. Chem.* 3, 15-70(1926).—Frankenheim's hypothesis that all solids are cryst., V.'s theory of ppts. and of the vectoriality of matter and Haber's theory of the initial condition of cryst. and amorphous ppts. are reviewed critically to justify V.'s assumption that there is no truly amorphous solid in the universe. V.'s three laws of pptn. are cited as proof that all apparently amorphous materials are really cryst. The conception of vectoriality is still more general than that of crystallinity. V. emphasizes the proof of crystallinity of many colloids afforded by studies in polarized light and with x-rays.

R. H. LAMBERT

A new equation for the determination of surface tension from the form of a sessile

drop or bubble. N. ERNEST DORSEY. Nat. Research Council. *J. Wash. Acad. Sci.* 18, 505-9(1928); cf. *C. A.* 22, 1071.—Heydewiller (*Wied. Ann.* 65, 311-19(1898)) computed a table upon the basis of several involved formulas, whereby surface tension can be calcd. from the form of sessile drops. Several of the exptl. quantities are difficult of accurate detn. and in certain cases the resultant errors are large. With the view of overcoming these difficulties, D. obtained from the data of Bashforth and Adams (*An Attempt to Test the Theory of Capillary Action*, Camb. Univ. Press, 1888) an empirical equation $A^2 = r^2 [(0.05200/f) - 0.12268 + 0.0481 f]$, which satisfies exptl. detns. of surface tension with a max. error of 1.34%. $A^2 = T/g(d-d')$. T is the surface tension, g the acceleration of gravity and d, d', r and f are factors dependent upon sp. measurements of the drop. These terms are explained diagrammatically and a table of calcd. values is given.

WILLIAM E. VAUGHAN

The electrical double layer in colloids. Silver iodide sol. H. R. KRUYT AND P. C. VAN DER WILLIGEN. Univ. Utrecht. *Z. physik. Chem.*, Abt. A., 139B, 53-63(1928).—Stable sols of AgI are produced by pptn. in the presence of small amts. of KI, KBr, KCl, KCN, KCNS and $K_3Fe(CN)_6$. The Ag salts corresponding to all but the last of these are isomorphous, showing that the anions can all take places in the crystal lattice of AgI. The conclusion is drawn that the origin of the double layer about crystals of AgI in the sol lies in these lattice forces. The peptizing action of $K_3Fe(CN)_6$ may be due to CN^- ions present in equil. with it or to the action of the trivalent anion in increasing the negative charge of AgI in contact with pure H_2O . Why AgI takes a negative charge in H_2O is unexplained, but it is true of many substances and is perhaps connected with the high mobility of OH^- . Cataphoresis measurements on positively charged AgI sol, peptized by $AgNO_3$, show that the charge decreases on diln. until finally the charge becomes negative.

F. L. BROWNE

Investigations on molecular sieve membranes. LEONOR MICHAELIS. *Fifth Colloid Symposium Monograph* 1928, 135-48.—Membrane permeability may be due to their selective soly. in the membrane or to sieve action, occasionally to both. Sieve membranes are classified according to their "mesh" as ordinary filters, filters for blood cells, bacteria filters, colloid filters and mol. sieve membranes. A specially strong mol. sieve filter is made by allowing a soln. of collodion to evap. on a surface of Hg. The "fineness" of a mol. sieve can be tested by placing it between 0.1 and 0.01 N KCl solns., between which there is ordinarily zero boundary potential, and observing the magnitude of the p. d. across the membrane. The dil. soln. becomes positive and the p. d. is 55 mv. for a perfect mol. sieve, which is permeable to the ion of charge opposite to that of the material of the sieve and impermeable to the ion of like charge. The diam. of the pores in mol. sieve membranes is probably of the order of magnitude of single mols. The following values in mv. were observed for different membranes: parchment paper 10, paraffined paper 13, waxed paper 21, mastic-impregnated paper 24, rubberized paper 29, collodion 5 to 10, dried "gun-cotton" 25, dried "celloidin" 45-55. The relative velocity of diffusion through membranes sepg. H_2O from 0.1 M solns. of the following solutes, arranged in the order of increasing mol. wt., was detd. analytically: MeOH 9.2, EtOH 3.0, PrOH 1.0, urca 1.0, BuOH 0.8, glycerol 0.22, chloral hydrate 0.11, monochlorohydrin 0.067, glucose 0.00. NH_3 diffuses much more rapidly than NH_4 . The diffusion of electrolytes is extremely slow, good membranes showing no passage after many days. But with KCl and $NaNO_3$ solns. sepd. by a membrane, diffusion of cations proceeds with reasonable speed, apparently by "exchange." The anions diffuse little, if at all, even here. With poor membranes these differences vanish. By using other combinations of electrolytes it was found that the valency of the anions has little influence, H ion plays no peculiar role, and with bivalent cations the p. ds. are very uncertain. The p. ds. across the membranes are due to differences in the mobilities of anions and cations within the small openings in the membrane. Thermodynamic factors play only a minor part.

Osmosis of ternary liquids. V. and VI. General considerations. F. A. H. SCHREINEMAKERS. Univ. Leiden. *Verslag Akad. Wetenschappen Amsterdam* 37, 374-83, 634-45(1928); *Proc. Acad. Sci. Amsterdam* 31, 459-68, 811-22.—Mathematical.

ALBERT L. HENNE

Effect of electrolytes on electroendosmose through wood membranes. ALFRED J. STAMM. *Fifth Colloid Symposium Monograph* 1928, 361-8.—Dil. alkali solns. increase the rate of electroendosmose through wood membranes, and dil. acid solns. decrease it, there is a straight-line relation between rate and pH . Dil. acids affect the membrane permanently, possibly causing hydrolysis on internal surfaces. Concd. acids and bases both permanently reduce the rate. Aq. salt solns. show the normal effect of salts with anions and cations of different valence on negatively charged mem-

branes. Tervalent and quadrivalent cations cause a reversal of the direction of flow and of the sign of the contact potential. Multivalent anions increase the rate of flow and the negative contact potential. The concn. at which a cation causes a max. in the rate of flow is less, the higher the valence of the ion.

JEROME ALEXANDER

Adsorptive combination. H. CASSEL. Univ. Berlin. *Z. Elektrochem.* 34, 536-8 (1928).—The point of view is set forth that solid adsorbents may not be sepd. from the gas phase by a sharp boundary corresponding to the surface of the crystal lattice, but that there may be an adsorbed layer of free mols. of the solid itself in thermal agitation. The existence of similar adsorbed layers about crystals undergoing growth or soln. has been demonstrated by other workers. Presumably the energy required to move mols. from the crystal lattice of the solid to the adsorbed layer is of the order of the heat of fusion and an arrangement of the Langmuir formula for adsorption expresses the no. of liberated mols. on the surface of the solid. During adsorption of a gas there would then be 2 possibilities, depending upon whether forces of attraction or of repulsion between mols. of adsorbent and adsorbate predominate; either (1) mols. of adsorbent are displaced from the adsorption layer to take up positions in new planes of the crystal lattice, on the surface of which more gas may be adsorbed, or (2) more mols. of adsorbent may be drawn into the adsorption layer. Usually both effects are in operation to greater or less extent. In case (1) adsorption affects the adsorbent much like a lowering of the temp. and in case (2) much like an increase in temp.

F. L. BROWNE

The process of adsorption. W. KÄLBERER AND H. MARK. I. G. Farbenindustrie, Ludwigshaven a. R. *Z. physik. Chem., Abt. A*, 139, 151-62(1928).—The initial portions of the adsorption isotherms for A and for CO₂ on many SiO₂ gels are linear for a considerable distance. For other SiO₂ gels the initial portion of the isotherm exhibits a much faster increase in the amt. adsorbed than in the succeeding linear region of the curve. The heat of adsorption in the linear regions of the isotherms is 2500 cal. per mol. for A and 6200 cal. for CO₂. In the steeper initial portion of the isotherm for one SiO₂ gel the av. heat of adsorption was 7500 cal. for CO₂. The thickness of the layer of adsorbed CO₂ on Al foil at 0°, 45° and 65° is of the order of 1.5×10^{-8} cm.

F. L. BROWNE

The expansion of charcoal accompanying sorption of gases and vapors. D. H. BANGHAM AND NAZIM FAKHOURY. Egyptian Univ. *Nature* 122, 681-2(1928).—The linear expansion of charcoal during sorption of H₂O vapor and of CO₂ at pressures short of satn. was measured. The expansion was directly proportional to the square of the amt. sorbed. The expansion caused by the sorption of a given no. of mols. was 10 to 11 times as great in the case of CO₂ as in that of H₂O. For CO₂ at 30° and 1 atm. pressure it amounts to roughly 0.101%. The usual form of the sorption isotherm may be due to the fact that the mechanical disturbance suffered by the solid becomes greater as the sorption proceeds.

F. L. BROWNE

Siloxene as an adsorbent. H. KAUTSKY AND G. BLINOFF. Kaiser Wilhelm-Inst. f. physik. Chem. u. Elektrochem., Berlin-Dahlem. *Z. physik. Chem., Abt. A*, 139, 497-515(1928).—Siloxene (C. A. 22, 2121, 3367) is a chemically and morphologically definite substance. It is a highly polymerized Si₆O₃H₆. It consists of "elementary planes" consisting of hexagons of 6 Si atoms joined together in the same plane by Si-O-Si linkages, with the H atoms disposed above and below this plane near the Si atoms. Many such elementary planes are attached parallel to each other by forces of adhesion. This simple structure is in marked contrast with the complicated capillary constitution of other adsorbents. Siloxene is also unusual among adsorbents in that different preps. of it always have the same adsorption isotherm toward a given adsorbed material. The sp. gr. of siloxene can be detd. directly, in contrast to charcoal. Siloxene is a very good adsorbent, taking up many org. substances from aq. soln. in an apolar manner. The adsorption of formic, acetic, propionic, butyric and valeric acids is shown to take place in accordance with Traube's rule. Oxidized siloxene exhibits exchange adsorption toward aniline-HCl. Only the cations are bound.

F. L. BROWNE

The physical chemistry of color-lake formation. HARRY B. WEISER AND EVERETT E. PORTER. *Fifth Colloid Symposium Monograph* 1928, 369-90; cf. C. A. 22, 1510-11.—The positive charge on dispersed particles of hydrous oxides decreases as the pH increases, and the capacity for adsorbing anions decreases correspondingly, becoming nil at pH 9.2. Adsorption of anions in alk. soln. is shown exptly. for OH⁻, SO₄⁻⁻ and C₂O₄⁻⁻. When both ions are present, SO₄⁻⁻ is less strongly adsorbed than C₂O₄⁻⁻, especially in neutral or alk. soln. The ratio of concns. of SO₄⁻⁻ to C₂O₄⁻⁻ for equal adsorption is 1.1 at pH 2.5 and 128 at pH 7. Miller's view that anions are taken up by hydrous oxides in solid soln. is disproved. Study of the taking up of dyes from solns.

at varying p_H by hydrous oxide mordants led to the conclusion that lake formation is due to adsorption of colored ions analogous to the adsorption of inorg. ions. Alizarin SW, alizarin and orange II were chosen to represent acid dyes and methylene blue as a basic dye. The conclusion of Marker and Gordon that Fe_2O_3 and Al_2O_3 form salts with orange II at low p_H is incorrect, because they failed to notice that the dye acid is pptd. in sufficient concn. of H_2SO_4 , forming a mixt. with the oxide. Methylene blue is adsorbed by hydrous oxides only when the p_H is high enough to peptize the oxide with a negative charge, the quantity of blue adsorbed being proportional to the amt. of the negative charge. In alizarin lakes, the dye ion is adsorbed, not neutral Na alizarinate. SO_4^{--} influences the adsorption of alizarin ion much as it does that of $C_2O_4^{--}$, replacing it in acid soln. but not in alk. soln. Ca^{++} increases the charge on the mordant and therefore its capacity for adsorption. In general, a strongly adsorbed cation increases and an anion decreases the adsorption of acid dyes. The effects are the reverse for basic dyes. The effects increase with concn. and with p_H . Cation and anion effects operate independently, the former predominating in basic and the latter in acid baths. The same generalizations apply to dyeing fibers in the absence of a mordant.

JEROME ALEXANDER

Physical chemistry of color-lake formation. IV. Red Congo acid and Congo red lakes. HARRY B. WEISER AND ROBERT S. RADCLIFFE. Rice Institute. *J. Phys. Chem.* 32, 1875-85(1928).—Aq. solns. of Congo red contain a red colloidal anion which is too small and hydrous to be visible in the ultramicroscope but which will not pass a membrane permeable to ions in true soln. Replacing the Na in Congo red with H gives a blue colloidal acid. A typical equation for the reaction is: $2Na^+ + R^{--}(\text{red}) + 2H^+ + 2Cl^- \rightleftharpoons H_2R(\text{blue}) + 2Na^+ + 2Cl^-$, where R^{--} stands for the anion of the dye. Since this reaction is partly reversible Congo red is not suitable for an indicator in acidimetry, in the presence of salts. The blue acid is very slightly sol. in H_2O , yielding the red colloidal anion. The soly. increases with rising temp. In the blue soln. the following equilibria exist: $nH_2R(\text{blue}) \rightleftharpoons nH_2R(\text{in soln.}) \rightleftharpoons 2nH^+ + nR^{--}(\text{red})$. The positively charged hydrous oxide mordants, such as alumina, adsorb the blue colloidal acid giving blue lakes. If the amt. of blue acid is small the blue lakes change to red very slowly at ordinary temps. and more rapidly at higher temps. The process consists in the adsorption of the red anion by the hydrous oxide, displacing the above reaction to the right until all the blue acid disappears. If the H-ion concn. of the bath is too high or the amt. of blue acid is in excess of the adsorption capacity of the hydrous oxide for the red anion, the lake remains purple to blue in color. The blue lake is an adsorption complex of the blue acid and the hydrous oxide. The red lake is an adsorption complex of hydrous oxide and the red acid (or alkali salt). The red alumina lake is not an Al salt of Congo red as assumed by Bayliss (*C. A.* 4, 405). Definite assurance of the existence of the red Congo acid in the solid state is lacking. The product formed by decomposing the pyridine salt is blue by transmitted light and reddish brown by reflected light. It is probable that Shaposhnikov and Bogoyavlenskii (*C. A.* 7, 1172, 1291) and Hantzsch (*C. A.* 9, 1175) mistook the surface color of the blue acid for the alleged red isomer.

H. B. W.

The adsorption of iron by kaolin and talc from solutions of ferric hydroxide and chloride. A FODOR AND A. ROSENBERG. *Kolloid-Z.* 46, 91-5(1928).—Kaolin adsorbs colloidal $Fe(OH)_3$ completely and instantaneously. It adsorbs the $Fe(OH)_3$ formed by partial hydrolysis in solns. of $FeCl_3$, but since it does not adsorb or neutralize the HCl liberated the hydrolysis reaches an equil. Kaolin does not adsorb $Al(OH)_3$; so a mixt. of $Fe(OH)_3$ and $Al(OH)_3$ can be sepd. quant. by adsorbing the $Fe(OH)_3$ on kaolin. Talc adsorbs colloidal $Fe(OH)_3$ and also neutralizes the HCl formed by the hydrolysis of $FeCl_3$; addn. of talc to a $FeCl_3$ soln. therefore causes complete hydrolysis of the $FeCl_3$ and the iron is entirely adsorbed.

J. G. McNALLY

The velocity of dehydration of gypsum at different temperatures. PETER P. BUDNIKOV. *Kolloid-Z.* 46, 97-9(1928).—The rate of drying of powdered natural and synthetic gypsum was detd. at 40°, 100°, 140° and 160°. The synthetic gypsum lost more water and lost it more slowly than the natural product at each temp. except 160°, at which the rates were equal.

J. G. McNALLY

The velocity of hydration of dry gypsum. PETER P. BUDNIKOV. *Kolloid-Z.* 46, 95-7(1928).—Both natural and synthetic gypsum previously dried at 140° adsorbed H_2O rapidly until 0.5 mol. of water of crystallization was taken up. The rate of adsorption then fell off markedly but increased on prolonged standing in contact with H_2O . The latter rapid adsorption is caused by the formation of a gel on the surface of the gypsum particles. Gypsum dried at 600° adsorbed H_2O only very slowly.

J. G. McNALLY

Studies of adsorption and swelling. II. V. KUBELKA AND J. WAGNER. *Kolloid. Z.* **46**, 107-14(1928).—The adsorption of HCl and H₂SO₄ by hide powder from aq. soln. was studied. The apparent adsorption of acid by unit mass of hide, x/m , increases with concn. of HCl until a concn. of 0.06 millimole per l. is reached; above this concn. x/m is const. With H₂SO₄, x/m steadily increases as the concn. of acid is increased. Hide powder shows a max. swelling in dil. HCl solns. but no max. was found in H₂SO₄, the swelling at low concn. being almost equal to that in pure water and lower at higher concn. of acid. When the concn. of acid in the solns. used in the adsorption expts. is corrected by allowing for the vol. of water adsorbed by the hide, x/m is almost a linear function of the equil. concn. of both HCl and H₂SO₄. J. G. McNALLY

The colloidal state as a universal property of matter. P. P. VON VETMARN. *Japan J. Chem.* **3**, 1-14(1926).—V. takes exception to the statement by J. Duclaux (*C. A.* **19**, 761) that the idea of the colloidal state of matter being a universal state in the same sense as the solid, liquid and gaseous states has no real advantage over the old doctrine of inherently colloidal substances. V.'s well-known arguments and examples are again presented in support of his point of view. RAYMOND H. LAMBERT

The stability of submicrons. I. The disintegration and formation of crystals and the formation of emulsions. I. TRAUBE AND WILHELM V. BEHREN. *Techn. Hochschule Charlottenburg. Z. physik. Chem., Abt. A*, **138**, 85-101(1928).—Previously (*C. A.* **16**, 518) T. and Klein concluded that the submicrons of lyophobic sols are not necessarily unstable, but that on the contrary solns. of substances of limited soly. contain submicrons in equil. with single mols. or ions. If the soly. is small enough practically all the "dissolved" substance may exist as submicrons. By observing the dissoln. of crystals of many substances under the ultramicroscope it is now shown that the crystals break up at least in part into submicrons before passing into mol. soln. and that the lower the soly. the more numerous the submicrons. Likewise during the formation of crystals, submicrons appear first and gradually clump together, lose their identity as submicrons, and unite as crystals. When CHCl₃ is emulsified in saponin soln., many very stable submicrons are formed in addition to the large drops of the emulsion. F. L. BROWNE

The constitution of micelles. IV. Colloidal aluminum oxide and ferric oxide. R. WINTGEN AND O. KÜHN. *Univ. Köln. Z. physik. Chem., Abt. A*, **138**, 135-57(1928); cf. *C. A.* **18**, 2989.—Sols of Al₂O₃ made by peptizing freshly pptd. Al₂O₃ with HCl are stable only for a short time. Sols made by adding to AlCl₃ soln. slightly less than enough NH₄OH to ppt. and purified at once by hot dialysis (*C. A.* **10**, 1957) are stable even in high concn. If dialyzed cold the Al₂O₃ is largely lost in the dialyzate. (Similar sols of Fe₂O₃ must be partly purified by cold dialysis before they will withstand hot dialysis.) The Al₂O₃ sols are not coagulated by KCl until they are dialyzed; if dialyzed too long they coagulate spontaneously. The lowest ratio of Cl to Al attained was 0.00144, but this sol was stable only for a few weeks. The ratio was 0.03 to 0.13 in the stable sols studied most carefully. Interrupting the dialysis to age the sol several weeks permits readjustment of the partition of electrolytes between the intermicellar soln. and the electrolytes enclosed within the micelles. During such aging the elec. conductivity of the ultrafiltrate increases measurably, and subsequent dialysis removes Cl⁻ from the sol more rapidly. This influence of aging is more marked the lower the temp. of the initial hot dialysis. Sols aged in this way during dialysis finally reach an equil. beyond which further dialysis fails to change the ratio of Cl to Al. From measurements of elec. conductivity and cataphoresis, the partition of Cl⁻ between intermicellar soln., "compensating" ions, and soln. enclosed in the micelles is calcd. and found to agree with interpretation of the elec. conductivity of the ultrafiltrate. The electrolyte in the intermicellar soln. proves on analysis to be AlOCl rather than NH₄Cl. For both Al₂O₃ and Cr₂O₃ sols the same straight line of negative slope serves to express the relation between the logarithms of the "equiv. aggregation" and of the ratio of Cl to Al or Cr; the corresponding line for Fe₂O₃ sol lies at higher values of the equiv. aggregation, indicating a greater tendency for Fe₂O₃ to form colloidal aggregates. In Al₂O₃ and Cr₂O₃ sols a far smaller proportion of the Cl⁻ is enclosed in the micelles than in Fe₂O₃ sols. In the ultramicroscope most of the Al₂O₃ sols exhibit only a Tyndall cone, but by using sunlight for illumination the micelles in some sols were resolved and counted. As in Fe₂O₃ sols, the no. of Al atoms per micelle increases when the ratio of Cl to Al decreases. The no. of atoms in the surface of the micelle carrying charge is approx. const. F. L. BROWNE

The structure of colloid particles and the formation of sols and gels. H. FREUNDLICH. *Ber.* **61B**, 2219-33(1928).—In general, gels differ from sols in that the solid particles of disperse phase are no longer free to move independently of each other but

are more or less firmly bound together. In both sols and gels the dispersion medium is liquid. By examn. with x-rays, the constitution of the disperse particles can be detd. Colloidal Au and Ag are shown to be small crystals of the metals; Bredig Cu sols are CuO; freshly prepd. sols of Al_2O_3 , ZrO_2 , ThO_2 , S and As_2S_3 have amorphous particles. Graham's Fe_2O_3 is basic FeCl_3 and Fe_2O_3 sol made by oxidation of $\text{Fe}(\text{CO})_5$ with H_2O_2 is $\text{FeO}(\text{OH})$. X-ray examn. reveals the compn. of the mass of the particles, but not that of the surface layer, which may be quite different. Three groups of methods have been used to distinguish spherical particles from non-spherical, and rod- from leaf-shaped particles. (1) In the ultramicroscope, spherical particles scatter a uniform light while non-spherical ones scintillate because the scattered light is most intense when the particle, in course of Brownian movement, lies with its long axis in the plane of the microscope and at right angles to the illuminating light. Such observations are made most conveniently in a cardioid ultramicroscope provided with an "azimuth diaphragm" by means of which light may be passed through the colloid along any chosen azimuth. Gels with non-spherical particles can be made to scintillate by changing the azimuth along which light is admitted. (2) In sols with spherical particles, the intensity of the Tyndall light is the same whether the sol be at rest or in motion, but in sols with non-spherical particles the intensity is different in the two cases because flow tends to orient the particles. In sols at rest or in gels the shape of the particles is revealed by the proportion of polarized to normal light in the Tyndall beam. (3) Sols with non-spherical particles which are themselves doubly refracting exhibit specific double refraction when the particles are oriented by causing the sol to flow. Sols with non-spherical particles that are amorphous or of the regular crystal system exhibit rod-double refraction when caused to flow. Much less is known about the disposition of disperse particles in sols and gels and about the forces acting between them. The phenomenon of thixotropy shows how slight the change from sol to gel condition must be. Although on gelation the particles are bound together and cease their Brownian movement, the negligible vol. change shows that they must retain their comparatively thick shells of the liquid phase and that the force of attraction between particles must operate over distances as great as $100\ \mu\text{m}$. Such forces cannot be ordinary mol. attraction but are believed to reside in the adsorbed shells of electrolytes and dispersion medium about the disperse particles. Even in concd. sols with non-spherical particles these forces often cause orientation of the particles in sols at rest and they are responsible for the departure from Poiseuille's law in the flow of such sols. F. L. BROWNE

Dispersoidological investigations. XXIV. The dispersoidology of gold. P. P. VON VEIMARN *et al.* *Repts. Imp. Ind. Res. Inst.* (Osaka, Japan) 9, 9-79(1928); cf. *C A* 23, 1010.—Zsigmondy holds that increasing the concn. of the soln. from which colloidal Au is sepg. increases the size of the particles, in contradiction to v. V.'s fundamental postulate. v. V. maintains that the reaction is anomalous in that, under many exptl conditions, an insol. compd. of Au rather than Au itself first seps. as a colloid and is later transformed into Au. Expts. are described in which colloidal Au is made by reaction between AuCl_3 and KI, KCNS, or Na citrate, resp. Here the corresponding Au salt seps. as the colloid first and is then reduced to Au. With equal concns. of reactants, the degree of dispersity and the stability increase in the order KI, KCNS, Na citrate, which is also the order of soly. of the Au salts. Orange-red and orange colloidal Au sols were made by boiling a dil. soln. contg. AuCl_3 and Na citrate until it became red, and then adding KCN. The sols were stable only for a few hours. The failure of a Au sol to give a blue ring at the point of contact with a superimposed layer of concd. NH_4OH does not prove the absence of compds. of Au. "Au is far from being one of the simplest objects for dispersoidological investigation; it is a multivalent chem. element and is inclined to the formation of complex combinations, which not seldom happen to be more stable than the simple Au combinations; on the other hand, the combinations of Au, being very numerous, are not characterized by stability and suffer rapid changes in their chem. compn., which changes often are difficult to define practically." F. L. BROWNE

Human saliva as a reagent for the preparation of a red dispersoidal solution and a red dispersed precipitate of gold. P. P. VON VEIMARN. Kyoto, Japan. *Japan J. Chem.* 2, 123-8(1928).—The technic of prepg. a Au sol by reduction with human saliva is described. Reproducible results may be obtained. Not only may the saliva of different individuals differ in its power of reducing AuCl_3 but that of any individual differs from time to time. A red Au sol can be made quickly by adding saliva to boiling distd water to which is then added a soln. of a Au salt soln. Continued digestion increases the intensity of the red sol. Photographs are shown of the tendency of such a sol to form rings when evapd. at room temp. Such Liesegang rings are not identical

with those formed chemically in gels. One photograph is that of Fe_2O_3 sol contg. a small amt. of Na citrate a spot of which was allowed to dry in the same manner as the Au sols.

RAYMOND H. LAMBERT

The technic and economics of mechanical dispersion methods. FELIX HEBLER. *Kolloid-Z.* 46, 225-7(1928); *Chem. Fabrik* 1928, 665-6.—As the problem of producing colloidal matter mechanically has not been satisfactorily solved despite numerous expts., a series of tests was carried out with different mills to compare the cost and efficiency of producing colloidal dispersions. Peptization is independent of type of mill and was not studied. The tube mill gives satisfactory results where large output at low cost is required, but fine dispersion is not required. The ball mill has a large capacity, requires little attendance, has a low cost but takes a long time. With proper control of time and water the "cross blow" mill is especially suited for the prepn. of colloidal dispersions. Usually no advantage is found in the high-speed colloid mill.

L. F. MAREK

The relation between the stability of a carbon suspension, the gas adsorbed by the particles and the p_H of the suspension medium. NATHALIE BACH-NIKOLAJEWA AND A. FRUMKIN. *Kolloid-Z.* 46, 89-90(1928).—Platinized C suspended in dil. HCl soln. was more stable when in contact with an atm. of air than one of H_2 . Unplatinized C suspended in dil. HCl in contact with air gave a system of intermediate stability. In dil. alk. soln. the suspension in contact with H_2 was much more stable than the one in contact with air. These results correspond to the fact that platinized C adsorbs acid when the suspension is in contact with air but it does not adsorb alkali. In an atm. of H_2 , however, it adsorbs alkali and not acid.

J. G. McNALLY

Flocculation of mixtures of colloids bearing the same sign. A. BOUTARIC AND (MLLE.) M. DUPIN. *Bull. soc. chim.* 43, 1059-62(1928).—The quantity of electrolyte (KCl, BaCl_2 , LiCl) required to flocculate a mixt. of (1) gamboge and As_2S_3 sols or (2) gamboge and mastic sols was detd. For (1) the quantity of electrolyte is always smaller than that calcd. from the proportions of the constituents, indicating a tendency for the two colloids to flocculate mutually. For (2) the amt. of electrolyte needed to flocculate the mixt. is the sum of the amts. needed for each one separately.

A. L. H.

Mechanical coagulation as a coagulation at boundary surfaces. H. FREUNDLICH AND S. LOEBMANN. *Z. physik. Chem., Abt. A*, 139, 368-74(1928).—The velocity of mech. coagulation of a sol is given by $k = (n_0 - n_t)/t$, where k is the velocity const., n_0 the initial concn. of the sol, n_t the concn. at time t . Sols of CuO and of $\text{FeO}(\text{OH})$ were studied. The velocity of coagulation was detd. by centrifuging the sol and titrating the supernatant soln. according to Zimmerman-Reinhardt. The velocity of mechanical coagulation was shown to be unaffected by the following: (1) changing from a contg. vessel and stirrer of glass to app. made of the same material as the sol (CuO) and having the same ζ potential; (2) concn. of sol; (3) temp. between 0° and 20° ; (4) amt. of liquid stirred; (5) negative charge acquired by the stirrer. The velocity of coagulation was proportional to the square of the speed of stirring. Coagulation was never complete, the amt. pptd. ranging from 20 to 70%. The ζ potential remained const. during coagulation. The coagulated sol showed anisotropic properties and examn. with the ultramicroscope showed that coagulated particles cohere with their longitudinal axes parallel. It is likely that coagulation occurs at the boundary between the sol and the air. Stirring increases this boundary surface. Coagulation was obtained by bubbling purified air through the sol, and also by bubbling C_4H_{10} , which has a lower dielec. const. than the sol. Addn. of substances that lower the surface tension increased the velocity of coagulation by stirring. According to Deutsch (*Z. physik. Chem.* 136, 353(1928)) equil. is displaced at the boundary of 2 phases of high and low dielec. consts. in favor of the electrically more satd. phase.

FRANK URBAN

The lyophilic colloids I. General introduction: agar sol. H. R. KRUYT AND H. G. BUNGENBERG DE JONG. Univ. Utrecht. *Kolloidchem. Beihefte* 28, 1-54(1928).—Marked contrasts in the theory of lyophilic as compared with lyophobic colloids are attributed in part to the fact that the former have been studied largely by physiologists seeking immediate application to biological systems and in part to the temptation to explain all of the behavior of the proteins on the basis of ionic reactions of amino acids. Agar, a carbohydrate, was therefore chosen as a less complex material for beginning a general study of lyophilic colloids. It was purified by thorough washing in H_2O , which reduced the ash content to 2.05%. Observations were made of the viscosity of 1/1% sols at 50° , with the Ostwald viscometer. Above 40° agar sols of this concn. behave like simple liquids obeying Poiseuille's law, free from ambiguity on the score of pre-history, hysteresis, or mechanical agitation. On standing at 50° the viscosity decreases only very slightly in 12 hrs., nevertheless correction was made for this change when

necessary. The viscosity of agar sols is some 200 times that predicted by the Einstein-Smoluchowski equation. It decreases when the temp. rises. Agar particles are therefore highly hydrated, the hydration decreasing with rising temp. just as the positive heat of swelling indicates. The curve relating the concn. of the sol with the difference between its viscosity and that of H_2O is very nearly linear but exhibits 2 distinct bends. Such a curve would result if the hydration of the particles increases on diln. All electrolytes in small concn. decrease the viscosity. The higher the valence of the cation of the electrolyte the lower the concn. necessary to produce a given reduction in viscosity. Salts of all cations of like valence are equally effective in equiv. concns. Cataphoresis proves agar sol to be negatively charged; the charge is decreased by cations. The elec. charge of agar sol is therefore of capillary-elec. origin, like that of lyophobic sols. Agar sol does not coagulate when discharged, so that its stability must be due to factors other than particle charge. HCl and KOH lower the viscosity more than $BaCl_2$, but this is in agreement with v. Smoluchowski's formula. Fuchsin is more effective than KCl , probably because of greater adsorption of org. ions, but strychnine nitrate behaves like KCl . At higher concns. of electrolytes the electro-viscous effect no longer dominates; the v. S. formula expresses the hydration and the lyotropic series is revealed in the influence of electrolytes on the hydration. Emulsoid agar sols possess 2 stability factors, elec. charge and hydration. To cause coagulation, both must be decreased. Thus addn. of electrolytes merely discharges the sol without coagulating, but if alc. or acetone is also added, dehydration with resulting coagulation takes place. The coagulum hydrates again reversibly but does not peptize at room temp. Addn. of alc. or acetone to electrolyte-free agar sol dehydrates without discharging, producing a lyophobic suspensoid which is then coagulated by electrolytes. The change from emulsoid to suspensoid is reversible. These generalizations for agar sol are extended to lyophilic sols in general and to proteins in particular.

F. L. BROWNE

Physical-chemical periodicity. N. v. RASCHEVSKY. *Z. Physik* 52, 372-81 (1928).—A cellular structure (foam-like or made up of drops) resulting from a sequence of reactions is necessarily rhythmic because of its cellular nature. Although the conditions necessary for this periodicity are quite general, very special conditions must obtain if the periodicity is to be of const. amplitude. R. will give these conditions in a note to follow.

GEORGE GLOCKLER

Certain physicochemical properties of pineapple-stem colloids. C. P. SIDERIS. *Plant Physiology* 3, 309-21 (1928); cf. *C. A.* 23, 171.—The colloids present in pineapple tissue were studied in the hope of discovering the reason for the optimum growth of the plant in soil and H_2O cultures at pH 4.5 to 6.5 (*C. A.* 22, 3683). From the fluid expressed from the stem, the colloids were sepd. by fractional pptn., by using acids and bases alternately. By applying the color reactions with protein reagents, 2 proteins and a carbohydrate were identified among the fractions. The 2 proteins, being amphotene, exhibit an isoelec. point, but the carbohydrate does not. The sepn. of one of the proten colloids on evapg. a sol also contg. $NaCl$ was observed under the microscope. If the soln. was on the alk. side of the isoelec. point the protein formed the central portion of the crystal mass; if the soln. was on the acid side $NaCl$ took the central position. At the isoelec. point the protein formed transparent threads made up of flakes chaotically arranged. On adding 0.1 N $NaOH$ dropwise to sols of the carbohydrate, hollow spheres or doughnuts of membranous ppt. were formed. These bodies were 0.05 to 0.5 mm thick and retained their identity from a few secs. in an acid soln. to many mins. in solns. of higher pH . Their formation is attributed to orientation of the active- $COOH$ groups of the protein colloid toward the interior of the bodies, the enclosed H_2O being that formed by neutralization of $-COOH$ by $NaOH$. The bodies break up finally as a result probably of osmosis. The hypothesis is advanced that the carbohydrate colloid has a hollow spherical structure, the shell of which is formed by aggregated micelles held together by electrostatic forces. Protein colloids may have similar structures. At the isoelec. point they would then be like collapsed rubber balloons; at pH values fairly close to the isoelec. point on either side they would be like inflated balloons; at pH values farther removed from the isoelec. point the micelles becomes so highly charged that they disperse, breaking up the structure. In the spherical bodies the $-COOH$ groups project inward and the $-NH_2$ groups outward as long as the soln. is on the acid side of the isoelec. point; on the alk. side the orientation is reversed.

W. T.

A general definition of acids, bases and salts. H. P. CADY AND H. M. ELSEY. Univ. of Kansas and Westinghouse Elec. and Mfg. Co. *J. Chem. Education* 5, 1425-8 (1928).—In order to make these terms applicable to any system involving an ionizing solvent, an acid is defined as "a substance which forms by its direct ionization only cations identical with the positive ions formed by the ionization of the solvent mols."

A base is "a substance whose mols. yield by a process of direct ionization only anions identical with those formed by ionization of the solvent mols." A salt is "a substance whose soln. in a solvent has an elec. cond. of a higher order than that of the pure solvent, and which by a process of direct ionization yields at least one kind of cation and one kind of anion different from those formed by direct ionization of the solvent." The terms *solvation*, *acid of a system*, *acidic*, *neutral*, *basic*, *acid ion*, *base ion*, *neutralization*, *acid salt*, *basic salt*, *neutral salt* and *solvolysis* also are discussed. A. M. P.

Invasion and solvation of gases in water. GEORG-MARIA SCHWAB AND EMIL BERNINGER. Univ. Wurtzburg and Chem. Lab. des Staates, München. *Z. physik. Chem.*, Abt. A, **138**, 55-74(1928).—A method is described for detg. quickly the soly. and the invasion coeff. of a gas in H₂O at temps. ranging from 15° to 80°. The method is based on the change in pressure in a bubble rising through a column of H₂O. The values of these coeffs. at various temps. are given for O₂, H₂, N₂O, CO₂, C₂H₄ and C₂H₂. The abs. solution velocities differ widely in their order of magnitude and their temp. coeffs. The soly. of CO₂ was detd. above 60°, that of N₂O, C₂H₄ and C₂H₂ above 30°. As the temp. rises the solubilities of CO₂ and C₂H₂ reach a min., the soly. of N₂O falls rapidly, and that of C₂H₄ remains nearly const. From the soly. data, the invasion coeffs. were calcd. At 20° they are of the same order of magnitude for the gases investigated, although their temp. coeffs. vary decidedly. The differences are attributed to differences in the H₂O films. Approx. calcns. give rough values of the hydration numbers. A comparison of the figures obtained at 20° and 60° shows that CO₂ and C₂H₂ have an abnormal positive temp. coeff. of hydration. This fact is to be connected with the soly. min. exhibited by these two gases. ALBERT L. HENNE

Molecular condition of salts in solution. H. ULLICH AND E. J. BIRK. Univ. of Rostock. *Z. angew. Chem.* **41**, 1075-8, 1141-4(1928); cf. *C. A.* **22**, 4326.—Deviations from the Debye-Hückel laws are discussed for moderately dil. and concd. solns. and for fused salts. The effects of ion radii, solvation and association are considered. *Associated ions* are pairs of ions whose charges have approached closer than a certain definite interval. In some ways they resemble undissocd. mols., and compared with individual ions they exert small elec. forces upon their environment. They represent a loose union of solvated undeformed ions, while undissocd. mols. are closely bound, unsolvated, deformed ions. The min. interval, b_{\min} , between two ions is given by the expression $b_{\min} = 4.16 \times 10^{-4} Z^2/DT$. In H₂O solns. of univalent electrolytes this is 1.76×10^{-8} cm. As long as b is greater than this value, Debye-Hückel's formulas are applicable for concns of 0.1 to 1.0 *M*, but if b becomes less than this they lose their value. In such solvents as EtOH and acetone, b_{\min} for a univalent salt is about 7×10^{-8} cm. A values are plotted against $\sqrt{2c}$ for KCl, KNO₃, LiCl and LiNO₃ in H₂O. With solvents having a dielec. const. (Dk) < 30, cond. curves show large deviations from the normal. In such solvents as acetone ($Dk = 21$), ethylene chloride ($Dk = 10$), and tetrachloroethane ($Dk = 8.15$), b_{\min} for univalent salts attains values of 7, 14 and even 19×10^{-8} . With falling Dk of solvent even stronger ion association occurs, and the A values show larger deviations. With "weak" salts such as (C₂H₅)₄NI, (C₂H₅)₄NCl and NaI, A values indicate the formation of undissocd. mols. In such solvents as H₂O, NH₄OH and EtOH most salts are almost completely dissocd., but in such non-polar solvents as C₂H₆ and acetone only such salts are dissocd. to a considerable extent as are also strongly dissocd. when fused. Three characteristic properties are found in concd. solns. of strong salts; polymerism in mol. wt. detns. by the osmotic method, anomalous cond. and increase in Dk . These are attributed to assocd. ions and are not found in concd. solns. of weak salts. Salts which possess poor cond. and show low dissocn. in solvents of low Dk , behave similarly in a state of fusion, while salts strongly dissocd. in such solvents are likewise strongly dissocd. in a state of fusion. H. STOERTZ

Free energy of nitric acid solutions in water. B. LENGVEL. *Magyar Chem. Folyóirat* **34**, 9-16, 23-32, 39-44(1928).—The freezing points of dil. HNO₃ solns. were detd. as an exptl. basis for the calcn. The exptl. app. consisted of 2 Dewar bottles contg., resp., ice water and ice in HNO₃ soln. The difference of temp. was detd. by means of a thermoelement combined with a galvanometer and a mirror. The accuracy of the detns. is 0.0002° for very dil. solns. Various dilns. were examd., from about 0.005 to 4 *N* HNO₃. The expts. gave a basis for the detn. of the activities of both components, as well as the activity coeff. of HNO₃ and the free energy of diln. for HNO₃ solns. S. S. DE FINÁLY

Incompatibility between any theory of complete dissociation and migration data for bivalent ions. JAMES W. MCBAIN AND PIERRE J. VAN RYSSELBERGE. *J. Am. Chem. Soc.* **50**, 3009-17(1928).—When SO₄²⁻ is added to 0.05 *M* MgSO₄ or CdSO₄, the Mg or Cd migrates toward the anode. All bivalent salts resemble Cd₁₂ in their

tendency to form complex anions. The extension of any hypothesis of complete dissociation to multivalent ions seems futile. Recent publications by Nernst, Fajans and MacInnes and Cowperthwaite support this view. *Measurements of migration* of Cd^{++} , Mg^{++} , Li^+ , K^+ and Ca^{++} in 0.05 *M* solns. of one of their salts contg. at least one bivalent ion were made in the presence of a 0.95 *M* soln. of a sulfate or chloride. Assumption of excessive hydration of cations does not explain the results. FRANK URBAN

The application of the distribution coefficient method for estimating the undissociated and dissociated portions of salicylic acid in a neutral salt solution. BOHDAN VON SZYSZKOWSKI AND ADAM VON SHAPSKI. *Z. physik. Chem.* 137, 238-62(1928).—The distribution coeff. of salicylic acid between C_6H_6 and solns. of NaCl , NaClO_3 , NaNO_3 , BaCl_2 , Na_2SO_4 and MgSO_4 for a range of concns. from 0.005 and 2.0 *M* was detd. The activity coeffs. of dissocd. and undissocd. acid were calcd. from the data. From the solubilities a general formula for the influence of weak solns. of weak electrolytes on soly. is obtained as follows: soly. in salt soln. \div soly. in H_2O = $[(1 - \alpha)/f_0] + (\alpha/f)$, where f_0 is the activity of undissocd. and f of dissocd. acid. Salicylic acid definitely forms hydrated single and double mols. in the C_6H_6 phase and its degree of dissocn. does not deviate much from 0.5 over the range of concns. studied. R. H. LAMBERT

The deviations of electrolytes from Ohm's law. M. WIEN. *Physik. Z.* 29, 751-5 (1928); cf. *C. A.* 22, 906.—The cond. of electrolytic solns. was measured in elec. fields of high voltage, in which the ions attain velocities as great as several m. per sec. The current impulse produced by the high voltage was used to measure the cond. The electrolytic cond. always increased when the field strength was increased. In weaker fields the cond. increased in proportion to the square of the field. The proportionality const. increased as the square of the product of the valences and was greater at lower concn. and at lower dielec. const. This effect can be expressed by the formula $\Delta\lambda = AX^2(1 - BX^2)$, where X is the field strength, A and B are consts. and $\Delta\lambda = (\lambda - \lambda_0)/\lambda$. In fields of very high strength the cond. approaches a limiting value. The more dil. the soln. the faster the limiting value is approached. This limiting cond. is identical, within the exptl. error, with the cond. at infinite diln. No increase of cond. occurs if the field is perpendicular to the voltage used in the measurement of the cond. E. R. S.

The theoretical explanation of the dependence of electrolytic conductance on the voltage and frequency. GEORG JOOS. *Physik. Z.* 29, 755-60(1928); cf. *C. A.* 22, 2861.—The concepts underlying modern theories of electrolytes are reviewed briefly. The increase in electrolytic cond. at high field strengths observed by Wien (cf. preceding abstr.) is explained by means of the Debye-Hückel theory and the equations of Onsager (*C. A.* 21, 2412). The equations of Debye and Falkenhagen (*C. A.* 22, 3573) for the formation of the ionic "atmosphere" predict that the force of relaxation of the ionic "atmosphere" vanishes at high frequencies and that the electrophoretic force vanishes at very high voltages, in agreement with the exptl. results of Wien. E. R. SMITH

The influence of glycocoll upon the electrical conductivity of salt solutions. TERUICHIRO MURAYASU. *Hokkaido Univ. Hokkaido J. Med.* 6, 328-36(1928).—By ordinary methods M. measured the elec. cond. of 0.5 *M* solns. of NH_4Cl , NaCl , etc., with and without addn. of glycocoll. The conductivities of the salts of univalent cation with uni- or bivalent anion, and of salts of bivalent cation with univalent anion decreases upon adding glycocoll, in the order: $\text{HCl} > \text{NaCl} > \text{Co}(\text{NO}_3)_2 > \text{Na}_2\text{CO}_3 > \text{CaCl}_2 > \text{K}_2\text{Cr}_2\text{O}_7 > \text{BaCl}_2 > \text{AlCl}_3 > \text{NH}_4\text{Cl}$. The cond. of the salts of bivalent cation with bivalent or multivalent anion, and of the tervalent cation with quadrivalent anion increases upon adding glycocoll, the order being $\text{FeCl}_3 > \text{CrCl}_3 > \text{ZnSO}_4 > \text{CuSO}_4 > \text{MgSO}_4 > \text{K}_4\text{Fe}(\text{CN})_6$. K. SOMEYA

The electrolytic oxidation of formaldehyde in alkaline solution. ERICH MÜLLER AND S. TAKEGAMI. *Z. Elektrochem.* 34, 704-13(1928).—The curves of current vs. voltage for the electrolytic oxidation of alk. H_2CO (24% H_2CO in equal vol. of 2 *N* or 4 *N* NaOH) were observed at 18-20°, with anodes of polished and spongy Au, Ag, Pd, Rh or Pt wire; the e. m. fs. were measured against a normal calomel electrode. They were typical decompn. curves and were similar for all anodes, the current beginning to increase within 0.1 v. of the H potential. With smooth anodes the c. d. at the turn in the curves varied with the metal; with spongy anodes the current up to the turn in the curves increased more rapidly and the turn occurred at higher c. d. The evolution of H_2 up to the turn in the curve was rapid with Au and Ag, slow with Pd and Rh and nil with Pt anodes. The max. c. d. at the turn increased with increasing concn. of alkali. The case of reduction of the oxide film by H_2CO (shown clearly on smooth Au and Ag anodes, less clearly on Pd and Rh, after the turn) detd. the returning leg of the curve. The processes taking place in the low-potential field were further studied, with 12% H_2CO and 4 *N* NaOH . Here the oxidation at Pt anodes is such that no H is formed

(I), while with the other anodes H is evolved (II). These studies show that both I and II occur simultaneously, the ratio II:I depending upon the anode metal (great with Au and Ag, small with Pd and Rh, and zero with Pt). For metals at which II takes place principally, the ratios are smaller with increasing anode potentials. At const. p. d. the ratio decreases somewhat with time. A mechanism is suggested for the part played by metals in the catalytic decompn. of HCOOH and H₂CO, and in the electrolytic oxidation of H₂CO up to the turn in the low-potential field. J. BALOZIAN

The anodic behavior of palladium in chloride solutions. FRIEDRICH MÜLLER Tech. Hochschule, Dresden. *Z. Elektrochem.* 34, 744-52(1928).—Pd behaves differently than Pt when used as a Cl₂ electrode in a chloride soln. It gives a less positive voltage and is attacked. On lifting the Pd electrode into the air for a moment the metal suddenly becomes passive and when replaced in the soln. gives the same potential as the Pt electrode and is no longer attacked. A Pd electrode which acts as a passive electrode in 0.01 N HCl is active in 1 N and 5 N HCl. In Cl-free NaNO₃ and HNO₃, the Pd as anode is passive. M. discusses the various theories of passivity that might account for the phenomena, in particular the theory that a higher oxide, PdO₂, which is only attacked by HCl, makes the metal passive. Results similar to those with chlorides were obtained with alkali bromides and iodides. Except in Na₂SO₄ solns. the passivity was destroyed by touching the Pd with a zinc wire. MALCOLM DOLE

Chemical reactions of the third order. FRANK E. GERMANN. Univ. Colorado J. Phys. Chem. 32, 1748-50(1928).—In case of a 3rd-order reaction of the form $A + 2B \rightleftharpoons R_1 + R_2 + \dots$, the form of the expression for velocity of reaction differs according to the use of mols. or equivalents per liter as the measure of concn. The expression obtained when mols. per liter is used is given and integrated. In all other cases of 3rd-order reaction, the equations are the same, whether mols. or equivs. per l. are used. R. J. HAVIGHURST

Reply to O. Warburg's comments (on the catalysis of the oxidation of iron). HANS HANDOVSKY. *Biochem. Z.* 202, 157 8(1928); cf. *C. A.* 22, 4333.—H. points out that Fe heated in an atm. of N₂ loses its ability to catalyze the oxidation of amino acids. S. MORGULIS

Catalysis in the hydration of acetic anhydride. MARTIN KILPATRICK, JR. Polytech. Inst., Copenhagen. *J. Am. Chem. Soc.* 50, 2891-902(1928).—The velocity const of hydration K_h of Ac₂O was detd. at 0° by a dilatometric method. The effect of a no of neutral salts upon K_h as well as the medium effect of acetic acid was also detd. The consts. for H⁺, AcO⁻ and formate-ion catalysis were measured, the latter being a very active catalysis. In propionate-propionic acid and in butyrate-butyric acid buffer solns. the hydration is slower than in H₂O alone. J. H. PERRY

The reversible addition of ethyl alcohol to *p*-bromobenzonitrile catalyzed by sodium, potassium and lithium ethylates. III. C. N. MYERS AND S. F. ACREB. Johns Hopkins Univ., H. A. Metz Lab., and Bur. Standards. *J. Am. Chem. Soc.* 50, 2916-22(1928).—The velocity of the reversible addn. of EtOH to *p*-bromobenzonitrile at 25° was measured in solns. of Na, K and Li ethylates in concns. from N/32 to N/2048 to det. whether both the ions and the non-ionized mols. are active catalytically. By substituting the different values of α and K_n in the equation $K_n = K_i\alpha + K_m(1 - \alpha)$, a series of equations was obtained which were solved for the individual and best av. values of K_i and K_m for each ethylate. K_i is the sum of the activities of the EtO ion in the two opposing reactions and K_m is the corresponding sum of the activities of the non-ionized metallic ethylate. The activities of the EtO ion in the three cases were the same. The corresponding values for the cations Na⁺, K⁺ and Li⁺ were: 0.163, 0.144 and 0.093, resp. The conclusions of this study agree with the application of the ion mol. theory of catalysis to 62 quant. studies of previously studied reactions of previous investigators. J. H. PERRY

Stopping corrosion by hydrogen-ion control. F. R. MCCRUMB. *Power* 68, 1038-40 (1928).—A description of the use of a comparator in detg. p_H of brine. D. B. DILL

Formation of nitrite and nitrate from ammonia and oxygen upon alkaline surfaces. K. A. HOFMANN. *Sitzb. preuss. Akad. Wiss.* 1928, 461-5.—It was shown previously that mixts. of NH₃ and air form nitrates rapidly at temps. even below 400°, without loss of NH₃ through decompn., provided that the gases react only on the alk. surfaces. The mechanism of the reaction is now discussed. The first product actually detected is nitrite, formed thus: $2\text{NH}_3 + 3\text{O}_2 + 2\text{NaOH} = 2\text{NaNO}_2 + 4\text{H}_2\text{O}$. N₂ is not formed, probably because =NH is produced first, as in the reaction between O₂ and NaN₃, NaNH₂, or NH₂OH. To hasten the formation of nitrate and nitrite, catalyzers like Cu, Ni, Co and Ag are necessary; the reactions then involved are similar

to those observed when Ag and Au dissolve in alk. cyanides or in NH_3 solns.

W. C. ERAUGH

Oxidation of mercury in the presence of incandescent platinum. A. I. LEIPUNSKII. *Physik. tech. Röntgen Inst., Leningrad. Z. physik. Chem., Abt. B*, 1, 369-74(1928).—The kinetics of the oxidation of Hg vapors in the presence of incandescent Pt are investigated. The reaction velocity is little affected by the pressure of O_2 ; it decreases with increasing vapor pressure of Hg, and increases with the temp. of the Pt filament. The reaction is considered as a catalytic process in which O_2 is activated by adsorption on the Hg-free surface of the Pt wire.

ALBERT L. HENNE

The states of aggregation of condensed helium. W. H. KEESOM. Univ. Leyden. *Nature* 122, 847-9(1928).—Helium was liquefied with the use as preliminary cooling agents first of H_2 vapor and then liquid H_2 boiling at -258° under reduced pressure. Although Kammerlingh-Onnes was unable to solidify the liquid even at 0.8°K ., K. succeeded. His app. is described in detail. By varying the pressure exerted on the He bath the fusion curve of the element was followed for pressures varying from 25 to 144 atms., with a corresponding temp. range of 1.2 to 4.2°K . The curve at its lower end becomes nearly parallel to the temp. axis and shows no evidence of meeting the vapor curve in a triple point; sublimation (below the crit. temp.) appears impossible. The dielec. const. of liquid He undergoes a sudden change at approx. 2.3°K .; liquid He evidently exists in two modifications, He I being stable above 2.3°K . and He II at lower temps. The heat of transformation of He I to He II is -0.13 cal./g . Helium has a triple point; liquid He I, liquid He II and vapor. The diagram is given. W. E. V.

The system: ammonium sulfate-sulfuric acid-ethyl alcohol. H. B. DUNNICLIFF, A. L. AGGARWAL AND R. C. HOON. Univ. of the Punjab, Lahore, India. *J. Phys. Chem.* 32, 1697-704(1928); cf. *C. A.* 20, 3627.—The system was investigated by a study of the action of EtOH or alc. H_2SO_4 on NH_4HSO_4 . When the liquid phase at equil. contains 0.28-2.53% H_2SO_4 as ester and 2.72-12.77% H_2SO_4 in the free state, the solid phase is $3(\text{NH}_4)_2\text{SO}_4 \cdot \text{H}_2\text{SO}_4$. When NH_4HSO_4 reacts with EtOH in a wt. ratio of one or more to one, there are indications of the formation of $2(\text{NH}_4)_2\text{SO}_4 \cdot \text{H}_2\text{SO}_4$. This solid phase is not formed when alc. H_2SO_4 acts on NH_4HSO_4 . When the liquid phase contains 3.08-4.37% H_2SO_4 as ester and 11.97-13.48% free acid, the solid phase has the compn. $3(\text{NH}_4)_2\text{SO}_4 \cdot 2\text{H}_2\text{SO}_4$, but it is doubtful whether a compd. of this formula is actually formed. When the liquid phase contains 5.48-12.06% H_2SO_4 as ester and 13.49-12.51% free acid, the solid phase is $(\text{NH}_4)_2\text{SO}_4 \cdot \text{H}_2\text{SO}_4$. When alc. H_2SO_4 with a total acidity of 80% or over reacts with NH_4HSO_4 , the solid disappears and no solid phase seps. down to -18° . The equil. depends upon some factor or factors other than the concn. of free H_2SO_4 .

R. J. HAVIGHURST

Heterogeneous elementary reactions I. The action of Cl_2 on Cu. L. FROMMER AND M. POLANYI. *Z. physik. Chem.* 137, 201-8(1928).—The reaction between halogens and metals is rapid and markedly influenced by temp. When the reaction proceeds exothermically all impacts of mols. are successful; when the reaction is endothermic the successful impacts may be calcd. from the equation, $n/n_0 = e^{-Q/RT}$, where Q is the heat evolved. The object of the expt. was to det. whether or not the reaction between Cl or Br and a metal is actually a "heterogeneous elementary reaction." The app. was so constructed that the gas reacted with the metal at very low pressure. The temp. of the metal could be varied independently of that of the gas. In the action of Cl on Cu at 470° , 0.33 to 0.44 of the impacts produce double decompn. while at 300° the successful impacts are about 1.5 times as many. Since Q is only 2.6 cal. it can hardly be the heat of activation as usually considered. The results appear to show that the Cl mols. tear Cu atoms from the crystal lattice to form CuCl , and that Cu_2Cl_2 is formed only in a secondary reaction. The study is being continued.

R. H. LAMBERT

The equilibrium diagram of the iron sulfide-manganese sulfide system. ZEN-ICHI SHIBATA. *Tech. Repts. Tohoku Imp. Univ.* 7, 279-87(1928).—FeS was prepd. by reducing Fe free from C, Si, Na_2CO_3 , N, and As with H_2 and mixing with flowers of S. The powder was strongly heated in H_2S and then in H_2 at 500° . MnS was pptd. by adding freshly prepd. $(\text{NH}_4)_2\text{S}$ to a soln. of MnCl_2 and heating on a water bath for 2 hrs., filtered, washed and dried. The dried mass was heated at 1000° in a current of H_2S and then in H_2 at 500° . Both the FeS and MnS were very pure. The m. ps. of FeS and MnS are $1163 \pm 2^\circ$ and $1610 \pm 3^\circ$, resp. An equil. diagram obtained from the result of thermal analysis shows that the 2 sulfides mix with each other in all proportions in the fused state, and partially in the solid state. On cooling from the melt, the eutectic is formed at 1164° with 93.5% FeS and 6.5% MnS. Twelve photographs are included showing the microstructure of specimens contg. 6.48, 9.68, 16.40, 25.57, 39.51, 48.10, 81.05 and 100% MnS, resp.

DOWNES SCHAAF

Spark ignition. E. TAYLOR JONES. Univ. of Glasgow. *Phil. Mag.* [7], 6, 1090-1103 (1928).—The chief topics discussed are the nature of the action of an elec. spark in igniting an inflammable gaseous mixt., and the conditions which det. whether a spark will ignite a given mixt.

GEORGE GLOCKLER

Kindling temperatures of mixtures of air and hydrogen. M. PRETTE AND P. LAFFITTE. *Compt. rend.* 187, 763-5(1928).—Because of differences in exptl. methods the data on the kindling temp. of air and H_2 are so contradictory that it is impossible to draw a curve connecting kindling temp. with concn. The following method is shown to be reliable and is proposed as a standard. The gaseous mixt. is prepd., dried thoroughly, stored over Hg and analyzed. The reaction vessel is a Pyrex cylinder (35 mm. diameter, 110 cc. capacity) surrounded by a steel jacket and elec. heated. The Pyrex vessel is evacuated to $1/10000$ mm. Hg before the gaseous mixt. is admitted. If a flame is observed, the vessel is again evacuated, its temp. lowered and gaseous mixt. readmitted, this being repeated until no flame appears. The temp. is then recorded. The expts. are then repeated with the same mixt. but at increasing temps. until kindling takes place. This new temp. is recorded. The av. of the two temps. is taken as the kindling point. Thorough evacuation is imperative because errors of 50-100° may be observed when the vacuum is only 1 cm. of Hg. When the concn. of H_2 in % by volume is: 10.10, 14.30, 19.90, 24.30, 29.70, 35.85, 42.90, 47.20, 58.80, 68.85, 79.40, 90.45, the kindling temps. are resp.: 456, 460, 462, 465, 468, 471, 475, 477, 482, 496, 514, 540.

ALBERT L. HENNE

A generalized Gibbs-Boltzmann equation. F. RUSSELL BICHOWSKY. Naval Research Lab., Wash. D. C. *Phys. Rev.* 32, 494-6(1928).—A generalized form of the Gibbs-Boltzmann canonical equation $1 = \int \phi(e/kT)e^{-(\alpha+e)/kT} d\omega$ is derived by reversing the line of proof used by Gibbs in showing the correspondence of statistical formulas with thermodynamics. The proof involves only the assumption of the first 2 laws of thermodynamics, the idea that thermodynamic quantities are the phys. av. of complicated mol. processes, and the assumption that energy, entropy and temp. give a sufficient description of the system considered. The equation allows a treatment by statistics of the most generalized type of systems.

BERNARD LEWIS

New thermochemical and refractometric investigations in the field of strong electrolytes. E. LANGE. *Physik. Z.* 29, 760-70(1928); cf. *C. A.* 22, 4337.—The heat effect caused by the diln. of a soln. contg. 1 mol. of salt from an initial concn. m to infinite diln. is the integral heat of diln. According to the Debye-Hückel theory this heat effect depends on interionic forces in a soln. of a completely dissoed. electrolyte. Aq. solns. in the concn. range below 0.01 M give a positive heat of diln. The simple expansion of the ionic system from a definite initial concn. to infinite diln. must have a cooling effect but, at the same time, in the dipole medium surrounding the ions heat is developed since the H_2O mols. added in the diln. process increase the hydration envelopes of the ions. At room temp. the quantity of heat given out by these H_2O mols. is greater than the heat effect of negative expansion and thus a positive net heat effect occurs. An adiabatic differential calorimeter sensitive to 0.5×10^{-6} degree, by means of which the net heat of diln. can be measured, is described. The theoretical expression for the heat of diln. (V_m) can be reduced to the formula $V_m = \text{const.} \sqrt{m}$, which requires that the heats of diln. of uni-univalent electrolytes be identical in the dil. concn. range, where the \sqrt{m} rule holds. Exptl. results with KF, KCl, CsCl and LiBr verified this prediction. KNO_3 showed a marked deviation from the rule in 0.01 M soln. The assumption that an appreciable number of mols. in solns. of strong electrolytes remains undissociated has not, as yet, been proved either by thermochem. or optical means.

E. R. SMITH

The heat capacity and entropy of barium bromate from 16° to 300° absolute. The entropy of bromate ion. BERNARD S. GREENSFELDER AND WENDELL M. LATIMER. Univ. of Calif. *J. Am. Chem. Soc.* 50, 3286-90(1928); cf. *C. A.* 22, 3570.—The sp. heat of $Ba(BrO_3)_2 \cdot H_2O$ was measured from 16° to 300°K., by technic developed in similar studies of Cs alum. The sp. heat together with the heat of soln. and the free energy of soln. of $Ba(BrO_3)_2$ were used to calc. the entropy of bromate ion in hypothetical 1 M aq. soln. $S^\circ_{BrO_3-} = +43.6$ E. U., with respect to $S^\circ_{H+} = 0$.

J. H. P.

The heat of formation of cementite. TAKEO WATASE. *Science Repts. Tohoku Imp. Univ.* 17, 1091-1109(1928).—Cementite prepd. by subjecting plates of C steel (2% C) to electrolysis with N HCl and a current d. of 0.075 amp. per sq. cm., was burned in a Berthelot-Mahler bomb calorimeter and its heat of combustion detd. From the observed amt. of heat evolved and the compn. of the combustion residue, the heat of the reaction $Fe_3C + 3O_2 = Fe_2O_3 + CO_2$ was found to be 366.3 kilocalories. From

this figure and those found in the literature for the formation of Fe_3O_4 and for CO_2 , the heat of formation of cementite is calcd. to be -4.8 kilocalories at 20° . D. S.

The quantum theory of the atom nucleus. G. GAMOW. *Z. Physik* 51, 204-12 (1928).—G. studies the process of emission of α -particles in the light of wave mechanics, and tries to derive theoretically the experimentally discovered relationship between life period and energy of the α -particle. G. CALINGAERT

The blind-alley of modern atomistics. DAN RĂDULESCU. *Scientia* 44, 307-16

(1928).—A number of the advances of modern physics are reviewed and the conclusion is drawn that while the new laws of statistical mechanics furnish a good description of phenomena, the theories explaining their causes have not kept pace, and a point is being approached where nothing will be comprehensible. L. A. SARVER

Experimental confirmation for Sommerfeld-Fermi-Dirac degenerate-gas theory of conduction electrons. JESSE W. M. DU MOND. *Calif. Inst. Science* 68, 452(1928).—Preliminary results of a study of the Compton modified line structure confirm the Sommerfeld theory of conduction electrons in metal crystal lattices. Al and Be have been studied, the results being most striking with Be, where probably 2 of the total 4 electrons per atom are in the degenerate gas-state. J. H. PERRY

Recent progress in the study of the structure of the nucleus. S. C. LIND. *Chem. Reviews* 5, 365-9(1928).—Review. GEO. GLOCKLER

Helium nucleus as the foundation of other atom nuclei. H. PETTERSSON. *Z. Physik* 48, 799-804(1928).—From the point of view of the new at. wt. detns. of Aston, arguments are brought forward against the theory that elements in general are built up from He nuclei. B. C. A.

Problems of radioactivity. S. C. LIND. *Chem. Bulletin* 15, 319-21(1928).—The exact branching point of the actinium family should be detd. and also the at. wts. of the members of the Ac series. The isotopes of U should be studied by the mass-spectrography. Atomic disintegration by means of α -particles must be carried further. The elements 85 and 87 are probably radioactive and should, therefore, be discovered by the methods of radioactivity. Elements higher than U in at. wt. should be sought and finally our knowledge of nuclear structure should be extended by studies in radioactivity. GEO. GLOCKLER

Problem of actinium. L. IMRE. *Magyar Chem. Folyoirat* 34, 49-56(1928); cf. C. A. 22, 1094.—It is not yet definitely decided whether the Ac-group is connected genetically with the U-Ra-group. If they were connected another branch-group might be expected at U₁₁. There are, however, some difficulties which cannot yet be explained. A method was found for sepg. Radio-Ac by means of two liquid phases. Exams. proved Radio-Ac to be an element of the character of thorium. Some quant difference between Th and Radio-Ac are now under actual examn. S. S. DE FINÁLY

Radium and geology. CHARLES S. PIGGOT. *Geophys. Lab. Carnegie Institution of Wash. J. Am. Chem. Soc.* 50, 2910-6(1928).—The significance of radioactivity to geology is discussed. The radioactivity of 7 granites of the eastern U. S. is given. A method for detg. U and U-derived Pb involved in an age detn. is outlined. L. D. R.

The physics of the universe. JAMES JEANS. *Nature* 122, 689-700(1928).—From a consideration of the transformation of matter into radiation, as in radioactive disintegration for example, and of the conditions under which radiation might be transformed into matter, it is concluded that "there can be no creation of matter out of radiation, and no reconstruction of radioactive atoms which have once broken up. The fabric of the universe weathers, crumbles and dissolves with age, and no restoration or reconstruction is possible." Millikan's hypothesis that matter is formed by combination of protons and electrons in interstellar space is rejected as a violation of the second law of thermodynamics. F. L. BROWNE

The rate of emission of α -particles from radium. H. J. J. BRADDICK AND H. M. CAVE. *Proc. Roy. Soc. (London)* A121, 367-80(1928).—A detn. by the "total charge" method, suggested by Rutherford, gave 3.68×10^{10} α -particles per g. per sec. This is in agreement with recent values calcd. from heating effects. Sources of Ra active deposit were used. Ra A was allowed to decay before measurements were made. γ -Rays from Ra C were used to measure the source. L. D. ROBERTS

The internal conversion of gamma rays. II. BERTHA SWIRLES. *Girton College, Cambridge. Proc. Roy. Soc. (London)* A121, 447-56(1928); cf. C. A. 22, 18.—A mathematical discussion of the absorption in the K- and L-levels, based on the exptl. results of Ellis and Wooster, is presented. L. D. ROBERTS

Loss of charge of positive rays and the influence of neighboring metallic walls. E. RÜCHARDT. *Z. Physik* 48, 594-9(1928).—Polemical. A reply to Koenigsberger (C. A. 22, 19). J. W. SMITH

Variation in radioactivity and mineralization of springs. V. SPRITZIN. *Trav. Radium et Minerais radioactifs Acad. sci. U. S. S. R.* 2, 272-6(1928); cf. *Ibid* 264 71.—A consideration of the relation between radioactivity and salt content of the water of radioactive springs. B. C. A.

Ionization measurements of γ -rays. J. A. CHALMERS. *Queens' College, Cambridge. Phil. Mag.* [7], 6, 745-62(1928).—The ionization produced in a chamber depends only on primary γ -rays through the agency of the secondary β -rays, and hence

may not measure any definite property of the γ -ray beam; expts. have been carried out which show striking alterations in the relative ionizations of the Ra B and Ra C γ -rays when the electroscope lining is altered, the γ -ray beam being the same. A qual. and a very roughly quant. explanation are given, by using well-known ideas of adsorption and scattering of β - and γ -rays. This demonstrates the part of an "ionization function" in γ -ray measurements, and the consequences of this are considered in relation to past work and in connection with the limitations necessary in the use of ionizations to measure γ -rays.

GEO. GLOCKLER

The effect of refraction on electron diffraction. G. P. THOMSON. Univ. Aberdeen. *Phil. Mag.* [7], 6, 939-42(1928).—Criticism of Rupp's calcn. of the refractive index of electrons passing through a metal (*C. A.* 22, 3094).

Dirac's theory of spinning electrons. J. VON NEUMANN. *Z. Physik* 48, 868-81 (1928), cf. *C. A.* 22, 1729, 3584.—Mathematical (cf. Dirac, *C. A.* 22, 1535, 2710).

H. G.

Is it possible to test by direct experiment the hypothesis of the spinning electron? L. BRILLOUIN. Univ. of Wis. *Proc. Nat. Acad. Sci.* 14, 755-63(1928).—L. discusses the theory of a proposed expt. on electronic motion in a magnetic field, designed to test the spinning-electron hypothesis. The order of magnitude of the expected effects is so small that the expt. would be very difficult.

R. L. HERSHEY

The ballistic method of ionization measurement with a quadrant electrometer. DAVID L. WEBSTER AND ROBERT M. YHATMAN. *J. Optical Soc. Am.* 17, 248-53(1928).—W and Y. discuss the theory of the true ballistic method of ionization measurement with quadrant electrometer, i. e. exposing the chamber to rays for a predetd. time and reading the farthest point of swing. Four conditions must be satisfied to insure the validity of the method: (1) linearity of the differential equation of motion; (2) its homogeneity, except for the term proportional to the ionization; (3) initial values of velocity, deflection and charge of zero; and (4) constancy of exposure time. The last is easily satisfied; the second and third demand cancellation of natural ionization by a const. opposite current. Tests on a Compton type electrometer show no systematic deviation from linearity discernible below 500 mm. For large deflections a departure from linearity of about 1% appears, but calibration in this range enables accurate comparisons to be made.

R. L. HERSHEY

The recombination of positive ions with free electrons. R. d'E. ATKINSON. Göttingen Univ. *Z. Physik* 51, 188-203(1928).—A. attempts to det. exptly. whether recombination takes place when a stream of positive ions is passed through a cloud of electrons. No loss of electrons could be detected and therefore it is only possible to calc. an upper limit for the probability of recombination.

G. CALINGAERT

The energy losses of electrons in hydrogen. H. JONES AND R. WHIDDINGTON. Univ. of Leeds. *Phil. Mag.* [7], 6, 889-910(1928).—The energy losses of electrons in H_2 of controllable velocity are measured, and also the relative no. in the different energy groups. The results of the measurement of the photographs and their photometric curves may be summarized as follows: By far the most probable effect of a collision between an electron of 50 v. or more velocity and a H_2 mol. is the excitation of the C state with a certain amt. of vibrational energy. The probability of effective collision at 150 v. is in the neighborhood of 1 or 2%. At low velocities, smaller losses, the upper limit of which is 8 or 9 v., varying slightly with the primary electron velocity, are observed, these may be connected with the disocn. of the mol. and the excitation of the continuous spectrum. There is no loss of about 11.1 v. to be found, indicating that the B and other low vibrational states cannot be stimulated directly by electron impact. There is no indication, except at very low velocities (8 to 10 v.) when it is very faint, of a loss occurring which might be connected with direct disocn.

G. G.

Electrical properties of neon. J. S. TOWNSEND AND S. P. MACCALLUM. *Phil. Mag.* [7], 6, 857-78(1928).—Impurities so small in amt. that they cannot be detected spectroscopically, affect the sparking potential. The ionization coeffs. α and β in Townsend's well-known equation are studied.

GEO. GLOCKLER

The investigation of predischarges. F. TREY. Riga Univ. *Phil. Mag.* [7], 6, 854-7(1928).—In 1922 T. published (*Physik. Z.* 23, 193) photographs of brush-discharge "Schlieren," and showed that the "Schlieren" method has been useful in giving more precise information about the life-history of the spark. Cf. Zinszer, *C. A.* 22, 2879.

GEO. GLOCKLER

The electric arc in gases at low pressures. F. H. NEWMAN. University Exeter. *Phil. Mag.* [7], 6, 811-7(1928).—Further study of a new type of elec. arc (*C. A.* 20, 2451) in which with cold electrodes an arc could be started and maintained in various gases at very low pressure provided that an initial elec. discharge was passed between

one of the "arc" electrodes and a third electrode placed within the discharge tube. There were two sep. effects: first the ordinary arc in which the current reached 10-15 amp., and second a brilliant glow discharge during which a very small current passed through the tube. Both of these effects could be excited at such low gas pressure that there was practically no luminosity due to the elec. discharge. GEO. GLOCKLER

The motions of electrons in ethylene. J. BANNON AND H. L. BROSE. Univ. Sydney. *Phil. Mag.* [7], 6, 817-24(1928).—Study of energy losses of electrons in C_2H_4 by the method of Townsend. GEO. GLOCKLER

Penetration of an electric field through wire-gauze. W. B. MORTON. Queen's Univ., Belfast. *Phil. Mag.* [7], 6, 795-801(1928).—Mathematical analysis of the problem as applied to the method of measuring mobilities of ions. The conclusion is that the error introduced by the interpenetration of the fields is small. G. G.

The increase of thermionic currents from tungsten in strong electric fields. RUSSELL S. BARTLETT. Yale Univ. *Proc. Roy. Soc. (London)* A121, 456-64(1928).—Exptl. results are in general agreement with theory, but exptl. deficiencies do not account for the departure from a predicted straight line. A modification of Schottky's equation to account for the influence of neighboring electrons close to the surface is suggested. Surface impurities in the cathode produce a marked effect upon the exptl. results. L. D. ROBERTS

Systematic variations of the constant A in thermionic emission. LEE A. DU BRIDGE. Cal. Inst. Tech. *Proc. Nat. Acad. Sci.* 14, 788-93(1928).—The tabulation of published exptl. results shows that the value of A in Richardson's equation for thermionic emission $I = AT^2e^{-b/T}$ is not strictly const. but that $\log A$ is linear with b . The slopes of the lines are not identical for different metals; however the lines for Cu, W, Pt and thoriated W all intersect at or near the value of $\log A$ corresponding to $A = 60$ amp./cm.² deg.² the theoretical value according to Dushman. The curves may thus be expressed: $\ln A = \ln A_0 + \beta(b - b_0)$, where $A_0 = 60$, β is a const. depending upon the nature of the surface, and b_0 is the same for the more refractory metals. (The line for K is also plotted but does not intersect the others.) These conclusions agree with latest theoretical conclusions of Bridgman. R. L. HERSHEY

Hydrogen ions as cause for the appearance of the photoelectrical spectral selectivity of potassium. RUD. SUHRMANN. *Physik. Z.* 29, 811-5(1928).—Hydrogen which has been carefully purified and dried produces no increase in the photoelectrical sensitivity of K but expts. are described which indicate that the selective max. of K at 440μ is caused by the appearance of positive H ions on the surface of the K. These H^+ ions probably combine very loosely with atoms of the K surface, forming ionized KH mols. W. F. MEGGERS

The photoelectric long wave limit of potassium vapor. R. C. WILLIAMSON. Univ. of Wis. *Proc. Nat. Acad. Sci.* 14, 793-6(1928).—The ionization of K vapor by ultra-violet light has been measured, by using a monochromator, and drawing the vapor from the liquid through a slightly superheated tube into a vacuum. Part of the ionizing radiation is reflected upon a photoelec. cell for comparison purposes. Ionization begins at about 3027 A. U., reaching a max. at about 2800 A. U.; it then declines to a min. at about 2600°, and rises sharply to a second max. at 2150 A. U. The spectroscopic limit of the K atom being at 2856 A. U., the presence of ionization at longer wave lengths indicates mol. ionization, and of two kinds, with and without dissociation. Thus the ionizing potential of a mol. without dissociation would be between 4.08 v. and 3.94 v. and with dissocn. about 4.74 v. R. L. HERSHEY

Emergent energy of photoelectrons in potassium vapor. R. C. WILLIAMSON. Univ. of Wis. *Proc. Nat. Acad. Sci.* 14, 796-801(1928).—Some preliminary expts. on the emergent energy of photoelectrons in K vapor have been performed. Two sets of observations were made, one using the total radiation of a quartz Hg arc, the other using a monochromator with a Hg arc. The evidence is strong that the currents due to electrons emitted from the internal surfaces of the vessel have been made small relative to those due to electrons from photo-ionization of the vapor and that the values of the stopping potentials obtained agree with those to be expected from the data relative to the ionization wave limits of the vapor. The measurements are only preliminary and reference should be made to the original for details. R. L. HERSHEY

The space distribution of the initial directions of the photoelectrons produced by monochromatic x-rays. PIERRE AUGER. *J. phys. radium* 9, 225-30(1928); cf. C. A. 21, 1754.—A series of new measurements permitting the precise definition of the form of the longitudinal distribution of the initial directions of the photoelectrons arising from the excitation of argon by monochromatic penetrating x-rays has been accom-

plished with app. similar to that described in former articles. The monochromatic x-rays were selected by reflection from a rock-salt crystal. Measures and calcs. have been improved by special app., taking into account the non-orthogonality of projections obtained by photography. The statistics, bearing upon 1000 secondary rays, give bipartition angles and av. cosines very different from those obtained in previous work; this is explained by the non-homogeneity of the rays formerly used. These values do not agree with the predictions of former theories, the forward displacement being about 50% too great; but the form of the dispersion is well represented by the $\sin^2 \omega$ formula.

L. A. SARVER

Electric conductivity and optical absorption of metals. EDWIN H. HALL. Harvard Univ. *Proc. Nat. Acad. Sci.* 14, 802-11(1928).—H. discusses the relations between the optical properties of metals and the various mechanisms of elec. conduction and concludes that nothing now known about such properties invalidates the mechanism in which elec. current is maintained partly by free electrons sharing the energy of heat agitation, but mainly by an interchange of electrons in encounters between atoms and positive ions.

R. L. HERSHEY

Recombination of ions in the chamber of an x-ray spectrometer. DAVID L. WEBSTER AND ROBERT M. YEATMAN. *J. Optical Soc. Am.* 17, 254-9(1928).—Tests on the ionization chamber used in these expts. show that the fraction of ions lost by recombination may be const. for any loss up to 10%. This permits accurate comparisons of ionization current with only 45 v. across the chamber. The constancy of fraction lost indicates the recombination is nearly all columnar, i. e. between ions produced by the same photoelectron in the x-ray case. Thus low voltages may be used only with the relatively weak rays used in spectrometry. Stronger rays would probably cause volume recombination; hence these tests indicate nothing about ordinary x-ray dosage measurement.

R. L. HERSHEY

What are the practical applications of Röntgen research? R. BERTHOLD. *Z. Metallkunde* 20, 378-86(1928).—B. discusses four general applications of x-rays: the detn. and description of the crystal structure of a material; the detn. of the presence and the quant. description of preferred orientations in cryst. masses; the measurement of grain size in metals and particle size in colloids; the study of lattice deformations. Examples from published researches are given in each of these four fields.

R. L. HERSHEY

The apparatus for microstructure research with x-rays. R. BERTHOLD. *Z. Metallkunde* 20, 350-8(1928).—After a brief discussion of the production of heterogeneous and homogenous x-rays, B. discusses x-ray tubes, high-tension app., universal and multiple diffraction app., protective measures and their relation to app. set-up, and the various types of x-ray diffraction cameras.

R. L. HERSHEY

The origin and character of x-rays and their application to crystal-structure research. I. MARK. *Z. Metallkunde* 20, 346-50(1928).—The physics of x-rays, as regards their origin, their propagation and their scattering by crystal lattices, is briefly discussed. The characteristics of Laue, Debye-Scherrer and the rotating-crystal methods are presented.

R. L. HERSHEY

Scattering by free gratings and the statistical significance of the distribution of rating spectra on the interference of plane waves. A. WINTNER. *Z. Physik* 48, 445-512(1928).—Mathematical.

H. G.

Reflection of soft x-rays. JOS. E. HENDERSON AND ELIZABETH R. LAIRD. *Proc. Nat. Acad. Sci.* 14, 773-7(1928).—The reflection of soft x-rays (194 v. to 4000 v.) from glass and iron surfaces has been measured. No sharply defined total reflection was obtained. It is shown that absorption by the mirror largely affects the reflection.

R. L. HERSHEY

K x-ray absorption spectra and chemical constitution. OTTO STELLING. *Chem. Inst., Lund Z. Elektrochem.* 34, 520-2(1928); cf. *C. A.* 22, 4056; 23, 32, 336.—A study of the K absorption limit of inorg. salts with similar anions, showing that similarly constituted compds. have the same limit.

WALLACE R. BRODE

The K x-ray absorption edge of iron. GEO. A. LINDSAY AND H. R. VOORHIES. Univ. of Mich. *Phil. Mag.* [7], 6, 910-20(1928).—The multiple structure for Fe, both as a metal and in compds., has been demonstrated to extend over a range considerably greater than that of any structure previously reported. The magnitude of this range is best explained by simultaneous ejection of electrons from outer orbits together with the K electron. Kossel's hypothesis appears satisfactory only as a possible explanation of the white-line absorption. As has been found previously, the principal edge shifts to shorter wave lengths as the valence increases. The effect of valence on the multiple

structure is small. When bivalent and trivalent iron are mech. mixed, the expected superposition of the 2 patterns can be detected, but when the 2 valencies were in the same chem. compd., as in lepidomelane, no such overlapping could be found. G. G.

Slip-bands produced when crystals of aluminum are extended. KEIJI YAMAGUCHI. *Bull. Inst. Phys. Chem. Research Tokyo* 7, 363-82; Abstracts 1, 34-5(1928).—When a test piece made from a single Al crystal is extended under tension, the following relations are found experimentally between the resistance to shear, and the shear as well as the slip-bands produced on a polished surface of the test piece. The slip plane and the direction of shear were detd. from Laue photographs for the condition of max. shearing stress, and were verified by the direction of the slip bands, the change of direction accompanying extension and Laue photographs taken after the extension. If ϵ = extension of the test piece + 1, s = shearing strain (elastic strain being omitted), S = resistance to shear on the slip plane to the direction of slip in kg./mm.², θ = angle between the normal to the slip plane and the initial direction of tension, φ = angle between the direction of slip and the projection of the initial direction of tension on the slip plane, N = no. of slip bands appearing per unit length along the axis of the specimen (no./mm.), N' = no. of slip planes per unit length on the normal to the slip plane (no./mm.), P = tension in kg., p = tensile stress in kg./mm.², A = original cross section of the test piece in mm.², the following relations are true: $N' = (\epsilon/\cos \theta)N$,

$(\sqrt{\epsilon^2 - 1} + \cos^2 \varphi \sin^2 \theta - \cos \varphi \sin \theta)/\cos \theta$, $p = (P/A) \epsilon$, and $S = (P/A) (\cos \theta \sqrt{\epsilon^2 - 1} + \cos \varphi \sin \theta/\epsilon)$. By calcg. these values after detn. of those of N' , P , A , ϵ , θ and φ by expts., the following relations were ascertained for the range $\epsilon = 1$ to 1.4: $S - S_0 = 0.0048(1/N')^{-1}$ and $s = 0.015 S^{2.5}$, where S_0 corresponds to the elastic limit of slip as found from the time of the first appearance of the slip-bands, and though it has the numerical value of about 0.5 kg./mm.², since the permanent strain already exists for this stress, S_0 is no more than an apparent elastic limit, and from the last equation it is seen that the elastic limit is nearly zero in reality. Slip bands disappeared completely when the surface was repolished after the extension, and did not appear again even by deep etching with Viella's reagent. Since the points representing the values of N' obtained from the further extension of this repolished specimen lie on the same line as the original one, it was concluded that the amts. of slip on the respective slip planes were nearly all equal. A special case is mentioned where the direction of tension is (110): the slip takes place on the plane {111} or {111} according to the locality and their boundary surface is parallel to {100}, presenting a macroscopical appearance as if the slip had taken place in this plane. This agrees with the conception that in order that there may not exist any irrationality of a gap, compression, etc., formed at the boundary of two slips, that boundary surface must be the one contg. the two directions of slip (011) and (011), i. e. {100}. Although the strain is as complex as described, the relation between the tensile stress and extension is the same as in the case of slip in a single plane.

ALBERT L. HENNE

Polarization of Compton scattering according to Dirac's new relativistic dynamics. Y. NISHINA. Univ. of Copenhagen. *Nature* 122, 843(1928).—The intensity of the scattered light in the x - z plane in a direction forming an angle θ with the z axis, is given by
$$I = \frac{e^2}{2m^2c^2r'^2} \left\{ \frac{I_0}{(1-\alpha)^2} \sin^2 \theta + \frac{2\alpha^2 + 2\alpha^3 + \alpha^4}{2(1+\alpha)^2} \right\}$$
, wherein $\alpha = h\nu/mc^2$, e and m the charge and mass of the electron, c the velocity of light, I_0 the intensity of the incident unpolarized beam, ν the frequency, r the distance of the first electron from the origin and r' the distance of the second electron from the first. This expression differs from the original equation of Dirac and Gordon by the second term. Present exptl. data are not sufficiently complete to test either theory and more accurate measurements with x-rays and γ -rays are desirable.

WILLIAM E. VAUGHAN

A plausible generalization of the Planck formula for radiation. L. STRUM. *Physik. Forschungskatheder, Kiew. Z. Physik* 51, 287-91(1928).—A generalized form of the Planck radiation formula is derived, also a new expression for the coeffs. of the Stefan Boltzmann equation, which clarify the discrepancies between exptl. and theoretical values (cf. C. A. 19, 1655).

W. F. MEGGERS

Studies on the emission band spectrum of chlorine. YORITSUNE ŌTA AND YŌICHI UCHIDA. Kyoto Imperial Univ. *Japan J. Physics* 5, 53-60(1928).—The emission spectrum of Cl gas under reduced pressure and at low temp. (-20°) was studied and 58 bands were identified. The data have been analyzed into 3 series of bands or lines, each arranged in a 2-dimensional scheme of vibrational quantum nos. No relation was found between the emission spectrum and the absorption spectrum of Cl (cf. C. A. 21, 19).

WALLACE R. BRODE

Studies on the emission band spectrum of bromine. YŌICHI UCHIDA AND YORITSUNE ŌTA. Kyoto Imperial Univ. *Japan J. Physics* 5, 59-60(1928); cf. preceding abstr.—The emission spectrum of Br was studied under similar conditions to those used in the Cl investigation. Approx. 80 bands were identified and analyzed into 2 systems having final states in common. No relation was found between the emission spectrum and the absorption spectrum of Br.

WALLACE R. BRODE

The Lyman bands of hydrogen. E. C. KEMBLE AND V. GUILLEMIN, JR. Harvard Univ. *Proc. Nat. Acad. Sci.* 14, 782-7(1928).—A study of the structure of the Lyman bands (B_2-A_1) on the hypothesis that they consist of two branches has been made. The normal alternating intensity of the H_2 band spectrum is practically absent in these bands; the distribution of mols. among different rotational states is one corresponding to a lower temp. than actually exists; there is an intensity dissymmetry favoring the P branch which has nothing to do with the distribution of population among different rotational levels. Peculiarities of the method of excitation may cause some of these results. Details of the discussion will be found in the original paper.

R. L. H.

Active nitrogen. JOSEPH KAPLAN. *Nature* 122, 771(1928); cf. C. A. 22, 2323.—Remarks on the article by Hinshelwood (C. A. 22, 4066). Glowing active N can be produced in air. Practically the entire first positive group of N band spectra is present in the afterglow. Independent evidence of the existence of metastable N_2 mols. is given. C. N. HINSHELWOOD. *Ibid* 771—Remarks on K.'s article.

R. J. H.

The ultra-violet band spectrum of nitrogen. R. T. BIRGE AND J. J. HOPFIELD. *Astrophys. J.* 68, 257-78(1928).—The ultra-violet emission spectrum of N_2 consists chiefly of a clearly defined system of more than 60 bands, degraded to the red. A number of spectrograms of this system have been obtained with a vacuum spectrograph, and the weighted av. wave length of each band is tabulated, together with the vibrational quantum analysis of the system. The absorption spectrum of N_2 also contains this system, and the absorption measurements have been used to det. most accurately the vibrational consts. of the upper level. Numerous emission and absorption bands occur in addn. to the foregoing system. Among the emission bands can be recognized 3 distinct progressions, representing presumably 3 new systems. The analysis of each of the 3 systems indicates that it is due to a transition from a new upper level to the vibrational states of the normal electronic level of the mol. One of these systems occurs, however, when commercial, partially purified N_2 is used, but not with chemically prepd. N_2 , and its origin is therefore in doubt. The intensity distribution in all 4 N systems presents several interesting features, some of which have not been explained. Further study is being made of the many remaining unassigned bands, in emission and in absorption. From the vibrational consts. of the several electronic levels one can calc. approx. the heat of dissocn. of N_2 . Two possible alternatives lead to most probable values of 11.9 and 9.5 v., resp.

W. F. MEGGERS

The Stark effect of lithium. YOSHIO ISHIDA AND MASAICHI FUKUSHIMA. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 9, 141-50(1928).—By means of a special cathode permitting elec. fields up to 180 kv. the Stark effect of the following Li lines was studied: 6708.2, 6103.77, 4971.98 and 4273.3 Å. U. The inverse Stark effect of the line 4113.7 Å. U. was photographed.

W. F. MEGGERS

The Stark effect of helium. YOSHIO ISHIDA AND GENJI KAMIJIMA. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 9, 117-40(1928).—Stark-effect photographs have been obtained for He lines as follows: 6681.89, 6068.77, 5380.3, 5043.6, 4277.1, 4054.8 Å. U. The polarization of these lines and their elec. deflections were observed. The results for the most part agree with Foster's theory (C. A. 22, 728), both as regards the number of branchings and their relative intensities.

W. F. MEGGERS

The continuous spectrum of hydrogen. F. H. NEWMAN. Univ. College, Exeter. *Phil. Mag.* [7], 6, 808-11(1928).—A continuous spectrum, which is quite distinct from that one which begins at the limit of the Balmer series and continues toward the shorter wave lengths, appears in celestial spectra in the absence of the Balmer lines and the secondary spectrum, and its limit on the red side is always a wave length greater than

λ 3646; for example, as an absorption spectrum it begins in α Cygni at λ 3710, having a max. intensity at λ 3660, approx., and in Vega it commences at λ 3800, its max. being at about λ 3710. This continuous spectrum may be produced at very low pressures, viz., by means of the elec. arc passed between cold electrodes in a rarefied H atm. An intermittent elec. discharge is passed between two Fe electrodes in a discharge tube, and between one of these electrodes and a third one a potential diff. of 200 v. is applied continuously.

GEO. GLOCKER

Some multiplets of doubly ionized lead. STANLEY SMITH. *Proc. Nat. Acad. Sci.* 14, 878-9(1928).—Lines of Pb III in the Schumann region have been classified as the combinations of 2S , $^3P'$ and 3D terms with a common term 1P . A group of lines in the near ultra-violet results from the combination of 1F with 3D .

C. C. KIESS

Some multiplets of singly ionized thallium. STANLEY SMITH. *Proc. Nat. Acad. Sci.* 14, 951-3(1928).—The regular and irregular doublet laws have been employed to interpolate from the known spectra Hg I and Pb III (cf. preceding abstract) the multiplets of Tl II which represent the term combinations $^3P-^1S$, $^3P-^3P'$, and $^3P-^3D$. The lines lie in the Schumann region. In addition to these the terms 1S , 1P and 1D have been established and the combinations of these with the triple terms identified.

Spectral intensities of radiation from non-harmonic and aperiodic systems. BENEDICT CASSEN. *Proc. Nat. Acad. Sci.* 14, 880-2(1928).—Theoretical.

C. C. KIESS

The aurora red line. JOSEPH KAPLAN. *Proc. Nat. Acad. Sci.* 14, 882-4(1928).—The red line at 6654.8 Å. U., described in a previous note (C. A. 22, 2887) as appearing when the auroral green line is excited in O mixed with active N, is shown to be a band belonging to the first pos. group of N. It cannot, therefore, be observed in the spectrum of the aurora. The only lines in the red capable of appearing in the auroral spectrum must result from the combination $^1D_2-^1P_{0,1,2}$, and these have wave lengths longer than 1 μ .

C. C. KIESS

The infra-red absorption spectra of ammonia, phosphine and arsine. ROBERT ROBERTSON AND J. J. FOX. *Nature* 122, 774-6(1928).—A résumé at length of work already published in detail (C. A. 22, 3835).

C. C. KIESS

Reaction of activated mercury with oxygen. A. I. LEIPUNSKII AND A. V. SAGULIN. Physik. Tech. Röntgen Inst., Leningrad. *Z. physik. Chem., Abt. B*, 1, 362-8(1928).—In the photochem. action between Hg and O, or when the action is promoted by ionic impacts, the reaction occurs between an activated Hg atom and oxygen. The following scheme is proposed: $Hg + E = Hg'$; $Hg' + O_2 = HgO + O$; $Hg + O = HgO$; $HgO' + Hg = HgO + Hg'$. This scheme is compatible with the formation of chains. Influence of the O_2 formed during the expts. remains unexplained.

ALBERT L. HENNE

Calculation and test of an apparatus for quantitative measurement of absorption spectra in the visible and ultra-violet ranges. HANS FROMHERZ. Bayer. Akad. Wiss., München. *Z. physik. Chem., Abt. B*, 1, 301-23(1928).—Discussion of the optics of an app. for photographic measurement of absorption spectra. It is a slight modification of Scheibe's app. (C. A. 19, 609). It has been tested with K_2CrO_4 solns. and satisfactory results have been obtained.

ALBERT L. HENNE

Characteristic differentiation in the spectra of saturated hydrocarbons. F. S. BRACKETT. *Proc. Nat. Acad. Sci.* 14, 857-64(1928).—Preliminary measurements of the absorption spectra of successive members of the paraffin series revealed marked differences in the band at 1.2 μ ; this led to a more detailed investigation with higher resolving power and with specially purified materials. Results are presented graphically for the normal hydrocarbons, pentane, hexane, octane and decane and for their isomers. In normal compds. the 1.2 μ band consists of a doublet of which the short-wave component shows almost no variation in frequency, but the long-wave component shows a marked shift of center of gravity toward lower frequencies with increase in length of chain. In the isomers the doublet character of the 1.2 μ band is not so evident, the absorption in the dominant, and shorter, component being much more intense than in the longer component. These differences furnish the basis for detg. the relative binding forces exerted upon the H atoms when attached to the primary, secondary and tertiary C atoms. A similar study of benzene leads to the conclusion that the binding force is much greater than in the satd. hydrocarbons.

C. C. KIESS

The origin of the continuous spectrum of the hydrogen molecule. J. G. WINANS AND E. C. G. STUECKELBERG. *Proc. Nat. Acad. Sci.* 14, 867-71(1928).—The continuous spectrum of the H mol., extending from the extreme ultra-violet into the visible region, is explained as resulting from transitions from any one of the excited triplet levels to the ground state, 1^1S , of this system.

C. C. KIESS

The structure of the Compton shifted line. JESSE W. M. DUMOND. *Proc. Nat.*

Acad. Sci. **14**, 875-8(1928).—To det. the natural structure of the Compton modified line in app. was designed which practically eliminated the exptl. widening of the line due to inhomogeneity of the scattering angle. The scatterers employed were Al and Be, and the scattering angle at which most observations were made was 176° . With Al the agreement between observed and theoretical structure for the shifted line is close; but with Ba the observed structure is wider than theory predicts. C. C. KRESS

Observations on the rare earths. XXX. Studies in the absorption spectra. LAURENCE L. QUILL AND PIERCE W. SELWOOD WITH B. S. HOPKINS. *J. Am. Chem. Soc.* **50**, 2929-37(1928).—The absorption spectra of carefully prepd. solns. of salts of Nd, Pr, Sm and Er were photographed with a quartz spectrograph. Addn. of HNO_3 in various concns. to the solns. of the nitrates affected the widths and positions of the bands, although the effect was not the same for all the elements. Addn. of $\text{Mg}(\text{NO}_3)_2$ to $\text{Nd}(\text{NO}_3)_3$ solns. produced similar but slightly greater changes than an equal normality of HNO_3 . The effects produced by adding HCl to the solns. of the chlorides were not the same as those of HNO_3 on the nitrates. In studying the influence of one rare earth salt on the absorption bands of another it was found that in the presence of a colored or colorless rare earth the absorption bands of an element present in small amts. cannot be relied upon for its quant. analysis and should be used with utmost caution for its qual. identification. C. C. KRESS

The quenching of cadmium resonance radiation. JOHN R. BATES. *Proc. Nat. Acad. Sci.* **14**, 849-52(1928).—An expt. is described in which the monochromatic resonance radiation of Cd irradiated a tube contg. a mixt. of Cd vapor with H_2 . The energy thus acquired by the Cd atoms was either re-emitted or quenched by the H_2 , the amt. of the quenching being detd. by photographing the intensity of the fluorescent light with a spectrograph. The energy obtained by the H mol. is 3.78 v., the excitation energy of the 2^3P_1 state of Cd, which results in an increase of the vibrational energy of the H mol. On account of the strong quenching the attempt to measure the temp. coeff. of the reaction between Cd atoms in the 2^3P_1 state and H mols. to give H atoms was not successful. C. C. KRESS

The intensity decay of the Balmer series. JOHANNES PORT. *Ann. Physik* **87**, 581-9(1928).—Canal rays in H were caused to emerge from the relatively high pressure of the discharge space through a narrow slit into the highly evacuated observation space, in which their decrease in intensity was measured by a method of photographic photometry. The observed fall in intensity along the ray for the lines H_α , H_β and H_γ , was found to be represented by a pure exponential function without deviation in the neighborhood of the slit. Such deviation, when it was observed, could be fully accounted for by the additional excitation produced by the gas issuing from the canal-ray slit and forming a cloud of higher pressure in the immediate vicinity of the slit. This instrumental defect was eliminated only after prolonged operation of the tube. It was found that the coeff. of intensity decay is the same for the lines H_α , H_β and H_γ . C. C. KRESS

Series limits. A. G. SHENSTONE. *Nature* **122**, 727-8(1928).—Hund's theory of the limits of component series is in error in that it fails to recognize that the magnetic field may be strong enough to break down the LS coupling but leave the (l_1l_2) and (s_1s_2) couplings intact. In the case of series terms obtained by adding an s electron to the limit term the usual rule is followed that, as the magnetic field increases, sub-levels of the same m must not cross. But in cases where the series terms result from addition of a p or a d electron to the limit term this rule cannot be adhered to, since the final result depends on the order in which the increasing field breaks down the various couplings. C. C. KRESS

An experimental test of Schrödinger's theory. E. GAVIOLA. *Nature* **122**, 772(1928).—The ratios of the intensities of the Hg lines 4358 and 4046 Å. U. in fluorescence were measured both when the optically excited vapor consisted only of Hg and when it consisted of Hg to which a few mm. of N_2 or H_2O vapor was added. In the latter case the foreign gases change the relative populations of the states 2^3P_0 and 2^3P_1 by several hundred times by bringing the resonance atoms, in the 2^3P_1 state, down to the metastable 2^3P_0 state. In both cases the value of the measured intensity ratio was 2, which proves that the ratio of the intensities of the lines in emission does not depend on the no. of atoms in the lower levels, in contradiction with the common interpretation of Schrödinger's theory. C. C. KRESS

A spectroscopic analysis of caliche. J. BANCELIN. Univ. of Chile. *Caliche* **10**, 97-8(1928).—By using an elec. arc between C electrodes, several photographs were made from one larger sample to obviate errors, in a study of the wave lengths between 2500 and 3500, exclusive of Na, K, Ca and Mg, well known to be present. All showed

Fe. Five trials showed Ti, the more frequent lines being 3186.6, 3200.1, 3349.6, 3354.8, 3361.4, 3371.6, 3373.0, 3377.7, 3388.0 and sometimes 2956.0, 3192.1, 3248.7. In one trial also appeared 3075.3, 3078.8, 3088.1, 3161.9, 3168.6, 3341.5, which indicate that possibly Ti would be shown by usual chem. method, though the whole spectrum of Ti contains 350 lines. Six trials showed 3183.5, 3184.1, 3185.5, which indicate V in not over 0.001%. Of the 1070 lines of the Mo spectrum, six trials showed 3152.7, 3194.1, 3170.5, 3158.3. Of the six lines of the Ga spectrum there were found in 7 trials 2500.3, 2659.9, 2874.2, 2943.7.

J. HOWARD FLINT

A new resonance series of selenium. BARBARA SCHMIDT. *Bull. intern. Acad. polonaise* 1928, No. 3A, 61-8.—A new series of resonance in Se excited by line 4481 of Mg is found. The greatest intensity is at 400°. The absorption of this line corresponds to the passage of state $n = 14$ to $n' = 1$. The results are in accord with former expts. of Ehrenfeucht and Rosen.

L. D. ROBERTS

Spark spectrum of sulfur, S II, in the Schumann region. PIERRE LACROUTE. *Compt. rend.* 187, 975-6(1928).—Spectral terms published for S II by Ingram (C. A. 23, 36) combine to explain 13 additional lines in the interval 1813 to 2004 Å. U. (cf. C. A. 22, 4373).

W. F. MEGGERS

Temperature classification of the stronger lines of cerium and praseodymium. ARTHUR S. KING. *Astrophys. J.* 68, 194-245(1928).—Previous results for Ce and Pr, confined largely to measurements of wave length, have been extended by studying the dependence of line intensity upon the conditions of the source, with special attention to the distinction between lines of the neutral and ionized spectra. Lines arising from the two states were segregated by a comparison of furnace, arc and spark spectra. This was facilitated by mixing Cs with the elements studied, which suppresses the ionized lines appearing normally in the furnace. The resemblance between the arc and spark spectra of rare-earth elements in the blue and violet has frequently been noted. The furnace is especially effective in this region for the lines of the neutral atom, which in these spectra are faint in the arc at shorter wave lengths and have been to a large extent unrecognized. In agreement with astrophys. evidence, it indicates that the prominent lines of Ce and Pr here belong to the ionized atom. At greater wave lengths, the neutral lines are stronger and form a large part of the arc spectrum. The relative energy levels at which the more sensitive lines originate are indicated as usual, for the neutral lines, by their behavior at different temps., and, for ionized lines, by the degree to which they persist in the furnace spectrum. The lines classified number 1362 for Ce and 1018 for Pr. These were selected from the very rich spectra on the basis of usefulness for identification of the elements in either the neutral or ionized states, and as probably the lines of lower energy-levels in each condition of the atom. A distinct variation in general intensity with wave length is noted for both the neutral and singly ionized spectra, and, further, that certain lines of each element appearing in the near ultra-violet probably arise from the doubly ionized state. The lines listed were selected not only from the available tables, but also from the large no. of neutral lines measured in the furnace spectrum by the writer, which number about 1700 for Ce. Most of these had not been measured previously, since in the arc they are relatively weak or obscured by blends. Of the ionized lines selected, many appear in the furnace spectrum, and in the case of Pr, even at moderate temps. A notable feature of the Pr spectrum is the large proportion of highly complex lines, nearly 40% being of this class. The no. and arrangement of their components are given as an aid to the series grouping of lines of similar type. Preliminary spectrograms made with high dispersion give improved resolution of the fine-structure patterns.

W. F. MEGGERS

Absorption spectra and molecular structure of the dihalogen derivatives of benzene. J. ERRERA AND V. HENRI. *J. phys. radium* 9, 205-24, 249-64(1928); cf. C. A. 20, 3388.—Absorption spectra of dihalobenzenes in vapor state were studied, because it had been previously observed that the ultra violet absorption bands of the *p*-benzene compds. and the *trans* ethylene compds. are situated nearer the red than in the case of the *o* and *cis* forms, showing a greater energy of electronic activation for the latter than for the former. Recent theoretical work had shown necessity of measuring intensities of bands as well as their position. The exptl. method was to introduce a small sealed tube contg. a few mg. of material dissolved in 0.1-0.2 cc. optically pure hexane into an observation tube 100 cm. long with quartz end-plates; upon crushing the sample tube, the soln. evapd. and filled the 450 cc. vol., whereupon the absorption spectrum was photographed. For higher pressures, a quartz tube with fused-on optically worked quartz end-plates was used, the whole being enclosed in a brass sleeve having quartz end-plates, and electrically heated. The spectra were thus studied at temps. up to 400° and with thicknesses of 10, 20, 30, 40, 50 and 100 mm. The light

source was a strong condensed high-frequency spark between Cu or Al electrodes submerged under water; and the comparison spectra were obtained from a condensed spark between Fe electrodes by introducing a self-inductance into the circuit according to the method of Hemsalech. Min. concn. of vapor for which any band appeared in a thickness of 100 cm. could be detd. with an accuracy of 5-10%. The method can thus be used to classify bands in the order of their intensities, and for the *quant. analysis of vapors*. The absorption spectra of the three dichloro- and dibromo-benzenes show two regions of absorption, one composed of bands and lines between 2850 and 2500 A. U., the other continuous, commencing at about 2350 and increasing toward the ultra-violet. The spectra of the diiodides show no narrow bands; the continuous absorption commences at 3100 or 3000 A. U. and increases toward the ultra-violet. The study of these spectra shows: (1) The bromides and chlorides exist in two states of electronic activation, the first provoking deformation of the mol., with increase in its moment of inertia. The energy necessary for this activation decreases in the order *o*, *m*, *p*, and is greater for the chlorides than for the corresponding bromides, the difference *m* - *p* being much greater than the difference *o* - *m*. The second state of electronic activation leads to decompn. of the mol. For the iodine compds. there is but one state of activation, and this leads to decompn. of the mol. (2) The spectra corresponding to the first state of activation of the chlorides and bromides are formed of doublets of electronic origin, and are comparable in form and magnitude to those of the univalent alkali metals. (3) In addn. to the electronic activation, there are 4 or 5 successive states of atomic vibration, the bands being sharper for the chlorides than for the bromides. (4) From numerical data given in tables, it is shown that the distribution of bands can be represented by equations of the type $\nu = \nu_0 + (p' - p_0)\alpha' - p_0(\alpha' - \alpha_0) + (q, -q_0)\beta' - q_0(\beta' - \beta_0) + (r' - r_0)\gamma$, ν_0 taking the values ν_1 and ν_2 , since the spectra are composed of doublets; the last term applies only to the para derivs. where $\gamma' = \gamma_0$. Another table gives the positions of the beginning of the states of activation, with the energies corresponding to them. (5) The movements of intramol. vibration are two in number for the *o* and *m* compds., and three for the *p*. Frequencies are lower from bromides than for corresponding chlorides, and slightly greater for the *m* compds. than for the *o*. The frequency differences for normal and activated mols., which measure the deformation during activation, show that the deformation is relatively great for the *o* and *m*, and slight for the *p*, of which the third vibration has the same frequency in the two states. The negative values of these differences indicate that the moment of inertia and the distances between vibrating atomic states are greater in the active state. (6) The spectra of mol. rotation are very crowded and represent large moments of inertia. (7) The spectrum of *o*-dichlorobenzene alone gives quant. information for the moment of inertia, and for the difference between normal and activated states, I_0 and I' . With allowance for the unharmonic character of the atomic vibrations, a value of from 38×10^{-40} to 75×10^{-40} is given for I_0 ; while the value 11×10^{-40} for $I' - I_0$ is deduced by measuring the distance between origin and head of the bands due to rotational movements of the mol.

L. A. SARVER

The spectrum of the solar corona. IRA M. FREEMAN. *Astrophys. J.* 68, 177-93 (1928). The origin of emission lines observed in the spectrum of the solar corona during total eclipses has been a mystery for 60 years. Thirty-three of the 38 lines of undoubted coronal origin are now identified with emission lines in the spectrum of argon. A systematic examn. of the spectra of prominent solar elements gave no significant correlation.

W. F. MCGOWERS

An analysis of the fine structure of the D_2 line of helium. H. R. WEI. *Astrophys. J.* 68, 246-56 (1928).—The D_2 line of He has been resolved into a triplet with plane diffraction gratings of high resolving power and large dispersion in high orders. An analysis of the triplets obtained with a self-recording microphotometer gives the ratios of intensity 4.5 : 3 : 1 and the interval ratio 10.3 : 1. These results are checked with an echelon spectrograph but the triplet structure of the line could not be observed with a concave grating giving somewhat smaller dispersion.

W. F. MCGOWERS

The rarest ultimes of mercury and of aluminum. ADOLFO T. WILLIAMS. *Compt. rend.* 187, 761-3 (1928).—According to a rule by Croze (*C. A.* 18, 627) the most persistent line of an element should not include combinations between terms of different multiplicity. Contradicting this rule the singlet line of Hg 1849.57 A. U. is much less sensitive than the intercombination line 2536.52 A. U. The 3S - 3P doublet of twice ionized Al, *vis.* 1862.90 and 1854.67 A. U., is found to persist in a concn. of Al of about 0.005%.

W. F. MCGOWERS

The infra-red absorption spectra of organic carbonates. FREDERICK K. BELL. Johns Hopkins Univ. *J. Am. Chem. Soc.* 50, 2940-50 (1928).—The absorption spectra

between 1 and 12μ of dimethyl, diethyl, dipropyl, dibutyl, diisobutyl, diisoamyl and diphenyl carbonate are given in graphical form. There is a quite apparent difference in the data for normal, iso and phenyl compds., although all of the compds., had certain bands in common.

WALLACE R. BRODE

Infra-red spectra of ammonium salts in the transformation range. GERHARD HETTNER AND FRANZ SIMON. Univ. Berlin. *Z. physik. Chem., Abt. B*, 1, 293-300 (1928).—An app. is described for measuring adsorption spectra at low tem. Infra-red spectra of NH_4 salts have been taken between 2 and 8μ . With NH_4Cl and NH_4SO_4 , a transformation of the NH_4 radical is evident between -30° and -40° , since the bands at 7.1 and 5.6μ are affected while the band at 3.1μ remains unchanged. It is not yet possible to throw light on the nature of change in the NH_4 radical. ALBERT L. HENNE

Fluorescence and solid solution. MABEL K. SLATTERY. Cornell Univ. *Proc. Nat. Acad. Sci.* 14, 777-82(1928).— NaF and LiF , activated to fluorescence by the addn. of small amts. of U, show no difference in crystal structure from the pure salts. This may be due to replacement of Li or Na by U in the lattice at random points, no distortion being expected since U has a quite small atomic radius. Mixts. of LiF and NaF (5% to 50% LiF) and a small and uniform amt. of U were fused. The fluorescent lines show a shift from the positions found in the pure fluorophors, but this shift is the same for all mixts., the increase in intensity of the LiF lines being the only change in going from the 5% to the 50% LiF mixt. Also the amt. of shift of the NaF x-ray diffraction lines is the same for all mixts. It thus appears that some Li had entered the NaF lattice but the remainder had crystallized separately. It finally appears that an increase in crystal dimensions causes an increase in wave-length of the fluorescent emission. R. L. HERSHEY

Fluorescence of mercury vapor under low excitation. LORD RAYLEIGH. *Nature* 122, 725(1928); cf. *C. A.* 22, 4065.—Photographs of the fluorescence show the well-known broad max. at about $\lambda 3300$, with effective exciting wave length about $\lambda 3000$. The fluorescence is of sufficiently long duration that it can be distilled away from the origin when the exciting wave length is about $\lambda 2650$. Exptl. difficulties have made it impossible to get this latter effect with longer waves. R. J. HAVIGHURST

The electric emission of incandescent platinum in an atmosphere of iodine. S. KALANDYK. *J. phys. radium* 9, 231-5(1928); cf. *C. A.* 19, 926.—Both the electronic and positive emissions of Pt at varying filament temp. were detd. in atm. of iodine vapor at varying pressures. I vapor increases only the negative emission and is without effect upon the positive emission. The effect of I is greatest at low filament temp., and becomes zero at high temp. Augmentation of emission at low temp. is attributed to formation of a layer of P iodide on the surface of the Pt; at high temp. this immediately sublimes. With the Pt only faintly incandescent, the electronic emission varies directly with the pressure of I vapor, but at high temp. the variation is much more complicated. L. A. SARVER

Velocity of photochemical reactions. JEAN PERRIN AND Mlle. CHOUKROUN. *Compt. rend.* 187, 697-8(1928).—The discoloration velocity of a soln. of indigo carmine in ammonium oxalate, by air oxidation under the influence of violet light, and for concns. ranging between 1% and $1/30000$ obeys the mass-action law. The oxidation of helianthine in oxalic acid or in ammonium oxalate also follows the mass-action law, even in the range of concns. where solns. exhibiting an appreciable fluorescence do not follow this law. ALBERT L. HENNE

Mechanism of the photochemical decomposition of nitrogen pentoxide. WARREN P. BAXTER AND ROSCOE C. DICKINSON. Gates Chem. Lab. Cal. Inst. Tech. *J. Am. Chem. Soc.* 51, 109-16(1929); cf. *C. A.* 22, 1545.—From a comparison of the rates of photochem. decompn. of N_2O_5 and NO_2 at wave lengths 4350, 4050 and 3660 A. U. it is concluded that the mechanism of the reaction is that suggested by Norrish (cf. *C. A.* 21, 1409). The photochem. decompn. of NO_2 into NO and O is followed by a dark reaction of NO and N_2O_5 . ARTHUR FLEISCHER

Action of ultra-violet light upon ferric citrate solutions. H. SHIPLEY FRY AND ELMER G. GERWE. Univ. Cincinnati. *Ind. Eng. Chem.* 20, 1392-4(1928).—Pharmaceutical solns. contg. citric acid and ferric compds. are readily decompd. when exposed to light. CO_2 is evolved and Me_2CO is formed; the ferric compds. are reduced. Three mols. of CO_2 are liberated per mol. of $\text{Fe}_2(\text{SO}_4)_3$. The photochem. change involves the oxidation of citric acid, with the liberation of 1 CO_2 , to the unstable acetonedicarboxylic acid. This also loses 1 CO_2 , yielding acetoacetic acid. The latter decomposes to acetone and CO_2 . ALBERT L. HENNE

The yield of photochemical reactions with pulsating monochromatic light. M. PADOA AND N. VITA. *Inst. chem. ind., Bologna. Gazz. chim. ital.* 58, 461-72(1928);

cf. *C. A.* 21, 2104; 22, 1913.—Under the influence of pulsating radiations of wave lengths 670.8, 587–589.6, 535 and 460.7 A. U., resp. (corresponding to quanta of 42.51, 48.57–48.35, 53.30 and 61.9 cal., resp.), the reaction: $2\text{FeI}_2 + \text{I}_2 \longrightarrow 2\text{FeI}_3$ gave the following relative max. yields: 1.40, 1.60, 1.70 and 2.15, resp. This shows that the greater the quanta of light, the higher the yield, the relation showing 3Q cal. as the min. necessary to start the reaction, the yields then being in proportion to the quanta. A comparison of the curves showing the relation between the yields with intermittent light and with continuous light reveal very frequent periodic oscillations for light of short wave length and similar periods of somewhat less frequency for light of longer wave length. Such oscillations may be explained by assuming the existence of active mols. which are the seat of adiabatic transformations and the period of existence of which appears to be the longer the higher is their level of energy. The relation between the yields and the quanta agrees with the expts. of Kistiakowsky (cf. *C. A.* 21, 1933) and of Franck (cf. *C. A.* 20, 548) but is at variance with those of Rideal and Williams (cf. *C. A.* 19, 1663).

C. C. DAVIS

Photochemical action of bromine on maleic and fumaric dimethyl esters. RICHARD SCHMIDT. Univ. Berlin. *Z. physik. Chem.*, Abt. B, 1, 205–38 (1928).—The photochem. reaction: dimethyl maleate + $\text{Br}_2 + h\nu \longrightarrow$ dimethyl fumarate is studied. It is admitted that the mechanism of reaction depends on the atoms of Br liberated by the absorbed light. The chief conclusions are: the quantic yield γ_0 of the transformation is dependent on the ester concn., the light intensity, the Br_2 concn., the wave length of the incident light and the temp. The relation between γ_0 and the ester concn. and the light intensity is expressed in a formula whose phys. meaning is not interpreted. The relations between γ_0 and the wave length and temp. are represented graphically and discussed. The addn. of Br on dimethyl maleate which takes place at the same time cannot be explained, because of many complicated side reactions. The quantic yield of the Br addn. on dimethyl fumarate is of the same order of magnitude as that found by Wachholtz (Dissertation, Berlin) for the bromination of diethyl maleate or fumarate. The reactions are thus considered to be similar in the case of the dimethyl and the diethyl esters. The quantic yield is of the same order of magnitude whether aq. or CCl_4 solns. of Br are used.

ALBERT L. HENNE

The effect of sunlight on citric acid in the presence of ferric salts (with special reference to the elixir of iron, quinine and strychnine and elixir of iron, quinine and strychnine phosphates). JOSEPH B. BURT. *J. Am. Pharm. Assoc.* 17, 650–8 (1928).—Expt. showed that citric acid does not dissolve $\text{Fe}(\text{OH})_3$ in mol. proportions, but that an excess of 12.5% of acid is required. Six solns. of Fe citrate of known strength were divided into 3 equal groups. Two were not treated, two were neutralized by NH_4OH and 2 were half neutralized by NH_4OH . All were exposed to sunlight in nitrometers. CO_2 was formed, the amt. being proportional to the amt. of free citric acid present; acetone and H_2O also were formed. The reaction ceases when all of the Fe^{+++} has been reduced to Fe^{++} . Detns. of the CO_2 and acetone formed indicate that for each mol. of acetone formed 3 of CO_2 are liberated. The reaction is probably: $\text{C}_6\text{H}_8\text{O}_7 + \text{O} = (\text{CH}_3)_2\text{CO} + 3\text{CO}_2 + \text{H}_2\text{O}$. The facts observed indicate that the various elixirs of Fe, quinine and strychnine should be as nearly neutral as possible and that they should be stored and dispensed in amber-glass containers.

L. E. WARREN

Constitution of thiourea. The absorption spectra of thiourea (RIVIER, BOREL) 10. The absorption spectra of irradiated and unirradiated ergosterol (SMAKULA) 11E. Evolution of the odd-numbered elements (HOWARD) 2.

Method for separation of barium chloride from radium chloride. I. YA. BASHILOV. *Russ.* 5046, Apr. 30, 1928. Conc'd. solns. of CaCl_2 or other chlorine salts are added to the repeatedly recrystd. Ba and Ra chlorides in soln., which do not form compds. sol. in the soln. of Ba and Ra salts.

4—ELECTROCHEMISTRY

C. G. FINK

Electric furnace indispensable in modern mine foundry. A. E. GREENE. *Eng. Min. J.* 126, 949 (1928).—At the Britannia Mining and Smelting Co., of B. C., castings are made from scrap melted in a 600-kw. Greene arc melting furnace. This installation has facilitated mining operations in preventing excessive delays when new castings are

needed. At the Wallace Foundry a large crusher jaw weighing $8\frac{1}{2}$ tons when cleaned was made from steel poured from a 3-ton Greene furnace (1100 kw.). The furnace operation lasted 5 hrs. and current consumption was 504 kw.-hr. per ton of scrap melted.

A. D. S.

Electric furnaces in the ceramic industries. S. R. HIND. *World Power* 10, 599 (1928).—The present status of the application of elec. heat to ceramic practice is reviewed. The characteristics of ceramic heat treatments are described with the aid of heating curves. In firing enamel a normal coal-fired muffle requires 19 hrs. to give satisfactory results. With elec. furnace better results can be obtained in half the time. Features favorable to the elec. heated kiln are: (1) purity of furnace atm., (2) good temp. control, (3) elimination of muffles, (4) economy of capital due to use of small unit furnaces and rapid output of ware, (5) const. load factor in continuous elec. tunnel-type kiln, (6) high availability of energy compared with fuels, (7) min. labor charges. In the tunnel kiln of Campbell and Moore, used for decorated ware, Ni-Cr heating elements are used. The hottest zone is near the middle of the tunnel, which is kept full of trucks of ware at all times. The maintenance cost ratio, per kiln doz. of ware, in elec. vs. coal is $\frac{1}{2}$ d. to $1\frac{1}{2}$ d. The overall cost showed a saving in favor of elec. heating. The Morgan elec. kilns are designed with special graphite ceramic resistors for lengths up to 60 ft. The Harper kiln is 68 ft. long equipped with 30 kw. looped wire in the 24-ft. pre-heating zone and 60-kw. Acheson graphite plate in the hot zone. Details of tests on this furnace are awaited.

A. D. SPILLMAN

Heat distribution in an electric furnace. B. M. RIKER. *Elec. World* 93, 96 (1929).—Kenworthy bright annealing furnaces for copper wire operate at 61% efficiency, have low operating and maintenance costs, and have high service factor.

B. M.

A valve-maintained high-frequency induction furnace and some notes on the performance of induction furnaces. G. ERIC BELL. *Proc. Phys. Soc. (London)* 40, 193 (1928).—Description of a valve-maintained induction furnace of 12 to 15 kv. amp. input for research lab.; frequencies ranging from 700 to 1000 kilocycles per sec. permit use of small condensers. Modification of Hartley circuit using center-tapped coil gave reliability, safety in operation and simplicity; air-cooled silica transmitting tubes were used. The furnace proper consists of SiO_2 tube round which is the inductor coil of solid Cu strip or flattened Cu tubing wound edgewise. The general lay-out is illustrated. Performance of high-frequency induction furnaces in general is discussed with exptl. results upholding the theory.

M. McMAHON

A high-frequency, variable-frequency induction furnace, with rotary spark gap. M. H. KRAEMER. *Stahl und Eisen* 48, 1120-4 (1928).—The high-frequency app. used for making C-free alloys at the Eisenhüttenmännischer Institut der techn. Hochsch., Berlin, is described in detail, with photographs. The primary of a transformer is connected to the 220-v., 50-cycle generator of a direct current driven motor-generator set. The 8000-v. secondary is connected to the furnace coil through a rotary spark gap. A variable capacitance, 0-0.66 microfarad, shunts the transformer secondary, and the inductance of the furnace coil may be varied by means of taps, so that the circuit may be tuned for frequencies between 14 and 230 kilocycles. A wave meter is used to det. the frequency. The advantage of variable frequency, over the const. frequency furnished by a rotary generator, is that the optimum frequency increases as the particle size decreases. With this app. charges of a few g. of powder are as easily handled as 10 kg. of lumps. The Northrup gap might have been used, but was not tried because of explosion risk. The quenched spark gap proved unsuited. Expts. with vacuum tubes at frequencies up to 2000 kilocycles gave good results, but they are too delicate and expensive for the melting industry. The efficiency depends on the load; the highest mentioned is 31%. The installation has been so satisfactory that a larger one—30 or 40 kg. capacity—is planned for the same institution, and a commercial organization is building a similar 75 kv.-amp., 60-kg. outfit for producing high-grade alloy steels for valve parts and ordnance.

BENJAMIN MILLER

How direct-current power is made for electrolytic processes. E. B. DAWSON. *Chem. Met. Eng.* 35, 668-71 (1928).—A discussion of the factors to be considered in installing machines for producing d.-c. power. Synchronous converters and motor-generator sets furnish most of the electrolysis power, but in a few cases it has been found economical to drive generators by steam turbines through reduction gears. Diesel engines may be used in some districts, and the Hg-arc rectifier may be developed for this service, especially where high voltage is required. The synchronous converter is in general more expensive to buy and maintain than the motor generator set, but is $1\frac{1}{2}$ % more efficient. In some cases the supply voltage may be too high for motor-generator sets, but not too high for synchronous converters. Under these conditions the

transformers required for the motor-generator sets will make the total cost higher than that for synchronous converters, and the efficiency advantage of the latter will increase to 3%. The motor-generator set has the advantage that its voltage may be easily varied over a wide range; it is not likely to pass on transient disturbances in a. c. supply to the d. c. lines; and it can be made to run with a leading power factor so as to correct the power factor of the plant or system.

BENJAMIN MILLER

Boiling points of electrolytic caustic solutions. C. C. MONRAD AND W. L. BADGER. *Ind. Eng. Chem.* 21, 40-2(1929).—The app. and the procedure employed in detg. the b. p. of caustic, purified over EtOH and satd. with NaCl, are described. NaCl was added to duplicate more nearly commercial caustic evaporator practice. The conditions were controllable to 0.05°. The recorded data are believed accurate to within $\pm 0.1^\circ$ up to 50 parts caustic per 100 parts water, and to $\pm 0.2^\circ$ above that concn. W. H. B.

The electrochemical manufacture of hydrogen peroxide. LEO LÖWENSTEIN. *Z. Elektrochem.* 34, 784-6(1928).—Two successful electrochem. processes for the manuf. of H_2O_2 have shown their superiority over the BaO_2 process. In one a soln. of $H_2S_2O_8$ is produced by the electrochem. oxidation of H_2SO_4 . The soln. is distd., whereupon the $H_2S_2O_8$ decomposes, forming H_2O_2 , which passes over with the steam, and regenerating the H_2SO_4 . The success of this process is due to the distn. method, which consists of passing the soln. to be distd. in thin films over hot walls. If distn. in bulk is attempted, the principal product is O_2 . By fractional condensation of the vapors H_2O_2 soln. of any strength can be prepd. In the other process a soln. of NH_4HSO_4 is electrolyzed. The $(NH_4)_2S_2O_8$ soln. formed is treated with $KHSO_4$, which ppts. $K_2S_2O_8$ and regenerates the NH_4 salt. The ppt. is charged into a stoneware still contg. H_2SO_4 and superheated steam is blown through the mass. H_2O_2 vaporizes, and $KHSO_4$ is regenerated. The current efficiency is greater with the salt process, 80-90% as against 40-70% for the acid process. The distn. cost is less with the salt process. The acid process has the low labor cost and low space requirement of a continuous process handling only fluids, whereas the salt process contains several batch operations and requires the handling of solids.

BENJAMIN MILLER

Electrochemical study of the action of acids on solutions of some zinc salts. J. GURRON. *Compt. rend.* 187, 599-601(1928).—The cell PtH_2 , soln. studied (x), satd. KCl, satd. or 0.1 N KCl, Hg_2Cl_2 , Hg is set up. After each addition of acid to (x) the e. m. f. of the cell is measured. The following solns. (x) were studied: $Zn(OAc)_2 - HCl$, $Zn(OAc)_2 - HOAc$, $ZnSO_4 - H_2SO_4$. $E = f(\log C)$ is traced for each salt and concn. studied. C = acid titer of the soln.

L. D. ROBERTS

The electrogalvanizing of wire and strip. A. C. J. CHARLIER. *Metal Ind.* (London) 33, 557-8(1928).—For successful working, the use of the highest no. of amp. at the lowest possible voltage is important. Each amp. will deposit 1.22 g. of Zn per hr. $ZnSO_4$ is the usual electrolyte, with addns. of substances to increase the throwing power of the soln. and to prevent the formation of undesirable gases. Dextrin, glucose or other org. compd. aids in the production of a smooth deposit. The soln. should be approx. 100% regenerative, requiring, rarely, a little new soln. to replace that adhering to the work when it leaves the vat. Voltage above 4 causes a granular deposit. Advantages of the electrogalvanizing process over the hot-spelter process are: a pure Zn deposit; a fine amorphous coating not tending to peel, crack, or fracture when wound round its own diam.; permissible use on the finest wire without disturbance of its original strength or ductility; greater economy where production is intermittent; and lower costs.

W. H. BOYNTON

Electric galvanizing. WALLACE G. IMHOFF. *Am. Metal Market* 35, No. 240, 2nd Sect., 13-7, 47(1928).—Some fundamental galvanizing principles are discussed. The powerful corrosive or dissolving action of molten Zn upon iron and steel at and above galvanizing temps. is indicated by tabulated exptl. results. Features to be considered in the choice of fuel are briefly discussed. Some plant figures on a commercial basis cover: (1) the B. t. u. value of the fuel used; (2) the cost of the fuel in the locality where used; and (3) actual production. Fuel costs are calcd. on a 1-ton (909 kg.) basis.

W. H. BOYNTON

Manufacturing metal parts by electrodeposition. JAMES SILBERSTEIN. *Metal Ind.* (N. Y.) 26, 474(1928).—Seamless Cu tubes, sheet Cu for punchings and stamps, Cu gaskets, light reflectors and Cu float-shells for steam traps and water columns are being produced by electrodeposition. By using cast Cu as anode and electrodepositing it on a roll to form an endless strip, all scrap from punchings and trimmings go back as anode metal.

W. H. BOYNTON

The Madsenell process—its products and their uses. F. M. DORSEY. *Ind. Eng. Chem.* 20, 1094-9(1928).—The "periodic" plating method is designed for job or

contract plating, the tanks are arranged in a straight line so that the work progresses from one solution to another until finally plated and dried. The order of operations including: cleansing, rinsing, pickling, degasification, plating bath, etc., are discussed. The "continuous" process consists of an assembly of equipment designed to prepare continuously, degasify and plate such material as wire strip, ribbons, etc. The process is adaptable to plating Ni, Cu, Pb, Sn, Zn, Cr and Cd. The elec. and mechanical designs for this method are included. The various patents issued covering the Madsenell process are listed.

A. D. SPILLMAN

Cathodic potential in electrolysis of chromic acid. Y. KATO AND T. MURAKAMI. *Chem. News* 137, 323(1928).—The "cathodic potential-current density" curve for chromic acid electrolysis shows several breaks which are explained by the authors on a hydrogen overvoltage basis. Cu ion increases cathodic polarization. C. L. MANTELL

Conduction and discharge of electricity in dielectric liquids. A. NIKURADSE. *Physik. Z.* 29, 778-81(1928).—Ohm's law is valid in very pure mineral oil at low field strengths. Between plate electrodes at higher field strength, the current increases more slowly until a satn. current is obtained. If the field strength is increased still further the current increases markedly. Just before discharge the current often increases without increase in voltage. This phenomenon is not observed if a point electrode is substituted for one of the plates. By purifying the liquid its cond. is decreased and the discharge potential is increased, but not in direct proportion. For many oils both the cond. and discharge potential increase with temp. between 20° and 60-80°. The cond. is independent of the pressure between 3 and 760 mm. The discharge potential increases with increase in pressure.

E. R. SMITH

Ohm's and Fourier's law of conductance. SATYENDRA RAY. Lucknow, India. *Z. Elektrochem.* 34, 753-6(1928).—R. shows the analogy between Ohm's law and the Fourier law of heat conductance. He derives an equation showing that the sp. resistance is proportional to the speed of the elec. current. He also shows, by means of the Poiseuille viscosity equation, the analogy between sp. resistance and viscosity and states that "super-cond." is due to the fact that the viscosity of the "electron gas" becomes zero at the abs. zero of temp. R. derives the well-known equation for tangential magnetic intensity, shows that a new phys. significance of induction must be given to Gilbert's expt. (carried out in connection with the theory of the earth's magnetism), and concludes that it is wrong to assume that lines of magnetic induction form closed curves while those of elec. induction do not.

MALCOM DOLE

The selenium cell: its properties and applications. GEORGE P. BARNARD. *J. Inst. Elec. Eng. (Brit.)* 67, 97-120(1928).—A survey with bibliography is given. The author's expts. show that the change in conductance is an exponential function of the illumination, for a given spectral distribution. The exponent is a const. for any cell, but differs somewhat for cells of the same type, and differs widely for cells of different types. Two commercial cells had values of 0.252 and 0.390. The law connecting stimulus with response is not simple, but the effect depends on the incident watts rather than on the incident foot-candles. No satisfactory theory has been advanced. The photoelec. theory is inadequate because of the enormous quantum yield. It is suggested that the change in conductance takes place at the boundaries of the crystals. The Se cell should have many applications, since it is 100 times as sensitive as the human eye, which is 1000 times as sensitive as the photoelec. cell. The chief disadvantage is the time lag, especially in recovering dark conductance after having been illuminated.

BENJAMIN MILLER

Characteristics of alkali cells and their use in photoelectric measuring methods. R. FLEISCHNER AND H. GOLDSCHMIDT. *Physik. Z.* 29, 691-8(1928).—Discrepancies in results caused the authors to investigate the methods used in photoelec. photometry and the cells designed for that purpose. The theory of the discharge method was discussed. The slope of current-voltage characteristics depends on frequency of radiated light. Importance of insulation errors is stressed. Current voltage characteristics on radiation with light of different wave length were measured for 5 cells: cell (1) had a Pt layer deposited on the wall of the bulb with additional layer of K on Pt, an anode of ring-shaped Pt wire, H filled-pressure of 0.1 mm. Hg; cell (2) was similar to (1) with H pressure of 0.01 mm. Hg; cell (3) was Osram G. E. C. Ltd. product with wire grid anode, alkali metal of cathode unknown, H-filled; cell (4) Rb cell with A filling, wire anode; cell (5) K cathode, cell was charged with H and then evacuated to best vacuum, anode of ring-shaped Pt wire. Error-free use of this measuring method is possible only when, for the spectral field investigated, the corresponding voltage curves are known or cells of type 5 are used. Evacuated cells show current voltage satn. curves parallel to abscissas; gas-filled cells and alkali cells are difficult to bring to satn.

M. McMAHON

A simple mercury arc lamp. T. H. OSGOOD. *J. Sci. Instruments* 5, 329(1928).—A Hg lamp of typical American design using Pyrex glass bulb with electrodes of tungsten wire 1 mm. in diam. is described. M. McMAHON

An application of electrical precipitation to the abatement of smoke. E. L. HALL. *Am. Gas Assoc. Monthly* 10, 745-8(1928).—Cottrell elec. precipitator is used to remove objectionable tar fog from stack gases in a lamp-black briquetting plant. More than 90% of the solid and liquid particles are removed by passing through a precipitator operating at 50,000 v. A. WHITE

A basic experiment on the contact theory of triboelectricity. Volta effect of first order and separation of two kinds of electricity by contact. ELIGIO PERUCCA. R. Scuola Ingeg., Torino, Italy. *Z. Physik* 51, 268-78(1928).—It is shown that when a solid and a liquid dielec. are brought in contact they become elec. charged. The point is of importance in the study of the development of electricity by friction. G. C.

Overload and reverse-current circuit breakers. ROBERT EDLER. *Elektrotech. Maschinenb.* 46, 1101-3(1928).—A mathematical treatment of the windings on electromagnetic protective devices for battery charging and for parallel operation of direct-current generators and rectifiers. Formulas are given for the sensitivity attainable by the combination of a potential winding with a current winding. BENJAMIN MILLER

Making rubber goods of latex by electrodeposition (KLEIN) 30. Recent progress in metallurgy (DROUOT) 9. The anodic behavior of Pd in chloride solutions (MÜLLER) 2. LEVASSEUR, ALBERT: *L'électrochimie et l'électrometallurgie*. 3rd ed. revised and enlarged. Paris: Dunod. 361 pp. F. 73. Reviewed in *Mech. Eng.* 51, 94(1929).

Electric battery. VAN RADEN & CO., LTD., AND J. P. STARLEY. Brit. 291,599, May 24, 1927. Structural features.

Electric battery. SOC. ANON. LE CARBONE. Brit. 291,420, June 4, 1927. In forming batteries similar to those described in Brit. 230,307 (*C. A.* 19, 3224), there is added to the porous C which has been rendered impermeable to liquids, a metal such as Pb which is capable of combining with Cl. The other electrode may be of Zn or galvanized iron and the electrolyte is a soln. of $ZnCl_2$ or $ZnBr_2$.

Dry cell electric battery assembly. HENRY W. PORTH (to National Carbon Co.). U. S. 1,699,446, Jan. 15. Structural features.

Device for sealing dry cell electric batteries. WILLIAM F. HENDRY (to National Carbon Co.). U. S. 1,697,596, Jan. 1.

Primary battery. WILLIAM A. F. BLEECK. U. S. 1,699,580, Jan. 22. In a primary battery of the double fluid type, an excitant is used consisting of a soln. of NaOH to which Na silicate is added, which serves to retard diffusion of the excitant.

Battery. ALBERT THURNHERR. Swiss 127,618, Sept. 9, 1927. The containers of the dry cells are acid proof and contains a paste-like electrolyte such as sal ammoniac or $ZnCl_2$.

Battery. SIEMENS & HALSKE A.-G. Ger. 469,133, Nov. 19, 1926. A Zn-C- $(NH_4)_2CO_3$ battery has metal plates carrying a rectifying compd. for prolonging its life.

Accumulator battery. NELKEN & CO. TECHNISCHES BÜRO FÜR PROJEKTIERUNG & PRÜFUNG ELEKTR. ANLAGEN. Ger. 469,440, Nov. 23, 1926. An accumulator battery having vertical bipolar electrodes is constructed with side leads, to reduce surface leakage.

Galvanic battery. ELEKTROTECHNISCHE FABRIK SCHMIDT & CO. G.M.B.H. Austrian 110,884, May 15, 1928. Constructional improvements are described in a battery of the type in which an electrolyte container is ruptured from outside when the battery is required for use.

Galvanic cell. HEINZ KÖHNKE and WILLIAM SUHRCKE. Swiss 127,617, July 23, 1927. The cell is of the Bunsen type and comprises a container with an alk. soln. and a detachable positive electrode chamber which is filled with concd. depolarizing acid and has a porous base.

Galvanic cell of the Leclanche type. D. F. TROFIMOVSKII. Russ. 4935, Mar. 31, 1928. Characterized by the negative pole being a rod from Pb-Zn alloy, preferably in the proportion 1:3.

Container for galvanic cells and storage batteries. V. S. LUIZLOV. Russ. 4596, Feb. 29, 1928.

Storage battery. HART ACCUMULATOR CO., LTD., AND W. SCHOFIELD. Brit. 291,138, Feb. 22, 1927. Structural features.

Storage battery. FRED L. SEARS. U. S. 1,699,633, Jan. 22. Structural features.

Storage battery. A. V. BELYAVSKII. Russ. 4973, Mar. 31, 1928. The electrodes of box shape are arranged in layers with a canal between for the escape of gases. The electrodes intended to carry the active mass have cone-like openings with the base inside of the walls.

Storage batteries. DONAT DE GIOVANNINI. Fr. 642,038, Oct. 6, 1927. To retard the discharge of a storage battery 5 to 10% of a hard absorbent C is added to the paste of each electrode. The C is preferably obtained by carbonization of vegetable substances rich in lignone such as olive husks, date stones or coconuts.

Storage batteries. GASTON GOSSET and JEAN SCHWARTZ. Fr. 640,935, Aug. 25, 1927. Terminals or other exposed metal parts are protected by a compn. contg. celluloid 150, acetone 750, NH_3 10, alc. 100 and an aniline dye 2 parts.

Storage batteries. MORITZ KUGEL. Fr. 642,145, Oct. 10, 1927. In Pb batteries a little phosphoric acid is added to the dil. H_2SO_4 electrolyte and may be renewed from time to time. Cf. C. A. 22, 2889.

Storage batteries. FRIEDRICH SCHÄFFER. Ger. 469,334, Feb. 1, 1928. Perforated plates are inserted in the acid, the diam. of the perforations in each plate increasing as their distance from a middle plate.

Storage batteries. COMPAGNIE GÉNÉRALE D'ÉLECTRICITÉ. Fr. 642,018, Oct. 6, 1927. Storage batteries having an alk. electrolyte have surrounding the positive plates a steel sheet which is corrugated to be elastic in the direction perpendicular to the plane of the plates.

Electrodes for storage batteries. M. KUGEL. Brit. 291,020, May 24, 1927. In order to compensate for loss of H_3PO_4 in an electrolyte as described in Brit. 280,197 (C. A. 22, 2889), due to combination of the H_3PO_4 with the PbO_2 of the positive electrode, addnl. quantities of H_3PO_4 are added during the working of the battery.

Storage-battery electrodes. J. M. LARGE. Brit. 291,745, June 7, 1927. Structural features.

Storage-battery electrodes. E. F. DRAISMA. Brit. 291,833, Feb. 22, 1927. Structural features are specified, of soft Pb plates surrounded by a border of Pb-Sb alloy formed by casting in a mold.

Storage-battery electrodes. I. G. FARBERIND. A.-G. Brit. 291,032, May 24, 1927. Electrodes are made from plates of Pb alloy by subjecting them to electrolysis in an acid soln. (suitably H_2SO_4 of 1.1 sp. gr. with a current d. of 1.2 amp. per sq. decimeter of electrode surface) to remove the alloying metal and simultaneously form the plates.

Storage-battery electrodes. I. G. FARBERIND. A.-G. Brit. 291,413, June 1, 1927. Electrodes consist of a rod or bar of porous Pb with a core of solid Pb; the porous Pb is formed by removal of a metal alloyed with the Pb as, e. g., by the removal of Na with H_2SO_4 or with alc. The alloying metal may be removed electrolytically and the electrodes simultaneously formed. Various details and modifications are described. Cf. C. A. 23, 777.

Storage-battery plates. RAYMOND T. MURRAY and FRANK M. KELLY. U. S. 1,697,078, Jan. 1. Structural features.

Storage-battery electrolyte. ANTHONIE JEAN ANDRÉ DE LA PORTE. Fr. 641,644, Sept. 29, 1927. The electrolyte of a Pb-PbO₂ battery is composed of dil. H_2SO_4 in which ammoniacal alum is dissolved.

Storage-battery receptacle covered with rubber composition. EDWARD LYNDON. U. S. 1,699,850, Jan. 22. Structural features.

Electric device for testing the condition of storage batteries. JOHN E. KENNEY (to Joseph E. Dunne). U. S. 1,699,893, Jan. 22.

Charge indicator (showing gas bubbles when the battery has reached full charge) for storage batteries. F. H. ROYCE. Brit. 291,885, March 11, 1927.

Electrodeposition of natural or synthetic resins. DUNLOP RUBBER CO., LTD., AND R. C. DAVIES. Brit. 291,477, Dec. 3, 1926. Deposition is effected on a body connected as anode or on a ceramic or other porous body enclosing the anode, from dispersions (which are described in detail) such as those prepd. from intermediate phenol-

CH_2O condensation products, aq. NH_3 , casein, gelatin, etc., to which various modifying agents may be added.

Apparatus for electrodeposition of metal sheets. J. C. F. A. SCHÜTTE. Brit. 292,015, Nov. 14, 1927. A cell is specified having a Pb lining serving as a cathode in which there is mounted an annular perforated vessel contg. scrap, ore or other anode material. The electrolyte is driven through the anode material toward the cathode by a mech. driven propeller. Various other structural details are described.

Electroplating. J. STRONG & Co. Fr. 641,037, Sept. 16, 1927. For plating the inside of tubes the anodes are placed in the tubes absolutely concentrically, the tubes being held in a frame which is immersed vertically in the electrolytic bath.

Electroplating process. FELIX KIRSCHNER and JOSEF HESS. Austrian 110,913, May 15, 1928. Metallic articles are coated electrolytically with a layer of a readily fusible metal, such as Sn, compatible with the metal of the article, and this layer is united with the article by smelting. Other metals or alloys are then deposited on the product, Ni and Ag, or Ni and a Cu alloy, for instance, being deposited in turn.

Electrical apparatus for heating electroplating baths or other liquids. WILFRED Y NEWLAND. U. S. 1,697,732, Jan. 1. Structural features.

Apparatus for controlling the movement of revoluble electroplating drums. FOREST H HARTZELL. U. S. 1,697,240, Jan. 1.

Metallic sheets formed by electroplating. GIBSON YUNGBLUT (to The Richardson Co.) U. S. 1,698,486, Jan. 8. In forming articles such as sheets a cathode is used shaped like the article but of another metal (suitably of Cu when plating with Fe) and the cathode is plated on one face and the cathode metal is then stripped from the plating in an electrolytic cell in which a like cathode is used and upon which the stripped metal is plated. An app. is described.

Chromium plating. METALS PROTECTION CORP. Fr. 640,913, July 12, 1927. Metals are plated with Cr at a temp. of about 20° at which the current efficiency is high, a dull deposit being obtained. The metal is further plated at about 40° to obtain a bright finish. Both platings may take place in the same electrolyte, consisting of a soln. of chromic acid with small amts. of hydrated $\text{Cr}(\text{OH})_3$ and $(\text{NH}_4)_2\text{SO}_4$.

Chromium plating. SOC. CHIM. DE LA SEINE. Fr. 642,242, Oct. 13, 1927. Cr is deposited electrolytically in a vat preferably of Fe surrounded with water maintained at $45-50^\circ$, and is provided with a neck so that the gas formed during the reaction may be evacuated. The bath may consist of chromic acid 25, CrSO_4 0.1–0.4, Na_2CO_3 0.1 to 0.4, H $^+$ BO $^-$ 0.1 to 0.4 parts in 100 of water.

Electrolytic gas cells. A. G. KHOTYAN. Russ. 3922, Oct. 31, 1927.

Stirring device for use in the electrolysis of fused electrolytes. FRANZ ELLINGER. Austrian 110,861, May 15, 1928. Constructional details.

Anodes for electrolysis of copper solutions. FREDERICK LAIST and FREDERICK F FRICK. U. S. 1,697,771, Jan. 1. Anodes suitable for use in deposition of Cu from solns. contg. chlorides and nitrates are composed of alloys of Pb, Sb and As which are resistant to corrosion.

Deoxidizing molten copper. HIRAM S. LUKENS and RUSSELL P. HEUER. U. S. 1,698,443, Jan. 8. Molten Cu is covered with slag capable of taking up Cu oxide from the Cu and the slag is treated *in situ* as a continuing operation to reduce its Cu oxide (suitably by electrolysis); the reduction of the oxide in the slag is effected while at the same time oxide is being extd. from the molten metal by the slag and without adding any of the initial slag to the Cu. An elec. furnace employing C electrodes is described.

Lightning rods and conductors from the rods to ground. W. PICKARD and R. SPENCER. Brit. 291,673, Nov. 1, 1927. The rod and preferably the conductor also are electrolytically coated with Pt, iridio-Pt or like non-oxidizing and non-fusible material. A formula is given for a bath for coating with Pt.

Electrometallurgy. NEW METALLURGY, LTD. Ger. 469,090, Mar. 9, 1927. Metals are extd. by the electrolysis of fused compds. with a carbon or graphite electrode free from or oxidizable S compds. The electrode is protected from the action of O by the introduction of S or S compds. into the electrolyte.

Recovery of tin. LUIGI UGHETTI LA CORSA. Fr. 642,313, Aug. 23, 1927. Waste sheet tin is treated with FeCl_3 to form SnCl_2 and FeCl_2 and the mixt. is electrolyzed, a deposit of Sn being obtained at the cathode and FeCl_2 at the anode with liberation of Cl $_2$, which may be collected, or if NH_4Cl is added to the bath FeCl_2 becomes reformed.

Aluminum. V. VERNEY and SOCIETÀ ITALIANA DI ELETTROCHIMICA. Brit. 291,219, May 19, 1927. Al is obtained by electrolysis of a fused electrolyte contg. $\text{Al}(\text{OH})_3$ produced by complete decompn. of hydrated AlCl_3 by heat.

Aluminum. SOCIÉTÉ ANON. POUR L'IND. DE L'ALUMINIUM. Fr. 642,550, Oct. 18,

1927. Al is prepd. electrolytically by using a solid anode composed of the material contg. Al to be refined and a solid cathode, both being disposed vertically in a bath of Al halides and alkali or alk. earth halides. The anode residues rich in Si are used to make the alloys which will constitute the anodes in the process. Cf. C. A. 23, 46.

Galvanizing. CARL JULIUS ZEYEN. Ger. 469,192, Oct. 23, 1927. The stamped blanks for chimney covers are smoothed before applying the layer of Sn by electrolysis.

Galvanizing. INTERNATIONAL COPPERCLAD CO. Ger. 469,097, Aug. 1, 1925. At least one cathode and one anode are moved through the bath in a closed cycle, as on a conveyer belt. The app. is described.

Galvanizing. GROOVE & WELTER. Ger. 470,105, July 2, 1926. The wire is clamped to one or more projections on the Zn anode which is then immersed in the bath up to the projections.

Electrolytic apparatus for galvanizing pipes. ALBERT KNEPPER. Ger. 469,429, Feb. 24, 1924.

Electric induction furnace. P. E. BUNET and ACIÉRIES DE GENNEVILLIERS. Brit. 291,455-6, June 2, 1927. Structural features.

Electric induction furnace. MARC GLIKSMAN. Fr. 641,071, Sept. 17, 1927.

Electric high-frequency induction furnace. SIEMENS & HALSKE AKT.-GES. Brit. 291,774, June 10, 1927. Structural features.

High-frequency induction furnace. SIEMENS & HALSKE AKT.-GES. Fr. 642,577, Oct. 19, 1927.

Cooling coil for an induction furnace. C. LORENZ A.-G. Ger. 469,247, Sept. 26, 1926. Details of arrangement.

Electric resistance and induction furnace. W. HAMMER. Brit. 291,450, June 2, 1927. A furnace suitable for smelting, annealing or hardening is heated by a fluid resistance in which currents are induced. Fe, Sn and Pb are suitable resistance materials. Various structural features are specified.

Electric resistance furnace. METALLWERK PLANSEE GES. AND PAUL SCHWARZKOPF. Swiss, 127,640, June 13, 1927. The resistance consists of W, Mo or alloys thereof which are coated with non-conducting layers of air-excluding, acid-resisting material. Cf. C. A. 22, 1737.

Electric resistance furnace suitable for melting various materials. JAMES C. WOODSON (to Westinghouse Elec. & Mfg. Co.). U. S. 1,697,486, Jan. 1. Structural features.

Electric annealing furnace. AKT.-GES. BROWN, BOVERI & CIE. Fr. 640,710, Sept. 9, 1927. Cooling of elec. annealing furnaces is accelerated by the provision of a cover which may be raised without admitting air and the insertion of a conducting wall between the body and cover of the furnace.

Electric furnace with resistance heating. HERMANN BÜHRLIN. Austrian 111,245, June 15, 1928. Tubular heating elements are provided through which a cooling medium may be circulated when the heating is finished.

Electric smelting furnace with resistance heating. DEMAG A. G. Swiss 127,394, Aug. 10, 1927. Structural features.

Electric furnace for heat treatment of metals. VICTOR SORREL and LOUIS ANDRÉ LAFONT. Fr. 641,635, Sept. 29, 1927. The heating chamber is entirely of metal. The temp. is recorded and regulated by a balance, the movement of which is controlled by the variation of magnetism of a body as a function of its temp.

Furnace (heated interiorly by electric heating elements) suitable for the heat treatment of metal articles. JAKOB SCHONBRUNN and GOTTLIEB KELLER (to Akt.-Ges. Brown, Boveri & Cie). U. S. 1,697,144, Jan. 1. Structural features.

Rotary electric furnace suitable for producing wrought iron. ARTHUR J. BRIGGS (to Onondaga Steel Co.). U. S. 1,697,259, Jan. 1.

Electrode holder for electric furnaces. GOTTLIEB KELLER and ERNST WIRZ (to A.-G. Brown, Boveri & Cie). U. S. 1,697,188, Jan. 1. Structural features.

Electrode holder for an electric furnace. SIEMENS & HALSKE A.-G. (Otto Rönitz, inventor). Ger. 469,287, Nov. 20, 1925. Addn. to Ger. 422,777.

Renewing furnace electrodes. RUTGERSWERKE A. G., ABTEILUNG PLANIAWERKE. Swiss 127,122, May 19, 1927. App. is described by which the new electrode is brought vertically above the electrode in use and mech. attached thereto.

Means for insulating the electrodes of electric furnaces from the means for moving them. AKT. GES. BROWN, BOVERI & CIE. Swiss 127,392, May 11, 1927. Structural features.

Seal for electrodes of smelting and refining furnaces, especially for steel manufac-

ture. SOCIETÀ ITALIANA ERNESTO BREDÀ. Austrian 110,914, May 15, 1928. Constructional details.

Charging inductively heated smelting furnaces. HIRSCH, KUPFER- UND MESSINGWERKE A.-G. (Otto Apel, inventor). Ger. 468,426, Dec. 24, 1926. The charge is rammed down into a metallic vessel and set, with the vessel, into the hot furnace. The vessel may be made of the material to be smelted.

Electric resistance unit variable by the action of light. JOHN L. BAIRD. U. S. 1,697,451, Jan. 1. Structural features.

Electric resistances. NAAMLLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 291,591, May 5, 1927. Resistances suitable for use as grid leaks have leading-in wires of ferro-chrome, and are made with a thin layer of cond. material deposited on an insulator such as a glass tube. The cond. coating may be formed by disintegration of a W or Mo wire by heating to incandescence after exhaustion.

Metallic rectifier plates. CLARENCE E. OGDEN (to Kodak Radio Corp.). U. S. 1,698,921, Jan. 15. A plate of metal such as Cu is formed with a terminal extension, an oxide film is formed on the plate, and the oxide on the extension is then fractured to scale it off so that an elec. connection may be attached.

Dry surface contact devices for rectifying alternating current. K. BRODOWSKI. Brit. 290,985, May 21, 1927. Contact elements of Zn or alloys of Cu or Al are used in conjunction with elements of a metallic sulfide such as Cu sulfide or PbS, and one at least of the elements is subjected, prior to use, to heating by passage of current in a direction opposite to that of the rectified current.

Dry surface contact (metal-metal oxide) device for rectifying alternating current. SIEMENS & HALSKE A.-G. Brit. 291,026, May 24, 1927. Structural features.

Electric transformers and similar apparatus. HERBERT H. DOW (to Dow Chemical Co.) U. S. 1,697,418, Jan. 1. A dielectric liquid used between a casing and transformer windings comprises an aryl compd. such as diphenyl oxide together with another material such as CCl₄ which serves to lower the freezing point.

Electric transformers or similar apparatus. CLARENCE J. RODMAN and AYLMER H. MAYER (to Westinghouse Elec. & Mfg. Co.). U. S. 1,697,141, Jan. 1. Oil subject to heating from a device such as an elec. transformer coil which is immersed in the oil has an overlying body of gas such as N, the coeff. of soly. of which in the oil increases with the temp., which serves to facilitate maintaining the pressure within desired limits.

Ozone. MICHEL CHATAGNIER and LOUIS LECARME. Fr. 640,874, Feb. 24, 1927. An app. is described for the production of ozone elec. from O or air, at a temp. below the b. p. of ozone. The liquid ozone may be dild. with N or CO₂ for safety.

Device for producing ozone. SIEMENS & HALSKE, A.-G. Swiss 127,518, July 1, 1927. An iron free transformer is used for producing the high-tension discharge in the ozone tube.

Electrical purification of gases. SIEMENS-SCHUCKERT-WERKE A.-G. (Richard Heinrich, inventor). Ger. 469,469, Dec. 1, 1923. The elec. charges and the gas velocity are so correlated that the suspended dust, etc., follows a predetermined path to dust-withdrawing devices opening inside the app. These openings may be upstanding vents arranged on the pptg. electrode so that the gas passing over the surface of the electrode follows sinuous paths while the dust, on account of its velocity, passes on through the vents.

Electric gas-purification apparatus. SIEMENS-SCHUCKERT-WERKE AKTIENGESELLSCHAFT. Fr. 641,802, Oct. 4, 1927. An. elec. rectifier is specified.

Electrical gas-purifying plant. SIEMENS-SCHUCKERTWERKE. A.-G. (Carl Hahn, inventor). Ger. 469,205, Jan. 29, 1924. Addn. to Ger. 409,269.

Electrical gas-purification plant. SIEMENS-SCHUCKERT-WERKE A.-G. (Richard Heinrich, inventor). Ger. 469,652, Dec. 19, 1925. Addn. to 438,972. A gas-purification plant having a pptg. electrode of the kind described in Ger. 438,972, i. e., a box-shaped electrode with slits for withdrawing the dust, is provided with means for moving the electrode in such a way that dust which has settled in the slits is driven into the interior of the electrode.

Precipitating electrodes for electric gas purifiers. METALLGES. A.-G. Ger. 469,594, Sept. 14, 1923. The electrodes are prepd. from carbonaceous materials and may be made similarly to furnace electrodes. Compns. comprising semi- or non-conductors, e. g., chamotte, and a carbonaceous binder may be shaped and burnt, or layers of different elec. cond. may be superposed.

Cleaning the electrodes of electrical gas purifiers. METALLOES. A.-G. Ger. 469,697, Mar. 24, 1926. A device for striking the electrodes is operated by a stream of

compressed gas supplied from a source remote from the electrodes; the necessity for insulating the electrodes from the gas conduit is thus avoided.

Accumulator. MANUEL LORING. Austrian 110,269, Mar. 15, 1928. An accumulator comprising a negative electrode of Zn, a positive electrode of graphite, and an electrolyte of ZnCl_2 or other Zn halide is improved by coating the positive electrode with finely divided Ag.

Circuit for rapidly regulating values such as current, voltage, or gas or vapor pressure by means of electron tubes. ÖSTERREICHISCHE SIEMENS-SCHUCKERT-WERKE (Josef Ebner, inventor). Austrian 111,157, June 15, 1928. Elec. details.

Metal foil. JOHN R. CAIN (to The Richardson Co.). U. S. 1,698,472, Jan. 8, 1928. A metal powder such as Cu is deposited on the surface of an acid aq. soln. or other suitable electrolyte so as to form an integral film on the surface and an elec. current is passed between an anode below the surface and a spongy electrode which is maintained in contact with the floating film, in order to produce a film of the metal.

Galvanoplastic manufacture of hollow bodies. ERNEST KELSEN. Austrian 109,695, Jan. 15, 1928. Models made of a readily fusible material such as wax are rendered electrically conductive in known manner and thinly coated with metal in the cold, for instance in an acid copper bath. The metal coating, preferably after removing the wax, is then coated in a hot bath, for instance, with iron, to the desired degree of thickness.

Impregnating fibrous materials. THE ANODE RUBBER CO., LTD. Ger. 469,602, July 24, 1926. In impregnating fibrous materials with water-insol. org. substances, such as rubber, artificial resins, and casein, by elec. pptg. the impregnating agent from an aq. dispersion, the depth to which the impregnating agent penetrates is regulated by preheating the fibrous materials with a soln. of a hydrophilic colloid such as glue, agar, starch, or dextrin. To the colloid soln. there may be added coagulants or buffer electrolytes, the nature and amt. of the addns., and also the concn. of the soln., depending on the result to be attained. Examples are given.

Device for cooling mercury vapor rectifiers. GLEICHRICHTER-G. M. B. H. Swiss 127,639, Aug. 23, 1927. Details of construction.

Cooling device for a mercury vapor rectifier with means for positively regulating the oil current. ALLGEM. ELEKTRIZITÄTS-GES. (Gustav W. Müller, inventor). Ger. 470,101, July 14, 1923.

Lenard cathode-ray lamps. C. H. F. MÜLLER AKTIENGESellschaft. Fr. 641,134, Sept. 7, 1927. Air-cooling means for the metallic foils are described.

Electron lamps. LA RADIOTECHNIQUE. Fr. 641,863, Jan. 21, 1927.

Displacing harmful and adsorbed gases from electric bulbs. Y. A. KHEVESH. Russ. 3667, Sept. 15, 1924. The bulb after removing the main part of the air when cold is filled with H_2 or a mixt. of H_2 and an inert gas, for example N, which is then pumped out, whereby the filament is brought to red heat at a const. or increasing voltage.

5—PHOTOGRAPHY

C. E. K. MEES

Warm tones on development papers. ANON. *Amat. Phot.* 65, 191(1928).—Pleasing warm tones may be obtained on gaslight paper by overexposing and using one of the following developers: (a) pyrocatechol 8.5 g., Na_2SO_3 (dry) 8.5 g., Na_2CO_3 (dry) 25 g., KBr 3 g., H_2O 1 l., or (b) glycine 8.5 g., Na_2SO_3 (dry) 40 g., hydroquinone 8.5 g., Na_2CO_3 (dry) 25 g., KBr 2 g., H_2O 1 l.

Photographic printing on canvas. ANON. *Il prog. fot.* 35, 128-31, 168-70(1928).—A canvas such as that used for oil painting is sized with the following soln.: casein 10 g., H_2O 90 cc., NH_4OH 10 cc. When the casein is dissolved, there are added 20 g. of Zn white and 5 cc. of linseed oil. This will be dry on the canvas in 24 hrs. and can then be coated with an emulsion. That suggested is a simple bromide emulsion made with ammoniacal AgNO_3 .

C. E. K. MEES

New principle of photographic development, especially of the so-called compensation development, its theoretical explanation and practical application. FRITZ HAGELSTEIN. Allg. Krankenhause St. Georg, Hamburg. *Arch. Pharm.* 266, 673-94(1929).—A detailed discussion of the various known factors relating to the taking and making of photographs. Among the points especially considered are: the advantage of individual tech. expts.; technic of photographic developing in general and in particular; analogies with Hans Windisch; the practical principle; supplement to the theoretical principle of a developer by Mereschkosky; new methods of detg. p_n and their importance in the action of developer solns.; principle of dilut.; theory of p_n in practice;

chem. reductions and the importance of light reductions of the latent picture for the theory of compensation development; practice of automatic equalization in over- and under-exposures; action of surface or equalization developers in comparison with deep or rapid developers; and "novobrol-detrast" developer as the universal composition in practice. Photographic reproductions are shown in connection with the discussion.

W. O. E.

Developer oxidation. R. E. LIESEGANG. *Phot. Korr.* 64, 240-2(1928).—A large crystal of AgCl surrounded by gelatin was treated with adurol developer. A stronger oxidation of the developer took place at the crystal surface than at the air. An envelope of strongly tanned gelatin was formed around the crystal. The phenomenon of development is compared to the Warburg model of biol. oxidation where reacting substances are concd. at the reacting surfaces by adsorption on a catalyst.

M. L. D.

Stains in photography. ANON. *Brit. J. Phot.* 75, 573-4(1928).—A permanganate salt-AcOH stain remover (Ilford bleacher) is recommended for treatment of pyro stains. This is followed by clearing in metabisulfite and redevelopment in amidol or metol. Stains on film packs resulting from failure to remove the paper separators are claimed to be removed wholly or partially by soaking in the following: chrome alum $1\frac{1}{2}$ oz., HCl $1\frac{1}{2}$ oz., H₂O 40 oz. Hg intensifier stains caused by insufficient washing between the two baths usually can be removed by bathing the negative in a weak metabisulfite soln. Stains with Farmer's reducer result from an excess of ferricyanide. Bathing a negative or print in vinegar is claimed to assist in removing dye stains; if persistent stains are found, an AcOH-sulfite soln. is recommended.

G. E. M.

Luminography. WITOLD HENNEL. *Przemysl Chem.* 11, 297-300(1927); cf. Vanino and Rothchild, *C. A.* 19, 2787.—H. describes the playertype method for copying pictures or script in a book. In order to copy a figure in a book it is covered with a sensitized paper, emulsion side to the figure. The paper is covered with a glass plate and placed under a lamp. The light passes through the photographic paper directly from the lamp and is also reflected from the figure. The paper is then developed to great contrast. Unevenness in the paper is compensated for on printing the positive by exactly the same procedure. By this method copying may be done any time and anywhere, even in the reading room of a public library.

A. C. ZACHLIN

Solarization theory. LÜPPO-CRAMER. *Phot. Ind.* 26, 596-9, 960-1(1928).—The regression theory of solarization is defended. Solarization after primary fixation as proposed by Leszynski is not a deciding argument; the lessening of reversal through presence of halogen-absorbing agents, such as nitrite, is decisive.

C. E. M.

Subhalide theory. R. E. LIESEGANG. *Phot. Ind.* 26, 933-4(1928).—Modern theories of exposure dealing with escaping electrons, and theories of development dealing with ions instead of atoms, do not necessarily exclude the existence of Ag subhalide as an intermediate product.

C. E. MEULENDYKE

Studies on irradiation. R. WILDT. *Z. wiss. Phot.* 25, 153-84(1928).—Influence of turbidity and of the law of blackening of the emulsion on the diam. of the image of a point of light is described. The experiences of W. indicates that the spreading of the image varies with the wave length (Ross), but is independent of the diam. of the opening used. W. has observed a slight contraction of the image during drying. Study is made, principally from an astronomical point of view, of the factor of turbidity (as measured by the rate of increase of the size of the image as a function of the time of exposure).

A. P. H. TRIVELLI

Catalytic poisoning in photography. LÜPPO-CRAMER. *Z. wiss. Phot.* 25, 133-7(1928).—AgBr adsorbs dyestuffs; but negative Ag adsorbs them also, and its catalytic action is thereby greatly enfeebled. Reduction by persulfate is hindered; by Rhodamine B, it is completely stopped. Whether the dyestuff be a sensitizer or a desensitizer the results are similar, and so whether the dyestuff be acid or basic.

A. P. H. TRIVELLI

New investigations on the Herschel effect. LÜPPO-CRAMER. *Phot. Korr.* 64, 108-11(1928).—The Herschel effect is well shown in the case of Satrox paper and a red safe-light, a white-light latent image being rapidly weakened by exposure, before development, to the red light. An orange light is nearly as effective as the red, and a yellow light less. Several other chloride-contg. papers showed a progressive destruction of the white-light image by an exposure to red light, as also did a pure AgCl emulsion prep'd by L.-C. Villard (1907) showed that treatment with red light restored a plate to its original condition. L.-C., however, with Satrox paper, now observes a notable increase in sensitivity to white light after destroying a previously impressed white-light latent image with red light. The Herschel effect can then be obtained a second time and probably repeatedly.

E. R. BULLOCK

Enhancing of the Herschel effect by oxidizing agents. LÜPPO-CRAMER. *Kino-technik* 10, 506-7(1928).—Lantern slide plates were bathed in weak solns. of the following oxidizing agents: $K_2Cr_2O_7$, $(NH_4)_2S_2O_8$, HNO_3 , H_2O_2 , $KMnO_4$, quinone and citric acid to each of which was added about 0.1% of KBr. They were then given a flash exposure and subsequently exposed under the Chapman-Jones scale as well as special red, yellow and blue filters. Bleaching was obtained with all the salts under the red and yellow filters and various amts. under the blue filter. Good bleaching was also obtained with a soln. of amidol and less with *p*-phenylenediamine. H. C. C.

Fine-grain images. R. NAMIAS. *Il progresso fotografico* 35, 253-6(1928).—Some of the very small cameras now on the market, as well as the amateur motion-picture cameras, make desirable images of the finest possible grain. High resolving power can be obtained only by the use of fine-grained emulsions. Reduced graininess in the developed image can be obtained by developers contg. little alkali and much sulfite, such as the Kodak borax formula, or the following formula of Mente: Metol, 15 g.; Na_2SO_3 (cryst.), 150 g.; 10% KBr soln., 2 cc.; H_2O , 1 l. C. E. K. MEES

Latent image bleaching. LÜPPO-CRAMER. *Phot. Ind.* 26, 627(1928).—The red-light bleaching of the latent image with chloride and bromide emulsions has been discovered to take place with certain gaslight papers. Such papers give bleaching not only in red, yellow and green light, but also in blue light. With light of short wave length, it is necessary to maintain low intensity or fogging, with little bleaching, results. The Herschel effect in blue light differs from solarization in that it takes place all along the upper portion of the curve. Both phenomena are related since they are types of regression. Reproductions of the original prints are given. C. E. M.

Weakening of latent image. LÜPPO-CRAMER. *Z. wiss. Phot.* 25, 129-33(1928).—Persulfate attacks most strongly the denser parts of a negative; Farmer's reducer, the thinner parts. Dichromate attacks most strongly the denser parts of a latent image. All oxidizers and Ag solvents appear to do the same, provided there is at the same time a solvent for the Ag halide adsorbed by the negative Ag, in the absence of which the attack may be mainly on the thinner parts. Persulfate promotes fogging, but not with bromide paper; H_2O_2 acts analogously, powerfully promoting fogging. The explanation is based upon the fact that the last remains of adsorbed substances or those in solid soln. are the most difficult to dissolve. A. P. H. TRIVELLI

Fogging by acids and oxidizing agents and the intensification of the photographic latent image. E. P. WIGHTMAN. *J. Am. Chem. Soc.* 50, 2923-9(1928).—Further arguments are given in support of the viewpoint of Wightman (*C. A.* 21, 3318) that latent fog formation from the action of certain oxidizing agents and acids is probably due to formation of bromine from the sol. bromide in the plate, with which hypothesis Lüpko-Cramer disagrees (*C. A.* 22, 1738). The hypothesis was originally based on the fact, discovered by Lüpko-Cramer himself, that very dil. Br soln. causes fog and on a previously proposed mechanism of latent image intensification and fog formation by H_2O_2 , further evidence for which is now presented. E. P. W.

Toning and intensification of selenium-toned prints and negatives. A. STEIGMANN. *Phot. Ind.* 26, 902(1928).—Se toning is followed by a bleach bath of dichromate acid and KBr. Redevelopment is effected with a soln. of $AgNO_3$ in Na_2SO_3 soln. Satisfactory chocolate-brown tones are claimed. C. E. MEULENDYKE

Intensifying the shadows of bromide prints. S. JASIENSKI. *Foto. Polski* 12, 199-200(1927).—Excellent gradations of tones ranging from clear highlights to a 10% intensification of the shadow can be obtained by the following method. The hardened dry prints are immersed in a warm 2% soln. of potassium chlorochromate and bleached thoroughly. The prints can then be redeveloped in two ways: (1) without washing, to produce warm tones; (2) after thorough washing, to produce cold tones. An unbromided pyrocatechol developer is recommended. If the highlights are not clear, a preliminary bathing is recommended in a weak soln. of $KMnO_4$ acidified with a few drops of H_2SO_4 . T. J. GASKI

Sensitization of emulsions by colloid materials. B. H. CARROLL AND D. HUBBARD. *Bur. Standards. J. Research* 1, 565-88(1928); *Brit. J. Phot.* 75, 711-2, 724-7, 738-9, 753-5(1928).—A study of the effect upon sensitivity of the adsorption of gelatin-protected insol. colloid nuclei to the surface of the Ag halide grains. Emulsions were treated with the colloid materials after ripening and washing, adsorption was facilitated by control of the charge on the grains, and unadsorbed colloid material removed by centrifuging. Colloidal AgI gave marked increase in contrast with chem. development and great increase in speed with physical development. Both effects are probably caused by acceleration of development by increased adsorption of the developer. Colloidal Au and Ag increased the speed of acid emulsions contg. slight excess of sol. Ag salts. This

it can possibly be explained by orientation of the photolysis. Ag_2S gave negative results.

C. E. MEULENDYKE

Light standard for sensitometry. E. CALZAVARA. *Sci. ind. phot.* 8A, 113(1928).—gives arguments against the use of pyridine and mannitol as standard media in connection with the prepn. of colored filters as recommended by the committee of the Soc. of Am. during the 7th Intern. Congress of Photography at London. Some of the objections to pyridine are considered from the standpoint of purity, doubtful degree of hydration, and reactivity to certain dehydrating agents forming dihydro derivs. Objections to mannitol are based upon the difficulty of obtaining a definite isomer, the change of optical rotatory power of *d*-mannitol (ordinary) in the presence of moisture, or of soda, potash, lime, baryta, magnesia, NH_4OH , boric acid, borates and other foreign compds.

L. E. MUEHLER

Interchangeability of zinc oxide and dyes in optical sensitization. C. NEUWEILER. *Phys. Phot.* 25, 187-224(1928).—In light, ZnO acts on aq. solns. of org. dyes of widely different classes. In pure, air-free aq. soln. the dyes are both oxidized and reduced. In vat dyes, photolysis still occurs even at the highest reduction potentials (safranin, $- +0.15$ v.). Considerable differences of potential, up to about 0.8 v., between anodic and cathodic photolysis processes can be overcome by light. With azos the photolytic reduction is not reversible; i. e., the reduction products were not converted into dyes by the O of the air. The alkyl. of the ZnO and heating play no part in the reactions studied. Under certain conditions, sensitizing dyes can exert the same photolytic effect on org. dyes as ZnO . The necessary condition is that the absorption region of the sensitizer must coincide with that of the acceptor on the short wave-length side.

A. P. H. TRIVELLI

Cellulose acetooleate (U. S. pat. 1,698,048) 23. Cellulosic esters containing Brstituted stearic acid groups (U. S. pat. 1,698,049) 23. Smooth metal coatings for photographic purposes (Swiss pat. 127,548) 9.

Photography. GUSTAV KÖGEL. Ger. 466,326, Dec. 14, 1927. Optically sensitive papers for yielding positives from negatives are produced by combining ferric salts with rhonyl compds. Thus, 1 part ferric ammonium citrate is mixed with 3 parts of an ethylrhinosoketone with excess of hydrolyzed starch and BaCl_2 and applied to paper. Rhinosoketone or β -naphtholquinone-4-sulfo acid may be used.

Photography. GUSTAV KOPPMANN. Ger. 469,224, Aug. 17, 1926. Ag prints are developed by reduction and the Ag compds. still capable of being blackened removed from the developing zone together with the colloid. The halogen-Ag film may be treated with a light absorbing medium.

Photography. JOHANNES HERZOG & Co. Ger. 466,327, July 6, 1927. Colored pictures are produced by using pigments capable of oxidation and exposing them to the action of leuco-dye solns.

Photography. KALLE & Co. A.-G. (Maximilian Paul Schmidt, Wilhelm Krieger and Rudolf Zahn, inventors). Ger. 467,162, Oct. 20, 1927. Natural color photographs are prepared by using diazo compds. which are not bleached by light. Thus, yellow, blue and red sheets of transparent material are separately impregnated with solns. containing, esp., boron fluoride of 1-diazo-4-ethylamino-3-methylbenzene, tartaric acid and phenol, boron fluoride of 1-diazo-4-ethylamino-3-methylbenzene, tartaric acid and the Na salt of 1-amino-8-naphthol-3,6-disulfonic acid, and 1-diazo-2-naphthol-4-sulfonic acid, $\text{Al}_2(\text{SO}_4)_3$ and resorcinol. The pictures are completed successively on the sheets, developed with gaseous NH_3 and superimposed on the same base. A further example is given (cf. C. A. 23, 349).

Photography. I. G. FARBENIND. A.-G. (Walter Dieterle, Otto Matthies, Emil Mauerhohl and Josef Reitsretter, inventors). Ger. 468,604, May 15, 1926. Addn. to Ger. 464,450. Gelatin for light-sensitive Ag salt emulsions, containing disintegrated animal and vegetable proteins, has also a content of disintegrating agent. Cf. C. A. 23, 571.

Photography. SOCIÉTÉ CIVILE POUR L'ÉTUDE DE LA PHOTOGRAPHIE ET DE LA CINÉMATOGRAPHIE EN COULEURS. Ger. 470,005, June 3, 1927. To prepare a lenticular film for color projection requiring a minimum of treatment with liquid reagent, a carrier of gelatin, celluloid, or cellulose is provided on one side with a layer of celluloid or other plastic material to form the lenticular light-refracting surface, and on the other side with a layer of gas-permeable material impregnated with light-sensitive azo derivs. gas-forming alkali is used for developing.

Color photography. JACOB F. LEVENTHAL. U. S. 1,697,194, Jan. 1, 1928. Registered images are produced in a single layer of colloid containing a light sensitive salt

and after developing and fixing to obtain an image capable of being bleached the colloid is treated with a bleach retardant such as dil. CH_3O soln. which diminishes the rapidity of action of a bleaching compn. such as a dil. aq. soln. of NH_4Br , KI and I which is subsequently applied.

Three-color photography. "SIRIUS" KLEUREN-FILM MAATSCHAPPIJ. Ger. 469,416, Mar. 19, 1927. To ensure accurate registration, the two-color picture is prepd. with a double-coated film having circular perforations of smaller diameter than the height of the oblong perforations usually provided, the normal perforations being made after the third layer has been applied.

Screens for color photography. JENS HERMAN CHRISTENSEN. Ger. 469,578, Sept. 8, 1927. The color particles contain a dye or dyes in addn. to a lake, e. g., one or more acid dyes in addn. to a lake prepd. in known manner from tannic acid and a basic dye.

Decolorizing colored films, film waste, and celluloid strips. BERLINER CELLULOID-VERWERTUNG G. M. B. H. Ger. 469,688, Aug. 4, 1927. The photographic emulsion is removed in known manner and the film, etc., then treated in a bath of dil. KMnO_4 soln. contg. HCl , with or without a chlorate. An after-treatment with dil. NaHSO_4 soln. may be given to remove MnO_2 .

Photographic films. I. G. FARBENIND. A.-G. (Hermann Lummerzheim and Eduard Schnitzler, inventors). Ger. 468,374, Aug. 13, 1927. Addn. to 467,780 (C. A. 23, 571). In the method of producing visible numerals or lettering on films described in Ger. 486,374, colloids which are not sol. in the liquid used for polishing the films are added to the printing soln., and finely divided pigments may replace partly or wholly the dyestuff of the printing soln.

Photographic sensitive material. WILLIAM B. DAILEY. U. S. 1,699,340, Jan. 15. A light-sensitive coating is applied to paper, "film" or other suitable sheet material and after the coating has set but before it is dried a protective coating such as non-sensitized gelatins is applied over it and both coatings are dried at the same time. An app. is described.

Printing plates. R. KLASTERNIGG (to C. Schinzel). Brit. 291,063, May 25, 1927. Printing plates are produced by electrolytic action on gelatin, albumin or similar colloid layers contg. substances such as hydroquinone or other photographic developers, chromic salts, ferric salts, and catalytic or hygroscopic salts, which under electrolytic action produce tanning or detanning agents.

Cinematograph films. PAUL REHLÄNDER. Ger. 469,415, Jan. 10, 1928. Celluloid rendered opaque by particles of high reflectivity is used to support the emulsion.

Lubricating motion picture films. ALBERT FIEDLER. U. S. 1,697,858, Jan. 8. A compn. of gelatin and oil dissolved in water and alc. is applied to the film edges.

Photographic developers. I. G. FARBENIND. A.-G. Fr. 641,409, Sept. 26, 1927. Cyanides of heavy metals, particularly $\text{Hg}(\text{CN})_2$, are added to photographic developers of all kinds.

Metallized photographic paper. LEOPOLD RADO and JULIUS MODERN. Austrian 110,592, Apr. 15, 1928. Metal foil, made adherent by a layer of hardened albumin, is inserted between the paper and the emulsion.

Photomechanical reproduction. FRIEDRICH PUPPE. Ger. 470,087, Dec. 15, 1926. Two-color prints are obtained by different color media. The printing elements for the two colors are etched by a common photomechanical color ext. and then sepd. for the introduction of the different media.

Package of sensitized material for x-ray purposes. FREDERICK C. MARTIN (to Eastman Kodak Co.). U. S. 1,698,058, Jan. 8. Structural features.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

The rare earths. N. A. ORLOV. *J. Russ. Phys.-Chem. Soc.* 60, 515-44 (1928).—A review of the methods of separation and purification written in 1913 or 1914 and published after the author's death. B. SOYENKOFF

Separation of pure yttrium from yttrious earths. G. CANNERI. *Atti accad. Lincei* 8, 164-8 (1928).—Pure Yt can be obtained from gadolinite by fractional crystn. of double carbonates with Na_2CO_3 as precipitant. HNO_3 soln. of the earth oxides is treated with K_2SO_4 which ppts. out most of the Ce earths as double sulfates. Then there is added $\text{Mg}(\text{NO}_3)_2$, which ppts. double nitrates of the other earths, leaving a

mother liquor rich in Yt. This is now treated with excess Na_2CO_3 till the ppt. is redissolved, and the soln. is fractionally crystd., the Yt being thus concd. in the various mother liquors as it is the most sol. of the double carbonates, the order of decreasing soly. being Yt, Er, Ho, Tm, Tb and Yb. The product gives an oxide with only a trace of Er and the mol. wt. detd. for Yt using the $\text{Yt}_2\text{O}_3:\text{Yt}_2(\text{SO}_4)_3$ relation was 94.5. The last traces of Er were removed by a modification of Prandtl's method, i. e., by partial pptn. of ferrocyanides with addn. of a Zn salt to help coagulate the gelatinous ferrocyanide ppt. C. improved this method by adding the precipitant $\text{K}_4[\text{Fe}(\text{CN})_6]$ (1% soln.) in small portions, slowly while stirring, in presence of excess alkali. After several mins. heavy yellow crystals form which quickly settle as an incrustation. This is easily sepd. from the mother liquor. Four pptns. were enough to give pure Yt, no absorption bands being shown by the HNO_3 soln. of the oxide. Mol. wt. of this pure Yt = 89.12. (Honigschmid and Meuwesen find 89.00.)

A. W. CONTIERI

Chemistry of gallium. II. R. FRICKE AND K. MEYRING. Univ. Münster i. W. *Z. anorg. allgem. Chem.* 176, 325-48(1928); cf. *C. A.* 19, 1543.—The Ga metal used contained as impurities 0.16% In, 0.10% Zn, 0.01% Pb and a trace of Ag. Ga is detd. by pptn. as $\text{Ga}(\text{OH})_3$ from a soln. of the chloride and ignition as Ga_2O_3 or by electrolysis from an alk. gallate soln. and deposition on Pt. The metal drops off the Pt electrode, collects as a liquid in the bottom of the vessel, is redissolved in aqua regia and pptd. as $\text{Ga}(\text{OH})_3$, followed by ignition. Freshly pptd. $\text{Ga}(\text{OH})_3$ dissolves readily in excess of NH_4OH , and cond. and f. p. detns. in these solns. show that $\text{Ga}(\text{OH})_3$ behaves as a relatively strong acid, the ammoniacal solns. being apparently due to its formation rather than to complexes. The sp. cond. of a soln. of 0.0315 mol. Ga in 0.219 *N* NH_3 is 3.47×10^{-3} as compared with 5.70×10^{-4} for the same NH_3 soln. without Ga, while the f. p. depression of these 2 solns. is 0.524° and 0.481° . The $[\text{H}^+]$ concn. of the NH_3 soln. is therefore strongly reduced by Ga. Colorimetric tests give for the Ga soln. $p_{\text{H}} = < 9.3$, while the NH_3 soln. has $p_{\text{H}} = > 10.1$. The basic and acid properties of $\text{Ga}(\text{OH})_3$ are studied by electrometric titration of GaCl_3 in with NaOH and of NaOH soln. with GaCl_3 , using the H electrode. On neutralizing GaCl_3 , the hydrolysis consts. for the 1st and 2nd stages are given as 1.4×10^{-3} and 3.5×10^{-4} , and the dissocn. consts. as 4×10^{-12} and 1.6×10^{-11} . The hydrolysis and the 3rd stage of neutralization cannot be detd. due to the formation of considerable ppt. In the titration of NaOH with GaCl_3 soln. the hydrolysis consts. for the first 2 stages are given as 3×10^{-3} and 1.2×10^{-4} , while the dissocn. consts. are 1×10^{-12} and 4.8×10^{-11} . The results show, however, that the dissocn. consts. for the 2nd stage in either direction can only be slightly less than the const. for the 3rd stage.

H. STÖERTZ

Some properties of the alkali metals. L. HACKSPILL. *Helv. Chim. Acta* 11, 1003-26 (1928). An address dealing with the prepn. and properties of the alkali metals.

FRANK URBAN

Univalent iron, cobalt and nickel. W. MANCHOT. Tech. Hochschule, München. *Monatsh. chem. ital.* 58, 560-2(1928).—Evidence already presented in original articles (cf. *C. A.* 20, 2455; 21, 869; 22, 1134) is repeated in its essentials in support of the existence of univalent Fe, Co and Ni, and in refutation of papers by Cambi (cf. *C. A.* 21, 1408, 22, 193). The conclusion that Fe can be univalent does not rest on absorption spectra evidence, but on the proof that NO behaves as a neutral mol., a proof which is well established by expts. already published on compds. of CO and NO (cf. M. and Pilgum, *C. A.* 22, 200). Researches on the mechanism of the reduction and the univalence of Mn (cf. M. and Gall, *C. A.* 21, 869; 22, 2522) also support the existence of univalent Fe.

The compounds of osmium tetroxide. F. KRAUSS. Tech. Hochschule Braunschweig. *Z. anorg. allgem. Chem.* 175, 343-6(1928).—Polemic against E. Fritzmann (cf. *C. A.* 22, 3362) who claims to have prepd. $\text{OsO}_4 \cdot 2\text{KOH}$, etc.

G. L. CLARK

The oxides of ruthenium and osmium. F. KRAUSS AND G. SCHRADER. Tech. Hochschule, Braunschweig. *Z. anorg. allgem. Chem.* 176, 385-97(1928).— RuO_4 is prepd. by reduction of an aq. soln. of RuO_4 with 4% H_2O_2 , and settles out as a black flocculent ppt. after heating the reaction mixt. on a H_2O bath. Dried in a vacuum desiccator over P_2O_5 , finely powdered, and heated to const. wt. at 500° , the product is amorphous and shows a d_{41}^{21} of 4.98. Calcd. from this, mol. vol. is 26.8. X-ray photographs show interference lines which the authors believe to be due to the presence of a small amt. of a cryst. modification. Efforts to prep. this by heating the amorphous form to 800° failed. OsO_4 is prepd. by heating Os with NO at 540° . It is a dark brown cryst. substance with $d_{41}^{21} = 11.32$, and mol. vol. = 19.6. The amorphous form is

unstable, and efforts to prepare it were unsuccessful. Its mol. vol. is about 29.0. RuO_4 in the fused condition gives a d. of 3.28 and mol. vol. of 50.7, the O vol. possessing its full zero point value of 10.7. RuO_4 has an extremely high vapor pressure and is very unstable. Addition of a small quantity of Cl to its soln. increases the stability. RuO_4 dissolves in liquid NH_3 with a violet-brown color. OsO_4 was prepd.; it has $d_4^{21} = 4.95$, mol. vol. = 51.4, the zero vol. of O having its full value of 10.7. Thus, the normal crystd. forms of the oxides of Ru^{IV} and Os^{IV} have for the zero vol. of O its half value of 5.35, while the crystd. oxides of Ru^{VIII} and Os^{VIII} have the full value of 10.7. The (iv) oxides also exist in an amorphous form in which the O vol. has its full value. If OsO_4 is dissolved in HCN , evapn. of the soln. leaves a white, cryst. substance with the probable compn. $\text{H}_2[\text{OsO}_4(\text{CN})_2]$.

H. STOERTZ

Microchemical reactions for theobromine. M. WAGENAAR. *Pharm. Weekblad* 66, 1-5(1929).—Various reagents for pptn. of complex salts of theobromine gave results as follows: (reagent; min. concn. of theobromine at which pptn. occurs; min. amt. of theobromine required for test, mg.) dil. AcOH to ppt. free base, 1:100, 10; HgCl_2 , 1:1000, 5; AuCl_3 , 1:100, 10; AgNO_3 , 1:100, 10; $\text{I} + \text{KI}$, 1:1000, 2; $\text{Br} + \text{KBr}$, 1:1000, 1; $\text{BiI}_3 + \text{KI}$, 1:1000, 2; $\text{SbI}_3 + \text{KI}$, 1:1000, 1.

A. W. DOX

Oxidation of cobalt in a solution of cobaltous nitrate by means of sodium bismuthate. SANSEI KITASHIMA. *Bull. Inst. Phys.-Chem. Research (Tokyo)* 7, 1035-40(1928); *Abstracts* 1, 100-1.—When a soln. of $\text{Co}(\text{NO}_3)_2$ in concd. HNO_3 is shaken with a sufficient quantity of Na bismuthate and any insol. residue is removed, a blue soln. is obtained, owing to the oxidation of Co. But if HNO_3 is very dil., the soln. remains red. In order to detect any oxidized Co in the red soln., the absorption spectrum has been taken. Oxidized Co is found in the red solns.; the degree of oxidation partially depends on the amount of bismuthate used. The duration of the shaking influences little the degree of oxidation in the presence of small amts. of HNO_3 , but has considerable influence when the acid concn. is large. On standing, the amt. of oxidized Co decreases decidedly.

ALBERT L. HENNE

The action of iron vapor on molecular nitrogen and the problem of nitrogen fixation on iron. A. MITTASCH AND W. FRANKENBURGER. *Forschungslab. Oppau Z. physik. Chem., Abt. A*, 139, 386-96(1928).—Although a number of Fe nitrides are mentioned in the literature nothing is known about the action of Fe vapor on gaseous N_2 . The authors, therefore, undertook a study of the action of Fe at high temps. on N_2 at a pressure of 0.1 mm. Hg. Thin wires of Fe, free from adsorbed gases, were electrically heated in the rarefied atm. of N_2 to temps. at which the metal vaporized readily (between 1200° and 1500°K). More than 100 expts. were performed but the results were negative: the Fe atoms do not combine with the N_2 mols.

H. S. v. K.

Action of hydrogen sulfide on chromates. I. H. B. DUNNICLIFF AND C. L. SONT. Punjab Univ., Lahore, India. *J. Phys. Chem.* 33, 81-7(1929).—When pure H_2S acts upon K_2CrO_4 in aq. soln. (concn. varying from 2 to 15%) at $80-5^\circ$, the products of the reaction are found to be $\text{K}_2\text{S}_2\text{O}_8$, K_2S_8 , S and $\text{Cr}(\text{OH})_3$.

LOUISE KELLEY

The reactions of hydrogen chloride with the dioxides of selenium and tellurium between 0° and 170° . THOMAS W. PARKER AND PERCY L. ROBINSON. Univ. of Durham. *J. Chem. Soc.* 1928, 2853-7; cf. Lenher, *C. A.* 3, 1124; 15, 480 and Ditte, *Compt. rend.* 83, 56, 336(1876).—Two addn. compds. exist between SeO_2 and HCl , viz., (1) $\text{SeO}_2 \cdot 4\text{HCl}$, a yellow solid, stable at 0° , and (2) $\text{SeO}_2 \cdot 2\text{HCl}$, a yellow liquid, stable up to and partly distillable at 170° . This liquid dissolves HCl in amts. varying with the temp. At 0° TeO_2 absorbs HCl in varying quantities, giving a non-homogeneous product, which loses H_2O continuously with rising temp. when heated in a stream of the gas. There is no evidence that TeO_2 forms a definite addn. compd. within the range $0-150^\circ$.

H. F. JOHNSTONE

Transformation of ortho-ferric oxide hydrate into meta-ferric oxide hydrate. ALFONS KRAUSE. Univ. of Posen. *Z. anorg. allgem. Chem.* 176, 398-402(1928); cf. *C. A.* 22, 4075.—Brown ortho-ferric oxide hydrate is produced by pptn. of ferric salts with NH_4OH . Its $p_H = 7.7$, and its particle size is relatively small. Dried on a watch glass in the air it forms almost black particles, which do not adhere to the glass. Allowed to age under H_2O , after removal of NH_4 salts, it is gradually converted into the meta-compd., which is bright yellow in color. After 8.5 months, the gel contains about 59% meta- and after 19.5 months about 68% meta-compd. This is easily peptized in dil. AcOH , HCl or NH_4OH , its particle size is relatively large, and when dried in the air on a watch glass, it adheres tenaciously to the glass. The isoelec. point of the meta-gel corresponds to $p_H = 5.2$. Dried samples of the aged ortho-gel show that Fe_2O_3 content increases with age. When fresh it contains about 70% Fe_2O_3 , after 3 months 77.3% and after 1 yr. about 80%. The dried meta-gel contains about

82.5% Fe_2O_3 . In the presence of OH ion the conversion from *ortho* to *meta* is very rapid. Freshly pptd. well-washed *ortho* compd. is added to N NaOH and allowed to stand 3-4 days at room temp. The gel is bright yellow and has the same properties as a gel aged for a long time under H_2O . H. STOERTZ

The reduction of selenious acid. LESLIE M. CLARK. *J. Chem. Soc.* 1928, 2388-93.—In the reduction of H_2SeO_3 by SO_2 in the presence of CuSO_4 and HCl, the ppt. varies in compn. from pure Se in the presence of high concns. of HCl to Cu_2Se in very dil HCl solns. SO_2 reduces SeO_3 directly to Se which reacts with Cu ions to form Cu_2Se ; the latter reaction depends on the concn. of HCl. ARTHUR FLEISCHER

Decomposition of trithionate solutions. A. HORNIG. *Tech. Hochschule, Dresden Z. anorg. allgem. Chem.* 176, 423-4(1928); cf. Riesenfeld and Sydow, *C. A.* 23, 352.—A method is developed for demonstrating the presence of $\text{S}_2\text{O}_3^{2-}$ in the decompn. products of $\text{S}_2\text{O}_6^{2-}$ in H_2O soln.: $\text{S}_2\text{O}_6^{2-} + \text{H}_2\text{O} = \text{SO}_4^{2-} + \text{S}_2\text{O}_3^{2-} + 2\text{H}^+$. The decompn. is conducted in a cold satd. soln. of copper acetate, $\text{S}_2\text{O}_6^{2-}$ being added to make it 0.2-0.3 M . After a few days at room temp. and in the dark, a yellow, cryst. substance seps., which on analysis is found to be $\text{K}_2\text{S}_2\text{O}_3 \cdot \text{Cu}_2\text{S}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$. Microscopic examn. shows the crystals to be yellow, monoclinic prisms. This complex becomes brown and finally black in the air, with sepn. of CuS , which is also formed when it is heated with H_2O . H. STOERTZ

Solid solutions of lime and arsenic acid. A. T. CLIFFORD AND F. K. CAMERON. *Univ. North Carolina. Ind. Eng. Chem.* 21, 69-70(1929).—There seems to be no evidence that $\text{Ca}_3(\text{AsO}_4)_2$ can be formed from aq. solns., or persist in contact with them. Analytical methods purporting to sep. it from other Ca compds. should be viewed with caution. E. F. SNYDER

The system: zinc oxide-water. A. GUTBLER AND HORST-RUDOLF BARFUSS-KNOCHENDOPPEL. *Univ. of Jena and Tech. Hochschule, Prague. Z. anorg. allgem. Chem.* 176, 363-71(1928); cf. *C. A.* 20, 2628; 22, 3568.—Crystd. zinc oxide monohydrate ($\text{ZnO} \cdot \text{H}_2\text{O}$) (I), aged amorphous zinc oxide hydrate ($\text{ZnO} \cdot 0.342\text{H}_2\text{O} \cdot 0.027\text{CO}_2$) (II), and fresh amorphous zinc oxide hydrate ($\text{ZnO} \cdot 0.275\text{H}_2\text{O} \cdot 0.005\text{CO}_2$) (III) are prepd. The decompn. of these compds. on heating is studied by means of H_2O vapor pressure detns. The bulk of the H_2O in prepn. I is loosely held and is given up at a uniform velocity on heating. A small part of the H_2O (0.060 mole) is very firmly held. Thus after heating at 73° , the amt. of H_2O (N) is 0.060 mole, at 175° $N = 0.058$, at 190° $N = 0.048$, at 260° $N = 0.034$, at 305° $N = 0.027$, at 500° $N = 0.018$. If $\text{ZnO} \cdot \text{H}_2\text{O}$ is heated to 73° in a vacuum, decompn. commences and continues without abatement even if the temp. is dropped to 56° . The temp. of the 4-phase point $\text{ZnO} \cdot \text{H}_2\text{O} | \text{crystd. ZnO} | \text{condensed H}_2\text{O} | \text{H}_2\text{O}$ vapor is not far removed from room temp. Decompn. of II and III shows that the first contains more H_2O and retains it more firmly. Chem. activity, however, decreases on aging, III taking up Ag from a Ag gel in greater quantity than II, the ratio being 31/9. X-ray examn. shows no interference lines with III, broad indistinct lines with II corresponding to those of ZnO , and sharp interference lines with I differing in position from those of ZnO . A freshly prepd. ppt. of zinc oxide hydrate is the richest in energy and the least stable component of this system; the most stable and lowest in energy is liquid H_2O + crystd. ZnO (contg. a small amt. of H_2O). However, under a definite temp. (60°) crystd. zinc oxide monohydrate can exist as a stable compd. H. STOERTZ

The quaternary system: $\text{Na}_2\text{C}_2\text{O}_4$, H_2SO_4 , Na_2SO_4 (or $\text{H}_2\text{C}_2\text{O}_4$)- H_2O at 25° . E. BLOD AND F. ACKER. *Tech. Hochschule, Karlsruhe. Z. anorg. allgem. Chem.* 176, 305-24(1928). This quaternary system is studied as an aid in understanding the double decompn.: $\text{Na}_2\text{C}_2\text{O}_4 + \text{H}_2\text{SO}_4 = \text{Na}_2\text{SO}_4 + \text{H}_2\text{C}_2\text{O}_4$. The principal points of the 4 ternary systems involved are given in tables. In the investigation of the satn. equl. between the solids and solns., a new substance is discovered which has the compn. $\text{Na}_2\text{H}_2(\text{SO}_4)_2 \cdot \text{C}_2\text{O}_4$ and is designated *acid sodium sulfate oxalate*. Microscopic examn. of the isolated salt shows that it occurs in more than 10 types of crystals. It is sol. in H_2O with sepn. of $\text{NaHC}_2\text{O}_4 \cdot \text{H}_2\text{O}$ when satn. is attained. Its zone of existence is found to extend over the great H_2SO_4 concn. range of 20-67%, and with bin-oxalate dominates the field of satd. solns. at 25° . The satn. field is detd. for the compds.: $\text{Na}_2\text{H}_2(\text{SO}_4)_2 \cdot \text{C}_2\text{O}_4$, $\text{H}_2\text{C}_2\text{O}_4$, $\text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$, NaHC_2O_4 , $\text{Na}_2\text{C}_2\text{O}_4$, Na_2SO_4 , $10\text{H}_2\text{O}$, $\text{Na}_2\text{SO}_4 \cdot \text{Na}_2\text{H}_2(\text{SO}_4)_2 \cdot \text{H}_2\text{O}$, $\text{Na}_2\text{H}(\text{SO}_4)_2$, $\text{NaHSO}_4 \cdot \text{H}_2\text{O}$, NaHSO_4 , $\text{NaH}_2(\text{SO}_4)_2 \cdot \text{H}_2\text{O}$. The results of the solv. detns. are plotted in the form of a horizontal projection of the phase diagram. By graphic detn. of the isothermal crystn. course with removal of the sepg. products, in addition to 2 actual crystn. end points, a final crystn. path is located along which the progress of crystn. practically comes to a standstill in the direction of a third, but "virtual" crystn. end point. H. STOERTZ

Complex salts. I. The preparation and properties of some selenitopentamminecobalt salts. HARRY L. RILEY. College of Science and Technology, S. Kensington. *J. Chem. Soc.* 1928, 2985-9.—Selenitopentamminecobaltic chloride (I), $[\text{Co}(\text{SeO}_3)(\text{NH}_3)_5]\text{Cl}$, was prepd. by adding NH_4Cl to a suspension of $\text{Co}(\text{OH})_2$ and SeO_2 . Large red crystals were obtained by evapn. of the liquid and crystn. from alc. Yield, 80%. A soln. of I is slowly reduced by SO_2 , pptg. Se. BaCl_2 gives no ppt. in the cold, while AgNO_3 ppts. the chloride on boiling. When boiled with HCl the chloropentamminecobaltic chloride is formed, along with H_2SeO_3 . Cryoscopic mol. wt. detns. indicate that this compd. is a binary electrolyte, 97% dissociated in 0.1 N soln. No evidence of a selenitetetrammine compd. was found. Selenitopentamminecobaltic selenite (II), $[\text{Co}(\text{SeO}_3)(\text{NH}_3)_5]_2\text{SeO}_3 \cdot 3\text{H}_2\text{O}$, was prepd. by adding NH_4OH to a suspension of CoSeO_3 and SeO_2 followed by evapn. and pptn. with alc. The action of II with BaCl_2 indicates the existence of the different SeO_3 groups. These results are evidence that ions of the sulfate and sulfite type have a tendency to occupy only one position in a complex, while those of the carbonate type usually occupy two, but sometimes only one position.

H. F. JOHNSTONE

Silver-alkali thiosulfates. ARTHUR ROSENHEIM AND GERT TREWENDT. *Ber.* 61B, 1731-5(1928).—Methods are described for prep. and isolating $\text{NH}_4(\text{Ag}(\text{S}_2\text{O}_3)_3)$, $(\text{NH}_4)_2(\text{Ag}_2(\text{S}_2\text{O}_3)_4)$, $\text{K}(\text{Ag}(\text{S}_2\text{O}_3)_3)$, $\text{K}_2(\text{Ag}_2(\text{S}_2\text{O}_3)_4)$, $\text{K}_3(\text{Ag}(\text{S}_2\text{O}_3)_3) + \text{H}_2\text{O}$, $\text{Na}(\text{Ag}(\text{S}_2\text{O}_3)_3)$ and $\text{Na}_2(\text{Ag}_2(\text{S}_2\text{O}_3)_4) + 3\text{H}_2\text{O}$. $\text{Na}_4(\text{Ag}_2(\text{S}_2\text{O}_3)_3) + 2\text{H}_2\text{O}$ does not exist; the compd. so designated is actually $\text{Na}_5(\text{Ag}_3(\text{S}_2\text{O}_3)_4) + 3\text{H}_2\text{O}$.

B. E. ROETHELI

Multinuclear cobaltamines and a productive method of preparation of the non-electrolyte $\text{Co}(\text{NH}_3)_6(\text{Cl})_3$. ERWIN BIRK. Tech. Hochschule, Hannover. *Z. anorg. allgem. Chem.* 175, 405-12(1928).—From $[\text{Co}(\text{NH}_3)_3(\text{NO}_3)_3]$, triquo-triammino cobaltchloride, $[\text{Co}(\text{NH}_3)_3(\text{H}_2\text{O})_3]\text{Cl}_3$ (I) is prepd. by the method of Werner (*Ber.* 39, 2678(1906)) and this in turn is converted to the hexamine-triol-dicobaltchloride

$$\begin{array}{c} \text{Co} \quad \text{OH} \quad \text{Co} \\ \diagdown \quad \diagup \\ (\text{NH}_3)_3\text{CO} \quad \text{OH} \quad \text{CO}(\text{NH}_3)_3 \\ \diagup \quad \diagdown \\ \quad \text{OH} \end{array} \text{Cl}_3 \cdot \text{H}_2\text{O} \text{ (II) with KOH and } \text{NH}_4\text{Cl. From the filtrate}$$

of this reaction the dodecammine-hexol-tetra-cobaltchloride $\left[\text{Co} \left(\begin{array}{c} \text{OH} \\ \text{OH} \end{array} (\text{NH}_3)_4 \text{Co} \right) \right]_4 \text{Cl}_6 \cdot \text{NH}_3\text{O}$ (III) is pptd. with alc. Dichloride $[\text{Co}(\text{NH}_3)_3(\text{H}_2\text{O})\text{Cl}_2]\text{Cl}$ (IV) prepd. by the method of Jörgensen (*Z. anorg. Chem.* 14, 418(1897)) is also a source for prepn. of II. Now 10 g. of II are thoroughly triturated with 30 cc. concd. HCl with the production of pure $[\text{Co}(\text{NH}_3)_6\text{Cl}_3]$.

G. L. CLARK

Some carbonatocobaltamines. JEAN KRANIG. Faculté des Sciences de Paris *Bull. soc. chim.* 43, 989-95(1928).—A concd. soln. of CoSO_4 contg. NH_4OH and $(\text{NH}_4)_2\text{CO}_3$ was oxidized by a current of air and the product recrystd. using alc. With BaCl_2 a soln. of the salt gives a ppt. of BaSO_4 contg. no BaCO_3 . Thus the SO_4 ion is free and is not a part of the complex, which has the formula $[\text{Co}_2(\text{NH}_3)_{10}\text{CO}_3](\text{SO}_4)_2 \cdot 4\text{H}_2\text{O}$. The chloride and oxalate of the pentamine series, discovered by Werner, were isolated and found to have the formulas $[\text{Co}(\text{NH}_3)_5\text{CO}_3]\text{Cl} \cdot \text{H}_2\text{O}$ and $[\text{Co}(\text{NH}_3)_5\text{CO}_3]_2\text{C}_2\text{O}_4 \cdot 3\text{H}_2\text{O}$. Contrary to Werner K. finds that the transformation of the nitrate of carbonatopentamine to the bromide is not quant., but by double decompn. between KBr and the chloride the bromide is easily obtained.

Refractometric analysis of solutions of pure compounds. FRANK URBAN AND V.

W. MÜLCHER. Univ. of Wis. *J. Am. Chem. Soc.* 50, 3003-9(1928).—Three tables are given which can be used for the analysis of pure solns. of H_2TeO_4 , H_2SeO_3 and $K_4Fe(CN)_6$, resp., by means of an *immersion refractometer*, at 25° . The concn. range for H_2TeO_4 is 0.656–11.226 g. per 100 cc. of soln., for H_2SO_3 0.758–10.474 g. and for $K_4Fe(CN)_6$ 0.466–15.516 g.

FRANK URBAN

A new replacement titration for the determination of strong acids which are combined with ammonia or with an organic amine. C. P. A. KAPPELMEIER. *Rec. trav. chim.* 47, 1064–71(1928).—It is sometimes desirable to det. the amt. of free acid and the amt. of combined acid present in a soln. The free acid, of course, can be titrated directly with standard NaOH. Now if, after the soln. has been neutralized in the usual manner, more NaOH is added, then if a drop of the soln. is placed on phenolphthalein paper which is heated, say, by placing it upon a steam pipe, the phenolphthalein color will disappear if an NH_4 salt or the salt of an amine (such as an alkaloid for example) is present. The reason for this is clear. When NaOH is heated with an NH_4 salt, the NH_4 is replaced by Na and the free NH_3 is volatile. By continuing the titration until the phenolphthalein color will not disappear on heating, it is possible to det. how much combined acid is present in combination with a weak, volatile base. It is necessary to carry out a blank detn. with the same vol. of water and also allow for the effect of a large quantity of amine. The reaction is showed to give good results with the sulfate, nitrate, chloride and oxalate of nicotine, but fails, as is to be expected, with an acetate.

W. T. H.

Rapid electrodeposition of cadmium and zinc and their separation by controlling the potential of the bath. ERNA BRENNKE. Univ. Leipsic. *Z. anal. Chem.* 75, 321–71(1928).—An attempt was made to develop a rapid electrolytic method for detg. first Cd and then Zn in solns. Many expts. were performed, most of which were unsuccessful. The conclusion is drawn that the deposition of Cd from very dil. H_2SO_4 , from dil. AcOH or from KCN solns. is never absolutely complete. If, however, a little concd. NH_4OH is added just prior to the washing of the electrode, the residual Cd can be reduced to about 0.5 mg. In spite of this loss of Cd, the deposit usually weighs too much, because of oxidation, especially when impure ether is used. The use of amalgamated brass gauze or of Pt gauze plated with Cu-Hg does not help matters. The use of Cu-Hg electrodes is also out of the question in the Zn detn. when $(NH_4)_2SO_4$ is present, because of the danger of forming NH_4 amalgam. In the presence of $(NH_4)_2SO_4$, Zn is best detd. electrolytically from an acetate soln. A fairly satisfactory sepn. of 0.2 g. Cd in the presence of an equal quantity of Zn can be effected in 110 cc. of sulfate soln. contg. 20 millimols. of H_2SO_4 by using an e. m. f. of 3 v. for 2 min. and then 2.80 v. for 25 min. The advantage of measuring the e. m. f. between the terminals rather than at the cathode is explained but it is necessary to measure the e. m. f. immediately after breaking the circuit and not while the current is flowing and to use a Cu-plated cathode. When they are deposited in the above manner, a slight correction should be applied both for the Zn and Cd detns. To sep. 0.5 g. of Cd from 0.16 g. of Zn it is best to have 24 milli-equiv. of H_2SO_4 in 110 cc. of electrolyte and to keep the terminal voltage 2.8 v. for 25 min. or with 20 milli-equiv. of the acid, use 2.8 v. for 6 min. and 2.70 v. for 35 min.

W. T. H.

Potentiometric determination of octavalent osmium. WILLIAM R. CROWELL AND H. DARWIN KIRSCHMAN. Calif. Inst. Tech. *J. Am. Chem. Soc.* 51, 175–9(1929).—A potentiometric method for titrating octavalent Os with hydrazine sulfate is described; the results are accurate to about 0.25% by comparison with the usual gravimetric and iodometric methods. The Os soln. is heated in boiling water with a little less than 1 mol. of hydrazine sulfate for each g.-atom of Os and enough HBr to make the soln. 1.5 N. Then the tube is opened and the contents are titrated with more hydrazine at 70° . A large drop in potential takes place at the end point. The Os is reduced 4 valences and the hydrazine is oxidized to N_2 .

W. T. H.

Determination and separation of the alkalis. A. THÜRMER. *Chem.-Ztg.* 52, 974–5(1928).—Various methods for the detn. of Na_2O and K_2O in glass are discussed, preference being given to the Berzelius method of decompn. rather than that of J. L. Smith.

W. T. H.

Determination of lead with 8-hydroxyquinoline. V. MARSSON AND L. W. HAASE. *Chem.-Ztg.* 52, 993–5(1928).—Pb can be pptd. quantitatively by o-hydroxyquinoline in a soln. of $pH = 8.5$ – 9.5 . As reagent the satd. aq. soln. is preferable to the alc. soln. The ppt. is best formed in a hot soln. but should be allowed to stand overnight in a cool place, to insure complete pptn. The ppt. should be washed with as little water as possible, and dried at 105° to const. wt.

W. T. H.

Determination of cadmium in cadmium-copper wire. CLEMENT BLAZEY. *Chem.*

Eng. Mining Rev. 21, 74-6(1929).—If no other volatile elements are present, the Cd content can be detd. by heating the wire in H_2 and weighing the residual metal. Details are given.

W. T. H.

The present situation with respect to the determination of oxygen in steel and iron. OSKAR MEYER. *Z. angew. Chem.* 41, 1273-6, 1295-8(1928).—The methods for the detn. of O in Fe and steel are discussed in considerable detail.

W. T. H.

Standard method for the analysis of ferrocyanides. ANON. *Chemistry & Industry* 47, 1308-10(1928).—The methods of testing the purity of ferrocyanides are discussed and a translation is given of the findings and method agreed upon by the European Prussiate Manufacturers. It was agreed that titration with $ZnSO_4$ standardized against pure $K_4Fe(CN)_6$ is the best method for detg. the ferrocyanide content, a 15% soln. of Fe alum being used as indicator.

W. T. H.

Potentiometric determination of silver as ferrocyanide. W. STEYER. *Z. anal. Chem.* 74, 108-13(1928).—The titration of Ag with Li or Na ferrocyanide gives satisfactory results although the steep drop in the titration curve does not always lie between the same e. m. f. readings in different expts. With $K_4Fe(CN)_6$ the results were not as satisfactory.

W. T. H.

Notes on the analytical chemistry of tungsten. I. Determination as mercurous tungstate by the method of Berzelius. VICTOR SPITZIN. Moscow Univ. *Z. anal. Chem.* 75, 433-40(1928).—If Hg_2WO_4 is pptd. from neutral soln. by adding $HgNO_3$, all of the W is pptd. without the necessity of adding any base. On the other hand, if the $HgNO_3$ is added to an acid soln. the results are not quantitative even if the soln. is subsequently made basic. The explanation seems to be that Hg_2WO_4 is decomposed by HNO_3 , forming H_2WO_4 and some such salt as the complex $9Hg_2O \cdot 24MoO_3 \cdot N_2O_5 \cdot 29H_2O$ described by Copaux. II. Quantitative analysis of tungsten compounds in the dry way. VICTOR SPITZIN AND L. KASCHTANOV. *Ibid* 440-57(1928).—The analysis of W compds. which are insol. in water or caustic alkali solns., like the W-bronzes, is not as simple as the analysis of water-sol. compds. By a suitable combination of heating in H_2 and in HCl it is possible to make a complete analysis of a W-bronze and the method is sensitive for the detn. of oxides in metallic W. By ignition in H_2 at 650-700°, Na_2WO_7 is reduced to Na_2WO_4 and W. Then, if the temp. is raised to 900°, volatile Na and non-volatile W are formed. By ignition in dry HCl at 500-550°, it is possible to volatilize W as WO_2Cl_2 , leaving a residue of NaCl in the case of W-bronze. The following methods of analysis are based on this behavior. *Analysis of tungsten bronze.*—(a) Heat in a dry stream of air at a temp. below 300°; the loss in wt. is H_2O . (b) Heat 2-4 hrs. at 500°; the gain in wt. corresponds to the oxidation of all W compds. to the sexivalent state and in this way the quadrivalent W is detd. (c) Det. the Na as NaCl by heating the oxidized bronze in HCl and weighing the non-volatile residue. (d) Det. the total W by heating in pure H_2 at 900° and weighing the residual W. (e) Det. the quadrivalent W by igniting in H_2 at 650°; the loss in wt. corresponds to the wt. of O combined with W in excess of that required to form Na_2WO_4 . Thus, $Na_2W_2O_9$ ignited in this way leaves Na_2WO_4 and 2W. *Analysis of metallic tungsten and its oxides.*—By ignition in air, all the W is converted into WO_3 . By ignition in H_2 all the combined O is detd. By ignition in O-free HCl, metallic W is unchanged but oxides are converted into volatile WO_2Cl_2 ; if the W is all sexivalent, the volatilization is complete, otherwise a part of the W is reduced to metal and the remainder is oxidized to WO_2Cl_2 . Thus $3W_2O_6 + 10HCl = W + 5WO_2Cl_2 + 5H_2O$.

W. T. H.

Determination of molybdenum by reduction of molybdic acid with zinc. J. KASSLER. *Z. anal. Chem.* 75, 457-66(1928).—If the reduction of the Mo takes place in hot acid soln. with 10 g. of Zn shavings, the reduction is complete to the tervalent condition and the reduced Mo can be titrated with $KMnO_4$ provided care is taken to prevent air entering the flask, by using a Bunsen valve or a Contat valve with $NaHCO_3$ soln.

W. T. H.

Electrometric iron-dichromate titrations. F. J. WATSON. *Chem. Eng. Mining Rev.* 20, 396-9(1928).—Typical titration curves were obtained in 0.8 N HCl solns. using several forms of indicator electrodes.

W. T. H.

Rapid analysis of brass and bronze, etc., without the use of rapid electrolysis. K. RIES. *Chem.-Ztg.* 52, 1007(1928). H. KRUG. *Ibid.*—A polemical discussion with respect to whether there is any new idea in the paper recently published by K. (C. A. 23, 792).

W. T. H.

Assay of low-grade tin ores and tailings. G. E. GABRIEL. *Chem. Eng. Mining Rev.* 20, 407(1928).—The method is based upon Low's well-known procedure and

depends upon fusion with NaOH and C, dissolving in HCl, reducing with Sb and titrating with I_2 in an atm. of CO_2 . W. T. H.

The oxidation of carbon compounds by sulfo-chromic acid. A general method for the microdetermination of carbon in the wet way. ANDRÉ BOIVIN. *Compt. rend.* 187, 1076-9(1928).—Nieloux's method of oxidizing C compds. with H_2SO_4 and CrO_3 in the presence of Ag salt as a catalyzer sometimes results in the formation of CO as well as CO_2 . This difficulty can be overcome by heating the oxidizing mixt. (with not more than 2% of moisture present) on the water bath for 30 min. and passing the gas, together with O_2 , over a heated Pt spiral. The CO_2 can be absorbed by KOH and then pptd. as $BaCO_3$ which can be weighed or, when very little CO_2 is present, estd. from the size of the ppt. W. T. H.

The determination of zinc as pyrophosphate in the presence of considerable sodium chloride. L. DEDÉ. *Ber.* 61B, 2463-65(1928).—When $ZnNH_4PO_4$ is pptd. by the method of Dakin in the presence of considerable Na salt, there is always some $ZnNaPO_4$ formed which is not changed to $Zn_2P_2O_7$ on ignition. The best way of overcoming this error is to sat. the concd. aq. soln. with HCl, filter off the pptd. NaCl, wash with concd. HCl, evap. off the acid and then proceed in the usual manner. A series of results shows that the error is very serious if the NaCl is not removed, but when the above-described method is carried out, it is possible to det. accurately 0.05 g. of Zn in the presence of 25 g. of NaCl. W. T. H.

Determination of metallic lead in litharge and in red lead. PAUL FLUCH. *Z. anal. Chem.* 75, 371-90(1928).—Commercial litharge is likely to contain about 1.5% of metallic Pb in very finely divided form. Red lead is much purer. For most purposes, as for making storage batteries, the Pb content does no harm. Three methods are given for the detn. of the Pb. (1) Treat 5 g. of sample in a 250-cc. Philips beaker of Jena glass with 25 cc. of glacial AcOH. Stir well, add another 25-cc. portion of AcOH and heat. Filter, wash with hot, dil. AcOH (25%) and finally with hot water, avoiding contact with air as much as possible. Dissolve the residue in hot 6 N HNO_3 and in the resulting soln. det. the Pb as $PbSO_4$ in the usual way. This method works well with litharge but it is sometimes difficult to dissolve all the Pb_3O_4 present. In that case a residue of PbO_2 and Pb is usually obtained but it can be digested with hot, dil. HNO_3 and only the Pb will dissolve. For rapid lab. control of the Pb content of litharge, dissolve the sample as outlined above and weigh the residue as Pb, finally washing with alc. and drying at 110° . (2) For red lead treat as above but add 0.5-0.6 g. of hydrazine sulfate to reduce the quadrivalent Pb. (3) Treat 5 g. of litharge with 50 cc. of water and after mixing well add 10-15 g. of solid NaOH. Heat, filter and wash the residual Pb in water. W. T. H.

Colorimetric determination of copper in zinc dust. S. S. FROLOV AND K. O. SVETLYAKOV. Ivanovo-Vosnesensk Polytechnicum. *J. Chem. Ind. (Moscow)* 5, 942-3(1928).—Moisten 0.5-1 g. Zn dust with a few drops of alc. and digest in a beaker while slightly heating with a definite vol. of $CuSO_4$ soln. of known concn. and stirring frequently. After 30 min. cool, add a few drops of H_2SO_4 or AcOH to dissolve the metallic oxides, and filter. Wash the deposited Cu carefully on the filter, and add an excess of ammonia to the filtrate. Compare the color in a colorimeter with standard solns. of $CuSO_4$ made ammoniacal. BERNARD NELSON

The determination of nitrates and nitrogen. EMERY M. EMMERT. Iowa State College. *Science* 68, 457-9(1928).—The method depends on digesting the sample with cold 75% H_2SO_4 , finally heating till all the HNO_3 and H_2O are expelled. The distillate is caught in ClO_2 soln. Eventually this soln. is boiled, neutralized, evapd. to dryness and analyzed for nitrate by the phenol-disulfonic method. The residue in the digestion flask is tested for N other than nitrate by the usual Kjeldahl method. E. F. SNYDER

Dimethyl- α -naphthylamine for determination of nitrite ion. FREDERICK G. GERMUTH. Dept. Pub. Works at Baltimore. *Ind. Eng. Chem., Anal. Ed.* 1, 28-9(1929).— α - $C_{10}H_7NMe_2$ produces a more stable and more distinct coloration than α - $C_{10}H_7NH_2$ in solns. contg. a small quantity of NO_2 anions. A soln. contg. 5 g. of the amine dissolved in MeOH which has been made 4 N in AcOH is recommended as reagent in water analysis. W. T. H.

Decomposition of barium sulfate by solutions of sodium carbonate. EDWARD WOLESIENSKY. Bur. Standards. *Ind. Eng. Chem., Anal. Ed.* 1, 29-31(1929).—By boiling 0.6-0.8 g. of $BaSO_4$ with at least 15 times the equiv. wt. of Na_2CO_3 in 2-4 N soln. it was found possible to convert 99% of the $BaSO_4$ into Na_2SO_4 in 1 hr. in the case of a fresh ppt. and in 2 hrs. in the case of native barite. For the detn. of S in rubber, the fusion with Na_2CO_3 can be omitted. W. T. H.

Evaluation of stibnite. I. Determination of sulfur. WALLACE M. McNABB AND E. C. WAGNER. *Ind. Eng. Chem., Anal. Ed.* 1, 32(1929).—For the analysis of Sb_2S_3 to be used in primers, an evolution method like that used for detg. S in steel (using concd. HCl) gives good results. The Br_2 oxidation method recommended by Cushman in 1918 usually gives higher results, due to the fact that a little free S is likely to be present in artificial samples of Sb_2S_3 . W. T. H.

A new titrimetric determination of the sulfate ion. Z. MINDALEV. Moscow Tech. Hochsch. *Z. anal. Chem.* 75, 392-5(1928).—If the conditions are kept uniform, it is possible to titrate 10 cc. of 0.1-0.05 N K_2SO_4 soln. in a 150-cc. Erlenmeyer flask with 0.1 N $\text{Pb}(\text{NO}_3)_2$ soln. after adding 10 cc. of alc. and 3 drops of cold, satd. KI soln. The end point is a permanent yellow color which does not disappear on shaking. The $\text{Pb}(\text{NO}_3)_2$ soln. used for titrating must be standardized in the same way against a known quantity of sulfate. W. T. H.

Method for the volumetric determination of phosphoric acid in alkali, alkaline-earth iron and aluminum phosphates. DRACHOUSSOF AND DOUCHY. *Chimie et industrie* 20, 823-8(1928).—The principle of the method consists in titrating an HCl or HNO_3 soln. of the phosphate contg. 4-5 mol. CaCl_2 (or $\text{Ca}(\text{NO}_3)_2$) per mol. P_2O_5 in presence of methyl orange and in presence of phenolphthalein. One cc. N NaOH = 0.0355 g. P_2O_5 . The soln. to be titrated should not contain both Cl^- and NO_3^- ; if NH_3 is present it should first be removed by boiling with NaOH; the solns. require to be filtered only if the insol. residue interferes with the end point. When little or no insol. phosphates are present, titrate to neutrality to methyl orange, add a suitable amt. of CaCl_2 (or $\text{Ca}(\text{NO}_3)_2$) and phenolphthalein indicator, make distinctly alk. with N NaOH and titrate back with N acid. In presence of phosphates which are insol. after neutralization to methyl orange, it is preferable to make the 2 titrations on sep. aliquots; if there is insufficient material for this, make acid again after titrating to methyl orange, add excess alkali, and titrate the excess. Examples are given showing the applicability of the method to the detn. of Na phosphate, CaHPO_4 , and of P_2O_5 in presence of Fe or Al, the results being practically identical with those of the gravimetric detns. in every case. By first dissolving CaHPO_4 in a measured vol. of N acid, the free CaO (or CaCO_3) can be detd. at the same time. The method is suitable for the detn. of total, H_2O -sol. and citrate-insol. P_2O_5 in fertilizers, but the citrate-insol. P_2O_5 is generally lower than by the usual method. A. PAPINEAU-COUTURE

The estimation of borate in natural waters. MARGARET D. FOSTER. U. S. Geol. Survey. *Ind. Eng. Chem., Anal. Ed.* 1, 29-31(1929).—Add 1 cc. of 0.46 N HCl and 1 cc. of 1% turmeric soln. to 10 cc. of the sample in a white dish. Evap. to dryness slowly on the steam bath. If the residue is pink or rose, H_3BO_3 is present and can be detd. by comparison with suitable standards. W. T. H.

Invert sugar as a satisfactory substitute for mannitol or glycerol in the titrimetric determination of boric acid. WERNER MYLIUS. *Keram. Rund.* 35, 365-8(1927). H. I.

Determination of iron and aluminum oxides, magnesium oxide and calcium oxide in portland cement. J. STANTON PIERCE AND W. C. SETZER. Georgetown College. *Ind. Eng. Chem., Anal. Ed.* 1, 25-6(1929).—A rapid control method. Cf. C. A. 22, 1557.

Methods applicable to determination of sulfur. RALPH E. GOODE. *Refiner Natural Gasoline Mfr.* 7, No. 9, 96-7(1928).—A brief review of current methods for detn. of S in various products. M. B. HART

The behavior of sulfur dioxide in the Orsat apparatus. G. N. BEZRADETSKII AND V. P. FEDOROV. *Izvestiya Teplotekhnicheskago Instituta (Trans. of the Thermo-Techn. Inst. (Russia))* 1928, No. 4, 3-4.—To check up a much discussed question in connection with the absorption of SO_2 gas present in flue gases by the water present in the Orsat app., various proportions of air and pure SO_2 gas were sent through a container with water. No absorption of SO_2 takes place at a concn. below 4.3%, where 0.5% is absorbed; the absorption increases then gradually and is 4.8% at a concn. of 25.5%. Therefore for the analysis of flue gases the presence of this gas, which as a rule is below 4%, is without effect. A. A. BOEHTLINGK

A new microcolorimetric method for chloroform. KASATARO YODOMIGAWA. Niigata Med. Univ. *Bul. Hokuetsu Med. Soc.* 43, 355-63(1928).—Pyridine in strongly alk. soln. gives a red color with CHCl_3 . Mix 3 cc. of 10% NaOH and 2 cc. of pyridine, heat to 740° in a glycerol bath and add the liquid to be tested for CHCl_3 . Shake, allow to settle and compare the color of the CHCl_3 layer with standards prepared from phenol red, KHPO_4 and Na_2HPO_4 solns. K. SOMEYA

Determination of small amounts of carbon monoxide in ethylene. WRIGHT M.

WELTON AND N. L. DRAKE. Univ. of Md. *Ind. Eng. Chem., Anal. Ed.* 1, 20-4(1929).—The method described will serve to det. satisfactorily less than 5 parts of CO per 100,000, which is about one-twentieth of the detectable amt. in the Bur. of Mines test. The gas under examn. is freed from ethylene by means of 25% oleum, then, after diln. with air, from traces of ethylene by 60% oleum, from SO₂ by 98% H₂SO₄, from the last traces of moisture by P₂O₅, and is then allowed to act upon hot, very pure I₂O₅. The I₂ liberated by the action of CO on I₂O₅, heated in a bath of Crisco, is absorbed in 1% KI soln. contg. some starch indicator; eventually the KI₂ is titrated with 0.0001 N arsenite soln. W. T. H.

The microscopic detection of substances which by the action of certain reagents yield aldehydes or ketones (chloral hydrate, glycerol, lactic, citric and malic acids). C. GRIEBEL AND F. WEISS. *Z. Untersuch. Lebensm.* 56, 158-67(1928); cf. *C. A.* 22, 1933.—The use of *p*-, *o*- or *m*-nitrophenylhydrazine to obtain crystals with aldehydes or ketones is described. C. R. F.

Detection and determination of methylpentose. TOSHI FUKAI. Tokyo Inst. Ferm. *Bul. Ferm.* 100, 106-29(1928).—F. distd. various kinds of sugars with HCl (d. 1.06), and examd. the furfural and the methylfurfural ext. of the distillate. The same test was made with the hydroxymethylfurfural obtained from insulin. By comparing all the reactions with the cholesterol-H₂SO₄ test it was found that the last reaction is the most sensitive of all. The HCl distillate of methylpentose gives a beautiful violet red coloration with vanillin in 0.5% H₂SO₄ reagent, and the other 2 furfural solns. do not, so that this test can be used for the detection of methylfurfural or methylpentose. The red color appears in 1 min. even with 0.0008% soln. of pentose. F. next prepd. phloroglucide, of the 3 kinds of furfural and found that each can be sepd. and detd. by their difference in soly. When 3 pentoses are present in a mixt. the phloroglucide of methylfurfural is first extd. with acetone, then the phloroglucide of hydroxymethylfurfural, finally leaving the phloroglucide of furfural. The H₃PO₄ distillate of various sugars shows only a faint test for furfurals. K. SOMEYA

Rapid method for distinguishing between tartaric and citric acids. LUIGI ROSSI. Med. School at Buenos Ayres. *Ann. chim. applicata* 18, 366-8(1928).—In this preliminary note, the hope is expressed that it will be found possible to differentiate between citric and tartaric acids by the color changes which the latter produces with alk. vanadate or pyrovanadate solns. C. C. DAVIS

The Gutzeit test (COMBRIE, WARD) (HENLEY) 16. Physical chemistry of color lake formation. IV. Red Congo acid and Congo red lakes (WEISER, RADCLIFFE) 2.

SMITH, D. P. AND MILLER, H. K.: Introduction to Qualitative Chemical Analysis and the Related Chemical Principles. New York: McGraw-Hill Book Co. 275 pp. \$2.25. Reviewed in *J. Western Soc. Eng.* 33, 599(1928).

Analysis of brass. MICHAEL POLANYI AND STEPHAN VON BOGDANDY. *Fr.* 640,903, Mar 23, 1927. A weighed fraction of the alloy is heated to 900-1100° in a narrow extension to a cylindrical tube, the top of which has cooling means and is connected to a high vacuum. The residual Cu is weighed.

8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

New mineral names. W. F. FOSHAG. *Am. Mineral.* 13, 491-4(1928).—A compilation of the properties of the new minerals antamokite, tikhvinite, slavikite, viterbite, fraiponte and tanatarite, with additional data on schafarzskite, arakawite, chevkinit and potarite, and a redefinition of the species, nontronite. A. M. BRANT

New mineral names. W. F. FOSHAG. *Am. Mineral.* 13, 569-70(1928).—A compilation of new minerals and their properties is given, comprising isomorphous members of the calcite group, alumohydrocalcite, hydrothorite and codazzite. A. M. B.

New mineral names. W. F. FOSHAG. *Am. Mineral.* 13, 592-3(1928).—Data, with references, are given on zirklerite, kolbeckite, gudmundite, haematophanite, gosseletite and lohestite. A. M. BRANT

New mineral names. W. F. FOSHAG. *Am. Mineral.* 14, 41-2(1929).—A summary of the properties of klockmannite, kerzinite and julienite, and additional data on

plumboferrite are given. Discredited species discussed are shannonite, graminite, pinguite, hoeferite, morencite, müllerite and eisenbrucite.

A. M. BRANT

Fluorescence of minerals in ultra-violet rays. L. J. SPENCER. *Nat. Hist. Mag.* 1, 291-8; *Am. Mineral.* 14, 33-7(1929); cf. C. A. 22, 1935.—A discussion of the phenomenon of fluorescence and a description of the results obtained with various minerals and artificial materials. A description of a museum case to illustrate the effects is given.

A. M. BRANT

The phosphorescence and fluorescence of Franklin minerals. CHARLES PALACHE. *Am. Mineral.* 13, 330-3(1928).—In ultra-violet light from an Fe arc, willemite is generally fluorescent green; manganiferous calcite vivid red to pale pink; calcium larsenite vivid lemon yellow; larsenite negative or pale violet; pectolite pure yellow; clinohedrite slight orange yellow; margarosanite pale violet; hardystonite dull faint violet; roebbingite negative or pale pink; hedyphane indistinct bluish gray. Willemite is the only one showing phosphorescence.

A. M. BRANT

Mineralogical notes on Franklin and Sterling Hill, New Jersey. CHARLES PALACHE. *Am. Mineral.* 13, 297-329(1928).—This article deals with the occurrence, crystallography and optical and chem. properties of the following minerals: azurite, bornite, cabnite, clinohedrite, clinozoisite, crocidolite, gageite, glaucocroite, heterocroite, hodgkinsonite, leucophoenicite, manganite, quartz, smithsonite, sussexite, tephroite, tennantite and willemite.

A. M. BRANT

Paragenetic classification of the minerals of Franklin, New Jersey. CHARLES PALACHE. *Am. Mineral.* 14, 1-18(1929).—Four main subdivisions are made and described: (1) primary ores; (2) pegmatite contact minerals divided into (a) skarns and recrystn. products and (b) pneumatolytic products; (3) hydrothermal vein materials; and (4) surface oxidation products. A table of the 137 species found in this district with their chem. formulas is given. The origin of the Zn ores is discussed, P.'s theory being that metasomatic deposits of hydrated oxides and silicates of Fe, Mn and Zn were formed by the replacement in white limestone, and that these ore-bodies were changed to their present compn. simultaneously with the recrystn. of the enclosing limestone during the Pre-Cambrian regional metamorphism.

A. M. B.

Seligmannite from Bingham, Utah. CHARLES PALACHE. *Am. Mineral.* 13, 402-5(1928).—A presentation of crystallographic data on this rare mineral, $\text{Cu}_2\text{S} \cdot 2\text{PbS} \cdot \text{As}_2\text{S}_3$, previously known only from the Binnenthal.

A. M. BRANT

The crystal form of boleite. B. GOSSNER. *Am. Mineral.* 13, 580-2(1928).—X ray evidence shows cubic structure. In the unit cube $a = 15.6 \text{ A. U.}$, the unit cell contg. 32 mols. The crystals show anomalous behavior, indicating a strained condition.

A. M. BRANT

Doubly terminated quartz crystals occurring in gypsum. W. A. TARR. *Am. Mineral.* 14, 19-25(1929).—Doubly terminated quartz crystals, showing the sequence in which the successive faces made their appearance, occur in massive gypsum near Acme, N. M. Silica-bearing solns. entered the gypsum and replaced it by these quartz crystals, which are colored by residual hematite.

A. M. BRANT

Spodumene and autunite from Alstead, New Hampshire. G. R. MEGATHLIN. *Am. Mineral.* 13, 578-9(1928).—Spodumene, occurring in large crystals, and autunite in small scales are reported as new in this district.

A. M. BRANT

The chemistry, optics and genesis of the hastingsite group of amphiboles. MARLAND BILLINGS. *Am. Mineral.* 13, 287-96(1928).—Chem. and optical data are given on ferrohastingsite, femaghastingsite, magnesiohastingsite and alkaliastingsite. The classification is based on the molecular FeO/MgO ratio. The last member is characterized by an alkali content of more than 6%. The genesis of the hastingsite group is given in tabular form.

A. M. BRANT

The nature and origin of the amphibole-asbestos of South Africa. MARTIN A. PEACOCK. *Am. Mineral.* 13, 241-86(1928).—The South African asbestos-bearing ironstones range from crypto-cryst. ferruginous cherts to fine-grained magnetite-quartzites. The dominant asbestos is blue crocidolite occurring chiefly in thin extensive cross-fiber seams conforming strictly with the bedding of the ironstones. New analyses conform tolerably well with the metasilicate $3\text{H}_2\text{O} \cdot 2\text{Na}_2\text{O} \cdot 6(\text{Fe}, \text{Mg})\text{O} \cdot 2\text{Fe}_2\text{O}_3 \cdot 17\text{SiO}_2$, in which H_2O is wholly basic. New optical data were obtained for crocidolite: $\alpha = 1.698$, $\beta = 1.699$, $\gamma = 1.706$, X, indigo, Y, yellow, Z, indigo, $XAc = 0^\circ$; $Z = b$; X and Y may possibly be interchanged. Amosite, the long-fibered ash-gray asbestos is an orthorhombic amphibole with ferrous oxide as the dominant base. It is sustained as a mineral species. Ash-gray amosite gave the following data: mean of α and $\beta = 1.675$; $\gamma = 1.702$; mean of X and Y, pale greenish brown; Z, pale greenish brown; $Z = c$. Greenish amosite gave: mean of α and $\beta = 1.663$; $\gamma = 1.680$; mean of X

and Y, grayish green; Z, grass green; Z = c. On the grounds of typical non-detrital character and uniquely simple chem. compn., the ironstones are regarded as having originated as chem. ppts. deposited in an extensive marine basin. Crocidolization is conceived as a mild, static, non-additive, metamorphic process resulting in the chem. union, along soda-rich bedding planes, of the necessary constituents already *in situ*. The process is described as a "sweating action," facilitated by interstitial rock moisture, and induced by a moderate rise of temp. and pressure, such as would result from simple burial of the ironstones to moderate depths. The transverse orientation of the fibers is believed to have developed after crocidolization was virtually completed. Chem. analyses of the ironstones, crocidolite, amosite and related amphiboles are given.

A. M. BRANT

Chemical investigation of Japanese minerals containing rarer elements. IV. Analysis of beryl from Ishikawa, Iwaki province. TAKU UEMURA. Tokyo Imp. Univ. Japan J. Chem. 2, 117-21(1926).—Analysis of Ishikawa beryl gave: SiO_2 49.60, BeO 19.31, Fe_2O_3 0.11, Al_2O_3 24.09, CaO 0.79, MgO 0.14, loss on ignition 2.81, sum with alkalis excluded 96.85%; sp. gr. 2.8. Another detn. gave Na_2O 3.65. The structural formula of this beryl contains a mol. of orthosilicic acid which was not present in the Naegi beryl (cf. Shibata and Uemura, C. A. 19, 2008), or in F. W. Clarke's formula for beryl. The fact that Copaux's method for estg. Be gave no const. results with this beryl, is due perhaps to a difference in mol. structure. The powd. mineral and each of the fractions obtained in analysis were examd. spectroscopically. In addn. to the elements reported above, Sc was detected, but no alkali other than Na was revealed.

L. W. RIGGS

Relations between index of refraction, density and chemical composition in the garnet group. H. VON PHILIPSBORN. Abhandl. math.-phys. Klasse sächs. Akad. Wiss. 40, 1-42(1928).—Light dispersion has been measured for 16 specimens, and chem. analyses are recorded. The relations between n , light dispersion, d , and chem. compn. have been detd. for the quaternary mixed crystals: pyrope + almandite + grossularite + andradite, and they are represented in tetrahedric diagrams. More complete data are tabulated, to make it possible to draw the diagrams on a larger scale. The relations are generally simple, often straight lines. The diagrams are reliable enough to permit detn. of the compn. from the phys. properties without chem. analysis. A method is outlined of representing the relations between the phys. properties and chem. compn. of mixed crystals contg. 5 components, and diagrams are given which include spessartite and uvarovite in addn. to the 4 previously named minerals.

ALBERT L. HENNE

Olivine: I, from the Hawaiian Islands, II, pure forsterite. M. AUROUSSEAU AND H. E. MERWIN. Am. Mineral. 13, 559-64(1928).—New and previous analyses of olivine are given with a discussion. Measurements of n for pure forsterite are tabulated. The effects of the constituents of olivine especially Fe, on n and on dispersion are pointed out. The d and n should be correlated with wt. % of the 2 oxides of Fe, and the % of the latter can be estd. when the properties are definitely known.

A. M. BRANT

Larsenite, calcium-larsenite and the associated minerals at Franklin, New Jersey. C. PALACHE, L. H. BAUER AND H. BERMAN. Am. Mineral. 13, 334-40(1928); cf. C. A. 22, 3115.—The paragenesis of the minerals is described. The crystallographic features of larsenite are given. The axial ratio is $a:b:c = 0.4339:1:0.5234$. The hardness is about 3, luster adamantine to pearly. The method of chem. analysis used and the results obtained are given.

A. M. BRANT

Friedelite, schallerite and related minerals. L. H. BAUER AND HARRY BERMAN. Am. Mineral. 13, 341-8(1928).—Accepted members of the group are friedelite, pyrosomalite and molybdophyllite. They are rhombohedral hemimorphic. Chem. analyses and phys. properties are tabulated. Probable additional members of the group are beneditite, schallerite, dixenite, mcgovernite and hematolite.

A. M. BRANT

Dipyrite and associated contact minerals from the Franklin mountains of Texas. JOHN T. LONSDALE. Am. Mineral. 14, 26-32(1929).—The district contains a large supply of this scapolite mineral in an unaltered condition. The dipyrite is light grayish blue in color and occurs in roughly radiating groups and bundles of vertically striated long-bladed crystals without crystal faces. It is optically —, with $\epsilon = 1.543$, $\omega = 1.553$; the cleavage is prismatic, excellent to perfect. The paragenetic relations are described.

A. M. BRANT

Zircon from North Burgess, Ontario. CHARLES PALACHE AND H. V. ELLSWORTH. Am. Mineral. 13, 384-91(1928).—The crystals possess unusual brilliancy. The polar angles of all forms were found to be from 5 to 6 mins. larger than the accepted values.

These angles lead to an axial ratio of $a:c = 1:0.6429$. Heating to redness increased the angles by about 1 min. It also changed the color from red to pure white and increased the sp. gr. from 4.646–4.658 to 4.659–4.667. Heating lowered n , as brought out by a table. Chem. analysis showed it to be very pure Zr silicate with a small Hf content.

A. M. BRANT

Occurrence of germanium in topaz. JACOB PAPISH. Cornell Univ. *Science* 68, 350–1(1928); cf. *C. A.* 22, 361.—By the arc spectrographic method Ge was found in slight traces in all the specimens of cassiterite examd. Of 34 specimens of topaz from 27 localities, all contained Ge. The quant. detn. of Ge in topaz is being studied.

L. W. RIGGS

Norbergite from Franklin, New Jersey. ESPER S. LARSEN, L. H. BAUER AND H. BERMAN. *Am. Mineral.* 13, 349–53(1928).—Most minerals labeled chondrodite or humite from Franklin, N. J., are norbergite. Optical and crystallographic data indicate norbergite to be orthorhombic. The color varies from tawny to chamois; $\alpha = 1.565$ –1.561, $\beta = 1.570$ –1.566, $\gamma = 1.591$ –1.587, optically +, $2V = 49$ –50°. Lighter color and lower n indicate lower Fe content. An analysis is given of material with sp. gr. 3.20 and hardness 5.5.

A. M. BRANT

The optical properties of the humite group. ESPER S. LARSEN. *Am. Mineral.* 13, 354–9(1928).—Chem. analysis and optical data are given for a no. of specimens of chondrodite, humite, clinohumite and norbergite. A definite correlation of chem. compn. and optical constants was not found possible.

A. M. BRANT

Tourmaline-bearing quartz from Amelia, Va. GERALD R. MACCARTHY. *Am. Mineral.* 13, 531(1928).—Light-colored smoky quartz crystals were found apparently containing needles of rutile. The color of the needles was brownish black rather than the usual red-brown, and they gave a negative test for Ti, but reacted strongly for B. The "rutile" was evidently tourmaline.

A. M. BRANT

The mineral dumortierite. MACKAY SCHOOL OF MINES STAFF. Univ. Nevada. *Bull.* 2, (1928); *Am. Mineral.* 13, 532(1928).—The existing data on this borosilicate are summarized. The Humboldt Queen deposit is the only com. occurrence thus far known in the world. The dumortierite occurs in lenticular masses and quartz veins, the former originating through the replacement of preëxisting lenses of andalusite formed in an earlier stage of metamorphism. The use of the mineral, and of andalusite, in the manufacture of special chem. porcelain, is described.

A. M. BRANT

Studies in the mica group. A discussion. A. F. HALLIMOND. *Am. Mineral.* 13, 451–2(1928).—A criticism of a contribution by A. N. Winchell (*C. A.* 22, 2904). The composition of muscovite (further discussion). A. N. WINCHELL. *Am. Mineral.* 13, 567–9(1928).—The dispute centers around which of the various elements or their oxides proxy for one another in different micas.

A. M. BRANT

Chlorophaeite, sideromelane and palagonite from the Columbia River plateau. MARTIN A. PEACOCK AND RICHARD E. FULLER. *Am. Mineral.* 13, 360–83(1928).—The definition of chlorophaeite should be extended to cover all hydrous, amorphous, pitch-like materials having deuterite origin, some of which have been named palagonite, in basalts and dolerites. Sideromelane should be continued, as distinct from tachylyte, as a specific name for ideal basaltic glass formed under conditions of specially rapid cooling. A chem. and genetic distinction exists between chlorophaeite and palagonite; the latter name should be restricted to a gel produced essentially in the hydration of sideromelane by water or water-vapor of exotic origin. The phys. properties, microscopic study and chem. analyses of these 3 mineraloids are given, and list of references included.

A. M. BRANT

The formula of glauconite. A. F. HALLIMOND. *Am. Mineral.* 13, 589–90(1928).—A discussion of a contribution by H. Schneider (*C. A.* 21, 3584), showing that the compns. deduced from the latter's theory do not agree so well with the analyses as do the theoretical values of H.

A. M. BRANT

Beryllonite and other phosphates from Newry, Maine. CHARLES PALACHE AND EARL V. SHANNON. *Am. Mineral.* 13, 392–6(1928).—The beryllonite crystals, more or less altered, were imbedded in platy albite. The sp. gr. was 2.806. Herderite occurred in radial fibrous form, yielding botryoidal or spheroidal aggregates which are new to the species. Eosphorite occurred in free crystals implanted on quartz in open cavities or on albite. The color varies from opaque blackish brown to transparent hair brown. The optical characters and chem. analysis are given for each mineral.

A. M. BRANT

Newberyite and other phosphates from Ascension Island. GRAGG RICHARDS. *Am. Mineral.* 13, 397–401(1928).—Newberyite, collophanite and martinite were

identified in thin phosphate deposits found on basaltic lava flows. Their optical properties are given. A. M. BRANT

A new meteorite from Washington County, Colorado. CHARLES PALACHE AND EARL V. SHANNON. *Am. Mineral.* 13, 408-9(1928).—A single sym. disk of iron, slightly ellipsoidal with major dimensions of 15 and 20 cm. and a max. thickness of 6 cm., was found. It weighs 5750 g. The analysis shows it to be a moderately Ni-rich ataxite. The presence of Cu and Pt is noteworthy. Troilite and schreibersite are practically absent. A. M. BRANT

The Rutherford Mines, Amelia County, Virginia. A. A. PEGAU. *Am. Mineral.* 13, 583-8(1928).—The pegmatites are briefly described and notes are given on the various minerals to be found at present. A. M. BRANT

Sequence of the mineralization in the Keystone, South Dakota, pegmatites. KENNETH L. LANDES. *Am. Mineral.* 13, 519-30, 537-58(1928).—The Etta, Peerless, Hugo and Bob Ingersoll pegmatites of the Keystone district are described, and notes on the geology given. The mineralization of these pegmatites was a continuous process, magmatic in its earlier, and hydrothermal in its later stages, with the later minerals filling cracks and replacing the older minerals. The evidence is given under the detailed description of the different minerals. Four magmas are thought to have existed, (1) a hypothetical deep-seated magma which crystd. and differentiated, producing (2) the Harney Peak "granite"; and then developed through residual concn. of mineralizers (3) the pegmatite magma, which followed a similar course and produced (4) hydrothermal solns. which dissolved and replaced earlier minerals. The first-stage minerals are microcline, quartz, muscovite, black tourmaline, apatite, triphylite and beryl, with K as the outstanding alkali. In the second stage were deposited spodumene, amblygonite and later beryl, Li being the chief alkali. The greatest variety of minerals was deposited in the third, or vein-forming stage. Important in this group are albite (cleavelandite), cassiterite, lepidolite, columbite and a second generation of quartz, muscovite and tourmaline, Na being the chief alkali, with less Li. In (1) and (2) P and Be were included, in (1) and (3) B; metals, except Fe, appear in (3) only. Rarer elements occur in the minerals cassiterite, columbite and tantalite. Detailed descriptions of all the minerals found, according to stages, are given. A. M. BRANT

Petrology of the North Conway quadrangle in the White Mountains of New Hampshire. MARLAND BILLINGS. Harvard Univ. *Proc. Am. Acad. Arts Sci.* 63, No. 3, 1-137(1928).—The relations of the petrology to the dynamical and historical geology of the area are studied. Nine chem. analyses of the rocks of the region are reported from Herdsman, 4 from Perry and 2 from Mrs. S. Parker. Other analyses of similar rocks are quoted. L. W. RIGGS

Constitution of the lavas of the Island Mehetia (Maitea), Society Islands. A. ACRON. *Compt. rend.* 187, 857-60(1928).—Chem. analyses by Raoult showed the compn. of ankaratritic limburgite, augite, doleritic luscladite, β doleritic melanocrate and β labradoric basalt. These rocks ranged from 41 to 46.2% in SiO_2 . The discussion is mainly lithological. L. W. RIGGS

A preliminary examination of the profile of the country rocks along the coast of southern Norrland, Sweden, as observed in the cuttings of the East Coast Railway. LARRY VON ECKERMANN. *Geol. Fören. Förh.* 50, 309-67(1928).—Until recently the geological mapping of the rocks of Southern Norrland was based on 2 general surveys. These surveys did not give any comparative data on the mineralogical and chem. compn. of the different rocks. Coördination of these rocks was therefore largely guesswork. In 1927 E. studied fresh railway cuttings, before they had weathered or blackened by smoke. The observations were confirmed by short field excursions both sides of the railroad and by examn. of some new exposures in road-making. Twenty-six new analyses of rocks were made: leptitic gneiss (2), tuffitic leptitic schists, quartzitic leptite, red Ljusne-type granite, pegmatitic granite and porphyritic gneiss-granite, red schistose granite, gray Ljusne granite and gneiss-granite (2), garnet-bearing gneiss-granite, cordierite-bearing gneiss-granite, spotted granite, Rapakivi granite, contact of hornröngite dike, center of the same, leptitic gneiss (2), Härnö granite, white aplitic Härnö granite, red aplitic Härnö granite, granite and gneiss granite at Bergfors and olivine diabase (2). Each analysis is accompanied by the Niggli classification, and some are followed by detailed descriptions of the specimens. The variations in the analyses are discussed in detail. E. finds that the differentiation follows entirely that of the normal granite magmas, i. e., with rising α -values, and increasing α -percentage, and a still more sharply rising alkali content, accompanied by a corresponding sharply decreasing fm -percentage and a somewhat less sharply falling c -content. E. distinguishes between 3 different gneiss granites: the red and gray

Ljusne granites and the gray Härnö granite with its basic variant, the Bergefors granite. E. proposes the hypothesis that the origin of migmatites depends less on pressure and temp. conditions, as such, than on the regenerated magma's fitting in with the normal differentiation scheme of the remelting granite under prevailing conditions of stability, both as regards temp. and pressure; this explains some of the differences in the granites studied.

WILHELM SEGERBLOM

Petrological notes on some alkaline basic rocks of New South Wales. W. R. BROWNE. *J. Proc. Roy. Soc. N. S. Wales* 61, 371-82(1928).—The rocks discussed are analcite-bearing basalt, nepheline-basalt, analcite-bearing theralitic dolerite, theralitic dolerite, analcite-theralite and teschenite-aplite. No chem. analyses are reported.

L. W. RIGGS

Some metamorphosed dolerites from Broken Hill. W. R. BROWNE. *J. Proc. Roy. Soc. N. S. Wales* 61, 383-400(1928).—These rocks, originally ophitic dolerites belonging to the quartz-dolerite kindred, have suffered high-grade thermal metamorphism with the production of augite, hypersthene, brown hornblende, very basic plagioclase and in some cases a little spinel, with partial or complete obliteration of original textures. Genetic relations are discussed.

L. W. RIGGS

The oceanic limestone cycle. J. THOULET. *Compt. rend.* 187, 898-9(1928).—CaCO₃ is made constantly in the upper layers of the ocean by *Globigerina* and other organisms, and destroyed in the volcanic acid waters of the abysmal layers.

9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, R. H. ABORN

Emil Schrödter. ANON. *Stahl u. Eisen* 47, 1633-6(1928).—An obituary, with portrait.

J. A. S.

Recent progress in metallurgy. H. DROUOT. *Tech. moderne* 20, 857-61(1928).—The high- and low-frequency induction furnaces are compared. Rolling mills of great capacity are described. The properties of nonferrous metals are greatly altered when extreme purity is attained. The properties of *Be* and *Ta* and their possible uses are discussed. New alloys are coming into use.

P. THOMASSET

Dressing of molybdenum ores. GAICHI YAMADA. Kyoto Imp. Univ. *J. Min. & Met.* 6, 186-95(1928). For the modern work, more than 85% of molybdenite is required as a refined ore; the refining from 1% ore is complicated by its property of producing a scaly cleavage and by the presence of foreign materials such as mica, graphite and pyrites. In powdering the ore, it is broken into scales, the accompanying rocks into grains; thus the sieving of the mixt. will help the refining, but it is made less effective by the presence of such scaly minerals as mica and graphite. Electrostatic concn. is effective when the ore contains such non-conductors as quartz and feldspar, but fails in the presence of such good conductors as pyrites and graphite. The film flotation method utilizes the difference of surface tension of minerals. The ore must be powd. below 10-mesh and must be thoroughly dried. The vacuum flotation method makes the ore float by reducing the pressure over the ore slime.

K. SOMEYA

The influence of hydrogen-ion concentration on recovery in simple flotation systems. A. M. GAUDIN. *Mining & Met.* 10, 19-20(1929).—Ions react with the mineral surfaces in some instances and have much to do with the adherence of collectors in others. Xanthates collect in acid circuits, though their almost general use in alk. circuit has led to the belief that they function only in alk. circuit. Twelve curves show the relation of recovery to H-ion concn.

W. H. BOYNTON

Flotation and leaching at Kennecott. E. J. DUGGAN. *Eng. Mining* J. 126,

3-15(1928).—"Much greater efficiency over the former all-leaching process has been achieved by sulfidizing the finely ground carbonate ore and floating the concentrate." Practically all of the freed sulfide ore is recovered and a good proportion of the carbonate. The av. % of tailings from the various depts. is as follows: jigs 76; sand tables 14; and shaker tables 10. Assays and screen tests are tabulated. Few changes have been made in the leaching process. A brief description is given of the plant and the leaching cycle. The Cu carbonate is treated by flotation. Sulfidizing is effected by use of a relatively small amount of oils and a critical amount of Na_2S added in stages with flotation following each stage. Flotation equipment consists of 8 mechanically agitated, single-spitz type flotation machines. A thickener and an Oliver filter de-water the flotation concentrate; Cu recovery of 72-75% is made on a concentrate assaying 32-35% Cu. Flotation reagents used in lb. per ton are Na_2S 3.0, S 0.8, quicklime 0.4, coal-tar creosote 0.1 and steam-distd. pine oil 0.3. All reagents are added directly to the mixing cell. General flow sheets and tables are included.

W. H. BOYNTON

Effect of the selective flotation reagents for pyrites and copper pyrites. GAICHI MADA AND KEIKICHI MAYAHARA. Kyoto Imp. Univ. *Suiyokashi* 5, 643-54(1928). To simplify the conditions, pure materials were used and the sample was prepd. by mixing with quartz sand in various proportions. A small wooden machine of the M. S. type was used; 500 g. of the sample was taken each time. Water of the Kyoto city water-works, with the mineral slime about 20%. Blue camphor oil 80 and 20% of oil tar was used. The reagents tested were CuSO_4 , CuSO_4 and Fe powder, H_2SO_4 , NaOH , K xanthate, T.T. mixt., KCN and alum. For copper pyrite, best result was obtained when 2 lbs. of H_2SO_4 per ton was used, yield 26.23%; next comes in efficiency lime and CuSO_4 . For copper pyrite, the yield with each reagent is good and there is no considerable difference with different reagents. For pyrite, best result was obtained when 2 lbs. of H_2SO_4 per ton was used; the poorest with 4 lbs. of lime. When CuSO_4 and Fe powder was used, the surface of the pyrite becomes clean from the galvanic action of the Fe powder, and a good rich ore results, but the yield is poor. For the mixt. of pyrite and copper pyrite, best result was obtained when 0.114 lb. of K xanthate, and 0.5 lb. of lime per ton was used. The result was also good when 0.05 lb. of KCN, 0.08 lb. of alum, and 0.5 lb. of lime per ton were used. Poorest result was obtained with 0.5 lb. of T.T. mixt. and 0.5 lb. of lime, probably because of the excess of oil. Even in the case where the flotation of a single substance can be effected by oil only, some reagent must be added to make a selective flotation; the combination of various reagents being most effective. For the sepn. of pyrite, alk. reagents, esp. xanthate-lime or KCN-alum-lime combination, are most effective. For making the soln. alk. NaOH is more effective than lime. In using CuSO_4 , an iron ball-mill should be used because of the good effect of the Fe powder.

K. SOMEYA

Advantages and disadvantages of the combined process of concentration by gravity and flotation, with relation to the mechanical preparation plant of the American Smelting & Refining Co. at Angangueo, Mich. C. BRUCHHOLD. *Bol. minero* 26, 188-99(1928).

E. M. SYMMES

The evolution of slime treatment on the Witwatersrand gold mines. J. R. THURLOW AND T. K. PRENTICE. *J. Chem. Met. Mining Soc. S. Africa* 29, 101-3(1928); cf. *C. A.* 22, 3608.—A discussion by A. King. The operation of the Sub Nigel slime plant is outlined. Of 5 vats, 2 were converted into Dorr thickeners and the other 3 into Dorr agitators. In the first agitator the pulp is diluted with cyanide soln. to an av. sp. gr. of 1.31. The pulp passes through the agitators arranged in series and flows by gravity from the last agitator to the Oliver continuous filter. In the Merrill vacuum filtration method of Zn dust pptn. the Au-bearing soln. is drawn through filter leaves suspended in a tank by a small centrifugal pump. A standard leaf may have a capacity of 45-50 tons soln. per 24 hrs. with periods of 15-17 days between clean-ups. The tanks have a conical or sloping bottom leading to a pump to which the Zn-Au slime ppt. is washed at the clean-up.

W. H. BOYNTON

Precious metals in the Sudbury [nickel] ores and their recovery. C. LANGER, SR. AND C. JOHNSON. *Trans. Can. Inst. Mining and Met.* 30, 903-8(1927).—The residues from the carbonyl volatilization of Ni in the Mond process of treating CuS-NiS ores contain practically the whole of the precious metals contd. in the original ore and represent a concn. of these metals of 16,000:1. A typical analysis of these residues is 1.85% Pt, 1.91% Pd, 0.56% Au, 0.39% Ir, Ru and Rh and 15.42% Ag, together with Sb, Pb, Ni, Cu, As, Se, and Te. The residues are roasted to expel volatile constituents, and smelted with litharge and alk. fluxes to obtain a lead regulus. This is cupelled with more Ag to give at least 6 times as much Ag as other precious metals in the resulting bullion, which is then electrolyzed in a AgNO_3 bath. Pure Ag is thus obtained at the cathode and a rich

slime at the anode, from which the Pt metals and Au may be recovered by the usual procedure.

B. C. A.

The recovery of precious metals from jeweler's waste. ERNEST A. SMITH. *Metal Ind.* (London) 33, 513-5, 565-7 (1928).—Filings, polishings and sweeps are heated to remove org. matter, and after a magnet is passed through them to remove Fe they are smelted down with a flux of soda and borax and the Pb is sepd. by cupellation and the Ag by electrolysis from Au and Pt. The slimes contg. Au and Pt are dissolved in aqua-regia and the Au is pptd. by FeSO_4 and the Pt is sepd. by the addn. of NH_4Cl ; the ppt. on heating gives a spongy gray mass of metallic Pt.

DOWNES SCHAAF

Smelting titaniferous ores of iron. A. STANSFIELD. *Trans. Can. Inst. Mining and Met.* 30, 802-18 (1927).—Titaniferous iron ores with a high percentage of titania can be smelted in blast furnaces under suitable conditions to obtain a pig iron and a fusible slag contg. about 20% of Ti oxide in the form of a lower oxide, probably Ti_2O_3 . Under too highly oxidizing conditions no reduction of the titania takes place and pasty slags are formed, whereas under very highly reducing conditions Ti carbide and cyanonitride are obtained and the slags are fusible only at very high temps.

B. C. A.

The reclamation and reconditioning of foundry sands. W. E. DENNISON. *Foundry Trade J.* 39, 447 (1928).—The reclamation and reconditioning of sand hitherto wasted will progress considerably as soon as the chem. and phys. characteristics of the sands come to be better understood. The "feel" of the sand as recognized by the molder is still today the main criterion in judging the qualities of molding sand. The proper interpretation of the tests in use today can be extremely useful in the synthesis of foundry sand. To facilitate the moisture content of sand various combinations of elec. instruments have been designed, the moisture being detd. by measuring the elec. cond. of the sand, which increased with the percentage of H_2O .

DOWNES SCHAAF

Properties of manganese in the basic open-hearth process. ISAMU KOTAIRA AND MOTOZO MAEDA. Yahata Steel Works. *J. Study of Ferrous Met.* 103, 110-33 (1928).—The effect of FeO and MnO upon the m. p. and the fluidity of the basic-furnace slag was studied; it is advantageous to make a slag rich in these oxides at the first stage of the melting. The affinities of CaO, FeO and MnO for SiO_2 were calcd. by means of Nernst's formula and compared. In the basic furnace a large proportion of FeO and MnO is liberated as a so-called mobile slag. The relation between the dissocn. pressure and concn. of FeO and MnO was deduced from the law of mass action, and the reaction of the oxidation of the impurities in these oxides is explained. For the reactions $\text{MnO} + \text{Fe} \rightleftharpoons \text{Mn} + \text{FeO}$ are deduced the expressions $C_{\text{MnO}}/C_{\text{FeO}} = K C_{\text{Mn}}$; $C'_{\text{MnO}}/C'_{\text{FeO}} = K' C_{\text{Mn}}$ for the equil. at the contact surface of the slag and of steel; this shows that increase in the concn. of FeO causes decreases in the concn. of Mn in steel, and conversely, the greater the concn. of Mn in the steel, the more complete the deoxidation, with consequent good killing. For this purpose the increase of furnace temp. and of CaO in the slag is necessary. With increased CaO, the liberation of MnO is increased in comparison with that of FeO, and hence this causes the increase of Mn in the steel. This explains why operation that causes Mn concn. in steel at the end of the melting is better than adding Mn from without. Desulfurization and the effect of Mn on the dephosphorization are discussed. Desulfurization is more effective the greater the CaO concn. Also the reason a reducing slag for desulfurization and an oxidizing slag for dephosphorization are needed is explained.

K. SOMEYA

Operation of Siemens Martin furnace with mixed gas. WERNER HEILIGENSTAEDT. *Stahl u. Eisen* 48, 1465-71 (1928).—Theoretically producer gas and mixed gas are of equal value, yet practical experiences showed that the use of mixed gas, consisting of coke-oven and blast-furnace gases, caused considerable variations in the production; so that either 15-20% producer gas, or tar (tar oil) had to be added in order to insure the regularity and continuity of production. The underlying principles of mixed-gas operation and the changes required when mixed gas is used instead of producer gas were investigated. The heat transfer between gas and hearth is regulated by the temp. of combustion, which should be sufficiently high to cause an adequate temp. difference, and also by the capability of the gas to give up heat. The temp. of combustion of mixed gas is as high as that of producer gas. The media of the exchange of heat are those constituents of the gas which are radiating heat, such as CO_2 and H_2O (steam), and that part of the gas which is commonly called flame, consisting of burning C particles of mol. dimensions. As mixed gas is somewhat richer in CO_2 and H_2O than producer gas, the only possible explanation of the poor performance of mixed gas is the inferior heat radiation of its flame. During the passage of the producer gas through the chambers its tar content is decompd. to H and C; this explains the high C content of the flame, also its good radiating qualities. Mixed gas does not contain tar. Blast-furnace gas con-

s only 2-3 g./m.³ C₆H₆, and no other hydrocarbons; if all the hydrocarbons contained in the av. coke-oven gas (3670 kcal./m.³) are decompd., the following amts. of C are obtained: 2.5 g. C/m.³ from C₆H₆, 20 g. C/m.³ from C₂H₂, and 135 g. C/m.³ from CH₄. Obviously the only way to increase the amt. of C particles in mixed gas and the luminosity of its flame is by facilitating the decompn. of CH₄. This can be attained by proper heating in the chambers. The producer gas enters the chambers at a temp. of 600° and has to be heated up to 1050°. Mixed gas enters the chambers at about 0° and has to be heated up to 1250°, that is above the temp. of decompn. of CH₄. For mixed gas chambers have to be enlarged and the draft increased. The above considerations are based as the basis to calc. the size of the chambers. The total heating surface of the chambers is 250 m.² or 20-22 tons of brick per ton of steel for producer gas; the corresponding figures for mixed gas are 320 m.² or 25-30 tons of brick per ton of steel. The luminosity of the flame of mixed gas can also be increased by catalysts such as Ni (cf. Meyer, *et al.*, *C. A.* 4, 2724). The 2 constituents of the mixed gas can be supplied separately to each furnace, or the mixing can be done on the sample place for all the furnaces, so that each furnace receives the same gas. The use of mixed gas requires a more rigid control than does producer-gas operation.

J. A. SZILARD

Results of Röntgen research upon alloys and metals—investigation of the fine structure of the metals and alloys. F. WEVER. *Z. Metallkunde* 20, 363-70(1928).—presents a valuable summary of results of x-ray research on metals and alloys. The following phases of the work are discussed: the structure of elementary metals and their distribution in the periodic table, polymorphism; the dependence of properties upon the constitution of alloys, mixed crystals and metallic compds.; examples of complete alloy systems.

R. L. HERSHEY

Mechanical properties and angle of fracture of cold-rolled metals. FRIEDRICH KÖRBER AND HUBERT HOFF. *Mitt. Kaiser-Wilhelm-Inst. Eisenforsch. Düsseldorf* 10, 5-87(1928).—The authors studied the mechanical properties of metal sheets as a function of crystal structure, degree of cold-rolling and orientation of the sheets with regard to the direction of rolling. Strips of Cu (99.9%), Al (99.1%), brasses (83/17 and 27/73), electrolytic Fe and Ni (98.6%) were tested. The reduction in thickness was from 50 to 98%. The sheets were cut in such a way that the angles with the direction of rolling varied in steps of 22.5° from 0 to 90°. The width was 1 cm. and the length 5 cm. The results were as follows: (1) Tensile strength and Brinell hardness increase with increasing degree of cold work, reaching a max. value between 90 and 98% reduction, followed by a slight decrease at the highest degrees of rolling. (2) The elongation shows a corresponding decrease and a min. value around 94% reduction. (3) The orientation of the sample has a marked effect on the value of the tensile strength and the changes in the elongation are rather irregular. (4) Samples less than 3 mm. thick contract on rupturing with the formation of an angle of fracture of less than 90° with respect to the length dimension of the strip. For specimens oriented in the direction of rolling this angle varies as a rule from 60° to 70°. For all other samples the angle is around 55°. (5) There is apparently no direct connection between the lattice structure and the angle of fracture. The angle of fracture can be accounted for by assuming 2 directions of slip which form an angle of 45° with the main axis of the sheet and intersect the other axes likewise under an angle of 45°. Under those conditions the angle of intersection with the surface of the sheets is 55°. Tables, graphs and photographic reproductions showing the fractured sheets are included.

Angle of fracture and the mechanism of plastic deformation. FRIEDRICH KÖRBER AND ERICH SIEHEL. *Mitt. Kaiser-Wilhelm-Inst. Eisenforsch. Düsseldorf* 10, 189-92(1928), cf. preceding abstr.—K. and S. develop a theoretical explanation for the mechanism of plastic deformation in metal strips which accounts for the appearance of angles of fracture in broken test pieces.

H. S. v. K.

Fatigue failures of mill shafts. H. J. B. SCHARNBERG. *Facts About Sugar* 24, 16-23, 38-47(1929).—S. believes that the failure of the open-hearth-steel shafts of the top rolls of cane mills is due not to chem. changes in the metal but to mech. deformation in the structure of the metal fiber, caused principally by const. reversal of the load stresses. He recommends the use of nickel steel or chrome nickel steel shafts. Deflection measurements were made on rolls under load with each kind of shaft and the results are reported in 2 tables. Impact-test data on samples of carbon, nickel, chrome nickel, manganese and silicon manganese alloy steels, and the exptl. data of 4 tests on the hydraulic mechanism of cane mills are also reported.

M. J. PROFFITT

The effect of cold-work and heat treatment on the electric conductance of copper, aluminum and iron. PETER BARDENHEUER AND HEINZ SCHMIDT. *Mitt. Kaiser-Wilhelm-Inst. Eisenforsch. Düsseldorf* 10, No. 10, 193-212(1928).—Previous work is

reviewed and new expts. are performed to clear up existing discrepancies. The lowering of the cond. resulting from mech. deformation is due to cold-work strains which vary considerably, depending on the methods employed. Cold-rolled Cu wire when reduced 50% showed a max. decrease in cond. of 3-4% but only after the application of *several light passes*. Annealing, if carried out below the temp. of beginning recrystn., generally improves the cond. without materially reducing the cold-work hardness. Annealing of Cu at temps. of 600° and higher produces excessive brittleness and a marked drop in cond. Subsequent heat treatment at lower temps. does not improve the cond. appreciably. Annealing of cold-rolled brass wire (72/28) (with 75% reduction) at 200° for 4 hrs. increases the conductance 7%. When annealed for 4 hrs. at 225° recrystn. sets in, and the increase in cond. amounts to 17%. The cond. of cold-drawn Al wire is increased by 3-6% when the wire is annealed at 200° (before recrystn. is complete) but subsequent prolonged heating at 150° again reduces the cond. by 3-4%. Cold-rolled electrolytic Fe exhibits a max. cond. after annealing for 1 hr. at 500°. Expts. performed with ingot iron indicated that the cond. of Fe is independent of the grain size. The effect of C in steel is to decrease the cond. linearly as the C content increases. The reduction is greater for steel contg. *lamellar pearlite* than for the same steel contg. finely distributed *granular cementite*.

H. S. VAN KLOOSTER

Recrystallization of metals. R. KARNOP AND G. SACHS. *Z. Physik* 52, 301-13 (1928).—The influence of repeated heating on commencement of recrystn. and grain-size is studied. The retardation of the recrystn. through deformations is investigated

GEO. GLOCKLER

Relation between the Shore hardness and the thickness of metals. YOSHIO NISHI. Tohoku Imp. Univ. *Kinzoku-no-Kenkyu (J. Study of Metals)* 5, 314-8 (1928).—N. made 10 specimens of 0.1, 0.5, 0.9% C-steel and 70:30 brass having various thicknesses ranging between 0.5 and 30 mm. and measured their Shore hardness to study the effect of thickness upon the hardness no. The result shows that up to 5 mm. thickness the hardness no. is independent of the thickness, but increases abruptly at about 5 mm. thickness and then decreases with decreasing depth. N. considers this to be due to the anvil effect and the way in which the specimen is attached to it. When the thin piece is soldered on to a hard metallic plate, accurate results can be obtained up to the thickness of 1 mm.

K. SOMEYA

A method for accelerating the transformation of the retained phase by means of an alternating current or field. TAKESHI TAKEI. Tohoku Imp. Univ. *Kinzoku-no-Kenkyu (J. Study of Metals)* 5, 267-70 (1928).—In a Co-Mo alloy contg. 16% Mo, a large part of the transformation from a face-centered cubic lattice to a hexagonal close-packed one is retarded and brought down below room temp. by supercooling, and the rest may take place by cooling the alloy in liquid air. T. has observed that the transformation is much accelerated by passing an alternating current through an alloy or placing it in a strong alternating field during cooling in liquid air.

K. SOMEYA

The use of Zeiss' bromonaphthalene immersion objective and other objectives of lower aperture in metallography. C. BENEDICKS AND P. SEDERHOLM. *Arkiv. Mat. Astron. Fysik* 21A, No 4, 8 pp. (1928); cf. *C. A.* 23, 74.—From a comparative study of immersion objectives of numerical aperture 1.6 and less B. and S. infer that the objective of 1.6 numerical aperture can be recommended in all cases where a magnification above 1600 is desired. For lower magnifications an aperture of 1.4 is preferable on account of lower cost and greater freedom from fogging.

H. S. v. K.

Fusible metal safety plugs in chlorine containers. ANON. *Compressed Gas Manufacturers Assoc. Bull. Tech. Series* 1929, 359-60.—A report of researches by the Niagara Alkali Co. on fusible metal plugs for 150-lb. cylinders. Failure to function properly is due to one of two causes; (1) corrosion (most important), and (2) segregation, the packing of primary Bi crystals across the plug. The formula of the quaternary eutectic is: Cd 10.10, Sn 13.13, Pb 27.27 and Bi 49.50%. This alloy is now employed and the plugs are chilled immediately after pouring. The use of pure metals, the prepn. of the alloy and the filling of the bodies of new valves are outlined.

W. H. BOYNTON

Metallic electrodes for cast-iron arc welding. SHUNICHI SATO. Mitsubishi Research Lab., Tokyo. *Am. Inst. Mining Met. Eng. Tech. Publication* 162, 3-16 (1929).—A short bibliography on elec. welding of cast Fe is given. Wrought-Fe welding rods of 0.49 cm. diam. were used, and they were wrapped with asbestos cord of 1 mm. diam., and coated with a paste of graphite, carborundum and water-glass up to a diam. of 9 mm. The coating compn. varied in steps of 10% from 100% graphite to 100% carborundum. Metal from these coated electrodes was deposited on steel plates, by using 25 v. and 140 amp. with the plain graphite coating, 20 v. and 155 amp. with the plain carborundum coating, and intermediate voltage and current for the mixed coatings. The micro-

structures, chem. analyses and hardness of the various deposits are shown. Good gray Fe contg. 1.5 to 3.4% graphite, 1.3 to 0.3% combined C, and 2.8 to 4.3% Si, was deposited by the electrodes coated with the 40 to 60% mixtures. With coated wires of only 7 mm. diam., the deposited metal contained only a trace of graphite. With the coated electrode positive and 3 to 5% of calcined borax, CaCO_3 , or BaCO_3 , in the coatings, the results were poor, but were improved by preheating. With the electrode negative, and 1 to 3% BaCO_3 added to the coating, fusion was much slower, requiring more energy, so that preheating was not necessary. With an 8 mm. diam. coated negative electrode, the coating contg. 40 to 60% graphite, 60 to 40% carborundum, mixed with water-glass, and with 1% BaCO_3 , good gray cast Fe was deposited on cast Fe without preheating. No hard zone was formed in the Fe, and bending tests of welded bars with the weld in tension gave results as good as those from the original cast Fe. Holes in a large casting were filled by cast Fe deposited in this way, and it then withstood hydraulic pressure of 230 lbs. per sq. in. GEO. F. COMSTOCK

Electric welding joins the field in high-pressure equipment. NORMAN W. KRASE. Univ. Ill. *Chem. Met. Eng.* 35, 661-7(1928).—The manuf. of all sorts of large-scale app. by a special welding process at the plant of A. O. Smith Corp. is described. J. H. P.

Eutectic cast iron. A. MITINSKI. *Foundry Trade J.* 39, 413(1928).—Eutectic cast Fe shows more nearly uniform distribution of all the elements in the metal on solidification than any other C concn. Since com. cast Fe is not a pure Fe-C alloy but a complex alloy of Fe, C, Si, Mn and P, the eutectic compn. is lowered by the concn. of Si and P, i. e., the eutectic compn. of cast Fe with 2% Si and 1% P would be 3.33% C, rather than the 4.3% C content of the pure Fe-C eutectic. DOWNS SCHAAF

Graphite in gray cast iron and its influence on strength. PETER BARDENHEUER AND KARL LUDWIG ZEYEN. *Tech. Hochschule, Aachen. Giesserei* 15, 354-65(1928); cf. *C. A.* 22, 2729.—The development of the theory of graphite (I) formation in cast Fe (II) is outlined. The soln. of I in the melt is found to be dependent on the overheating temp. and the C content. The I crystals composing the flakes are invisible under a powerful microscope. With increasing overheating temps. fine eutectic I displaces the coarser flakes. White spots, which appear in the structure of specimens heated above 1500°, increase with the overheating temps. The Si in the gray outer zone is greater than that in the original II, but less than that of the interior. *Ibid* 385-97.—The influence of C on the I formation and the mech. properties of II (cylinder, Fe poor in P and S, the same with 3.5% Si) cast in chill (then annealed) and sand molds is studied. The chill castings show higher tensile properties than the sand. Expts. with specimens annealed at 750-800° and 850-900° show that only at the higher temps. is the white structure transformed into the pearlite-ferrite. *Ibid* 411-20.—The influence of the overheating and pouring temps., and stirring of the bath on I formation and strength of I is studied. With increasing overheating temps. the fineness of the I formation is constant in cylinder II, and decreases in the other types. When poured at the highest temps. the I is finely divided, while at the lowest it occurs as coarse flakes. The overheating and pouring temps., and mech. stirring of the melt have no marked influence on the mech. properties of II. Numerous photomicrographs, tables and references to the literature are given. J. BALOZIAN

Hardness and tool behavior of cast iron. WALTER MELLE. *Giesserei-Ztg.* 24, 485-6. *Chem. Zentr.* 1927, II, 2100.—M. defines the term "tool behavior" ("Bearbeitbarkeit") as the length of the abscissa in cm. in the boring diagram for every 100 revolutions of the boring-shaft at certain definite working conditions. From many expts. on samples of cast iron with 100-230 Brinell units it was concluded that under certain exptl. conditions there exists a relation $B. II^{1.47} = e$ between the tool behavior B and the hardness II. In the expts., which were carried out without regard to the analysis and the strength of the walls, the const. e was found to be 10,000. G. SCHWOCH

The system ferrous oxide-silica. C. H. HERTY, JR. AND G. R. FITTERER. *Ind. Eng. Chem.* 21, 51-7(1929).—The following conclusions are drawn from the m. p. detns. and microstructure of the ferrous silicates: (1) the m. p. of FeO lies between 1355° and 1377°; (2) at 22% SiO_2 a eutectic is indicated by m. p. data, the eutectic temp. being 1240°; (3) the compd. fayalite is present in the system; it m. 1355°; (4) a second eutectic, m. 1260°, is found at 35% SiO_2 ; (5) the transformation from cristobalite to tridymite is found noticeably to distort the diagram. DOWNS SCHAAF

The critical points of pure carbon steels. TOMOO SATO. *Tech. Repts. Tohoku Imp. Univ.* 8, 27-52(1928).—The crit. points of pure Fe and C steels were detd. for different rates of heating and cooling by means of dilatometric and differential dilatometric methods and also by magnetic analysis. The degree of superheating and supercooling of the A_3 change increases as the C content increases. An equil. diagram of the

Fe-Fe₃C system in the solid state was constructed from the data obtained in the investigation. DOWNS SCHAAF

Influence of temperature upon the mechanical properties of steel. Kiyoshi SASAKAWA. *Tetsu-to Ko (Iron and Steel)* 14, 567-86(1928).—S. devised an app. for measuring the impact resistance in which the Izod impact testing machine is used, and which requires only $\frac{1}{8}$ second from the time of the removal of the furnace to the application of impact with consequent small lowering of temp. This app. was used for impact test of 6 kinds of C steel (0.11-1.20% C), Ni-Cr steels (2.40-3.74% Ni, 0.63-0.78% Cr) quenched at 820° and annealed at 620°, 3 kinds of stainless steels, high-speed steel, Si-Cr steel (11% Cr, 3% Si) and Ni-Si-Cr steel (4% Ni, 1.5% Si, 10% Cr), the temp. range of the test being 20-1000°. In C steels the max. of impact resistance becomes higher with higher C content, with 0.1% C, it is at ordinary temp. and with 1.2% C it is near 400°; at higher temp. it once lowers and then increases abruptly near 700°, showing there again a max., and finally decreases considerably above 800°. In Ni-Cr steels the same value is maintained up to 300°, the value lowering once, then increasing abruptly to a max. near 720° and gradually decreasing at higher temps. In stainless steels, the impact resistance decreases with temp. rise if the structure is ferrite-sorbite. When the structure is martensite-sorbite, no change of value is observed up to a high temp., while when it is austenitic, the value lowers up to 400°, then does not change up to 700°, and above 700°, abruptly decreases. With high-speed steels, the resistance is small at low temp. but increases gradually with temp. rise. In Si-Cr steel or Ni-Si-Cr steel, there is a max. near 800°. K. SOMEYA

Alloy steels and their application in the automotive industry. B. E. EGERBERG Intern. Silver Co. *J. Soc. Automotive Eng.* 23, 362-70(1928).—The progress of research in the development of alloy steels is outlined. The resistance of various steels to corrosive agents is discussed. Transverse and bending tests, S print and gelatin paper tests are described. M. B. HART

The equilibrium diagram of iron-zinc system. YOSHIKI OGAWA AND TAKEJIRO MURAKAMI. *Tech. Repts. Tohoku Imp. Univ.* 8, 53-69(1928).—The equil. diagram of the Fe-Zn system was studied by using specimens prepd. for the most part from powd. mixts.; the Fe-rich alloys were made by packing ground mixts. of the mother alloy (approx. FeZn₇) and reduced Fe in porcelain tubes fused at one end, heating in H to 650° to reduce any oxide film, and then after cooling, closing the other end of the tube in a C arc; the tube and contents were then heated to 900°, cooled down to 740° and kept there for 12 hrs. The results of thermal analysis confirm in general the work of previous investigators. The magnetic change of Fe was lowered by the addn. of Zn until a concn. of 25% was reached and remained constant at 623°. An abrupt change was observed at 623° by the thermal dilation method and was confirmed by microscopic investigation to be a eutectoid change. The limit of soly. of Zn in α Fe was found to be 18% and the eutectoid compn. to be 25%. DOWNS SCHAAF

Cause of the thermal brittleness of cupriferous steel. ISAMU KOTAIRA. Yahata Steel Works. *Seitetsu Kenkyu (J. Study of Ferrous Met.)* 8, 25-39(1928).—K. examd. microscopically 8 kinds of Cu-Fe alloys contg. 0-9% Cu and found that with more than 1% Cu, there is a dendritic structure of solid soln. rich in Cu, which cannot be made to vanish by simple annealing. With the alloy contg. 9% Cu, sepn. of reddish yellow Cu solid soln. occurs at the center of the dendrite. No similar thing happened with the Cu content less than 0.8%. Expts. on the diffusibility of Cu and copper oxide at 1100-1200° show the sepn. of the net of the Cu-rich solid soln. around the Fe crystal, the latter being surrounded by an Fe-rich solid soln. This phenomenon can be observed only in Cu steel. When the cupriferous steel is heated at 1000° for 22 hrs. the surface oxide is removed, and when the Cu content in the surface oxide and in the remaining steel is analyzed, it is found that only 10-20% of the original Cu is contained in the oxide, the Cu content in the unoxidized steel increasing by 5-10%. Microscopic examn. of the heated specimens shows the sepn. of reddish yellow Cu-rich and the brownish yellow Fe-rich solids solns. on the surface, having the thickness of 0.5-1 mm. The same thing can be observed even with low-Cu steels if long annealed. T. discusses the mechanism of the sepn. of these solid solns. K. SOMEYA

Influence of copper on mild steel. SHINKYO KODAMA. Yahata Steel Works. *Seitetsu Kenkyu (J. Study of Ferrous Met.)* 8, 1-23(1928).—In the Yahata steel works it was observed that C steels contg. more than 0.3% Cu form a surface fissure on rolling at 1100°, this tendency being more marked in low-C steels. Microscopic examn. of the fissures of mild steels showed the presence of a substance colored like natural Cu. To study the nature of this substance, thermal and magnetic analyses were made with 32 specimens, the result being in agreement with Ruer's equil. diagram of the Cu-Fe sys-

tem, according to which 0.3% Cu can be completely dissolved in Fe as a solid soln. Test of the diffusibility of Cu in solid Fe at high temp. showed that it is great above 1200° but very small at 1100°, and there is a tendency of Cu entering into the boundary of the ferrite grain to destroy the latter. Similar diffusibility tests with Al, pyrite, S, Pb, Si and Mn showed that the above tendency is peculiar to Cu. Repeated heating of the cupriferous steel, removal of the surface crust, and analysis of the remainder showed that with the progressive increase of the portion removed by heating, there is a corresponding increase of Cu in the remainder. Hence K. concludes that in the surface oxidation of steel, Cu remains unoxidized and enters the boundary of ferrite which is present on the surface and makes the Cu concn. there large, and this constitutes the cause of the fissure formed in hot rolling.

K. SOMEYA

Specific gravity of some tool steels and special steels. SABURO UMINO. Yahata Steel Works. *Denki Seiko (Electro-met. of Steel)* 4, 287-93; *Seitetsu Kenkyu (J. Study of Ferrous Met.* 8, (4) 1-7 (1928).—U. annealed 8 kinds of ordinary tool steels, and 8 kinds of special steels by cooling them from 950° in the furnace, polished and then measured their sp. gr. at 0°. With one or two exceptions the normalized steels show a decrease of sp. gr. of 0.27% on the av. In C steels the increase of C decreases the sp. gr. Some microscopic examn. of the specimens were also made.

K. SOMEYA

Incipient shrinkage in some non-ferrous alloys. J. W. BOLTON AND S. A. WEIGAND. Lukkenheimer Co., Cincinnati, O. *Am. Inst. Mining Met. Eng. Tech. Publication* No. 163, 3-18 (1929).—The literature on soundness of bronze castings is briefly reviewed. Porosity is generally due to intercrystalline fissures, which cause red or brown stains in fractures. The alloy studied contained 6% Sn, 4% Zn, less than 2% Pb, 0.5% Ni, balance Cu. When melted in an atm. contg. much CO this alloy gave unsound castings. Even with a good fracture, the castings might be porous. The porosity occurs as minute shrinkage cavities between the dendritic crystals, which are prominent in this alloy because of the long interval between primary and final crystallization. It is most serious in the central parts of sand-castings, and may be decreased by pouring at the correct temp. and by proper gating. The porosity is increased by gas evolution from the solidifying alloy. The alloy on a large scale was melted and cast under different conditions, and the porosity was detd. by the use of a special test-casting, machined all over. In melting by gas, lowering the CO in the furnace atm. from 6.78 to 0.9% reduced the percentage of porous castings. Melts in an indirect arc furnace showed that the soundest castings were obtained by melting in an atm. contg. below 2% CO, and pouring at about 2200°F. The presence of P, S, Si and other impurities in the bronze had no effect on the porosity. The product of this foundry has been much improved in soundness and strength since reducing atm. have been avoided in melting. Porosity and discolored fractures are not generally due to oxidation. GEO. F. COMSTOCK

Gases in a sample of overpoled fire-refined copper. O. W. ELLIS. Westinghouse, East Pittsburgh, Pa. *Am. Inst. Mining Met. Eng. Tech. Publication* No. 158, 3-7 (1929). A ladle of Cu contg. small amts. of impurities was overpoled with green hard wood, and cast in a small mold. Some absorption of oxide occurred to a depth of 10 mm while the Cu was liquid in the mold, but it was hard to detect any oxide particles below that level. A detn. of the gases extd. from half this ingot showed no N, O, CO or H, and only 5.6% CO₂ and 2.5% H₂O by vol. The gases contained 23.1% C by wt. The absence of CO and H was surprising. The C content of the gas is the same as was found in Cu melted under oxidizing conditions, and perhaps such Cu retains its C content unchanged after being overpoled.

GEO. F. COMSTOCK

Dispersion hardening in copper and silver base alloys. J. L. GREGG. Western Elec Co., Chicago. *Am. Inst. Mining Met. Eng. Tech. Publication* No. 161, 3-7 (1929).—Alloys of Cu with a 3% addn. each of the following were rolled or forged, quenched from 870°, aged at lower temp. for 1 hr., and their final hardness was compared with the hardness as quenched: Ni₃Si, Co₃Si, Mn₃Si, Mg₃Si, Si, Be₃Si, FeSi, FeAl₃, Fe₃Sn, NiAl, Ni₃Sn₃, CoAl, Co₃Sn, CoZn₃, Mn₃Al, Mn₃Sn, Al₃Zn₃, Ni₃Sn. Only the Cu-Si alloys showed significant dispersion hardening, and the only one not previously described by Corson was the Be₃Si alloy. It scaled little on heating, and hardened very rapidly on cold working. When quenched its tensile strength was 52,200, and when aged at 427°, 71,200 lbs. per sq. in. The hardenable Cu-Co₃Si alloys showed max. elec. cond. (about 63%) for the compn. corresponding to no excess of either Co or Si over the proportions in the compd. Co₃Si. Alloys of Ag with 3% of CuAl₃, Cu₃Mg, Cu₃Sb, MgZn₃, Cu₃Cd and CdSb, resp., were quenched from 815°, aged and tested for hardness. Only those contg. CuAl₃ showed marked dispersion hardening. GEO. F. COMSTOCK

Investigation of high-strength brass. II. TOMOJIRO TANABE. *J. Min. Japan* 44, 219-31 (1928). T. has made a detailed investigation of the structure and mech. proper-

ties which results on adding several pairs of such metals as Mn + Ni, Mn + Fe, Mn + Al, Mn + Sn, Ni + Fe and Ni + Sn, to 60% Cu brass. The paper contains extensive exptl. data with a few photomicrographic plates. Among the results the notable findings are: (1) with the alloy made by adding Ni + Al, a suitable heat treatment can give it properties comparable with those of steel. Thus, alloys contg. 2% Ni, 1% Al attain the tensile strength of 81 kg./mm.² by quenching at 800° and annealing at 350°; the alloy contg. 4.7% Ni, 4.0% Al attains the tensile strength of 70–75 kg./mm.², elastic limit 45–50 kg./mm.², 19–14% of elongation and 25–16% of area contraction. K. S.

Gold alloy 750–2. Its behavior after cold working and annealing. W. HEIKE AND F. WÜSTERHOLT. Freiberg i. S. (Berg Acad.). *Z. anorg. allgem. Chem.* **176**, 200–4 (1928).—Alloy 750/2 is 18 karat Au, contg. 75% Au, 4% Ag, 21% Cu. Wires 3 mm. diam. were given 33% cold working and were then annealed at different temps. up to 750°. Below 450° the annealing time was 1 hr., 450–550° 45 mins., and above 550° 30 mins. In one set of tests the wires were cooled in the furnace and in the other quenched in H₂O, and in each case ultimate strength, elongation and reduction in area were detd. With slow cooling ultimate strength is 100 kg./sq. mm. after annealing at 20°, 102 kg./sq. mm. after annealing at 150°, 124 at 280°, 110 at 350°, 105.5 at 450° and 101 at 750°; elongation is 1% after annealing at 20°, 0.5% at 150°, 0.8 at 280°, 2.0 at 350°, 3.4% at 450°, 4.2% at 650° and 2.5% at 750°, while reduction in area is 32.5% at 20°, 16% at 150°, 10.0% at 350°, 12.0% at 550° and 11.5% at 750°. In the quenched samples the ultimate strength falls above 360° from about 100 kg./sq. mm. to 50 kg./sq. mm., while the elongation correspondingly increases from about 2 to 40% at 750°. Reduction in area falls up to about 300°, and then rises very sharply, being about 60% with an annealing temp. of 600°. With slow cooling this alloy is very brittle, probably because of the formation of the compds. AuCu and AuCu₃. These compds. are formed from mixed crystals at 367° and 371°. H. STÖRTZ

The equilibrium diagram of the cadmium-antimony system. TATEJIRO MURAKAMI AND TOSHIO SHINAGAWA. Tohoku Imp. Univ. *Kinzoku-no Kenkyu (J. Study of Metals)* **5**, 283–96 (1928).—M. and S. studied the Cd-Sb system by thermal analysis, elec. resistance and microscopic examn. **Conclusions.**—(1) This system has 2 conditions, metastable and stable. When the velocity of cooling from the melt is great, the β -phase belonging to the metastable system appears and changes into the γ -phase of the stable system during its further cooling; when the cooling is slow, γ -phase is formed directly from the outset. (2) The β -phase is a solid soln. contg. the compd. Cd₂Sb₃ and has the min. temp. 420° on the liquidus line of the metastable system and forms a eutectic with Cd at 395° (54% Sb). (3) The β -phase is present in the range of 40–45% Sb, makes a eutectic change at 250°, decomp. into Cd and Sb (or γ -phase). (4) The γ -phase is a solid soln. contg. the compd. CdSb, and has a max. temp. 456° along the liquidus line of the stable system, forms a eutectic (7.5% Cd) with Cd, and then also forms a eutectic with Sb (59–53% Sb) and slightly decreases its soly. with lowering temp. (6) The solid-soly. limits of Cd in Sb are 0.15% at the eutectic temp. and less than 0.1% at ordinary temp. Also the soly. of Sb in Cd is less than 0.1% at its eutectic as well as at ordinary temp. Investigations regarding the influence of remelting as well as rolling and annealing upon aluminum. E. MAASS AND W. WIEDERHOLT. *Korrosion und Metallschutz* **4**, 245–51 (1928).—Al was remelted at the m. p. and at a temp. 800° above the m. p. and the following properties were detd.: Chem. analysis, sp. gr., hardness, penetrability, acid resistance, corrosion in ammoniacal NaCl in presence of H₂O₂, corrosion in NaCl in presence of H₂O₂. With exception of the tests in the NaCl-H₂O₂ soln. the material which was melted at the low temp. stood up better in chem. tests, while there was little difference in mech. properties. B. E. ROETHELT

Properties of aluminum ingot. GUNJI SHINODA. Kyoto Imp. Univ. *Suiyokuishi* **5**, 593–5 (1928).—S. carried out x-ray analyses and tests of the mech. properties of 99.8% Al ingot from the Aluminum Co. of U. S. A. The result shows that the portion in contact with the metallic mold consists of a large no. of small fibrous crystals but in the portion which is distant from the wall of the mold and is near the surface, there is a large fibrous structure with [110] as its common axis. There is sometimes a large, almost single crystal having a peculiarly regular structure. That the axis along which the development of the crystal takes place coincides in Al (also probably in all metals having a face-centered cubic lattice) with that of the case of recrystn. seems to S. very interesting in that it indicates the similarity of the crystal growth in both cases. The hardness no. measured by "baby Brinell" machine (5-mm. sphere, 30 sec.) is 19–21. The sp. gr. of Al forged at 400°, and annealed for 2 hrs. at 450°, is 2.710, m. p. 659.0°. K. S.

The development of aluminum for automotive purposes. R. S. ARCHER. J.

Soc. Automotive Eng. 23, 149-61(1928).—Development of the production of Al and its alloys and their application to the automotive industry. M. B. HART

Studies in light alloys for casting purposes. IV. KIYOSHI TAKAHASHI. Tohoku Imp. Univ. *Kinzoku-no Kenkyu (J. Study of Metals)* 5, 209-33(1928).—T. took the 4 elements Cu, Zn, Mg and Si, and detd. the effective range of concn. of each element. The alloys made by adding 2 of these elements to Al were made to test their mech. as well as their casting properties. A review of these ternary alloys shows that, in comparison with the case of binary alloys, the tensile strength is great, and although the elongation and area contraction are small, the hardness is large, and especially the casting properties are very good, showing that they are decidedly superior to binary alloys in many respects. On the other hand, the effect of added elements is not necessarily as large as in the case of binary alloys, *i. e.*, the individual effects cancel each other to some extent. For details of this very extensive investigation the original article must be consulted. K. SOMEYA

Drop-hammer method for the study of forging temperature of light alloys. CHUYO HISATSUNE. Kyoto Imp. Univ. *Suiyokaishi* 5, 627-32(1928).—It is well known that there is a suitable forging temp. for Al alloys. This was studied by the drop-hammer test. The test was also made to see whether there is cold- or hot-shortness in the alloy. A light Fe hammer (2 kg.) was dropped repeatedly from the height of 1 m. upon a cylindrical specimen. The ratio of height/diam. of the specimen is 1.5. The deformation is measured at every drop, the contraction only being taken as the measure of forgeability for convenience. Preliminary expt. was made with Al and then the test was applied to duralumin (4% Cu, 0.5% Mn, 0.5% Mg), Y alloy (4% Cu, 2% Ni, 5% Mn, 1.5% Mg), A alloy (English) (3% Cu, 20% Zn) and E alloy (English) (2.3% Cu, 20% Zn, 0.5% Mg, A 5% Mn) in the temp. range: room temp.—600°. From the result H recommends as a suitable forging temp. the following: Al 400-550°, duralumin, 480-520°, Y alloy 480-90°, A alloy 450°, E alloy 350-450°. The thermal brittleness of alloys contg. Zn mentioned by some authors could not be found in this investigation. K. SOMEYA

Equilibrium diagrams of the aluminum-antimony-silicon and aluminum-antimony-copper system with aluminum as their chief constituent. TATSUO MATSUKAWA. Kyoto Imp. Univ. *Suiyokaishi* 5, 596-603(1928).—(1) *Al-Sb-Si diagram*.—Although there are many equil. diagrams proposed for the Al-Sb system, M. recognizes only one compd., AlSb. The eutectic crystals consisting of Al and AlSb, and that consisting of AlSb and Sb are present on both sides of the compd. Since in the Al-Si system there are many reliable investigations, M. did not study it. M. next considered the sections corresponding to Sb 3, 6 and 10% parallel to the Al side, made the thermal analyses of the alloys corresponding to them, plotted the results, and considered the ternary diagram consisting of Al and less than 10% Sb, 20% Si. M. confirmed that the ternary eutectic almost coincides with the binary eutectic of Al-Si and also indicated all the primary surfaces and the primary crystals sepg. from them, and detd. that the univariant reaction occurring on the liquidus surface is $\text{Liq.} \rightarrow \text{AlSb} + \text{Si}$. Many microscopic observations are described to support the result. (2) *Al-Sb-Cu diagram*.—M. did not repeat the study of the Al-Cu system and considers the 3 sections contg. Sb 2%, 4% and 6%. M. made the thermal analyses of the alloys belonging to them. The result obtained was plotted to construct the equil. diagram of the Al side, which is bounded by the straight line passing through the compn. of the compd. CuAl_2 and that of AlSb. Various primary surfaces were detd., the univariant reactions on the liquidus surfaces being $\text{Liq.} \rightarrow \text{CuAl}_2 + \text{AlSb}$, $\text{Liq.} \rightarrow \text{CuAl} + \text{AlSb}$ and $\text{Liq.} \rightarrow \text{CuAl} + \text{CuAl}_2$. At 585°, a new reaction of a non-variant system $\text{Liq.} + \text{CuAl} \rightarrow \text{CuAl}_2 + \text{AlSb}$ was found at Sb 2.5%, Cu 47%, rest Al. The ternary eutectic point almost coincides with that of the Al-Cu binary eutectic. Microscopic observations are described to support these conclusions. K. SOMEYA

Study of the aluminum-copper-nickel system with aluminum as chief constituent. HIROO NISHIMURA. Kyoto Imp. Univ. *Suiyokaishi* 5, 616-26(1928).—The results are given of a number of thermal analyses made with alloys corresponding to 98, 96, 94, 90, 85, 80, 75, 68 and 60% Al and also with many of the alloys corresponding to each of the sections made by connecting the point of Cu 50% in the Al-Cu system and those of Ni 40% of the Al-Ni system. Many sectional equil. diagrams have been constructed from the results, by which N. found besides those invariant reactions occurring at 540-85°, a new invariant reaction occurring at 600°, each being interpreted as $\text{melt} \rightarrow \alpha + \text{CuAl}_2$ + T, melt $\rightarrow \text{NiAl}_3$ + T, melt + $\text{NiAl}_3 \rightarrow \text{NiAl}_2$ + T, where α is a solid soln. contg. Al as chief constituent and T a ternary compd. which was assumed by Bingham and Haughton (*Proc. Roy. Soc.* 99, [A], 47(1921)); (cf. C. A. 17, 2854) to be Cu_3NiAl_3 (or CuAl_3Ni).

Al₃). But N. concludes from the equil. diagram obtained as well as from the measurement of sp. gr. that T is 3CuAl₂.NiAl₃. N. made a detailed microscopic examn. of many of the alloys which had been cooled very slowly so as to reach equil. From the above results N. constructed the equil. diagram, and gives the kinds of primary crystals and the reactions occurring along the 7 univariant liquidus lines. N. gives Cu 32, Ni 0.5, Al 67.5% for the invariant point at 540°, and Cu 23, Ni 4.0, Al 73.0% for the invariant point at 600°, and also the range of compn. for each of the reactions.

K. SOMEYA

Röntgenographic study of the improvement of aluminum alloys. GUNJI SHINODA. Kyoto Imp. Univ. *J. Jap. Min. and Met.* 44, 514-62(1928).—(1) *Improvement of the Al-Si alloys.*—Although the Al-Si alloys contg. 8-13% Si with a small quantity of alkali metals or their salts as flux are generally known as silumin or alpac, and have good properties, there is no definite theory as to the mechanism of their improvement or "modification." S. considers that for the study of the mechanism, the investigation of the case of the addn. of Na only is insufficient, but the cases of addn. of other alkali or alk. earth metals as well as the effect produced when these metals are added to other Al alloys than of the Al-Si system must also be considered, and made his expts. from this standpoint. A comparatively wide and flat part in the surface of fracture when the Al-Si alloy scrap is remelted and remodified consists of the Al dendrite and the silumin structure, the Al belonging to both of these having the axis [110] as the one along which the crystal growth occurs, the plane of the flat part above mentioned coinciding with the face [001]. To study the effect of K salts upon the Al-Si alloys, thermal analyses were made of the alloys to which 5 or 10% of KHF₂ was added and it was found that although the temp. of the beginning of the eutectic crystn. is slightly lowered, there is no clear stepwise change near the eutectic point, so that S. concludes that the solidification of the Al dendrite and the silumin structure occur at almost the same time. Röntgenographic and microscopic investigation give almost the same result as in the case of the NaF addn. When Na₂O₂ is added to Al-Si alloys, a marked improvement occurs, but not so when borax, Na₂CO₃ and K₂CO₃ or their mixt. was added. For the cases where Ca was added to the alloys, S. expected some difference from the case of Na addn., since Al and Ca easily form alloys, and made the thermal analyses of numerous alloys from 2 to 13% Si and detd. a part of the ternary equil. diagram, finding a ternary eutectic (576°) at 11.5% Si, 0.9% Ca. Microscopic study showed that the modified alloy made by Ca addn. is ternary, differing somewhat from that made by Na addn. Measurement of the mech. properties showed that those of the former are all inferior to the latter. (2) *Improvement of Al-Ni alloys.*—Addn. of Na to Al-Ni alloys brings no marked improvement in the Al-Ni alloys. S. also detd. the ternary equil. diagram of the Al side made by adding up to 8% Ca to Al-Ni alloys contg., resp., 2.46 and 10.0% Ni. Al-Ni and Al-Ca systems have binary eutectics, and in the ternary alloy, there is a non-variant reaction near 610°, which is considered by S. to be a ternary eutectic reaction, the approx. compn. of the eutectic being 5.7% Ni, 6.7% Ca, the rest Al. Microscopic examn. shows a close agreement with the above conclusion, and when considered also from the results of x-ray investigation, refinement of the structure occurs in alloys contg. more than 2% Ca, but the refinement is not comparable with the silumin structure. S. considers that in such a ternary alloy, insufficient refinement is obtained, and conversely, the modified structure of the silumin is not of the ternary alloy type. Addn. of Ca does not improve the mech. properties. Finally S. emphasizes the fact that in every case the direction of the axis along which the crystn. of Al develops is always found röntgenographically at [110], in the Al-alloy castings.

K. SOMEYA

A solution of the ternary equilibrium diagram and a contribution to the aluminum-copper-zinc system. MATSUJIRO HAMASUMI AND SACHIO MATOBA. *Tech. Repts. Tôhoku Imp. Univ.* 8, 71-98(1928).—Since the binary equil. diagram can be considered as the assemblage of many soly. curves, the conditions of their intersections being controlled by the phase rule, the authors have proposed a general soln. of the ternary equil. diagram upon the same principle, the soly. curves of the binary system becoming in a wide sense soly. surfaces in a ternary system. By this method the equil. diagrams of the Al-Cu-Zn system, the one by Hanson and Gayler, the other by Nishimura, are both found to be correct from a theoretical point of view, but the Hanson and Gayler diagram is more probable in so far as liquidus surfaces are concerned.

Metallschutz 4, 242-5(1928).—A discussion to show that J. A. N. Friend's colloidal theory of corrosion (cf. C. A. 18, 1461) is incorrect in its assumptions. B. E. R.

Corrosion and metal protection in boiler operation. R. STUMPER. *Korrosion Metallschutz* 4, 217-27(1928).—The problem of boiler corrosion is subdivided into 1) scaling and burning of grates, tubes and superheaters, (2) attack of metals by steam, (3) attack of condenser systems, and (4) corrosion of wetted boiler parts. Scaling and burning of parts are influenced by the structure of the metal, analysis of combustible, and purity of the boiler H_2O . Porous, graphitic irons are most easily oxidized, the oxidation starting at the graphitic particles. S. in coal accelerates oxidation by forming FeS , which loosens structure and fluxes the oxides. Impure H_2O causes scale formation inside the pipes, local overheating and burning out. Steam causes oxidation with formation of H_2 . Introduction of H_2 into the boiler is a possible preventative but too expensive. The corrosion of wetted boiler parts is discussed in the light of the electrochemical theory. The driving force of the reaction is the difference in H_2 and Fe potentials, which is shown to have only a small temp. coeff. Pressure and temp. have opposing tendencies on O_2 soly. and hence on corrosion. Chlorides, sulfates and nitrates of Na, Ca and Mg increase the corrosion in boiler waters; 0.2% NaOH minimizes the boiler corrosion. Too high an alk. tends to cause H_2 embrittlement; this can, however, be remedied by the presence of sulfates. B. E. ROETHLI

Light alloys in aircraft from the standpoint of corrosion. H. SUTTON. *Metal Ind. (London)* 33, 391-4, 417-25(1928).—The corrosion of Al is accelerated by Cl^- . Contact with Cu rivets causes failure due to cells set up. Corrosion often follows soldering due to incomplete removal of fluorides or chlorides used as fluxes. Duralumin usually fails by intercryst. corrosion decreasing static tensile strength and elongation. The tendency for intercryst. corrosion is increased by heat treatment, high-temp. quenching, cold work and inclusions of foreign material. Addns. of Cu or Si decrease corrosion resistance while 2-3% Cu and Ni increase it. Enamels, paints and varnishes protect Al and light alloys. Anodic oxidation affords considerable protection, especially when grease films are also used. Deposits of Ni have been found unsuccessful unless they are very heavy. Zn and Cd have been plated on duralumin. Pure Al coatings on duralumin combine the corrosion resistance of Al with the mechanical properties of the light alloy. Fatigue limits of Al and Al alloys are markedly lowered by corrosion in sea water. Mg has been used in Germany and is found satisfactory when the metal is covered with a film of oil. It is not resistant to marine corrosion. Paints and enamels satisfactory for Al in sea water are useless for Mg or Mg alloys. Dipping in 10-20% solns of $Na_2Cr_2O_7$ or $K_2Cr_2O_7$ improves corrosion resistance and forms films which are good paint bases. B. E. ROETHLI

An apparatus for corrosion testing. V. DUFFEK. *Korrosion u. Metallschutz* 4, 1-3(1928).—A description of a gas-tight app. in which the progress of corrosion is measured by measuring the current flowing between the test piece and a Hg electrode. The app. is said to show when rusting starts and to give in a short time results which are comparable to long-time tests. The app. permits control of the atm. compn. and partial pressure of the gases. B. E. ROETHLI

Relative corrosion of electro- and hot-galvanized steel. W. S. PATTERSON. *J. oc. Chem. Ind.* 47, No. 44, 313T-17T(1928).—Expts. conducted on hot-galvanized and electro-galvanized mild steel showed hot-galvanized material to be more resistant to corrosion in atm., dil. KCl and dil. acids. In cases where a corrosion product was formed little difference was apparent between the two. B. E. ROETHLI

Influence of grain size of brass and bronze upon corrosion resistance. W. KÖHLER. *Korrosion u. Metallschutz* 4, 227-30(1928).—Two brasses 70-30 and admiralty 70-29-1 untreated, and annealed at 450° and 750° for 12 hrs. were treated in hot salt and acid solns. In general, corrosion resistance decreased with higher annealing temps. and more so in the case of the 70-30 brass. B. E. ROETHLI

Prevention of corrosion under water. R. A. BOYD. *Columbian Gasoline Corp. Refiner Natural Gasoline Mfr.* 7, No. 7, 78, 92(1928).—Various methods for preventing corrosion under water are reviewed briefly. M. B. HART

Effect of additions of lime and soda ash to brackish water on the corrosion of iron and steel. H. O. FORREST, J. K. ROBERTS AND B. E. ROETHLI. *Ind. Eng. Chem.* 21, 33-5(1929).—Addns. of lime to waters high in HCO_3^- and Ca cause formations of $CaCO_3$ scales. Waters high in Mg salts require Na_2CO_3 as well as lime to increase pH and supply CO_3^{--} to permit scale formation. A pH of 8.5 or more is favorable to formation of protective scales. B. E. ROETHLI

Coil corrosion. E. L. FISHER. *Bell Laboratories Record* 7, 155-6(1928).—Coils in electromagnetic app. corrode electrolytically in consequence of imperfections in in-

sulation (especially enamel insulation) which permit moisture from the atm. to form an electrolyte with impurities from the coating. Various materials were investigated such as impregnated papers, cotton fiber and coil coverings contg. starch loading materials. These promoted corrosion in presence of moisture. A satisfactory soln. consisted in using insulating material of high quality in addn. to a highly moisture-proof covering on the outside of the coil such as a film of cellulose acetate, which is also heat resistant.

B. E. ROETHELI

Corrosion of aluminum. J. HAUSEN. *Wochschr. Brau.* **45**, 344-7(1928).—Al of over 99% purity is more resistant than the com. form contg. 1% or more of Fe and Si. Local electrolytic action set up by foreign metals is the chief cause of corrosion. Impurities in the form of mixed crystals are harmless. Hence the importance of proper heat treatment to prevent sepn. of crystals or isolated particles.

A. SCHULTZ

Effect of inhibitors on the acid solution of copper and copper alloys. H. O. FORREST, J. K. ROBERTS AND B. E. ROETHELI. *Mass. Inst. of Tech. Ind. Eng. Chem.* **20**, 1369-71(1928).—Cu and various Cu-Zn alloys dissolve in strong HCl with H evolution. Increasing temp. decreases the min. concn. of acid necessary for H evolution. Inhibitors become effective in decreasing the corrosion of Cu and Cu alloys when depolarization by mol. H formation becomes important. A min. concn. of inhibitor is necessary to decrease the soln. rate, greater amts. being of little value. This concn. is unaffected by temp. Inhibitor action consists in the formation of a film of inhibitor substance or reaction product of the inhibitor substance on the metal, thereby decreasing the area effective for depolarization.

Apparatus for wet-magnetic separation of ores, etc. GEORG ULLRICH (to Fried. Krupp Grusonwerk A.-G.). U. S. 1,697,375, Jan. 1.

Preparing ores for roasting. F. L. WILDER, E. MORRIS, E. SCHIFF and E. S. KING. *Brit.* **291,568**, April 6, 1927. Ores are prepd. for roasting by mixing the finely divided

ore with an aluminous binding material such as clay and a soln. of FeSO_4 and shaping the material into forms of large surface such as rings of hexagonal section with axial projections. If the material is low in pyrites, S, pyrites or other S compd. may be added.

Briquetting ores and the like. BRUCK, KRETSCHEL & CO. AND OTTO KIPPE. Austrian 110,246, Mar. 15, 1928. The briquetting of ores and the like by roasting them with iron shavings or other iron waste in presence of water and air, with or without the addn. of salts or acids promoting oxidation and hydration, is facilitated by using the iron in a finely divided state.

Calcination of ores evolving carbon dioxide, particularly spathic iron ore. ANTON APOLD and HANS FLEISSNER. Austrian 109,862, Aug. 15, 1926. In a process of the kind in which hot gases are forced through the ore while the partial pressure of the formed gases is simultaneously reduced, the inlet for the hot gases is arranged above the inlet for the gases which reduce the partial pressure. A shaft furnace with inlets about half way down and at the bottom is suitable.

Apparatus for determining variations in the average size of ore particles in a flow of ore pulp. HERBERT E. T. HAULTAIN. U. S. 1,697,867, Jan. 8.

Reducing iron ores on carriages in channel furnaces. NYBERGS GRUFKÄTBOLAG. Brit. 291,822, Jan. 31, 1927. Ore loaded in carriages is fed through a preheating and roasting zone, where it is desulfurized and strongly heated by combustion of a combustible gas with an excess of air, and is then passed into a "pre-reduction" zone in which reduction by means of a current of reducing gases is begun, and thence into a final reduction zone, where it is subjected to the action of gases contg. CO; gases from this zone are regenerated in recarbonizing furnaces and the excess of gas is wholly or partly supplied to the prereduction zone and then burned in the roasting zone. An app. is described.

Treating various ores, etc. F. L. WILDER, E. MORRIS, E. SCHIFF and E. S. KING. Brit. 291,919, April 6, 1927. Pyritic ores, residues, regulus, hardheads and other materials contg. metals such as Sn, Pb, Zn, Cu, Bi, W, Sb, Fe and precious metals are oxidized, finely ground and treated with NH_3 soln., preferably in the presence of an NH_4 salt such as the carbonate, to remove Cu and W, and the residues, after removal of the ammoniacal liquors and washing, are treated with acid brine for removal of Ag, Zn, Pb, Bi and Sb. Various details of procedure and an app. are described.

Treating iron ores. GRANULAR IRON CO. Fr. 640,917, July 26, 1927. The ore is passed through a no. of sloping rotatable cylinders, the crude ore and the treated ore both acting as hermetically sealing agents.

Treating vanadium ores. IRA M. PAUL (to Metal & Thermit Corp.). U. S. 1,606,923, Jan. 1. V ore in finely divided condition is heated with a hydrated alkali metal sulfide until the latter first melts in its H_2O of crystn. and then solidifies by loss of H_2O . The material may then be leached, the soln. purified by adding $\text{Al}_2(\text{SO}_4)_3$ and the V then pptd.

Treating ores of titanium, zirconium, etc. DEUTSCHE GASGLÜHLICHT AUER-GES. Brit. 291,004, May 23, 1927. Ores of Ti and of Zr and other rare earths are sulfatized with H_2SO_4 and the resulting sulfates are roasted to form oxides. SO_2 and SO_3 evolved are passed over finely divided ores in the presence of O or air to form addnl. sulfates and the partially sulfatized ore is then treated with H_2SO_4 . The process may be carried out in 2 rotary furnaces.

Treating flue gases obtained in smelting lead ores, etc. S. J. WARREN (to J. D. McLachlan). Brit. 291,079, May 28, 1927. Substances in smoke carrying Pb and S are converted into a product similar to "sublimed white lead" by a direct oxidation process, either while still carried by the smoke gases or after sepn. as by bag filters. Air or gases carrying addnl. S may be supplied as necessary to effect the desired oxidation or increase of sulfate content of the product. The Cd present may be rendered sol. but if the added S is in the form of a very stable sulfate the Cd may remain insol. Cf. C. A. 23, 216.

Extracting iron. ERNST DIEPSCHLAG. Ger. 470,015, Dec. 12, 1926. Fe is extd. from ore, slag or other materials by treatment with HCl gas and decomp. the volatile FeCl_2 compd. with H in the warm. The HCl and powd. ore are heated prior to the reaction to about 300° to avoid formation of FeCl_3 .

Separation of metals. PAUL RIBES and LÉON PIROT. Fr. 640,982, Sept. 14, 1927. White metals having a basis of tin are sepd. from bronze turnings by centrifuging in a closed vessel in a chamber heated so as to melt the tin.

Apparatus for separating gold and platinum from rock. A. M. CHEREPUKHIN. Russ. 4583, Feb. 29, 1928.

Recovering gold or platinum carried off during the washing process. S. M. KO-

LESNIKOV. Russ. 4608, Feb. 29, 1928. Sand contg. Au is passed over a 900-mesh sieve. The sifted material drops on to flowing water with a thin crude oil film (100–200 mm. below) whereby small particles of Au are held by the oil, from which they are removed by known methods.

Plant for opening up and washing ores. ILSEDER HÜTTE. Ger. 469,549, Nov. 19, 1928.

Precious metals and copper from cyanide solutions. LIONEL H. DUSCHAK (to Oliver Continuous Filter Co.). U. S. 1,699,350, Jan. 15. Cyanide solns. contg. Cu and precious metals are treated with an amalgam contg. a metal electropositive to Cu such as Zn or Na for a short period to remove the precious metals from the soln. and then treated with a sep. portion of an ama'gam of the same character for a longer period to remove the Cu; the treated soln. is used for treating a fresh quantity of ore.

Flux for aluminum. WILHELM REUSS. Ger. 468,540, Feb. 16, 1928. Addn. to 464,338. Ger. 464,338 describes a flux for Al comprising equal parts of borax, $B(OH)_3$ and caustic alkali. This compn. is now improved by addn. of a salt and of H_2SO_4 . For example, to an aqueous soln. of 10 g. each of borax, $B(OH)_3$ and caustic alkali in 70 cc. water there may be added 15 g. of NaCl and 1 g. of H_2SO_4 of 66° Bé. dissolved in 9 cc. of water.

Granulating molten slag. FRIEDRICH W. E. SPIES. U. S. 1,699,575, Jan. 22. Molten slag is brought into contact with water so as to form a spongy mass and the latter is then exposed to the action of a relatively cool gas stream such as air or steam to convert it into a substantially dry, granular form, suitable for manuf. of cement, bricks, etc.

Improving basic slag. JACOB LUKASCZYK. Ger. 469,609, Oct. 28, 1926. To increase the citric acid soly. of the slag, the Thomas process of steel manuf. is modified by adding to the charge, preferably shortly before the after-blow, a ferrous silicate slag, *e. g.*, reheating-furnace slag or tap cinder, in granular or liquid form.

Centrifugal sand-feeding machine for mold making. WILHELM KURZE. Ger. 469,346, July 31, 1926.

Parting material for foundry molds. CHARLES P. STAMM. U. S. 1,698,972, Jan. 15. Finely ground residual oil shale is used as a parting material.

Spraying device for applying mineral blacking to foundry molds. JAMES DEAN. U. S. 1,697,167, Jan. 1.

Pouring device for a centrifugal mold. CARL BILLAND. Ger. 469,199, Apr. 14, 1927. Details of arrangement.

Molds for casting metals. BRITISH MAXIUM CO., LTD. (Maurice-Noël Lacell, inventor). Fr. 641,962, Mar. 18, 1927. See Brit. 287,164 (*C. A.* 23, 368).

Two-part mold for casting metal boxes. WALTER HADDON and JOHN A. FULLILOVE. Ger. 469,572, Feb. 5, 1926.

Steel molds for centrifugal casting of iron pipes. J. H. UHRIG (to International De Lavaud Mfg. Corp., Ltd.). Brit. 291,759, June 8, 1927. The inner surface of the mold, in zones most likely to crack, is somewhat roughened and preferably also hardened as by a blast of spherical steel shot.

Retaining rod for interior mold pieces. THEODOR WEYMERSKIRCH. Ger. 469,569, Nov. 27, 1926.

Means for lifting the prepared mold from the pattern. SVEND DYHR. Ger. 469,567, May 8, 1926.

Hot top for ingot molds. MAX R. TREMBOUR. U. S. 1,696,986, Jan. 1. Structural features.

Bituminous material for making foundry models. CHEM. FABRIKEN WORMS A.-G. Ger. 469,292, Dec. 9, 1925. Coal pitch and S-contg. material, intimately mixed with the correct quantity of powd. kaolin or loam for setting, is used for the models. The brittleness is diminished by adding resin or wax.

Apparatus for molding bearing cages or other metal articles under pressure. HERMANN BARTHEL. U. S. 1,698,010, Jan. 8. Structural features.

Casting machine using compressed gas. JOSEPH SOSS. Ger. 468,621, July 10, 1924.

Centrifugal casting machine. SAND SPUN PATENTS CORP. Ger. 469,571, Sept. 13, 1925.

Centrifugal casting apparatus for making bearings or similar articles. NATHAN M. LOWER, WILLIAM H. STEELE and LOUIS P. MORRIS. U. S. 1,699,848, Jan. 22.

Apparatus for manufacture of die castings. CONRAD VAUGHAN. U. S. 1,697,741, Jan. 1. Structural features.

Apparatus for casting hollow ingots. HEINRICH LEMCKE. U. S. 1,698,308, Jan. 8.

Apparatus (with movable furnace and mold) for casting metal in molds. ROBERT KOLB. U. S. 1,698,441, Jan. 8.

Casting metal articles in molds. AUGUST KADOW (to Vacuum Casting Co.). U. S. 1,699,592, Jan. 22. Mech. features.

Casting iron or other metals in rotary molds. ROBERT B. DALE. U. S. 1,698,624, Jan. 8. Mech. features.

Casting gray iron. MASCHINENFABRIK ESSLINGEN. Brit. 291,112, May 27, 1927. In a casting process as described in Brit. 260,990 (C. A. 21, 3342), the C content is maintained unaltered for all, or sep. groups of, compns. and for all wall thicknesses and only the Si content is varied (increasing as the thickness decreases, according to a diagram which is given).

Casting steel tires on cast-iron car wheels or other metal articles without cracks, fissures or undue stresses. CERROL E. REINHARDT. U. S. 1,699,120, Jan. 15. Sufficient pressure is applied substantially throughout the period of solidification over all parts where greatest obstruction to normal contraction occurs, to prevent formation of fissures, cracks or undue internal stress. An app. is described.

Casting gears or like articles of manganese steel with soft-iron centers. WALTER H. NOURSE (to Electric Steel Foundry). U. S. 1,697,470, Jan. 1. Mech. features.

Casting automobile fittings from light-metal alloys. AUGUST SCHUSTER. Ger. 469,627, Sept. 14, 1927.

Unhardened castings formed in rotating metal molds. HENRI DOAT (to Compagnie générale des conduites d'eau). U. S. 1,699,612, Jan. 22. While the mold is rotating and before the introduction of the molten metal, a loose powder of ferro-Si alloy is introduced into the mold and the powder is held against the interior surface of the mold by centrifugal force; this protects the mold during casting and converts the white cast metal with which it contacts into gray cast metal without large excess of cementite.

Manufacture of pipes by centrifugal casting. CARL BILLAND. Ger. 469,570, Feb. 3, 1926.

Crucibles for molten metals. COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 641,148, Sept. 20, 1927. Crucibles are made impermeable to molten metals by impregnating them with a liquid contg. C such as tar or pitch, then baking them to remove volatile constituents of the liquid.

Preventing sticking or freezing of foundry ladle plugs. WERNER STUDTE. Ger. 469,573, Sept. 28, 1926. The plug is impregnated with an easily inflammable material, e. g., gilsonite, which burns while the ladle is in use.

Furnace for heat-treatment of metal articles, etc. HARRY P. McCANN. U. S. 1,697,129, Jan. 1.

Muffle furnace for heat treatment of metals. A. SMALLWOOD and J. FALLON. Brit. 291,270, Sept. 20, 1927. Structural features are given of a furnace comprising preheating, heating and cooling sections.

Crucible furnace. ANTON SCHAUER and HERMANN FRITZ. Aust. 109,688, Jan. 15, 1928. The heating gases circulate through an annular space, the bottom surface of which supports the crucibles and is rotatable.

Fusion furnace for copper, manganese, etc., using liquid fuel. GEORGES REGNAC-P. Fr. 641,556, Aug. 12, 1927.

Pit furnace suitable for heating ingots. GOTTFRIED KEHREN. U. S. 1,698,367, Jan. 8.

Smelting furnace. MAX KIENE, JR. Ger. 468,463, July 1, 1926. A smelting furnace having an inner trough is fitted with independent burners for the internal and the external heating of the trough, the burners for internal heating being movable.

Cupola furnace suitable for melting pig iron, steel, scrap metal, etc. G. SIMON. Brit. 291,248, July 21, 1927.

Metallic lock for the discharge opening of a cupola furnace. D. I. YERSHOV. Russ. 1897, Mar. 31, 1928.

Martin furnace with air-cooled cupola and supports. I. V. LEONT'EV-LEVIN. Russ. 5092, Apr. 30, 1928.

Tunnel furnace for annealing. H. A. PROCTER. Brit. 291,570, April 9, 1927. Structural features.

Tunnel annealing furnace suitable for heating wire coils. BRITISH FURNACES, LTD. AND E. W. SMITH. Brit. 291,909, March 23, 1927.

Continuous furnace for heating small metal articles to effect hardening, annealing, etc. R. M. HEAMES, H. STARK and B. W. LINDQUIST (to Surface Combustion Co.). Brit. 291,446, June 2, 1927.

Furnace, quenching tank and associated apparatus for hardening shafts such as

automobile rear axles. HARRY O. LANG and JOHN McGEORGE (to General Motors Corp.). U. S. 1,697,820, Jan. 1.

Apparatus for heat treatment of bars of tungsten or other metals. EMILIO ROMANELLI (to Westinghouse Lamp Co.). U. S. 1,698,824, Jan. 15.

Furnace suitable for heating long metal bars or tubes. A. SMALLWOOD and J. FALLON. Brit. 291,153, Feb. 25, 1927.

Furnace for heat-treating wire. OSCAR C. TRAUTMAN. U. S. 1,700,002, Jan. 22

Heat treatment of metal wire. A. G. BROWN, BOVERI ET CIE. Swiss 127,086, June 2, 1927. The treatment is carried out in an elec. heated oven having tubes for the inlet and outlet of indifferent gas and perforated partitions of good heat-conducting material on which the layers of wire are placed.

Heat treatment of metal bands. MANSFELD AKT.-GES. FÜR BERGBAU UND HÜTTENBETRIEB AND OTTO BUSSE. Swiss 127,087, June 11, 1927. The bands are heated on a heat-resistant support arranged above the furnace hearth and capable of taking up impurities, splinters, etc., from the bands. The support may be an endless belt of asbestos on which the bands are conveyed through the furnace. Cf. C. A. 23, 89.

Heat treatment of ball races or other metal articles. A. HILGER, LTD., AND F. TWYMAN. Brit. 291,483, Jan. 27, 1927. Heat is applied during the cooling of the heated articles, to prevent too rapid cooling; an app. is described in which the articles are handled automatically and continuously by electromagnetic force generated by the elec. heating means.

Iron penetrable by nails, etc. J. HUNDHAUSEN. Ger. 469,626, Apr. 17, 1927. Iron is made penetrable by nails or screws by incorporating heat-resistant non-metallic substances, e. g., SiO_2 , Al_2O_3 , MgO , talc, graphite, or asbestos in such a way that they appear in strips on the surface of the finished product.

Hardening iron or steel. DEUTSCHE GOLD UND SILBERSCHNEIDANSTALT VORM. ROESSLER. Brit. 291,423, June 4, 1927. A process as described in Brit. 277,030 (C. A. 22, 2351) is carried out at temps. of 900° or higher and local overheating of the bath is avoided by adjusting the heating flame so as to avoid pointed flames, and the addn. of a froth-preventing agent is dispensed with. The surface of the bath may be protected from the air by a protective layer which may be formed by adding graphite. Cf. C. A. 23, 368.

Hardening composition for iron and steel. FRANZ KRUSEK. Aust. 111,239, June 15, 1928. The compn. comprises 54-36% powd. wood charcoal, 22-26% NaCN , 10-15% colophony, 12-18% graphite, and 2-5% NH_4Cl . It can be applied either in case-hardening processes or by blazing off.

Steel. F. SIEMENS A.-G., R. DURRER, F. C. SIEMENS and A. SPRENGER. Brit. 291,717, Dec. 24, 1926. In producing steel in a Siemens-Martin furnace, dust from coal poor in gas, semi-coke or "poor coal" or coke is introduced into the furnace at least from the termination of the refining stage so as to form a protective layer over the bath. Various details and modifications of operation are described.

Steel ingots. CHARLES A. PARSONS. Fr. 641,505, Sept. 27, 1927. Molten steel is poured into a mold of greater length than height, a thick refractory material covering the sides of the mold, and the base being of large dimensions and in metal. The mold is heated before pouring in the metal to about the temp. of the molten metal, and the upper surface of the metal is heated continuously so that it is last to solidify. Heaters may be built into the sides of the mold.

High-speed steel. HERMAN J. BIEFANG. U. S. 1,699,683, Jan. 22. In order to facilitate hardening of high-speed steel it is immersed in a molten bath of Cu 7 and Pb 1 part for about 20 mins. in the case of a piece 0.5 in. thick, at a temp. between the m. p. of the bath and about 980° .

Hollow rock drill steel. LESLIE PRYCE. U. S. 1,697,086, Jan. 1. See Can. 284,179 (C. A. 23, 592).

Manufacture of chrome steel. EMIL HERGET. Aust. 110,259, Mar. 15, 1928. The manuf. of Cr steel from a mixt. of Cr_2O_3 and ferrosilicon is carried out, without other addns., in a furnace without an acid lining.

Vanadium steel. ALEXANDER L. FEILD (to Electro Metallurgical Co.). U. S. 1,697,759, Jan. 1. Uncombined V oxide is brought into contact with a steel bath in the presence of only such reducing agents as are normally present in a steel bath and the material is maintained in molten condition for a sufficient time to permit the desired quantity of V to become incorporated in the steel.

Nickel manganese steel. CHARLES MCKNIGHT, JR., THOMAS H. WICKENDEN and PAUL D. MERICA (to International Nickel Co.). U. S. 1,697,130, Jan. 1. An alloy steel capable of developing in heavy sections high physical properties and ductility, by mild

heat treatment, and suitable for heavy forgings, etc., contains Ni 0.5-3.5, C 0.1-0.6 and Mn 0.9-2.0%.

Tempering powder for steel. ENGELBERT GASTINGER. Austrian 110,591, Apr. 15, 1928. The powder contains beech-wood charcoal 50, anthracite 20, Na_2CO_3 25 and NaNO_3 5%.

Apparatus for heat treating steel, etc. JOHN B. DAILEY. U. S. 1,697,811, Jan. 1.

Alloy. FRIEDRICH EICHLEITER. Austrian 111,204, June 15, 1928. A resistant alloy, particularly for the condenser tubes of marine engines, comprises 48-55% Cu, 3-10% Ni, 0-3% Mn, 1-2% Fe, 0-1% Al and the remainder Zn, the amt. of Zn being over 40%. The preferred compn. is Cu 52, Ni 3, Mn 1, Fe 1, Al 0.5 and Zn 42.5%.

Alloys. ALFRED KROPP. Swiss 127,586, Jan. 15, 1927. Alloys of high m. p. contain C, W and at least one other metal. The proportions are 1.5% C, 50% and upward W, and 0.5 to 50% Mo, Ta, Co, Cr, Ni, Fe, V and Si. Cf. C. A. 22, 1568.

Alloys. FRIED. KRUPP A.-G. Fr. 642,203, Oct. 12, 1927. Alloys to be used for tools, etc., contain the heavy metal forming the principal constituent in the form of the carbide but contain no free graphite. Thus, W is carburized with the calcd. amt. of C in an elec. furnace in an atm. of H, and the carbide is utilized by adding the required amt. of softer metals. Fr. 642,204 describes a method of making an alloy whose fracture at a magnification of 50 does not show pores. Thus, a heavy metal, e. g., W and a softer metal such as Co are separately ground so that each particle is less than 10^{-4} mm.; the W is carburized, ground as before and mixed with the Co and again ground, after which the articles to be made are formed in a press and submitted to a fritting.

Alloys. WILLOUGHBY S. SMITH, HENRY J. GARNETT and JOHN A. HOLDEN. Fr. 641,620, Sept. 28, 1927. Alloys of the Fe group are made by introducing an ore or oxide of the metal or metals of the alloy with a reducing agent into the charge of molten metals, the reduction preferably taking place in a reducing atm. without a slag. To make, e. g., an anti-rust Fe contg. 12% of Cr, steel is melted in a reducing atm. in an induction furnace, and calcined powdered chromite mixed with a reducing agent such as terosilicon is added. After the chem. action has taken place the slag formed is removed and the cycle of operations continued until the desired alloy is produced. Fr. 641,621. See Brit. 282,901 (C. A. 22, 3877).

Alloys for fusing in or on glass. HERAEUS-VACUUMSCHMELZE A.-G. Ger. 469,630, June 8, 1927. Fe-V alloys contg. 20-30% V, or Fe-Cr-V alloys contg. 10-40% Cr and 20-50% V are used.

Treatment of copper-beryllium alloys. SIEMENS & HALSKE A.-G. (Georg Masing and Otto Dahl, inventors). Ger. 468,688, May 22, 1926. Cu-Be alloys contg. 0.5-11% Be, with or without other addns. such as Zn up to 25%, or Ni, Al or Sn up to 10%, are improved as regards hardness and resistance to corrosion by heating them to above 600° and rapidly cooling. The alloys may be further modified by heating at 150-500°.

Alloys for making springs and parts of plants subjected to friction, especially electrical contacts. SIEMENS & HALSKE A.-G. (Georg Masing and Otto Dahl, inventors). Ger. 469,218 and 468,219. May 23, 1926. Addns. to 468,688. Cu-Be alloys treated according to Ger. 468,688 (preceding abstract) are used.

Fusible alloys for use in safety devices. RUDOLF KELLER. Swiss 127,385, Nov. 9, 1926. Sn-Pb alloys for use in safety devices are improved by addn. of Sb, suitably in amts. of 2-15%, whereby the interval between the m. p. and the softening point of the alloys is diminished. Addns. of Bi and Cd may also be made.

Alloy for high-speed tools. PERCY C. CHESTERFIELD (to Chesterfield Metal Co.). U. S. 1,698,935, Jan. 15. Alloys are formed contg. Co 15-50, Ni 7-30, Cr 20-45 and Mo 35%, together with a small quantity of C (suitably about 0.5-3.5%). U. S. 1,698,936 describes alloys contg. Co 15-55, Ni 7-30, Cr 20-45, together with a metal not of Cr group such as V capable of forming a hard carbide and having a m. p. between 1000° and 2100°, with a small quantity of C (suitably about 0.5-3.5%).

Alloys suitable for high-speed tools. PERCY C. CHESTERFIELD (to Chesterfield Metal Co.). U. S. 1,698,934, Jan. 15. Alloys are formed contg. Ni and Co which together constitute about 40% of the alloy, together with about 30% each of Cr and W and some C (suitably about 0.5-3.5%).

Aluminum alloys. COMPAGNIE DE PRODUITS CHIMIQUES ET ÉLECTROMÉTALLURGIQUES ALAIS, FROGES ET CAMARGUE. Fr. 641,200, Mar. 2, 1927. Wires of Al alloys such as Al Mg₂Si, Al-Cu, Al-Li, etc., are made suitable for elec. conductors by raising them to a temp. of 150-175° after tempering and before cold-hammering.

Aluminum alloy. VEREINIGTE ALUMINIUM-WERKE A.-G. Fr. 641,005, Sept. 15, 1927. An Al alloy resistant to corrosive agents and sea water contains 0.05-1% of Ti and 1 to 6% of Mg. The Ti may be alloyed in the electrolytic bath.

Improving objects of aluminum or its alloys. BOHUMIL JIROTKA. Ger. 469,534, June 8, 1926. The appearance of objects of Al or its alloys is improved by immersing them in a bath of concd. HNO_3 or in a bath contg. HNO_3 and heavy-metal salts. According to the nature and concn. of the bath, brighter, duller, or iridescent durable surface layers of different colors may be obtained. E. g., an iridescent green surface layer is obtained by immersion for about 1 hr. in a bath comprising 5 g. $\text{Cr}_2(\text{SO}_4)_3$ dissolved in 50 cc. H_2O and mixed with 1 l. HNO_3 of sp. gr. 1.40.

Forge-iron alloy. THE INTERNATIONAL NICKEL COMPANY. Fr. 642,626, Oct. 20, 1927. The physical properties of forge iron are improved by the addn. of 0.25–5% of Ni, up to 1% of Cr or Mo, or Cu may also be added. The content of C should be below 0.08%.

Method for obtaining decarbonized iron-carbon alloys, particularly cast iron, in the cupola furnace. A. P. VOLKOV. Russ. 4628, Feb. 29, 1928.

Heat-resisting alloy containing iron, chromium and nickel. NOAK V. HYBINETTE. U. S. 1,698,098, Jan. 8. Alloys which are highly resistant to oxidation when heated contain approx. 30% Cr and 35% Ni, the remainder of the alloy being principally Fe. The alloys are heat resistant at high temps. in the presence of alkali salts. Cf. C. A. 22, 3128.

Bearing alloys containing lead. W. J. MERTEN (to Metropolitan-Vickers Electrical Co., Ltd.). Brit. 291,462, June 4, 1927. Alloys such as bronzes contg. Sn 2–10 and Pb 10–28% are melted with CaC_2 in order to effect uniform distribution of the Pb. About 2% of the CaC_2 is sufficient.

Magnesium and its alloys. GILBERT MICHEL (to Hart O. Berg). U. S. 1,698,647, Jan. 8. In purifying Mg and its alloys, complexes with the oxychlorides and oxides in the bath are formed by admixture with MgF_2 acting as the main purifier and the complexes are collected at the surface of the bath.

Treatment of alloys containing silicon. OTTO H. DÖBNER. Swiss 126,451, Apr. 11, 1927. The elec. properties of the alloys are improved by subjecting them once or more to "critical cold working" followed by heating to the recrystn. temp., which must be ascertained. In connection with "critical cold working" cf. A. von Vegesack, *Stahl u. Eisen*, 1923, 1280.

Tungsten alloys. HENRY L. COLES and JOSEPH G. DONALDSON (to Guardian Metals Co.). U. S. 1,698,212, Jan. 8. Alloys contg. over 60% W and contg. 10–25% Ni and which also may contain C or carbides and Cu are incased in a different metal such as Cu which has a materially higher heat cond. than the W-Ni alloy, in order to form composite plates for safe or vault walls, etc.

Alloy steels. JOHN L. ANDREN. U. S. 1,699,731, Jan. 22. A mixt. of Fe ore, ore contg. alloying metal such as Mn, Cr, Mo or V, approx. the quantity of coal required to reduce the ores and give the desired C content in the finished product is heated to a temp. sufficient to reduce the ores but below the m. p. of the metals in an externally heated container, and the metals are thereafter melted.

Steel alloys. JOHN HARRIS. Fr. 641,852, Oct. 5, 1927. A steel alloy for articles resistant to heat contains Fe and Cr 16, W 4.5, Si 0.7, Mn 0.8, S 0.006, P 0.004, Ni 5.5, C 1.75. The above figures may be varied somewhat.

Ferrocerium. SIGMOND GOLDFINGER. Fr. 641,940, Mar. 14, 1927. Ferrocerium is made unalterable by treatment in a galvanoplastic bath contg., e. g., double sulfate of Ni and NH_4 725, $(\text{NH}_4)_2\text{SO}_4$ 225 and citric acid 25 g. in 10 l. of water. The impurities are removed and a coating is deposited in the pores.

Brass. OTTO JUNKER. U. S. 1,699,665, Jan. 22. Brass-forming metals comprising more than 63% Cu and less than 37% Zn are melted in the presence of soot and stirred while molten to effect thorough deoxidation.

Core for use in making hollow metal rods. A. P. PEHRSON and F. LLOYD. Brit. 291,147, Feb. 24, 1927. In forming hollow metal rods or bars by rolling, forging or drawing, from hollow billets, blooms or ingots, a core is used comprising an asbestos tube or cylinder filled with friable material such as sand. Cf. C. A. 22, 1323.

Hollow metal bars. R. A. BEDFORD. Brit. 290,951, Feb. 7, 1928. In making hollow metal bars such as those formed of tool steel by rolling a hollow billet on a core of ductile metals such as Cu, the core, after insertion in the billet and before rolling, is compressed, to avoid tendency of the billet during rolling to produce "blind" or waste ends. Various mech. features are specified.

Hollow metal bars. A. P. PEHRSON, F. LLOYD and L. T. BREARLE. Brit. 291,161, Feb. 28, 1927. In the manuf. of hollow metal bars by reducing a billet on a core of austenitic steel as described in Brit. 273,008 (C. A. 22, 1754) the billet and core are heated to different temps. prior to reduction in order that the core may be readily elongated

during the reduction and may be of the required ductility for withdrawal from the finished bar. The core may be heated to about 1150–1250° and the billet to about 950–1100°.

Cold rolling of metal bands or strips. O. BUSSE. Brit. 291,323, Dec. 3, 1927. A cooling liquid (suitably heavy oil or glycerol or a mixt. of oil and water) is supplied directly to the roll surfaces. An app. is described.

Detection of unhomogeneous spots in metals with x-rays. E. Z. KAMINSKII. Russ. 3703, Sept. 30, 1927.

Fusing aluminum waste. KURT ALBRECHT. Swiss 127,078, June 30, 1927. Flawless ingots are obtained from Al waste by fusing it in a bath of a mixt. of NaCl, NaF and CaF₂ which is specifically lighter than Al. A suitable bath comprises 60 parts NaCl, 3 parts NaF and 1 part CaF₂, this mixt. melting at 740–760°. The packed waste may be preheated and cleaned by the gases and vapors evolved from the bath.

Working zinc foil. GEBRÜDER REISS. Austrian 110,841, May 15, 1928. In working Zn foil, especially in making hollow bodies of light wt. for pocket batteries, the tendency of the metal to tear is overcome by using, instead of oil, an aq. soln. of soap and soda, with or without glycerol. A suitable soln. comprises 50–60 g. curd soap and 30 g. soda in 500 g. water, to which 30 g. glycerol may be added.

Treatment of non-ductile metals. RUDOLF AUERBACH and WILHELM STEINHORST. Ger. 469,358, Mar. 8, 1928. Non-ductile metals such as Cr are powdered and mixed with a binding agent, *e. g.*, gelatin, and the mixt. is pressed through nozzles into a hardening agent, *e. g.*, Cr alum soln., fibers or bands being so obtained. Reference is made to the similar treatment of mixts., *e. g.*, Cr and Ni and C, or Cr, Fe, Ni and C, and to the manuf. of alloys from the products.

Spherical metal particles. EMIL PODSZUS and ERWIN KRAMER (to Hartstoff-Metall A.-G. (Hametag)). U. S. 1,699,205, Jan. 15. Flake-shaped particles of metal are subjected to an operation such as a rubbing and rolling together in a cylinder which will gradually turn over their edges and convert the particles into hollow spheres which are suitable for making magnet cores, dynamo brushes, etc.

Mercury. ITALO CAVALLI. Fr. 641,178, Sept. 22, 1927. Hg is extd. from poor ores or waste by concg. the finely divided material by levigation and treating with a soln. of NaOCl, which oxidizes the HgS to HgSO₄.

Machine for testing the tensile strength of tin. RENÉ GUILLERY. Ger. 469,058, Feb. 15, 1927. Details of construction.

Manufacture of iron sheets containing silicon or boron, especially core sheets. SIEMENS & HALSKE A.-G. Ger. 469,368, Jan. 10, 1925. Thin sheets of Fe are treated at a raised temp. with gaseous compds. of Si or B with H. The Si or B pptd. on the sheets may be incorporated by tempering *in vacuo*.

Apparatus for quenching articles of ferrous metal. ROY H. SMITH. U. S. 1,698,858, Jan. 15.

Ferrous metal containing molybdenum. WILLIAM H. PHILLIPS (to Molybdenum Corp. of America). U. S. 1,697,083, Jan. 1. A hard, tough coherent and adherent nitrogenized surface is formed on articles of ferrous metal contg. Mo. The Mo facilitates the nitrogenization and lessens the time required for it. Al may also be added.

Magnetic material. WESTERN ELECTRIC Co. (Standard Telephones & Cables, Ltd.) Brit. 290,736, Feb. 19, 1927. A magnetic material which can readily be reduced to fine particles for forming cores of telephone loading coils and the like is made from a Ni-Fe alloy contg. at least 10% of Fe or Ni by adding to the molten material a substance (such as Sb 5–8%) which will render it brittle. Numerous details of treatment including use of deoxidizers, etc., are given.

Metallic reflectors. WILLIAM E. WUELKER. U. S. 1,697,216, Jan. 1. After cleaning a metal reflecting surface such as Al the metal is treated or pickled (suitably with H₂SO₄ and HNO₃), polished and then brushed with a wire brush. The process is suitable for making reflectors of spotlights, etc.

Gramophone needles pointed with chromium. G. GÖFLER (to W. Tuchmann). Brit. 291,755, June 8, 1927.

Coating metals. MAX LEHNIG. Fr. 641,349, Sept. 23, 1927. A coating on metals which is resistant to chem. influences is composed of a mixt. with artificial resin or substances forming it of an emulsion of sol. glass, clay, metallic oxides, Si compds. or other mineral substances. The final hardening preferably takes place in a bath of oil of high b. p., *e. g.*, castor oil.

Smooth metal coatings, particularly for photographic purposes. MAX ULRICH SCHOOP. Swiss 127,548, June 14, 1927. Finely powd. metal intimately mixed with

explosive gas is blown on to the object and melted. The app. comprises a mixing nozzle into which the powder and gas are conducted.

Protecting adsorption vessels against corrosion. WACLAW DEMEL. Ger. 468,389, Oct. 16, 1926. Iron adsorption vessels, for instance vessels in which gasoline is adsorbed in active charcoal, are protected against corrosion by fixing to the inner wall of the vessel, to the grate carrying the charcoal, and to the heating coil a no. of pieces of a metal more electropositive than iron, such as Zn. It is found that these pieces are preferentially corroded.

Rust-removing compositions. I. G. FARBENIND. A.-G. Ger. 468,598, Jan. 6, 1926. Addn. to 466,077. Rust-removing compns. prepd. according to Ger. 466,077 are improved by addn. of a soln. of a fatty acid in an org. solvent, particularly a soln. of oleic acid in hexalin. The addn. prevents re-formation of rust.

Rust-removing compositions. I. G. FARBENIND. A.-G. Ger. 468,599, May 29, 1926. Addn. to 466,077. Rust-removing compns. prepd. according to Ger. 466,077 are improved by addn. of substances which delay the drying of the compn. on the treated surface. Suitable addns. are CaCl_2 , MgCl_2 , PhOH , glycerol and glycol.

Galvanizing bath heated internally by heat-conducting bars of iron and aluminum. N. K. TURNBULL. Brit. 291,961, June 14, 1927. Structural features.

Plating rustless chrome or chrome-nickel steel with iron or other base metal. GUSAV SEIDL. Austrian 110,685, Jan. 15, 1928. The plates to be united are encased in iron coated with Al, Cr or Ni, or in rustless steel, before introducing them into the smelting furnace.

Aluminum plating and welding sheet iron. FRANZ JORDAN. U. S. 1,699,434, Jan. 15. Sheet iron is plated with Al and pieces of the plated material are elec. welded without addition of other welding materials at a temp. at which the iron melts and the Al is converted into oxide which is permitted to combine with molten iron to effect the welding.

Welding iron. BOHLER & Co. A.-G. Austrian 109,975, Feb. 15, 1928. The welding pieces contain 0.1 to 15% Al.

Solder. JAMES SILBERSTEIN (to Westinghouse Elec. & Mfg. Co.). U. S. 1,699,761, Jan. 22. A solder suitable for use with Cu comprises Ag 0.25-5 and Cu about 0.25-10%, together with Pb and minor impurities. The solder m. 301-325°.

Solder for cast iron and other metals, for surfacing them. JEREMIAH BUTLER (one-half to Isaac P. Walton). U. S. 1,697,714, Jan. 1. A compn. suitable for soldering or welding cast iron is formed of ground steel 3, pure Pb 1.5, block Sn 1.5, flux of steel and emery (approx. equal proportions) 2, tobin bronze 1.5, plaster of Paris 1, borax 1, Epsom salt 1.5 and salt 0.5 part.

Flux-cored solder. JOHN H. ADAMS (to Western Electric Co.). U. S. 1,697,815, Jan. 8. Extruded soldering material is made with a core of enamel-removing flux comprising naphthalene 1 and rosin 2 parts.

Composition for soldering aluminum. JEREMIAH BUTLER (one-half to Isaac P. Walton). U. S. 1,697,715, Jan. 1. Steel filings 16, block tin 400, steel 0.5, borax 3.5, plaster of Paris 4, salt 16 and Ag 12 oz.

Soldering stick. HERMANN A. MEINHARDT. U. S. 1,699,438, Jan. 15. An outer casing of soldering metal contains a core of soldering metal of higher m. p. than that of the casing, and the core also carries a fluxing agent. Cf. C. A. 22, 3625.

Electrodes for arc welding. COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 640,991, Sept. 15, 1927. The properties of the electrodes are improved by immersion in a bath of molten NaNO_3 , KNO_3 or $\text{Ca(NO}_3)_2$.

Coating electrode for arc welding. D. A. DULCHEVSKII. Russ. 4708, Feb. 29, 1928. Electrodes are coated with a mixt. of 25-75% of vegetable sugar and 75-25% of lime.

10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

Reactions of simultaneous reduction and oxidation, and isomeric transformations. A. E. FAVORSKII, V. VASIL'EV, A. I. UMNova, E. KOCHERGINA AND E. VÉNUS-DANILOVA. *J. Russ. Phys. Chem. Soc.* 60, 369-414(1928).—See C. A. 22, 3136, 4199, 4472, 4473. E. J. C.

The synthesis of methane from carbon monoxide and hydrogen by nickel. H. A. BAHR AND TH. BAHR. *Ber.* 61B, 2465-9(1928).—A mixt. of CO-H_2 in a ratio of 1:3 is passed over a Ni_3C catalyst at 250°. This catalyst is much less sensitive than Saba-

tier's Ni catalyst for the same reaction. The Ni_3C catalyst is pyrophoric and therefore must be handled in an atm. of inert gas, as N_2 . The reactions occurring are: $2\text{CO} + 2\text{H}_2 = \text{CH}_4 + \text{CO}_2$; $\text{CO} + 3\text{H}_2 = \text{CH}_4 + \text{H}_2\text{O}$; $\text{Ni}_3\text{C} + 2\text{H}_2 = \text{CH}_4 + \text{Ni}_3$; and $2\text{CO} = \text{C} + \text{CO}_2$. After a short period of operation the initial catalyst Ni_3C is reduced to Ni, but again reacts to give Ni_3C . The main reactions are (1) $\text{Ni}_3 + \text{CO} = \text{Ni}_3\text{C} + \text{O}$ and (2) $\text{Ni}_3\text{C} + 2\text{H}_2 = \text{CH}_4 + \text{Ni}_3$. J. H. PERRY

Formation of allyl alcohol. Preparation of formates of glycerol. RAYMOND DELABY AND PIERRE DUBOIS. *Compt. rend.* 187, 767-9(1928).—Allyl alc. is obtained from glycerol by the HCO_2H method with higher yields than reported in the literature. [No figures are given but the method is claimed to be even better than that given by Kamm and Marvel, *Org. Syntheses* 1, 15. ABSTRACTOR.] The formation of formates as intermediary products is evident since the following compds. were isolated: a monoformate of glycerol, b_{10} 154-7°, d_4^{20} 1.3052, $n_D^{12.5}$ 1.4614; a diformate (chief reaction product), b_{18} 148-9° d_4^{20} 1.3209, $n_D^{23.4}$ 1.4492. No triformate was observed. Syntheses have been made of: 1-glyceryl formate, from the 1-chlorohydrin and HCO_2Na ; it is unstable, decomp. 150° during vacuum distn.; 1,3-glyceryl diformate, from 1,3-dichlorohydrin, b_{11} 144-6°, d_4^{20} 1.3218, $n_D^{18.3}$ 1.4486, very hygroscopic, sol. in EtOH , Me_2CO , little sol. in Et_2O , insol. in C_6H_6 ; 1,2-glyceryl diformate, from 1,2-dibromohydrin, b_{17} 151-3°, d_4^{20} 1.3252, d_4^{17} 1.3214, n_D^{17} 1.4503, same soly. characteristics as the 1,3-compd. The yields of these syntheses are very poor. ALBERT L. HENNE

The preparation of neutral sulfuric esters. R. LEVAILLANT. *Compt. rend.* 187, 130 2(1928); cf. *C. A.* 22, 3880.—Adding PrOH to SO_2Cl_2 (I) in the cold gives 70% PrOSO_2Cl (II), b_{16} 65°, b_4 44°, $n_D^{19.6}$ 1.4214, $d_4^{17.5}$ 1.288. PrNO_2 with II at 80° gives 32% Pr_2SO_4 , b_4 90-94°. I with $\text{HOC}_2\text{H}_4\text{Cl}$ gives 70% $\text{ClC}_2\text{H}_4\text{OSO}_2\text{Cl}$ (III), b_{23} 101°, d_4^{20} 1.4587, $d_{20.8}$ 1.552. $\text{ClC}_2\text{H}_4\text{NO}_2$ with III gives 40% $(\text{ClC}_2\text{H}_4)_2\text{SO}_4$, $b_{3.6}$ 130°, n_D^{20} 1.4620, d_{20} 1.481. D. H. POWERS

The constitution of organic magnesium compounds. QUINTINO MINGOIA. *Istituto Chimico-Farmaceutico, Reale Univ., Pavia. Gazz. chim. ital.* 58, 532-41(1928).—The results obtained by Kierzek (cf. *C. A.* 22, 573) in the hydrolysis of MeMgI suggest that the unstable white ppt. is HOMgI , and that the latter during the extn. with Et_2O decomps. to $\text{Mg}(\text{OH})_2$ and MgI_2 . On this supposition the action of $\text{C}_6\text{H}_5\text{N}$ and quinoline bases on the decompn. product of MeMgI and water was studied. If MgI is formed directly, as believed by Kierzek, then with $\text{C}_6\text{H}_5\text{N}$, either $[\text{Mg}(\text{C}_6\text{H}_5\text{N})_6]\text{I}_2$ or

$\left[\begin{array}{l} (\text{C}_6\text{H}_5\text{N})_4 \\ \text{Mg} \\ (\text{EtO})_2 \end{array} \right] \text{I}_2$ should be formed (cf. Spacu, *C. A.* 17, 1395, 2090). On the other

hand, HOMgI should not form addn. compds. with $\text{C}_6\text{H}_5\text{N}$. Mg (2.4 g.) dissolved in EtBr (11 g. in twice its vol. of Et_2O), water (1.8 g.) added cautiously while cooling, heated on the water bath several min., anhyd. $\text{C}_6\text{H}_5\text{N}$ (15.8 g. freshly distd.) in Et_2O added, heated on the water bath several min., cooled, the ppt. washed with anhyd. Et_2O , extd. in a Soxhlet for 10 hrs. with anhyd. Et_2O , washed with Et_2O and dried *in vacuo* over H_2SO_4 yielded a product which contained no N, and which was either HOMgBr or a mixt. of MgBr_2 and $\text{Mg}(\text{OH})_2$. Analysis showed that it was neither (25.01% Mg , 44.61% Br), and moreover MgBr_2 was found in the residue obtained by evapn. of the Et_2O in the Soxhlet, and concn. of the Et_2O used for the original washing yielded nearly all the $\text{C}_6\text{H}_5\text{N}$. Therefore no $\text{C}_6\text{H}_5\text{N}$ addn. compd. is formed, and the stability of HOMgBr is a function of the time and temp., for though it may be formed at first, it decomps. into MgBr_2 and $\text{Mg}(\text{OH})_2$ during the extn. with Et_2O . For the prepn. of BrMgSH , a method already described by M. (cf. *C. A.* 20, 879) was used. Addn. of anhyd. $\text{C}_6\text{H}_5\text{N}$ (2 mols. freshly distd.) in Et_2O , heating for 2 hrs. on the water bath, extn. for 10 hrs. in a Soxhlet with anhyd. Et_2O and drying *in vacuo* over H_2SO_4 yielded the compd. $\text{C}_{10}\text{H}_{11}\text{N}_2\text{SMgBr}$, which conforms perfectly with previous results. The reactions support the view that org. Mg compds. have an asym. structure (cf. Grignard, *C. A.* 21, 731, 3894; Terentiev, *C. A.* 21, 564; Ivanov, *C. A.* 21, 3893; Meisenheimer and Schlichenmaier, *C. A.* 22, 2365). C. C. DAVIS

Some factors influencing the yields of *tert*-butylmagnesium chloride and *tert*-amylmagnesium chloride, and the preparation of acids obtained from them and carbon dioxide. H. GILMAN AND E. A. ZOELLNER. Iowa State College, Ames. *Rec. trav. chim.* 47, 1058-63(1928).—Previously G. and McCracken (*C. A.* 17, 3859) had shown that the yield of organomagnesium halide decreases with increasing branching of the alkyl group, the normal halide giving higher yields than the secondary and the secondary higher yields than the tertiary. The 2 outstanding exceptions to this general

rule are Ph_3CCl and PhBr , which, under optimal conditions (cf. C. A. 17, 531), give yields of 90%. For *tert*-Bu and *tert*-Am chloride low yields of the Grignard compds. have always been recorded in the literature and these prepn. were now improved considerably by G. and Z. The following factors are of importance: (1) temp.: in both cases (cf. C. A. 22, 942) better yields are obtained when the reaction mixt. boils during the addn. of the *tert*. chloride, continuous stirring being, of course, applied; (2) amount of ether: in small runs (0.1 mole) 7-8 moles of ether are to be used, with 1-2 moles of the chloride 6 moles and with larger quantities 5 moles of ether; (3) rate of addn. of the org. chloride: the soln. of the org. halide in ether is to be added slowly, the yield of the Grignard reagent decreasing continuously with increasing velocity of the addn. of the halide soln.; (4) kind of Mg: the yields of Grignard compds. are the higher, the more finely divided the Mg, finely divided Mg powder giving better results than the commercially available Mg turnings; the highest yield was obtained with 200-mesh powd. Mg, prepd. directly before use. Excellent yields having been obtained in the prepn. of allylmagnesium bromide by the use of 2-3 atoms of fine Mg, it seems reasonable to predict that a liberal excess of Mg will give still better results. The yield of $\text{Me}_2\text{EtCCO}_2\text{H}$ was 53% and the highest yield of $\text{Et}_2\text{CCO}_2\text{H}$ 69.5%. C. F. v. D.

Reply to H. Reihlen [univalent iron]. W. MANCHOT AND H. GALL. Techn. Hochschule, München. *Ann.* 465, 304-5(1928).—Polemical; cf. C. A. 22, 1134, 4476; 23, 1073. C. J. WEST

The action of ketones upon mercuric iodide in alkaline medium. E. MONTIGNIE. *Bull. soc. chim.* 43, 1115-7(1928).—Five g. HgI_2 , 1.0 g. KOH , 70 g. H_2O and 1.0 g. Me_2CO added together, shaken thoroughly and boiled for 10-15 mins., gave a compd. $\text{MeCOCHHg}_2\text{I}_2$, insol. in all solvents, which begins to decomp. 180° , turns black 210° and at 250° is entirely volatilized. The reaction is characteristic of all ketones, having been repeated with MeCOEt , a mixt. of $\text{MeCOC}_7\text{H}_{15}$ and $\text{MeCOC}_8\text{H}_{17}$, $\text{CH}_2:\text{CMe}(\text{CH}_2)_3\text{COMe}$, MeCOPh , $\text{PhCH}_2\text{CH}_2\text{COMe}$, MeCOCH_2Ph , $\text{PhCH}:\text{CHCOMe}$, Ph_2CO , cyclohexanone, camphor and antipyrine. This reaction is specific and sensitive enough to be used in detg. Me_2CO in urine. R. C. ROBERTS

The stereochemical hypothesis of Hantzsch and Werner in its relation to experimental facts and the constitution of isomeric oximes. GARTANO MINUNNI. Reale Univ., Catania (Sicily). *Gazz. chim. ital.* 58, 504-21(1928).—Recent researches by various workers on aldoximes and ketoximes have raised problems of constitution which were previously considered settled by the stereochem. hypothesis of Hantzsch and Werner. A long crit. discussion, with much evidence from the literature, leads to the conclusion that the hypothesis of Hantzsch and Werner both in its fundamental principles and in its deductions is at variance with exptl. facts, particularly the cleavage of acyl derivs. of α -aldoximes into an acid and nitrile. The Hantzsch and Werner hypothesis cannot therefore explain the phenomena of isomerism among the oximes. On the other hand all known facts, recent as well as old, are still readily explainable by the structural hypothesis advanced by M. many years ago (cf. *Gazz. chim. ital.* 21, i, 113, 136(1891); 21, ii, 192(1891); 22, ii, 139, 149, 164, 174, 183, 191, 431(1892); 23, ii, 244(1893); 26, i, 456(1896); 27, ii, 263(1897); 29, ii, 387, 404, 452(1899); 34, ii, 373(1904); *Rend. accad. Lincei* [5], 14, ii, 420, 518(1905)). At first generally accepted relations between the symmetry and stability of the mols. of org. compds. were utilized in conjunction with the hypothesis to formulate the structure of the individual oximes, but at the present time it is possible to utilize the many new facts concerning NH_2OH derivs. to establish on a still sounder basis the structure of isomeric oximes. C. C. DAVIS

The oxidation of hexadecylene. STANISLAS LANDA. Czech Polytechnic School, Prague. *Bull. soc. chim.* 43, 1086-8(1928).—Hexadecylene, obtained by distn. of spermaceti, gave hexadecane, m. 18° , which was oxidized by KMnO_4 to pentadecylic acid, b_p $193-5^\circ$; m. $52-2.5^\circ$. The acid may be purified by forming its Et ester, b_p $172-4^\circ$. This method of prepn. is preferable to those involving the oxidation of Me pentadecyl ketone or pentadecylaldehyde. R. C. ROBERTS

Chemical constitution of the iwashi acid. MITSUMARU TSUJIMOTO. Inst. Tokyo Ind. Research. *Bull. Inst. Tokyo Ind. Research Lab.* [3], 23, 1-23(1928).—T. extd. from the "sardine oil" from Hokkaido sardine a higher unsatd. acid by his Li salt-acetone method, made its Me ester, fractionated the part b_p $217-26^\circ$ which was sapond. to obtain the "iwashi (sardine) acid," $\text{C}_{22}\text{H}_{40}\text{O}_2$, d_4^{15} 0.9410, n_D^{15} 1.5057, I no. (bromopyridine method) 388.8. This acid and its Am ester were each ozonized in CHCl_3 soln., hydrolyzed, obtaining among the volatile matter AcH , EtCHO and CO_2 together with comparatively large quantity of succinic acid. T. considers AcH and CO_2 to have come from malonic aldehyde or its semi-aldehyde, and calcg. from the quantity of CO_2 infers the

presence of 1 $\text{=CHCH}_2\text{CH=}$ group in the mol. of iwashi acid. The ozonization of the Am ester was successfully made to produce a large quantity of insol. ozonide decompn. product, which when sapond. gave succinic acid and T. infers the presence of the initial double bond at the 4th and 5th C. No conjugate double bond is present. Hence T. concludes the acid to contain the groups: (1) EtCH= , (2) $\text{=CHCH}_2\text{CH=}$, (3) $\text{=CH(CH}_2)_2\text{CH=}$, (4) $\text{=CH(CH}_2)_2\text{CO}_2\text{H}$. From the analogy that the C_{22} acid, docosenic acid, which is widely distributed among oils of sea animals, has the double bond at $\Delta^{11,12}$, T. infers the constitution of iwashi acid to be one of the following: (1) $\text{EtCH:CH(CH}_2)_3\text{CH:CH(CH}_2)_2\text{CH:CH(CH}_2)_2\text{CH:CHCH}_2\text{CH:CH(CH}_2)_2\text{CO}_2\text{H}$; (2) $\text{EtCH:CH(CH}_2)_3\text{CH:CH(CH}_2)_2\text{CH:CHCH}_2\text{CH:CH(CH}_2)_2\text{CH:CH(CH}_2)_2\text{CO}_2\text{H}$. T. also infers the acid to have a straight chain because on hydrogenation it forms behenic acid.

K. SOMEYA

Chemical constitution of tetradecenic acid obtained from *Tetradenia glanca* Matsum. (MITSUMARU TSUJIMOTO. Inst. Tokyo Ind. Research. *Bull. Inst. Tokyo Ind. Research Lab.* [3], 23, 53–60(1928); cf. C. A. 22, 4470.—T. found another kind of tetradecenic acid, $\text{C}_{14}\text{H}_{26}\text{O}_2$ (cf. *Bull. Inst. Tokyo Ind. Research Lab.* [6], 21, 113; cf. C. A. 20, 2482) from the oil of *Tetradenia glanca*, which acid differs from the 5,6-tetradecenic acid, m. 20° , found by T. in the oil from the whale *Physeter macrocephalus*. To det. the constitution of the new acid T. ozonized it with O_3 in CHCl_3 and obtained capraldehyde, $\text{C}_{10}\text{H}_{18}\text{O}$, capric acid, succinic acid and its semi-aldehyde; hence the constitution is $\text{Me-(CH}_2)_3\text{CH:CH(CH}_2)_2\text{CO}_2\text{H}$. T. proposes to designate the two different tetradecenic acids by physeteric and tsuzuic (Tsuzu, Japanese for *Tetradenia glanca*) acid, resp.

K. S.

Esters of α -bromoisovaleric acid. VENANCIO DEULOFEU. Faculty of Sciences, E. F. N., Buenos Aires. *Bull. soc. chim.* 43, 1229–30(1928); cf. C. A. 22, 3881; 23, 596. By treating α -bromoisovaleryl bromide with dehydrated PrOH , iso- PrOH and $\text{CH}_2\text{:CHCH}_2\text{OH}$, D. obtained, resp., 38% of the *Pr*, b_m 115°, 41% of the *iso-Pr*, b_m 104°, and 38% of the *allyl* esters of the acid.

R. C. ROBERTS

The catalytic influence of hydrogen ions in the internal dehydration of a *cis*-ethylenic γ -glycol in the presence of water. M. BOURGUEL AND RAMBAUD. *Compt. rend* 187, 663–6(1928); cf. C. A. 22, 4106.—It has been shown that dehydration of the glycols is dependent on H-ion concn. Any dil. acid accelerates it markedly. The *cis* isomer of $\text{Me}_2\text{C(OH)CH:CHC(OH)Me}_2$, m. $69\text{--}70^\circ$, is dissolved in H_2O and the rate of dehydration studied in unsatd. soln. The reaction is stopped by making the soln alk. and removing the anhydride under vacuum. The unchanged glycol is detd. by Br₂ adsorption of the ethylenic bond. For a given concn. of acid the dehydration is monomol. The catalytic effect of the acid is not directly proportional to the H-ion concn. 0.1 *N* and 0.01 *N* HCl have the coeffs. for *K* of 0.0108 and 0.00102 at 50° . The value of *K* for 0.1 *N* H_2SO_4 and 0.1 *N* $[\text{CH(OH)CO}_2\text{H}]_2$ is 0.0056 and 0.00069, which is in close agreement with the predicted value. The variation of *K* is directly proportional to the change of the concn. of H ion. With an H-ion concn. of 0.0065 and 0.09 the ratio of $K/II \times 10$ is 1.06 and 1.18. It is noted that the sensitivity of the glycol to H-ion concn. is greatest when it is first prepd. In prepg. this glycol by the reduction of the acetylenic glycol with colloidal Pt the ethylenic glycol dehydrates rapidly when first formed, even at 20° .

D. H. POWERS

Possibility of ring-chain valency tautomerism and of a type of mobile-hydrogen tautomerism analogous to the Wagner-Meerwein rearrangement. V. Pinacolic electron displacement as an explanation of various intramolecular transformations. C. W. SUOPPEE. Univ. Leeds. *Proc. Leeds Phil. Lit. Soc., Sci. Sect.* 1, Pt. VII, 301–11 (1928), cf. C. A. 23, 109.—After discussing the older theories on the mechanism of several intramol. transformations, S. gives a new theory, which is more general than the others. The mechanism involved has been named "pinacolic electron displacement," and with its help the pinacol-pinacolin change, the Wagner-Meerwein change, the benzil benzilic acid transformation, the pinacolic deamination and the conversion of α -HO ketones and α -Cl ketones into CO_2H acids are explained in a satisfactory way. The new theory also accounts for the function of the reagents, which have to be anionic or cationic. The transformations proceed according to the scheme:

Both an electron source and an electron-sink must be present in the mol. to make the pinacolic electron displacement possible.

G. SCHWACH

Propyl ethers of β,γ -dibromopropyl alcohol. VENANCIO DEULOFEU. *Anales asoc. quim. Argentina* 16, 53-5(1928).—Boiling PrONa , free of PrOH , with $\text{CH}_2\text{:CHCH}_2\text{I}$ for 2.5 hrs. gives 90% of the ether; similarly iso-PrONa gives 88% of the allyl ether. Bromination of the latter gives 50% of $\text{iso-Pr } \beta,\gamma\text{-dibromopropyl ether}$, b. 205-7°.

C. J. WEST

Glycerides of fatty acids. A. HEIDUSCHKA AND H. SCHUSTER. *Techn. Hochschule, Dresden. J. prakt. Chem.* 120, 145-59(1928).—Triglycerides contg. 1, 2 or 3 different aliphatic acid residues have been synthesized by methods which define their constitution. Mono- and diglycerides were prepd. from the appropriate Na salts and halohydrins and the diglycerides converted into triglycerides by interaction with the requisite acid chloride in dry $\text{CHCl}_3\text{-C}_6\text{H}_5\text{N}$ or with the anhydride; when using unsatd. acid chlorides or anhydrides the reaction should be carried out in dry CO_2 . SOCl_2 reacts only with primary alc. groups in the glyceride and thus serves to differentiate between α,β - and α,α' -diglycerides. The wandering of an acyl group has been investigated by this means and under the conditions of reaction α,β -distearin is converted into the α,α' -isomer to the extent of 20%. SOCl_2 , followed by the appropriate Na salt, may be used to introduce an acid residue into the α -position in the glyceride mol. and by suitable combination of this with the above method any triglyceride may be obtained. The m. p. of glycerides are subjected to alteration on keeping. α,α' -Dipalmitin, m. 72°, prepd. from α,α' -dichlorohydrin and Na palmitate, with lauryl chloride in $\text{CHCl}_3\text{-C}_6\text{H}_5\text{N}$ for 8-10 hrs. at 45-50°, yields *glyceryl β -laurate α,α' -dipalmitate*, m. 54.6°. From α,β -dipalmitin, m. 66.5°, SOCl_2 gives *α,β -dipalmitin- α' -chlorohydrin*, m. 48.6°; heated with Na palmitate for 8 hrs. at 150°, there results 65% of *glyceryl α,β -dipalmitate α' -laurate*, m. 53.5°. α,α' -Dimyristin, m. 60.5°, heated with excess of palmitic anhydride for 8-10 hrs. at 75-80° and 20-25 mm. in CO_2 , yields *glyceryl β -palmitate α,α' -dimyristate*, m. 49.5°. α,β -Dimyristin, m. 58.1°, and palmityl chloride at 50° for 8 hrs. in $\text{CHCl}_3\text{-C}_6\text{H}_5\text{N}$ give 60% of *glyceryl α' -palmitate α,β -dimyristate*, m. 47.8°. α -Myristin and $\text{C}_7\text{H}_{15}\text{COCl}$ in $\text{CHCl}_3\text{-C}_6\text{H}_5\text{N}$ at 50-60° for several hrs. give *glyceryl α -octoate α' -myristate*, oily, which yields with lauric anhydride (1.5 mols.) at 70-80° for 9 hrs. in CO_2 *glyceryl α' -octoate β -laurate α -myristate*, m. 17.7°, f. 3°. Similarly, α -chloro- α' -myristin gives the β -octyl deriv., which, heated with Na laurate for 8 hrs. at 150°, gives *glyceryl β -octoate α -laurate α -myristate*, m. 18.8°, f. 4.55°. α -Laurin, successively treated with $\text{C}_7\text{H}_{15}\text{COCl}$ and myristyl chloride in $\text{CHCl}_3\text{-C}_6\text{H}_5\text{N}$, gives 54% of *glyceryl α -octoate α' -laurate β -myristate*, m. 14.1°, which closely resembles the product isolated from coconut oil. α -Octoin, treated with oleyl chloride in CO_2 and then with myristic anhydride, gives 60% of *glyceryl α -octoate β -myristate α' -oleate*, m. 10.5°, f. -1°. The isomeric *glyceryl α -octoate α' -myristate β -oleate*, m. 15.8°, f. 3.5°, is obtained in 35% yield from α -myristin with $\text{C}_7\text{H}_{15}\text{COCl}$ and oleyl chloride. α -Chloro- α' -myristin and Na oleate, 8 hrs. at 150° in CO_2 , give 80% of *glyceryl α' -myristate α -oleate*, m. 20-3°, converted by $\text{C}_7\text{H}_{15}\text{COCl}$ in $\text{CHCl}_3\text{-C}_6\text{H}_5\text{N}$ into *glyceryl β -octoate α' -myristate α -oleate*, m. 14.8°, f. 6.7° in 67% yield; this appears to be identical with the glyceride isolated from palm kernel oil. Improved methods for the prepn. of α -stearin and α,α' -distearin are given.

C. J. WEST

Ricinic acid. CH. SUNDER. *Bull. soc. ind. Mulhouse* 94, 477-81(1928).—Acid products obtained by treating castor oil with dil. NaOH or acids remained liquid at the lowest temp. obtainable by means of ice and salt, but a ricinic acid which solidified at a higher temp. (not specified) was obtained by effecting the sapon. with 36° B $\acute{\text{e}}$. NaOH at 100-20°; this latter acid is not identical with the one previously described by Juillard (*Bull. soc. ind. Mulhouse*, Aug.-Sept. 1892). These new ricinic acids are capable of acting as mordants for alizarin dyes in the presence of alum.

A. P.-C.

Carbon rings. XIII. Oxidation of the 13- to 17- membered monocyclic ketones with Caro's acid to the 14- to 18-membered lactones. L. RUZICKA AND M. STOLL. *Helv. Chim. Acta* 11, 1159-73(1928); cf. *C. A.* 22, 4482.—Angelica oil contains the lactone (I) of pentadecan-15-ol-1-acid, and musk-seed oil the lactone (II) of ambrettolide acid:

Kerschbaum (*C. A.* 21, 2118) does not state the properties of I. Ambrettolide is described as a liquid b $_b$ 185-190°, and d 20 0.938. Its C content is 1-1.5% above the theoretical. Kerschbaum obtains by catalytic reduction of ambrettolide the lactone of hexadecan-16-ol-1-acid, a thin liquid b. 175-180°. The constitution of this acid is proven by oxidation to the HO acid. He describes a synthetic mode of formation of I which has a musk fragrance but no further properties are given. The evidence that

the musk fragrance comes from the lactone lies in the loss of the odor after sapon. The exact proof of relation between the no. of ring members and odor necessitates knowledge of the pure lactone. The pure lactone originates through the reaction of Caro's acid on the ketone. The authors believe that 3 classes of compds. arise, a simple peroxide, polymeric peroxide and the lactone. Baeyer and Villager now assume the simple peroxide to lie in the lactone. The lactone is isolated by means of menthol or camphor. With exaltone (cyclopentadecanone) the direction of the reaction of Caro's acid on a high-membered ketone is investigated. In petroleum ether below 20° there is a slow reaction, at 30° the lactone and polymeric peroxide are formed, and at 50–65° a 50% yield of rather pure lactone is given. In all cases arises a mixt. of ethoxide, which, purified by sapon., gives the pentadecan-15-ol-1-acid. The lactone of the acid, sapond. by warm alc. alkali, forms the HO acid, which on oxidation yields tridecane-1,13-dicarboxylic acid. In an analogous manner and with similar results the 13-, 14-, 16- and 17-membered ketones are transformed to lactones. The phys. properties of this homologous series of 5 high-membered lactones run in a regular course. The HO acids show a homogeneous oscillation of m. p. like the other series of aliphatic compds. **XIV. The ketones of the 19-, 21- and 29-membered carbon rings.** L. Ruzicka, M. Stoll and H. Schinz. *Ibid* 1174–80.—Fifty g. of octadecane-1,18-dicarboxylic acid is converted with NaOH to a di-Na salt. This salt pptd. with $\text{Th}(\text{NO}_3)_4$ forms a Th salt, b_p 60°–60.5, 260°. The various fractions are treated with alc semicarbazide. After crystn. the pure semicarbazone yield is 2.5%. This pure semicarbazone heated with $(\text{CO}_2\text{H})_2$ soln. forms the cyclononadecanone, b_p 160°. 185 g. of eicosane-1,20 dicarboxylic acid is converted to an Yt salt, decompd. and distd.: (1) 90–162°, 18.8 g.; (2) 162–215°, 21 g.; (3) 215–45°, 6 g. These fractions are shaken with semicarbazide acetate, evapd., washed with water and petroleum ether. The result is 18.6 g., b. 160–170°, of raw semicarbazone. After several crystns. 8.6 g. of pure semicarbazone, b. 177–8°, is obtained. The ketone, regenerated with 20% HCl, b_p 176–7° and forms a colorless, rapidly solidifying oil. 3 g. of the ketone is allowed to stand with 3 g. BzH and 1.5 g. of Na in 40 cc. of alc. The pulp formed is decompd. in water and the BzH distd. off. The residue is distd. under 1 mm., the viscous substance is treated with NaHSO_4 , reheated to 200°, dehydrated, washed, dried and redistd. This 1.7 g. of benzal compd. is dissolved in 30 cc. of glacial AcOH and ozonized. The resulting liquid is oxidized, heated to 60°, mixed with HCl and water and extd. with ether. The resulting acid is esterified and distd. The fraction between 210–25° is sapond. and crystd. successively from C_6H_6 , AcOH and C_6H_6 . A white powder, nonadecane-1,19-dicarboxylic acid, m. 118–20°, is formed. 195 g. of octacosane-1,28-dicarboxylic acid is converted to an Yt salt, decompd. at 300–470°, the distillate dissolved in ether and collected in alc. The fraction between 225–85° is boiled in 500 cc. alc. The ppt. is dissolved in 3 g. of an aq. semicarbazide acetate. The ppt. is filtered, dried (m. 137–40°) and crystd. The semicarbazone is split with 15% HCl and the ketone extd. with ether and dried. After several crystns. cyclononacosanone is obtained, m. 45–7°. The octadecane-1,18-dicarboxylic acid is produced by electrolysis of mono-Et nonane-1,9-dicarboxylate.

The neutral part is distd. The fraction between 210–30° is crystd. 3 times and sapond. The resulting acid after 5 crystns. m. 124–5°. The eicosane-1,20-dicarboxylic acid is obtained by electrolysis of mono-Et decane-1,10-dicarboxylate. The octacosane-1,28-dicarboxylic acid is produced by electrolysis of mono-Me tetradecane-1,14-dicarboxylate.

C. SCOTT

Neutral salt addition compounds of *N*-methylated glycines: their formulation and that of their hydrates. WINSTON K. ANSLOW AND HAROLD KING. National Institute for Med. Research, London. *Biochem. J.* 22, 1253–63(1928).— $\text{Me}_2\text{NCH}_2\text{CO}_2\text{H}$ gives a series of additive compds. with the chlorides, bromides and iodides of Ca, Sr, Ba, Li and Na, but only 1 compd. with a K halide. These compds. contain a metallic salt associated with 1, 2, 3 or 4 mols. of the amino acid. B. H.

Comparative studies on the cleavage of polypeptides and their derivatives by erepsin, trypsin-kinase and *N* alkali. EMIL ABDERHALDEN AND OSKAR HERRMANN. Univ. Halle. *Fermentforschung* 10, 145–58(1928).—The following peptides and derivs. were prepd. by the usual procedure. *dl*- α -Aminobutyrylglycine (I), m. 220°, from glycine and $\text{MeCH}_2\text{CHBrCOBr}$ and treatment of the intermediate bromobutyrylglycine with NH_4OH ; *PhNCO deriv.* (II), m. 203°; *2,4-Me(NO_2)_2C_6H_3SO_2 deriv.* (III), m. 170–2°; *p-O_2NC_6H_4CO deriv.* (IV), m. 188–9°; *m-O_2NC_6H_4CO deriv.* (V), m. 204°. I was coupled with *dl*- MeCHBrCOBr to yield *dl*- α -bromopropionyl-*dl*- α -aminobutyrylglycine, m. 173°, and this by treatment with NH_4OH was converted into *dl*-alanine-*dl*- α -amino-

butyrylglycine (VI), m. 225°; *PhNCO* deriv., m. 208–10°; the Bz and β -C₁₀H₇SO₂ derivs. could not be obtained. *dl*-Valylglycine (VII), m. 245°, was obtained from *dl*- α -bromoisovalerylglycine and NH₄OH. This was coupled to *dl*-MeCHBrCOBr to form *dl*- α -bromopropionyl-*dl*-valylglycine, m. 202°, and the latter converted by NH₄OH into *dl*-alanyl-*dl*-valylglycine (VIII), m. 248°; β -C₁₀H₇SO₂ deriv. (IX), m. 198°; *PhNCO* deriv. (X), m. 218°. *dl*-Leucyl-*dl*-phenylalanine was sepd. by means of 50% EtOH into 2 racemic dipeptides, m. 220° and 260°, resp. The latter (XI) is attacked by erepsin and is therefore the *ll* + *dd* mixt., while the other (XII) is the *ld* + *dl* mixt. *PhNCO* deriv. of XI, m. 193° (XIII); 2,4-Me(NO₂)C₆H₃SO₂ deriv. (XIV), m. 75°; *PhNCO* deriv. of XII (XIIIa), m. 183°. Glycyl-*dl*-phenylalanine (XV), m. 260° (decompn.), was obtained from phenylalanine, ClCH₂COCl and NH₄OH; *PhNCO* deriv. (XVI), m. 208°; β -C₁₀H₇SO₂ deriv. (XVII), m. 100° (decompn.); Bz deriv. (XVIII), m. 172°. Phenylalanine and *dl*-Me₂CHCHBrCOBr yielded *dl*- α -bromoisovalerylphenylalanine, m. 135°, but treatment of this with NH₄OH gave only an unsatd. compd., decomp. 260°, instead of the expected dipeptide. *N* alkali at 37° slowly attacks I, giving almost complete hydrolysis in 209 hrs. It attacks II much more readily than the free dipeptide with complete hydrolysis in 20 hrs.; IV and V are also hydrolyzed more readily than I but less so than II. The tripeptide VI is easily hydrolyzed and its *PhNCO* deriv. still more so. VIII is slowly hydrolyzed. Both isomers XIII and XIIIa are attacked by alkali. XV and XVII remain unaltered, whereas XVI and XVIII show 50% hydrolysis in 96 hrs. In general the *PhNCO* derivs. are more susceptible to the influence of OH ions than the unsubstituted peptides, although the *PhNCO* remains attached to the amino acid after cleavage has occurred. On the other hand, a substitution in the free NH₂ group renders the peptide resistant to the action of erepsin. I, VI and VIII are attacked by erepsin, but not their *PhNCO*, Me(NO₂)C₆H₃SO₂ or O₂NC₆H₄CO derivs. Neither the dipeptide XV nor its substitution products XVI and XVII are attacked by erepsin. Trypsin-kinase, however, is without action on the free peptides but attacks their substitution products. Thus I is resistant, while II, III, IV and V undergo cleavage. VI is resistant, but its *PhNCO* deriv. is slowly hydrolyzed. VIII, XI, XII and XV remain unaltered, whereas the derivs. of the last 3 undergo hydrolysis. In some cases the extent of hydrolysis is small, possibly because further enzymic action is inhibited by the cleavage products.

A. W. DOX

The specific mode of linkage between substrate and enzyme complex which initiates the hydrolysis of polypeptides. EMIL ABDERHALDEN AND HANS BROCKMANN. Univ. Halle. *Fermentforschung* 10, 159–72 (1928).—According to v. Euler the cleavage of polypeptides by erepsin requires the presence of a free NH₂ group which enters into combination with the enzyme, and according to Waldschmidt-Leitz the cleavage by trypsin requires the presence of a CO₂H in order to form the intermediate complex. A no. of new derivs. of amino acids and peptides are described in which the CO₂H is masked by condensation with PhNH₂, etc., to form substances of the anilide type. If the theory is correct these derivs. should be amenable to hydrolysis by erepsin but not by trypsin. Cholamine, b₁₈ 75–8°, was prepd. by the Knorr method from (CH₂)₂O and NH₄OH in 30 g. yield from 100 g. (CH₂)₂O. It was condensed with 0.5 mol *dl*-MeCHBrCOBr in CHCl₃, yielding 90% *dl*- α -bromopropionylcholamine, m. 78.5°. The condensation was also performed in aq. NaOH with an 80% yield, the advantage here being that all of the cholamine is utilized. Treatment of this product with NH₄OH yielded *dl*-alanylcholamine-HBr from which the free base, m. 78–9°, was obtained by addn. of K₂CO₃ and extn. with CHCl₃, and purified by pptn. from EtOH by petroleum ether. It is best isolated through the *picrate*, m. 105–8°, from which the free base is obtained by dissolving in *N* H₂SO₄, extg. the picric acid with Et₂O and removing the H₂SO₄ by Ba(OH)₂. Alanylcholamine gives the ninhydrin reaction. PhNH₂ and ClCH₂COCl were condensed in Et₂O to ClCH₂CONHPh and this converted into 45% glycylaniline, m. 62–3°, by treatment with NH₄OH; *picrate*, m. 186° (decompn.). A residue insol. in dil. HCl consisted of a *sec. amine*, (PhNHCOCH₂)₂NH, m. 144.5°. This was condensed with *dl*-MeCHBrCOCl to form the *bromopropionyl deriv.*, m. 244–5°, which on treatment with NH₄OH decompd. into the original *sec. amine* and alanine. In a similar manner PhNH₂ was condensed with *dl*-MeCHBrCOBr, yielding *dl*- α -bromopropionanilide, m. 101°, and the latter aminated by NH₄OH to *dl*-alanyl-aniline, b_{16–8} 190–6°; *picrate*, m. 175°. Condensation of this in CHCl₃, and in aq. NaOH, with ClCH₂COCl gave *chloroacetyl-dl-alanylaniline*, m. 156°, which was then aminated to 60% glycyl-*dl*-alanylaniline, m. 80°; *picrate*, m. 186° (decompn.). An insol. residue from the amination was the *sec. amine of the dipeptideanilide*, (PhNHCO-CHMeNHCOCH₂)₂NH, which m. 207° Glycyaniline was coupled with *dl*-Me-CHBrCOBr in CHCl₃ in the presence of aq. NaOH and yielded 70% *dl*- α -bromopro-

glycylglycylaniline, m. 145–6°, and the latter aminated to 45% *dl*-*alanylglycylaniline*, m. 124–5°; *picrate*, m. 198° (decompn.). In Et₂O, Ph₂NH and *dl*-MeCHBrCOCl condensed to *dl*- α -*bromopropionyl*diphenylamide, m. 110°. This was aminated to *dl*-*alanyldiphenylamine*, m. 86°. For detg. the *picric acid* content of picrates of the above bases an *app.* is described which consists of a micro-Kjeldahl flask to which is fitted a stopper bearing a syphon tube and a dropping funnel with 3-way stopcock. The sample is weighed into the flask, 0.1 *N* H₂SO₄ and a layer of Et₂O are added. The flask is shaken with the syphon raised flush with the stopper, then the syphon lowered to the bottom of the Et₂O layer and air pressure applied which forces the Et₂O through the syphon on the principle of a wash bottle. The Et₂O is renewed and the operation repeated several times. After evapn. of the solvent the extd. *picric acid* is dissolved in H₂O and titrated with 0.1 *N* NaOH and phenolphthalein. Erepsin at *p*_H 8 hydrolyzes all of the peptide-aniline derivs. except *alanyldiphenylamine*, while trypsin at *p*_H 8.5 is without action except in the case of *alanylcholamine* where the increase in amino N is almost negligible. The PhNH₂ derivs. of glycine, *alanylglycine* and *glycylaniline* undergo hydrolysis by *N* alkali.

A. W. Dox

Comparative studies on the influence of *N* alkali, erepsin and trypsin-kinase on polypeptide-like compounds containing β -alanine. EMIL ABDERHALDEN AND FRITZ REICH Univ. Halle. *Fermentforschung* 10, 173–8(1928).—Two dipeptides contg. β -alanine were prepd. by the usual method of peptide synthesis and examd. with respect to their susceptibility to enzymic hydrolysis. *Chloroacetyl- β -alanine*, a non-crystg. oil, was obtained from β -alanine and ClCH₂COCl with *N* NaOH. Treatment with NH₃ in abs. EtOH converted it into *glycyl- β -alanine* (I), which decomps. 230°. β -Alanine and *dl*-Me₂CHCH₂CHBrCOCl reacted in the same manner to form *dl*- α -*bromoisocaproyl- β -alanine*, m. 69–72°, which on treatment with NH₃ in EtOH yielded *dl*-*leucyl- β -alanine* (II), m. 202–4°; its PhNCO deriv. (III), which m. 160–2°, is strongly acid. Both dipeptides are faintly acid, and give an intense ninhydrin but no biuret or *picric acid* reaction. *N* alkali at 37° hydrolyzes I rather rapidly, II only slightly and III very rapidly. None of the 3 is attacked by erepsin or by trypsin-kinase.

A. W. Dox

The specific action of erepsin and trypsin-kinase. EMIL ABDERHALDEN AND ERNST SCHWAB. Univ. Halle. *Fermentforschung* 10, 179–87(1928).—In continuation of studies on the influence of substituents in the NH₂ group of peptides toward enzymic hydrolysis, several new peptides, ureido and PhNCO derivs. were prepd. and examd. *dl*-*leucylglycine* and ClCH₂COCl were condensed to form *chloroacetyl-dl-leucylglycine*, m. 141°, and the product aminated by NH₄OH to 75% *glycyl-dl-leucylglycine*, m. 206° (decompn.). Condensation of the *l*-component of this with *dl*-Me₂CHCH₂CHBrCOBr gave *dl*- α -*bromoisocaproylglycyl-l-leucylglycine*, m. 180°, which was aminated to *dl*-*leucylglycyl-l-leucylglycine*, m. 256°. Diglycyl-*l*-leucine and *dl*-Me₂CHCH₂CHBrCOBr gave *dl*- α -*bromoisocaproylglycylglycyl-l-leucine*, m. 84°, which was converted into the tetrapeptide *dl-leucylglycylglycyl-l-leucine*. The PhNCO deriv. of *dl-leucyl- γ -aminobutyric acid*, prepd. from the dipeptide and PhNCO, m. 166°. The ureido derivs. of *dl*-leucylglycine, *glycyl-dl-valine* and *dl-leucylglycylglycine* were obtained from the corresponding CO₂Et and CO₂Me derivs. by means of alc. NH₃ under pressure and are to be described in a later paper. These were subjected to the action of erepsin and trypsin-kinase, along with a no. of peptides previously described. The ureido derivs. were not attacked by purified erepsin or purified trypsin-kinase, but gave 27–65% cleavage with ext. of powd. pancreas. The PhNCO derivs. of *dl-leucylglycylglycine* and *dl-leucylglycine* gave 8–13% hydrolysis with purified trypsin-kinase and 58–66% hydrolysis with ext. of dried pancreas. It is possible that pancreatic ext. contains another enzyme or activator which is removed in the sepn. of pure enzymes by the Waldschmidt-Leitz method. A group of polypeptides contg. *l*-leucine was studied for comparison of the action of erepsin and trypsin. *l*-Leucylglycyl-*l*-leucine, *glycyl-l-leucylglycyl-l-leucine*, *dl-leucylglycyl-l-leucylglycine*, *dl-leucylglycylglycyl-l-leucine* and *l-leucylglycyl-l-leucylglycyl-l-leucine* were attacked by both enzymes, while *glycyl-dl-leucylglycine*, *dl-leucyl-dl-leucylglycylglycine*, *l-leucylpentaglycylglycine*, *di-[l-leucyltriglycyl]-l-leucylpentaglycylglycine*, and *tri-[l-leucyltriglycyl]-l-leucylpentaglycylglycine* were attacked by erepsin only. Trypsin-kinase attacks those compds. in which leucine carries the CO₂H group but not those in which the terminal amino acid is glycine. One might infer a sp. affinity of trypsin for the leucine complex were it not for certain exceptions such as *leucyltriglycylleucine* and *glycyl-l-leucyl-l-leucine* which are resistant to trypsin-kinase. Peptides contg. an amino acid with NH₂ in other than the α -position, e. g., *dl-leucyl- γ -aminobutyric acid* and its PhNCO deriv., are not attacked by either enzyme. Only the *d*-isomer of *glycyl- α -amino-*

butyric acid is hydrolyzed by erepsin. Of special interest is the observation that *d*-leucylglycyl-*l*-leucine but not *l*-leucylglycyl-*d*-leucine is hydrolyzed by trypsin-kinase. The terminal amino acid appears to be the detg. factor. Neither of these tripeptides is attacked by erepsin. A. W. Dox

The behavior of α,δ -di-(*dl*-leucyl)-*dl*-ornithine and its phenyl isocyanate compound toward *N* alkali, erepsin, trypsin-kinase, pepsin-hydrochloric acid and arginase. EMIL ABDERHALDEN AND HANS SICKEL. Univ. Halle. *Fermentforschung* 10, 188-94 (1928).—As the 1st model of a peptide contg. a diamino acid the dileucyl deriv. of ornithine and its PhNCO deriv. were subjected to the action of enzymes. *dl*-Ornithine, obtained by hydrolysis of its di-Bz deriv., was condensed with *dl*-Me₂CHCH₂-CHBrCOCl in the presence of NaOH and the pasty product treated with Et₂O and petroleum ether and finally crystd. from dil. MeOH. A yield of 43% α,δ -di-[*dl*- α -bromoisocaproyl]-*dl*-ornithine, m. 126-8°, was thus obtained. A by-product, m. 165°, was probably the mono deriv. with a Bz still attached to the δ -NH₂. Amination of the di-deriv. with alc. NH₃ and removal of the NH₄Br by Ag₂SO₄ and Ba(OH)₂ yielded α,δ -di-[*dl*-leucyl]-*dl*-ornithine, which sinters 95°, m. 105-10° and decomps. 150°. It takes up CO₂ from the air with formation of a sirup, gives the ninhydrin and a bluish violet biuret reaction, and negative picric acid reaction. It is pptd. by picric acid, phosphotungstic acid, Millon reagent and Nessler reagent. Its PhNCO deriv. is amorphous sinters 98° and forms a viscous foam at 130°. *N* alkali hydrolyzes the tripeptide, but its PhNCO deriv. more rapidly. Erepsin and trypsin-kinase are without action on either. The tripeptide is not attacked by pepsin-HCl or by arginase. A. W. D

Malonitrile and malonitrile condensations. II. RUDOLF SCHENCK AND H. FINKEN WITH P. MICHAELIS, K. PAPPE AND FR. PLEUGER. Univ. Münster. *Ann.* 462, 267-83(1928); cf. C. A. 22, 3631.—Me₂C(CN)₂ (6.6 g.) and 10 cc. Me₂CO in 30 cc. abs. EtOH, treated with 0.75 g. K in 10 cc. abs. EtOH, give 70% of dimethyldicyanoethylene, m. 171.5°; a freshly prepd. sample showed a normal mol. wt., while a sample 2 yrs. old showed twice the normal mol. wt. Similarly BzPh gives diphenyldicyanoethylene, m. 136°, and fluorenone gives 86.8% of biphenylenedicyanoethylene, m. 213°; soly. in hot AcOH, 1:40; in hot EtOH, 1:250. In the condensation of Me₂C(CN)₂ with esters, using Et₃NH or EtONa, there results a *tris*-malonitrile (I), m. about 290° (decompn.); a 2nd isomer (II) results from the action of NH₃ in C₆H₆, this m. 218°; heating II several degrees above its m. p., there results a 3rd isomer (III), which m. 300° and may be the same as I. II reacts with PhNH₂, giving the yellow compd. C₁₂H₈N₄, m. 236° (decompn.). The use of Me₂C(CN)₂ as a cryoscopic solvent is discussed; the av. const. found is 48.90; results are given for H₂O, BzOH, *o*-HOC₆H₄CO₂H, NH₂CH₂CO₂Et, CO(NH₂)₂, NaI, KI, Me₄NI and Et₄NI. C. J. WEST

Existence of a second oxalic acid. A. F. CHICHIBABIN. *J. prakt. Chem.* 120, 214-20(1928).—C. discusses the possibility of the existence of a 2nd (CO₂H)₂ and describes certain expts. in which he attempted its prepn. Thus far no evidence for the existence of the 2nd isomer has been obtained. C. J. WEST

The sulfopyrotartaric acids. III. H. J. BACKER AND J. BUINING. Groningen (Holland). *The University. Rec. trav. chim.* 47, 1000-10(1928); cf. C. A. 22, 1138.—*Propane-1,2-dicarboxylic-1-sulfonic acid* (I) was prepd. from MeCH(CO₂H)CH(CO₂H)₂ (II) by sulfonation with SO₃, concd. H₂SO₄, oleum contg. 65% SO₃ and ClSO₃H, the latter reagent being preferred for the prepn. of larger quantities. II was prepd. by a modification of Bischoff's method (*Ann.* 214, 53(1882)): 362 g. MeCHBrCO₂Et is added gradually to a solution of CHNa(CO₂Et)₂, prepd. from 46 g. Na, 500 cc. abs. alc. and 320 g. CH₂(CO₂Et)₂; after boiling the mixt. 1 hr. the reaction is complete. Yield of Et propenyltricarboxylate 93%, from which on sapon. with an excess of aq. alc. KOH, II, m. 147-8°, was obtained in almost theoretical yield. The sulfonation of II by any one of the methods mentioned above always yields a crude Ba salt with a too high S content, showing that at the same time some disulfonation takes place; the pure Ba salt was obtained on recrystn. from water. The best way to obtain I consists in heating at 100-5° during 5 hrs. 17.6 g. of II and 29 g. ClSO₃H; yield 40% of the Ba salt, obtained from the reaction mixt. in the usual way. The free I, C₅H₇O₇S.2H₂O, is hygroscopic and m. 115-20°; the Ba salt, (C₅H₇O₇S)₂Ba₂, was obtained with 6 and 9 mols. water of crystn.; even after drying at 110-20° it contains 2H₂O; at 25° 100 g. of a satd. aq. soln. contains 5.84 g. of the anhyd. salt; the Ca salt, (C₅H₇O₇S)₂Ca₂.7H₂O, of a satd. aq. soln. contains 5.84 g. of the anhyd. salt; the Ca salt, (C₅H₇O₇S)₂Ca₂.7H₂O, is very sol. in water. The interaction of Et propenyltricarboxylate and ClSO₃Et does not give rise to the formation of the ester of I, but yields NaEtSO₃ and Et chloropropenyltricarboxylate (III) on MeCH(CO₂Et)CCl(CO₂Et)₂. The optical resolution of I may be carried out by means of the strychnine and quinine salts, both giving the *d*-rotatory acid. The resolution with the secondary strychnine salt, C₁₂H₁₇O₇S.2C₁₇H₂₁N₂O₈

$\text{H}_{22}\text{O}_2\text{N}_2 \cdot 4\text{H}_2\text{O}$, is described by B. and B.; one "cold crystn." of this salt gave the optically pure compd. (*d*), which is racemized only with difficulty, even in alk. soln. at higher temp. $[\text{M}]_{\text{D}}$ for the ion $\text{MeCH}(\text{CO}_2\text{H})\text{CH}(\text{CO}_2\text{H})\text{SO}_3' = 35^\circ$, for the ion $\text{MeCH}(\text{CO}_2')\text{CH}(\text{CO}_2')\text{SO}_3' = +19^\circ$. The constitution of I was proved only by the fact that this acid is different from the other isomers, the constitution of which was proved by an independent synthesis, *viz*, by the interaction of $\text{BrCH}_2\text{CH}(\text{CO}_2\text{H})\text{CH}_2\text{CO}_2\text{H}$ and $\text{MeCBr}(\text{CO}_2\text{H})\text{CH}_2\text{CO}_2\text{H}$ and sulfites (cf. *C. A.* 22, 847). When sulfites act upon $\text{MeCH}(\text{CO}_2\text{H})\text{CHBrCO}_2\text{H}$, hydrolysis takes place with the formation of methylmalic acid, even in neutral solns. C. F. VAN DUIN

Mercuric-oxycyanide compounds of a few organic acids and their sterilizing action upon gonorrheal bacilli. HITOSHI TAKAOKA. Inst. of Osaka Ind. Research. *Bull. Osaka Inst. Ind. Research* 4, 1-8(1928).—Since the compds. of tartaric acid with Hg'' salts are known to have a good sterilizing action upon gonorrheal bacilli, T. synthesized pure condensation products of a few org. acids and Hg'' salts and tested their sterilizing action. In the detn. of Hg in these compds. a good result was obtained by using a tube instead of boat for holding the silver asbestos for Hg absorption. *Mercuric cyanide*

tartrate, $\begin{array}{c} \text{CH}(\text{OH})-\text{CO}_2 \\ | \\ \text{CH}(\text{OH})-\text{CO}_2 \end{array} \text{Hg} \cdot \text{Hg}(\text{CN})_2 \cdot \text{H}_2\text{O}$, obtained by making $\text{C}_4\text{H}_6\text{O}_4$ react with

$\text{HgO} \cdot 3\text{Hg}(\text{CN})_2$ in 90% alc., colorless prisms, was easily sol. in H_2O , difficultly in acetone and EtOH. The soln. has an immediate sterilizing action upon gonorrheal bacilli even with 1/50,000 diln., the same effect being obtained in 10 min. with 1/400,000 diln. If pure H_2O is used in the reaction, the acid salt is formed. *Mercuric-cyanide-salicylate* $[\text{C}_6\text{H}_4(\text{OH})\text{CO}_2]_2\text{Hg} \cdot \text{Hg}(\text{CN})_2 \cdot 2\text{C}_2\text{H}_5\text{OH}$, obtained by making mercuric oxy-cyanide act upon salicylic acid in 99% EtOH is difficultly sol. in H_2O , sol. in EtOH and acetone. It effloresces. *Mercuric cyanide citrate*: a cryst. substance was obtained also from citric acid. K. SOMEYA

Constitution of thiourea. The absorption spectra of thiourea. H. RIVIER AND JAMES BOREL. Univ. Neuchâtel. *Helv. Chim. Acta* 11, 1219-28(1928).—Thiourea and its trimethyl, tetramethyl, dimethyldiphenyl and tetraphenyl derivs. and pentamethyldithiobiuret (including both normal and iso forms of all except thiourea and trimethylthiourea) were prepd. and spectroscopically studied to det. whether the S atom in thiourea is linked by a double bond, $(\text{S} \cdot \text{C}(\text{NH}_2)_2)$ (normal) or a single bond $(\text{HN} \cdot \text{C}(\text{NH}_2)\text{SH})$ (iso). The normal derivs. have a stronger absorption than the iso derivs. which is caused by the presence of the C:S group in the structure. R. and B. conclude that thiourea and trimethylthiourea can exist only in the iso state and do not contain the C:S group. New compds. described: isodimethyldiphenylthiourea, m. 30° , b.p. 175° (picrate, m. 131°); isotetraphenylthiourea, m. 70° . W. R. B.

Preparation of some substituted guanidines. FRITZ BISCHOFF. Santa Barbara Cottage Hospital. Santa Barbara. *J. Biol. Chem.* 80, 345-55(1928).—Diguanylpiperazine, guanylpiperidine, guanyl-*p*-aminodimethylaniline and diguanidinooctamethylene were prepd. by the usual methods of guanidine synthesis. Diguanidinopentamethylene was also prepd. by a new method utilizing the Erlenmeyer synthesis. ARTHUR GROLLMAN

The biuret reaction. I. The biuret reaction of acid imides of the barbituric acid type. MARY M. RISING AND CLARENCE A. JOHNSON. Univ. of Chicago. *J. Biol. Chem.* 80, 709-22(1928).—Diethylbarbituric acid acted as a typical acid imide in its behavior with the biuret reagents, forming a product of formula $\text{X}_2\text{Cu}(\text{imide})_4 \cdot x\text{H}_2\text{O}$. Na_2Cu diethylbarbitate and K_2Cu diethylbarbitate were isolated and analyzed. The role of the biuret reagents and the atoms concerned in the reaction are discussed. ARTHUR GROLLMAN

Constitution of hexosediphosphoric acid. II. The dephosphorylated α - and β -methyl hexosides. WALTER T. J. MORGAN AND ROBERT ROBISON. Lister Inst., London. *Biochem. J.* 22, 1270-6(1928); cf. *C. A.* 21, 3064.—Proof is given that methylhexosediphosphoric acids (I) are derivs. of γ -fructose. The I have been converted into α - and β -Me hexosides (II) by the action of bone phosphatase. The properties of the II correspond to those of α - and β -Me- γ -fructosides. The II have been converted into fully methylated derivs. from which tetramethyl- γ -fructose has been obtained by acid hydrolysis. It is suggested that hexosediphosphoric acid is γ -fructose-1,6-diphosphoric acid. BENJAMIN HARROW

Trehalosemonophosphoric ester isolated from the products of fermentation of sugars with dried yeast. ROBERT ROBISON AND WALTER T. J. MORGAN. Lister Inst., London. *Biochem. J.* 22, 1277-88(1928).—A monophosphoric ester of the disaccharide trehalose (I) has been isolated from the products of fermentation of fructose

by dried yeast, and has been purified by its Ba and brucine salts. The ester is non-reducing and *d*-rotatory. Bone phosphatase converts I into cryst. trehalose. Hydrolysis converts I into glucose and glucosemonophosphoric ester, the latter being then further hydrolyzed into glucose and phosphoric acid. I is fermented by dried yeast and more slowly by yeast juice and zymoin.

BENJAMIN HARROW

The mechanism of the oxidation of some carbohydrates and polyhydric alcohols by hydrogen peroxide with iron salts as catalyst in acid media. (Preliminary communication.) A. TH. KÜCHLIN AND J. BÖSEKEN. Techn. University, Delft, Holland. *Rec. trav. chim.* 47, 1011-26(1928).—The oxidation of glucose with H_2O_2 and Fe salts to *d*-arabinose may proceed either via gluconic acid, or via 1,2-glucosone, both being oxidized further to the α -keto acid, which splits off CO_2 with the formation of *d*-arabinose. That the oxidation proceeds to a great extent according to the 2nd way is now shown by taking as a measure of the rate of the oxidation of the various intermediate compds. or the original sugar the quantity of CO_2 evolved in unit time at 70° . Gluconic acid proved to be much more slowly oxidized than glucose, fructose more quickly than glucose and *d*-arabinose practically at the same rate as glucose. After all the H_2O_2 had disappeared, all expts. showed the Fe in the Fe'' state; further it was shown that HCO_2H , $(CO_2H)_2$, $HOCH_2CO_2H$, glyceric, tartronic and keto-acids of the nature of 1,5-ketogluconic acid, are present among the oxidation products of glucose. In connection with the investigation of Wieland and Franke (*C. A.* 22, 1065) it was found that the osones, the first oxidation products, are oxidized by Fe''' salts; consequently, there is a regular reformation of the Fe'' ion which promotes the catalytic oxidation much better than the Fe''' ion. At low H-ion concns. the osones are oxidized more slowly; with an insufficient amount of H ions at the beginning of the expt. basic Fe''' sulfate or $Fe(OH)_3$ are formed, the latter being without oxidizing action on the osones. This course of the reaction does not take place, of course, if acids are formed by the catalytic oxidation of the substrates. The CHOH group is much more rapidly oxidized than the CH_2OH group, whereas with more concd. solns. and at higher temps. several side reactions occur. In studying these reactions K. and B. therefore recommend working with low concns. of H_2O_2 at low temps., taking compds. of simple structure in order to avoid side reactions as much as possible, and preventing the auto-decompn. of the H_2O_2 as much as possible so that it only acts as an oxidizing agent. The oxidation product of erythritol gave with semicarbazide the 1,2- or 2,3-disemicarbazone, m. 222° , which, according to the slightly low N content, was contaminated with a small amount of the semicarbazone of $OHCCO_2H$, formed by further decompn. For details the original paper must be consulted.

C. F. VAN DUIN

Oxygen bridges in sugars. IV. Anhydrides of 2,3,6-trimethylglucose. KURT HESS AND FRITZ MICHEL. *Ann.* 466, 100-14(1928); cf. *C. A.* 22, 226.—Repetition of the prepn. of 2,3,6-trimethylanhydroglucose previously described yielded the same product, b.p. $111-3^\circ$, $[\alpha]_D^{19}$ 70.6° ($CHCl_3$), contrary to the statement of Freudenberg and Braun (*C. A.* 22, 3635), but the behavior of the product with C_6H_5N and Ac_2O and the action of Br indicate that instead of being a mixt. of the strained and unstrained forms of trimethylanhydroglucose in the proportions 75 and 25%, resp. (not 25 and 75% as previously given), it contains an unstrained form and an unsatd. compd., which gives an oily Ac deriv., $[\alpha]_D^{18}$ 45.5° ($CHCl_3$). An attempt was made to complete an analogous series of reactions with derivs. of 2,3,6-trimethylglucose(I) contg. a butylene oxide ring. I, conveniently prepd. in quantity by hydrolysis of trimethylcellulose with $MeOH-H_2SO_4$, was converted into a mixt. of the α - and β -forms of butylene oxidic 2,3,6-trimethylmethylglucoside. The action of $BzCl$ in C_6H_5N yielded the 5-Bz deriv., $[\alpha]_D^{20}$ -35° to -43° in $MeOH$; HCl in Et_2O converted this into butylene oxidic 2,3,6-trimethyl-5-benzoyl-1-chloroglucose, m. $122-3^\circ$, $[\alpha]_D^{19}$ -114.5° ($CHCl_3$); this reacts with Me_3N to give 2,3,6-trimethyl-5-benzoylglucosidotrimethylammonium chloride, m. $146-9^\circ$ (decompn.), $[\alpha]_D^{17}$ -60.2° (H_2O); $C_6H_5N.HCl$ addn. product, m. $102-4^\circ$, $[\alpha]_D^{20}$ -48.4° (H_2O). Attempts to prep. an anhydride by the action of alkali gave only butylene oxidic 2,3,6-trimethylglucosidotrimethylammonium hydroxide, m. $187-8^\circ$, $[\alpha]_D^{21}$ -68.3° (H_2O); chloride, m. 165° , $[\alpha]_D^{17}$ -68.4° (H_2O). Butylene oxidic 2,3,6-trimethyl-5-acetylglucosidotrimethylammonium chloride, amorphous, $[\alpha]_D^{19}$ -33.9° (H_2O), could not be converted into an anhydride. V. A method of determining α - or β -configuration of disaccharides. F. MICHEL AND O. LITTMANN. *ibid.* 115-30. If a disaccharide is hydrolyzed by $MeOH-HCl$, the proportions of α - and β -Me hexosides derived from the hexose present as hexoside may be expected to vary according to the nature of the linking in the original disaccharide and an excess of 1 form as compared

with the proportion present in the equil. mixt. may be taken as evidence that the hexoside linking in the disaccharide is of that configuration, assuming that no inversion takes place. In the application of this method to the detn. of the configurations of lactose and cellobiose, the fully methylated sugars were used, in order to avoid the shifting of the O bridge and the hydrolysis was performed at 0°, with the addn. of sufficient MeCl to keep the concn. of the acid sensibly const. The tetramethylmethyl hexoside mixt. was sepd. from the mixed sugars after benzylation by extn. with H₂O and distn. The equil. mixts. were obtained by keeping the hexosides under the conditions used in the hydrolysis and working up in a similar way. Both lactose and cellobiose yielded hexoside mixts. contg. the β -form in larger proportion than the equil. mixt. as detd. by observations of the rotatory powers of the mixts. and the pure components, and the β -configuration deduced by fermentation methods was thus confirmed. α -Me galactoside, prepd. by passing HCl into galactose in MeOH was converted by Ac₂O in C₆H₅N into 2,3,4,6-tetraacetyl- α -methylgalactoside, m. 86–7°, $[\alpha]_D^{20}$ 132.5° (CHCl₃), which yields the unchanged galactoside on hydrolysis. Methylation of the acetate by Me₂SO₄ and alkali yields 2,3,4,6-tetramethyl- α -methylgalactoside, b.p. 80–4°, $[\alpha]_D^{20}$ 188.5° (H₂O). Octamethylcellobiose, m. 86°, $[\alpha]_D^{19.5}$ -15.70° (H₂O), 14.63° (CHCl₃), was prepd. by repeated treatment of the heptaacetylmethylcellobiose with Me₂SO₄ and NaOH. C. J. WEST

Substances accompanying cellulose. III. Isolation of mannan and xylan from pine sulphite pulp. KURT HESS AND MAX LÜDTKE. Kaiser Wilhelm Institut für Chemie. *Ann.* 466, 18–26 (1928); cf. *C. A.* 22, 2964.—Extn. of pine sulphite pulp with 2 N NaOH and addn. of AcOH to the ext. yields a ppt. contg. mannan, cellulose and xylan. The mannan was isolated by pptg. the Cu-alkali complex from cuprammonium soln. by the addn. of NaOH to the concn. of 0.2 N. From the soln. of the complex in H₂O, made faintly acid with AcOH, MeOH ppts. crude mannan. After redissolving it in cuprammonium soln. and 2 repetitions of the above process, pure mannan is obtained, the rotatory power of which was unchanged by further purification and shows identical properties with mannan A from ivory nuts. The alk. cuprammonium soln. from which the mannan had been pptd. yields on neutralization a ppt. of cellulose. Crude xylan was pptd. from the filtrate by MeOH and purified by repptn. The xylan thus obtained differs from that from bamboo; it gives no reaction with ZnCl₂, was sol. in H₂O only when freshly pptd. and has $[\alpha]_D^{20}$ -87.44° in 2 N NaOH and $[\alpha]_{435}^{20}$ -4.55 in cuprammonium soln. under standard conditions. Xylose, characterized by the osazone and the CdBr₂ compd. of xylonic acid, is the only product of hydrolysis. IV. Cell membrane of plants. *Ibid* 27–58.—Bamboo stalks, after disintegration by treatment with ClO₂ and Na₂SO₃, yields a fiber with 70% cellulose. By extn. with NaOH, pptn. of the ext. by MeOH and purification by pptn. from cuprammonium soln. with AcOH, a xylan was isolated, $[\alpha]_{435}^{20}$ -4.85° in cuprammonium soln. under standard conditions, colored violet by ZnCl₂ and yielding only xylose on hydrolysis. Further fractionation from cuprammonium soln. gave no evidence of sepn. The pentosan content of the fiber is 22.5% but after removal of long fibers by sieving this rises to 39% and it is concluded that the xylan is essentially a constituent of the parenchyma. This is confirmed by microscopical observation of corrosion of the fibers by NaOH and by 12% HCl. Cutin was detected in the residual epidermal cells after treatment of the fiber with cold 75% H₂SO₄. A further account is given of the detection of a substance of "furfuroid" nature, not a carbohydrate, present in the primary layer of the bamboo fiber, characterized by a reddish violet color with phloroglucinol and EtOH-HCl which appears after 1–2 days. Bamboo fibers swollen in cuprammonium soln. assume the appearance of a string of beads. This phenomenon appears to be due to an outer skin on the fiber and crosswise subdivision of the fibers of 10–30 μ by layers of the above substance. Microscopical observation of the swelling also indicates that the fiber is constructed of concentric layers, probably sepd. by a substance similar to that which forms the skin, and a lengthwise striation is also visible. It is suggested that the sections of fibers formed in this way yield the "cell-wall units" isolated by Hess and Schultze from the bast fibers of ramie. Further subdivisions of the cell wall may exist in the form of actual or potential fibrillae. The investigation of bamboo fibers confirm the previous conclusion that lignin is not chemically bound with the cellulose. V. Cellulose from young shoots and old heart wood. K. HESS, M. LÜDTKE AND HERBERT REIN. *Ibid* 58–72.—The fiber obtained from 14-day old beech shoots by treatment with ClO₂ and Na₂SO₃ was repeatedly extd. with NaOH of increasing concns. The residue was pure cellulose. The exts. contd. no cellulose but only a xylan and a small amt. of a new glucosan. Similar treatment of a 385-year old wood

of *Sequoia gigantea* yielded cellulose indistinguishable from the 1st in rotatory power or viscosity in cuprammonium soln. (With C. Trogus.) The sepn. of the cellulose from each of the raw materials was followed by observation of the x-ray diagrams. In each case the characteristic cellulose interference rings, at first faint, are intensified as the interference by foreign substances decreases. The crystallites appear to be less uniformly oriented in the young shoot.

C. J. WEST

Cellulose. XXXII. Characterization of cellulose preparations by the rotation method. KURT HESS AND NOAH LJUBITSCH. Kaiser-Wilhelm-Institut für Chemie. *Ann.* 466, 1-18(1928); cf. *C. A.* 22, 4793.—The identity of the rotatory power of cuprammonium solns. of cellulose from different sources and of the course of variation of rotatory power with concn. is reaffirmed, contrary to the observations of Hägglund and Klingstedt (*C. A.* 22, 1234). The exact exptl. procedure is now described in greater detail. Repetition of the measurements recorded by H. and K., using samples of the same material, showed that when appropriate precautions were taken, including prepn. of solns. in absence of air and complete removal of foreign materials from the crude cellulose material, the figures for cotton and pine wood cellulose agreed closely with those for "standard cellulose." In view of the suggestion that foreign materials might influence the values of the rotatory power, the behavior of mannan and xylan from pine wood was examd. The mannan is completely pptd. as a Cu-alkali complex under the standard conditions of the detns. and therefore has only an indirect influence on the figures obtained if it is not removed. In the absence of alkali the rotatory power is much less than that of cellulose but the rotatory power-concn. curve is of the same type. The xylan has a slightly greater rotatory power than cellulose, and the curve is again of the same type. Rotatory powers, but not the course of the curve, may, therefore, be affected by these impurities and an estimate of their amt. may be obtained by measurement of the rotatory power of the crude material. **XXXIII. Detection of a foreign substance in cellulose fibers. II.** KURT HESS, FRITZ MICHEEL AND WATROSLAV REICH. *Ibid* 73-9.—Further investigation of the N- and ash-contg. foreign substance in cotton fibers showed that it was destroyed completely by hydrolysis with concd. HCl, partly destroyed by acetolysis with AcOH and HBr or, to a smaller degree, with AcO and H₂SO₄. The last process yields an ash-free substance. A similar foreign substance can be isolated from ramie fibers. The substance can be obtained practically free from ash by pptn. of the Ca in H₂O by (CO₂H)₂. Treatment of the ash-free substance with Ca(OH)₂ yields a substance contg. 33% ash. **XXXIV. Trimethylcellulose.** K. HESS, CARL TROGUS AND HERMANN FRIESE. *Ibid* 80-94.—There is no real discrepancy between the results of methylation of cellulose by Hess and Pichlmayr (*C. A.* 21, 174), by Urban (*C. A.* 20, 3080) and by Freudenberg and Braun (*C. A.* 22, 3635). A sample of the product obtained by the last named could be partly dissolved in H₂O with suitable mech. treatment (shaking with glass beads in H₂O or keeping in H₂O for several weeks) or after swelling and dissolving in indifferent solvents. The H₂O-sol. fractions in each case had the same rotatory power and x-ray diagrams. Such difference as appears to exist at first sight is caused by preservation of the non-cellulosic coating of the fiber due to incomplete purification in the case of cotton from which "insol." trimethylcellulose is prepd. There are, therefore, no grounds for assuming either that an insol. trimethylcellulose exists or that sol. trimethylcellulose is a disintegration product. (With H. PICHLMAYR.) Further details are given of the prepn. of cryst. trimethylcellulose. **XXXV. Crystalline triethylcellulose. II.** K. HESS AND ALEXANDER MÜLLER. *Ibid* 94-9.—Triethylcellulose was prepd. in 70% yield by repeated treatment of purified cotton with Et₂SO₄ and NaOH and had the same properties as the material from other sources. Hydrolysis by EtOH-HCl gives triethylglucoside, b_{0.2} 120-3°, [α]_D¹⁸ 63.37° in H₂O, in 94% yield. Further hydrolysis of the latter yields triethylglucose.

C. J. WEST

The pectin and hemicelluloses of the flax plant. S. T. HENDERSON. *J. Chem. Soc.* 1928, 2117-25(1928).—Three products are described: (1) Pectin was extd. from unretted straw by 0.5% (CO₂NH₄)₂ at 80-90° for 7 hrs. Most of the MeO was removed by NaOH, and the resulting product appeared to be (C₆H₁₀O₆)₄C₆H₅O₆·(H₂O)_n. This differs from Nangi, Paton and Ling's proposed pectic acid by the lack of arabinose. By hydrolysis with dil. acid this became a polygalacturonic acid, probably (4C₆H₅O₆·H₂O)_n, and corresponded closely to Ehrlich's "tetragalacturonic acid a." (2) Extn. of flax fiber or straw with water at 100 to 145° gave a material low in uronic acid and in MeO, agreeing fairly well with the formula (C₆H₇O₆)₄CaMg(C₆H₁₀O₆)₆·H₂O, and designated a "hemicellulose." (3) After pptn. of (2) with alc., the filtrate yielded a hexopentosan, free from uronic acid, and contg. galactose, xylose, and arabinose.

J. J. WILLAMAN

Strained and strainless rings. T. M. LOWRY. *Chemistry and Industry* 47, 1149-50(1928).—Positive evidence has been recently obtained that satd. rings contg. more than 5 atoms are strain-free and that this state is brought about by the buckling of the ring. The atoms are then not in a ring but assume such positions that free rotation is possible at every single bond in the ring. The atoms may be arranged in two forms: (1) chair-shaped and rigid with 3 atoms above and 3 atoms below the *av.* plane; (2) boat-shaped and flexible, capable of being flexed freely, and its plane of symmetry capable of being passed through any opposite pair of atoms. In a 6-atom ring the angle between the bonds of a 1,2-di-deriv. can be decreased to 60° in the *trans*-, and increased to 60° in the *cis*-isomerides. In a 7-atom ring, these angles can be decreased to 10° and increased to 110° , which would make the formation of the *trans*-ring nearly as easy as that of a *cis*-ring. Huckel's discovery of the new type of isomerism in the simple derivs. of decahydronaphthalene is the most conclusive vindication of the theory of strainless rings.

J. H. PERRY

The cyclohexanediols. I. Separation and properties of *cis*- and *trans*-quinitols. L. PALFRAY AND B. ROTHSTEIN. Catholic Institute, Paris. *Bull. soc. chim.* 43, 1122-31(1928).—*Cis*- and *trans*-quinitols may be sep'd. by recrystg. from Me_2CO contg. a little BuOH to diminish the volatility of Me_2CO . The *trans*-isomer is insol. and can be identified by its *phenylurethan*, m. 262° ; the *cis*-isomer is sol. and gives a *phenylurethan*, m. 188° . Soly. coeffs. are given so as to det. the amt. of solvent to use while the table of m.-p curves gives the approx. compn. of any mixt. of the 2 isomers.

R. C. ROBERTS

Catalytic dehydration of alcohols with alkaline bisulfates. JEAN-BAPTISTE SENDERLUS. *Compt. rend.* 187, 1102-5(1928).—The dehydration of cyclohexanol is obtained with 2 parts of NaHSO_4 to 100 parts of cyclohexanol but the reaction is slow due to the insoly. of both NaHSO_4 and KHSO_4 . The conversions with methylocyclohexanols are of the same order as those with cyclohexanol. NaHSO_4 is more active than KHSO_4 due to its greater affinity for H_2O .

J. H. PERRY

The structure of the benzene ring. K. LONSDALE (née YARDLEY). Univ. Leeds. *Nature* 122, 810(1928). Preliminary note on the x-ray analysis of hexamethylbenzene, indicating that the C atoms in benzene exist in 1 plane.

WALLACE R. BRODE

Formation of benzene and hydrocarbons by the action of heat on methane. FRANZ FISCHER. Kaiser Wilhelm Institut für Kohlenforschung. *Chem. Markets* 23, 587-91(1928). By conducting CH_4 of various origins through tubes at certain temps., pressure, rate of flow and cooling speeds, it was shown that C_6H_6 , C_{10}H_8 and other aromatic hydrocarbons could be formed, whereas earlier investigators had pointed to the formation of C (carbon black) and H_2 as the chief or only products. Exptl. conditions and results are detailed, and the suggestion is made that in some countries where carbon black is now made by wasteful processes it may be feasible to resort to CH_4 as raw material for synthesizing C_6H_6 .

W. C. EBAUGH

Reduction of mono- and polynitro compounds. XI. Reduction of aromatic mono- and polynitro compounds. K. BRAND AND A. MODERSOHN. Univ. Giessen. *J. prakt. Chem.* 120, 160-76(1928).—The reduction of aromatic mono- and polynitro compds. to β -arylhydroxylamines in so-called neutral soln. has been investigated and it is shown that, using H_2O - EtOH CaCl_2 soln. and Zn dust, the soln. becomes alk. slowly at the ordinary temp. and more rapidly on heating. The role played by the CaCl_2 is obscure and a scheme is given for the reaction which includes Zn and H_2O only. Zn dust and NH_4Cl react in the absence of a NO_2 compd. to produce HO ions, but the concn. of the latter is much lower than that produced by Zn dust, CaCl_2 and a NO_2 compd. On the basis of the above facts it is possible to explain the results of Brand (*Ber.* 38, 4006(1905)), who showed that reduction of $m\text{-C}_6\text{H}_4(\text{NO}_2)_2$ with Zn dust and CaCl_2 gives, not $m\text{-O}_2\text{NC}_6\text{H}_4\text{NHOH}$, but $m,m'-(\text{O}_2\text{NC}_6\text{H}_4)_2\text{N}_2\text{O}$ (I). Brand and Kowallek find that the velocity of combination of $m\text{-O}_2\text{NC}_6\text{H}_4\text{NO}$ with $m\text{-O}_2\text{NC}_6\text{H}_4\text{NHOH}$ to yield I in neutral soln. is greater than that of PhNO with PhNHOH to azoxybenzene, under the same conditions. This difference is due to the acceleration by small HO -ion concns. of the velocity of the reactions: $\text{O}_2\text{NC}_6\text{H}_4\text{NO} + \text{O}_2\text{NC}_6\text{H}_4\text{NHOH} \rightarrow \text{O}_2\text{NC}_6\text{H}_4\text{NO} \cdot \text{NC}_6\text{H}_4\text{NO} + \text{H}_2\text{O}$ and $3\text{O}_2\text{NC}_6\text{H}_4\text{NHOH} \rightarrow \text{O}_2\text{NC}_6\text{H}_4\text{NH}_2 + \text{O}_2\text{NC}_6\text{H}_4\text{NO} \cdot \text{NC}_6\text{H}_4\text{NO}$. Since these small HO -ion concns. prevail the velocity of formation of I increases and becomes greater than the reduction velocity of $m\text{-O}_2\text{NC}_6\text{H}_4\text{NO}$ to $m\text{-O}_2\text{NC}_6\text{H}_4\text{NHOH}$ and the formation of the I proceeds at the expense of the $\text{O}_2\text{NC}_6\text{H}_4\text{NHOH}$. The velocity of formation of azoxybenzene is smaller than that of I and although accelerated by increased HO ion, does not overtake the velocity of reduction of PhNO to PhNHOH ; consequently the latter is the main product. By adding traces of acids or acid salts (e. g., KHSO_4) at the commencement of the reaction, the hydroxylamines

may be intercepted and preserved and the formation of azoxy compds. checked. Owing to the lower concn. of HO ions produced, the use of Zn dust and NH_4Cl is preferable to that of Zn and CaCl_2 for the general prepn. of β -arylhydroxylamines; by adding traces of acids (AcOH is recommended) hydroxylamines sensitive to very small HO-ion concns. are readily obtained. The prepn. of the following is described: $m\text{-O}_2\text{NC}_6\text{H}_4\text{NHOH}$, m. 118° ; $2,6\text{-O}_2\text{N}(\text{NHOH})\text{C}_6\text{H}_3\text{Me}$, m. $120\text{--}1^\circ$ (68% yield); $2,4\text{-O}_2\text{N}(\text{NHOH})\text{C}_6\text{H}_3\text{Me}$, m. $108\text{--}9^\circ$ (50% yield); $2,4\text{-O}_2\text{N}(\text{NHOH})\text{C}_6\text{H}_3\text{OMe}$, m. 129° ; $2,6,4\text{-(O}_2\text{N)}_3(\text{NHOH})\text{C}_6\text{H}_2\text{Me}$, m. $143\text{--}4^\circ$. C. J. WEST

New syntheses in the group of amino acids. I. Condensation of aldoximes with esters of β -ketonic acids. GAETANO MINUNNI AND SALVATORE D'URSO. Reale Univ. Catania (Sicily). *Gazz. chim. ital.* 58, 485-504(1928).—The general method of synthesis of pyrazole derivs. from arylhydrazones of acyclic or isocyclic aldehydes and esters of β -ketonic acids developed by M. (cf. C. A. 20, 599) suggested a study of the action of oximes and esters of β -ketonic acids, which might lead to NH_2OH derivs. of keto compds., of interest because of the means of identifying the CHO or CO function, because of the isomers formed, and because of the mol. transpositions involved. PhCH:NHOH (I) and $\text{AcCH}_2\text{CO}_2\text{Et}$ (II) react energetically when heated with a trace of ZnCl_2 and tend to resinify completely. I (5 g.), II (5 g.) and ZnCl_2 (0.1 g.) heated 90 min. at $120\text{--}5^\circ$, removed with the aid of boiling water to a cold receptacle, washed 3 times with water and then with EtOH, the solvents being decanted each time, filtered and washed with EtOH, yields 2.40 g. of *benzylidene- α -amino- β -crotonolactone*, $\text{MeC:C(N:CHPh).CO.O}$ (III), yellow, m. $146.5\text{--}7.5^\circ$. Almost the same yield is

obtained with H_3PO_4 by allowing to stand 20 days at room temp. A higher yield in a shorter time is obtainable with H_3PO_4 . I (10 g.), II (10 g.) and H_3PO_4 (10 g.) heated very cautiously around $110\text{--}5^\circ$ for 30 min., boiling water added, the latter sepd., the residue washed with 10% Na_2CO_3 , filtered, washed until neutral, extd. and washed with EtOH, yields 10.5 g. of III. Boiled with HCl (d. 1.19), III decomps. to BzH. Heated with 1% aq. KOH, III hydrolyzes to BzH, which was removed with EtO. The aq. residue freed of Et_2O , dil. HCl added, the ppt. dissolved in Na_2CO_3 , reprecip. by HCl and recrystd. from a hot mixt. of EtOH and C_6H_6 , yields a hydrolytic compd. (IV), m. $150\text{--}1^\circ$, very sensitive to heating (decomps. when maintained at $85\text{--}90^\circ$). IV is also formed by refluxing III with dil. alc. Na_2CO_3 . $\text{C}_6\text{H}_5\text{OH}$ (2.5 g.) and Na_2CO_3 (2 g.) in a little water added to III (5 g.) in EtOH (20 cc.), let stand 1 hr., filtered, dild. with water, acidified with dil. HCl, and the ppt. recrystd. from a mixt. of EtOH and C_6H_6 , yields IV. III refluxed for several hrs. with excess $\text{C}_6\text{H}_5\text{OH}$ and EtOH, distd., the residue poured in water, the sepd. oil (after solidification) dissolved in EtOH, pptd. with dil. EtOH, extd. with the latter and filtered, yields a residue which was proved to be a mixt., m. $130\text{--}42^\circ$. III (5 g.), $\text{C}_6\text{H}_5\text{OH}$ (3 g.) and EtOH (50 cc) kept (with periodical agitation) at room temp. for 2 months, then allowed to evap., yielded, after washing the ppt. with water and recrystg. from a mixt. of EtOH and C_6H_6 , 4 g. of IV. III (6 g.) in 50% EtOH (70 cc.) refluxed for 10 min. with PhHNNH_2 (4 g.), cooled, and the ppt. recrystd. from boiling EtOH, yields 6.2 g. (98.4%) of *benzaldehyde phenylhydrazone* (V). Addn. of $\text{Pb}(\text{OAc})_2$, HgCl_2 or CdSO_4 soln. to the dil. alc. mother liquor ppts. yellow compds., CuSO_4 ppts. a brown compd. and AgNO_3 ppts. a yellowish compd. which turns brown on exposure to light. These ppts. do not form if the mother liquor is dild. with water and extd. with Et_2O . The yellow ppt. with $\text{Pb}(\text{OAc})_2$, filtered, washed, dried, suspended in 50% EtOH, H_2S passed through, filtered, the filtrate cooled and refiltered several times, allowed to evap., yields a brown, amorphous mass which could not be crystd. Another way was then tried to isolate the 2nd product of the action of PhHNNH_2 on III. The dil. alc. mother liquor of V was distd. *in vacuo* to eliminate EtOH, and was then let stand, whereby there slowly sepd. a yellow amorphous substance which, dried in air, m. below 100° , but which could not be crystd. If to the residue after elimination of the EtOH is added cold, dild. HCl, a flocculent yellow substance (VI) seps., which redissolves in excess HCl, and which could not be crystd. Since VI was sol. in Na_2CO_3 , the attempt was made to purify it by soln. in 10% Na_2CO_3 , filtration and reprecip. with dil. HCl, but after 3 treatments a substance was obtained which m. $105\text{--}15^\circ$. I (5 g.), $\text{BzCH}_2\text{CO}_2\text{H}$ (VII) (4 g.) and H_3PO_4 (5 g.), heated 3 hrs. at $100\text{--}5^\circ$, let cool several hrs., a little EtOH added, filtered, washed with EtOH, yield 2.2 g. of a substance (VIII), more of which is obtained by allowing the wash liquors to evap. The 2nd filtrate heated to eliminate EtOH, leaves an oil which, treated with water and steam-distd., yields an uncrystallizable pitch and a distillate from which addn. of AcOH and PhHNNH_2 yields V. VIII purified by crystn. from a hot mixt. of EtOH and C_6H_6 , yields *benzylidene- α -amino- β -cinnamolactone*,

$\text{PhC}:\text{C}(\text{N}:\text{CHPh})\text{CO}_2\text{O}$, (IX), lustrous yellow, m. $194-5^\circ$. I, VII and H_3PO_4 also

react at room temp., the yield of IX being higher. By first heating the mixt. until homogeneous, and then leaving it to itself the reaction is complete after about 1 month. IX heated with 1% aq. KOH yields BzH, while the residual liquor after extn. of the BzH by Et_2O , treated with dil. HCl, ppts. a flocculent mixt. which turns yellow and then pink in air. Extd. with hot water, this mixt. yields a cryst. compd., extd. with hot glacial AcOH it yields another cryst. compd. and still another cryst. compd. less sol. in AcOH which is yellow and m. $191-3^\circ$ (decompn.). IX (2 g.) suspended in EtOH (40 cc.) refluxed with PhHNNH_2 (2 g.) for 15 min. and the ppt. washed with boiling EtOH, yields the compd. $\text{C}_{22}\text{H}_{19}\text{O}_2\text{N}_3$, not altered by exposure to light, decomps. violently at 140° . The yield corresponds exactly to the reaction $\text{IX} + \text{PhHNNH}_2 \longrightarrow \text{C}_{22}\text{H}_{19}\text{O}_2\text{N}_3$. I (2 g.), VII (1.6 g.) and ZnCl_2 (0.05 g.) heated 90 min. at $125-30^\circ$, cooled rapidly, the cryst mass extd. with hot water, steam-distd. to eliminate excess VII, the residue filtered hot (0.35 g. of pitchy residue), cooled, and the ppt. recrystd. repeatedly from hot water, yields about 50% of the compd. $\text{C}_7\text{H}_7\text{ON}$ (X), m. $132.5-3.5^\circ$, dissolves in dil. KOH with evolution of heat, from which soln. Et_2O exts. a substance which m. 130° . X is also formed from I and ZnCl_2 alone. I (2 g.) and ZnCl_2 (0.05 g.) heated 1.5 hrs. at $125-30^\circ$, more ZnCl_2 (0.10 g.) added, the mixt. heated 2 hrs. longer at $125-30^\circ$, let stand several hrs., heated with water, filtered, and the filtrate cooled, ppts. about 1 g. of X. The residue insol. in hot water treated with hot EtOH and allowed to cool slowly, yields, a cryst. compd., m. $226-7^\circ$. The formation of III and of is a general reaction, and the products can be shown to be of the character described, to contain the $\text{RCH}:\text{N}-$ group, by their chem. properties, particularly by their reaction with PhHNNH_2 , a reaction already shown by Diels (C. A. 14, 2631, 3243) to be characteristic of compds. congt. this group. It is considered that III is formed by and II first reacting thus: $\text{I} + \text{II} \longrightarrow \text{H}_2\text{O} + \text{AcCH}(\text{N}:\text{CHPh})\text{CO}_2\text{Et}$, the latter intermediate compd. in its enolic form $\text{MeC}(\text{OH}):\text{C}(\text{N}:\text{CHPh})\text{CO}_2\text{Et}$ then losing 1 mol of EtOH, thus forming III. This is in harmony with the known property of II to oliv. i. e., to behave as β -hydroxycrotonic acid. The expts. open an interesting field of research, since the simple technic, good yields and available raw materials are a generally practical method for synthesizing a new type of compds. which belong to the hydroxy- and amino-acid groups, and which may be readily converted by hydrazes, NH_2OH , mineral acids, NH_4OH , alk. hydroxides and other reagents, into various products.

C. C. DAVIS

Mercuration of aromatic amines and the problem of substitution. AUGUST F. LEBERT AND W. SCHNEIDER. Techn. Hochschule, Munchen. Ann. 465, 257-72 (1928). —(On the basis of Wieland's addn. theory of substitution, Kharasch and Jacobson postulated the production of complex salts in the mercuration of aromatic amines. Such salts have now been isolated. The action of $\text{Hg}(\text{OAc})_2$ on an aromatic amine may be represented by the typical scheme: $\text{PhNH}_2 \longrightarrow [\text{H}_2\text{NPhHgOAc}]\text{OAc}(\text{I}) \longrightarrow [\text{NPhH}_2\text{HgOAc}(\text{IIa}) + \text{HNPhHgOH}(\text{IIb}) \longrightarrow \text{H}_2\text{NC}_6\text{H}_4\text{HgOAc}(\text{III})$. With PhNH_2 the amine in MeOH is treated with MeOH- $\text{Hg}(\text{OAc})_2$; after addn. of a little AcOH the mixt. becomes clear and on cooling deposits aniline acetate *N*-mercuriacetate (I), m. 87° ; similarly are obtained the *p*-toluidine, m. 155° , *o*-toluidine, m. 76° , *m*-aminotolophenone, m. 104° , *p*-anisidine, m. 125° and *bis*-*o*-toluidine, acetate *N*-mercuriacetate, m. 96° . These compds. are very unstable, changing slowly on keeping or at once on melting, or heating in aq. H_2O or EtOH, into the mono- or dinuclear-substituted products. When $[\text{H}_2\text{NPhHgOAc}]\text{OAc}$ is kept *in vacuo* no change of compn. occurs but the m p changes. In the cold $(\text{NH}_4)_2\text{S}$, NaOH or NaI solns. all give with I the corresponding Hg compd. NaI may be employed to distinguish between the different stages of the reaction, since with I AcONa is formed in soln., but with II NaOH also. At stage III alkalinity is developed only in so far as Hg is being removed from the nucleus. The stage II compd. is obtained, in the case of PhNH_2 , by shaking I with Et_2O ; amine *N*-mercuriacetate is obtained impure, m. about 154° . Stage II is the 1st result of the action of $\text{Hg}(\text{OAc})_2$ on *p*- $\text{H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{Et}$, which gives a product, m. 117° , estimated, from the analytical results, to contain 80% of IIa, 12% of IIb and 8% of $\text{Hg}(\text{OAc})_2$. Stage I compds. have a great surface activity, e. g., in absorbing impurities; the above product when prepd. in Et_2O yields a solid mass, which contains absorbed Et_2O and becomes gelatinous in H_2O . *p*- $\text{H}_2\text{NC}_6\text{H}_4\text{Ac}$ and *m*- $\text{O}_2\text{NC}_6\text{H}_4\text{NH}_2$ also gives stage II products. These are more stable than I but are converted by AcOH into nuclear-substituted compds. *p*-Ethylaminophenylmercuric acetate and *p*-dimethylaminophenylmercuric acetate have been prepd., without intermediate products being isolated. It is suggested that if the stage I \longrightarrow II cannot take place at the

ordinary temp., mercurization will not occur. Attention is directed to the danger that, since impurities may be introduced by absorption, pharmacol. Hg compds. may be impure.

C. J. WEST

Symmetrical *m*-xylenol derivatives. E. NOELTING. *Bull. soc. ind. Mulhouse* 94, 648-9(1928); Sealed Note 2333, Jan. 4, 1915.—Under N.'s direction P. Pfeiffer and J. Lichtenberger began a detailed study of sym. $C_6H_3Me_2OH$, which was stopped by the war. Pfeiffer prepd. a few acyl derivs. (acetate, benzoate) and the *acetophenone*, 2,4,6- $Me_2(HO)C_6H_2COMe$ (I), and found that only the *o*-compd. is formed. From I he prepd. the *chalcone*, $Me_2(AcO)C_6H_2COCH:CHPh$, (II) and its dibromide, and the *flavone* $Me_2C_6H_2.CO.CH:CPh.O$, (III) which was studied in detail and treated with $MeMgI$.

From the *chloroacetophenone* (IV), *coumaranone*, $Me_2C_6H_2.CO.CH_2.O$, (V) was prepd.

and condensed with various aldehydes. Lichtenberger studied the mono- and diazo compds. of *m*-xylenol. *Aminoxymenol*, 3,5,4- $Me_2(H_2N)C_6H_2OH$, (VI), obtained from the monoazo deriv., was converted into *m*-xyloquinone (VII), which can easily be prepd. in this way. In the prepn. of the *nitroso deriv.*, $Me_2(ON)C_6H_2OH$, (VIII) the *o*-compd. is apparently not formed. Hydroxyaldehydes were obtained by treatment with $CHCl_3$ and $NaOH$. By condensation with dimethylaminohydroxybenzoylbenzoic acid, *aporphodamine* (IX) is formed.

By condensation with tetramethyldiaminobenzohydrol, the *triphenylmethane deriv.*, (p - $Me_2NC_6H_4$) $_2CHC_6H_2(OH)Me_2$ (X), was obtained, which gives a green dye by oxidation. Treatment of aminoxymenol with Na_2S and S gave a brown S dye. Report. M. BATTEGAY. *Ibid* 650-1.—*m*-Xylenol acetate was prepd. by Zimmermann (*Thesis, Fribourg*, published in the summer of 1914). The benzoate was prepd. by Béhal and Choay (*Bull. soc. chim.* [3], 11, 702(1894)) in the isolation of *m*-xylenol from wood creosote. I, V, VIII and the *o*- and *p*-hydroxyaldehydes were prepd. by Steinich (*Thesis, Greifswald*, passed May 7, 1914) and described in detail by von Auwers *et al* (*C. A.* 9, 1057; 10, 200, 202; 17, 736). VI was prepd. by Bamberger and Rising (*Ann.* 316, 300(1901)) by the action of dil. H_2SO_4 on 2,6- $Me_2C_6H_3NHOH$. Mono- and diazo-*m*-xylenol were prepd. by von Auwers and Michaelis (*C. A.* 8, 2389, 2391) and at the same time by Zimmermann (*Thesis*). II and its dibromide, III, VII, IX, X and the S dye are new.

A. PAPINEAU-COUTURE

Nitration of phenol. KARL BEAUCOURT AND ECKHARD HÄMMERLE. *Techn. Hochschule Wien. J. Prakt. Chem.* 120, 185-92(1928).—Nitration of $PhOH$ in H_2O , $EtOH$ or glacial $AcOH$ with HNO_3 of d. 1.35 at 7-12° yields 77-82% of NO_2 compds, which consists of 40% *o*-, 35-40% *p*- NO_2 and 2.5% 2,4-(O_2N) $_2C_6H_2OH$. With HNO_3 of d. 1.42 a yield of 75% mono- NO_2 compds. is obtained but the *o*:*p*-ratio is shifted in favor of the *p*-isomer. Variation of temp. has only a small effect on the *o*:*p*-ratio, rise in temp. favoring the production of the *o*-isomer and *vice versa*. The yield of o - $O_2NC_6H_4OH$ is but little affected by employing excess of HNO_3 but the yield of the *p*-isomer is largely depressed, while the production of 2,4-(O_2N) $_2C_6H_2OH$ is correspondingly increased; this is probably due to the greater soly. of p - $O_2NC_6H_4OH$ in the residual HNO_3 . This residual acid, contg. dissolved p - $O_2NC_6H_4OH$, after restoration to the original HNO_3 concn. by addn. of HNO_3 , may be used again.

C. J. WEST

Odor and molecular structure—derivatives of 5-acetocarvacryl methyl ether and certain other 1,2,4,5-tetra-substituted benzenes. MARSTON T. BOGERT AND ISRAEL GOLDSTEIN. *Am. Perfumer* 23, 524-6(1928).—The primary purpose of this investigation was to discover in what way the strong and persistent aromatic odor of carvacryl Me ether would be affected by the introduction of additional substituents in position 5,

since this arrangement of substituents is found in certain naturally occurring odorous compds., as *e. g.*, the asaric aldehyde of calamus oil, or the asarone present in the essential oil of *Asarum arifolium*. The results of the investigation may be summarized as follows: Carvacryl Me ether was converted into the 5-Ac deriv. and this in turn into the chalcone, from which a dibromide and several reduction products were prepd. From the oxime of the Ac deriv. the 5-AcNH deriv. was secured by a Beckmann rearrangement, while direct oxidation of the Ac deriv. itself led to the methylisopropylanisic acid. Another series led from carvacryl Me ether, via the methylisopropylanisaldehyde to the corresponding methylisopropylanisalacetone. Attempts to rearrange carvacryl acetate or carvacryl allyl ether were unsuccessful. Methylisopropyl-*p*-hydroxybenzaldehyde and methylisopropyl-*p*-coumaric acid were also produced from carvacrol; and from its Me ether a Bz deriv., reduction of which gave the benzohydrol. Efforts to oxidize the cymyl ester of *p*-MeC₆H₄SO₃H, so as to replace the cymene Me by the CHO group, failed. With the exception of carvacryl allyl ether, which had a sharp aromatic odor, the other new compds. prepd. were practically odorless. 5-Cinnamylcarvacryl Me ether, C₂₀H₂₂O₂, m. 72-3°, (oxime, C₂₀H₂₃O₂N, m. 201-2°); 2-isopropyl-4-methoxy-5-methylphenylstyrylcarbinol, C₂₀H₂₄O₂, m. 54-5°; 5-cinnamylcarvacryl Me ether dibromide, C₂₀H₂₂O₂Br₂, m. 175° (decompn.); 5-benzoylcarvacryl Me ether, C₁₈H₂₀O₂, m. 55°, b₂₅ 218-21°; 2-isopropyl-4-methoxy-5-methylbenzohydrol, C₁₈H₂₂O₂, m. 113-5-4°. Cf. the recent article of Rosenmund and Wha, ketones of carvacrol, C. A. 22, 3402.

W. O. E.

Aromatic allyl and propenyl compounds. II. The geometric isomerism of isosafrole H. I. WATERMAN AND R. PRIESTER. Tech. University, Delft, Holland. *Rec. trav. chim.* 47, 1027-30 (1928); cf. C. A. 22, 3643.—Hoering and Baum have investigated the geometric isomerism of isosafrole (C. A. 3, 2946) and claim to have isolated the α -(*cis*)-isosafrole as well as the β -(*trans*)-compd. usually investigated; the same result was recorded by Nagai (C. A. 16, 418) who converted safrole into isosafrole by means of *dil.* alc. KOH in order to obtain a product which should be rich in the γ -compd. W. and P., however, did not succeed in converting safrole into isosafrole by means of such *dild.* alc. KOH, but were able to convert the larger part of the safrole into isosafrole on boiling 150 g. safrole during 30 hrs. with 90 g. KOH in 510 g. 96% alc. The reaction product, however, consisted only of unchanged safrole and *trans*-isosafrole, on treating the lower boiling fractions with an aq. Hg(OAc)₂ (cf. Balbiano, C. A. 3, 2156) the safrole dissolves, leaving β -isosafrole behind. On boiling 1 kg. safrole, 2.5 kg. 96% alc. and 450 g. KOH during 25 hrs., a mixt. of 55% *trans*-isosafrole and 45% unchanged safrole was obtained; this figure was found by sepgg. the components with Hg(OAc)₂, by the I addn. method (cf. C. A. 22, 3643) and from the mol. refraction which is additive in such mixts., provided no other compds. be present (cf. Eisenlohr, *Spektrochemie org. Verb.* 1912, 39). On heating such a mixt. in a sealed tube during 8 hrs. at 200°, the refraction is raised a little, but as the mixt. assumes a strongly yellow color by this treatment, the higher refraction cannot be ascribed to a transformation of *cis*- into *trans*-isosafrole (Nagai, *l.c.*) but may just as well be due to decompn., oxidation or polymerization. From this research it follows, that the conversion of safrole into isosafrole by means of alc. KOH only gives rise to the formation of *trans*-isosafrole.

C. F. VAN DUIN

Constitution of mylistinol and isomylistinol. KINZO KAFUKU AND NOBUTOSHI ISHIKAWA. Centr. Research Lab. Government of Formosa. *Bull. Ind. Dept. Centr. Research Lab. Government of Formosa* 24, 27-34 (1928).—The constitution of these compds. must be mylistinol, 3,5,4- or 4,5,3-HO(MeO)(EtO)C₆H₂CH:CH₂, isomylistinol, 3,5,4- or 4,5,3-HO(MeO)(EtO)C₆H₂CH:CHMe, as may be inferred from the analogous case of the action of the Grignard reagent upon safrole. K. and I. synthesized mylistinol according to the following scheme and established its constitution. 4,3-HO(MeO)C₆H₂CH:CH₂ \rightarrow 4,3,5-HO(MeO)(O₂N)C₆H₂CH:CH₂ \rightarrow 5,3,4-HO(MeO)(EtO)C₆H₂CH:CH₂ (I) \rightarrow 5,3,4-BzO(MeO)(EtO)C₆H₂CH:CH₂ (II); 4,3,5-HO(MeO)(O₂N)C₆H₂CH:CH₂ \rightarrow 5,3,4-BzO(MeO)C₆H₂CH:CH₂ (III). II, m. 55.5-7°, mixed with benzoylated mylistinol, it m. 57-8°. The KMnO₄ oxidation product of III is a liquid, by comparing which with the oxidation product of mylistinol Me ether, m. 91°, it was established that mylistinol (I) is 5-hydroxy-eugenol Et ether. Et and Me ethers. 15 g. of nitro-eugenol, 15 g. EtI (13 g. MeI) and 130 cc. abs. EtOH(MeOH) are heated in a pressure oven for 5-6 hrs. Nitro-eugenol Et ether, b₂₅ 156-7.6°. Me ether decomps. on heating. Amino-eugenol Et and 3-Me ether. To 1 to 12 g. nitro compd. and 12 g. metallic Sn 20 cc. concd. HCl is slowly added and the mixt. heated on a H₂O bath. After the reaction is over the soln. is made strongly alk., distd. with steam, the distillate being made acid by HCl. The unchanged

substance is removed by Et_2O , again made alk. and extd. with Et_2O , *Et ether*, b_{10} 165–8°, *Me ether*, b_{10} 162–4°. 5-Hydroxyeugenol *Et* and *Me ether*. A mixt. of 25 cc. H_2O , concd. H_2SO_4 and 10 g. of amino compd. is diazotized with NaNO_2 with cooling, and hydrolyzed. After distg. with steam and extg. with Et_2O , the phenol is removed by NaOH , the soln. made acid and extd. with Et_2O ; *Et ether*, b_{10} 156–60°; *Me ether*, b_{10} 134°. Other const. of the former also coincide with those of mylistinol. 5-Benzoyl-4-ethoxy-3-methoxy-1-allylbenzene, from the above *Et ether* benzoylated by Schotten-Baumann's method, m. 55.5–7°, unchanged when mixed with benzoylmylistinol.

K. SOMEYA

Synthesis of safrovanillin from isosafroegenol. KINZO KAFUKU AND NOBUTOSHI ISHIKAWA. Centr. Research Lab. Government of Formosa. *Bull. Ind. Dept. Centr. Research Lab. Government of Formosa* 24, 24-7(1928).—When isosafroegenol is oxidized with various oxidizing agents among which ozonized O (5–10%) is best (yield, 60–80%), 3-hydroxy-4-ethoxybenzaldehyde, m. 125°, is obtained, as a white or dirty red mass which may be purified by sublimation. Oxime, m. 181–3°. Semicarbazone, m. 202–3°.

K. SOMEYA

The action of potassium ferricyanide on sodium formanilide in alkaline medium. Preparation of derivatives of imidoquinones. E. I. ORLOV. *Ukrainskii Khim. Zhurnal* 3, No. 2, Pt. sci., 161-9(1928).—The action of strong oxidizing agents on aniline and its salts produces *p*-quinone and quinonediimides (aniline black) studied by Willstätter. The action of mild oxidizing agents, particularly in alk. media, was not studied before. As starting material there was selected not aniline but PhNNaCHO (I) in solid form and $\text{K}_3\text{Fe}(\text{CN})_6$ (II) as oxidizing agent. The supposition was that I will reduce II to $\text{K}_2\text{NaFe}(\text{CN})_6$: $2\text{PhNNaCHO} + 2\text{K}_3\text{FeCN}_6 = [\text{PhN}(\text{CHO})_2]_2 + 2\text{K}_2\text{NaFeCN}_6$. However in the presence of H_2O complications occur, and II acts in alk. medium as a strong oxidizing agent. *Exp. I.*—29 g. I and 140 g. II are ground in a mortar, then 160 g. NaOH (1:2) is added, the mixt. is transferred to a flask, 100 g. H_2O added, and the resulting magma is agitated with Et_2O . An exothermic reaction takes place, while the Et_2O becomes brown. The Et_2O ext. is sepd., and the extn. is repeated 5–6 times. The mass in the flask is of a dark violet color. After sepn. of the Et_2O the mass is treated with some more H_2O and Et_2O , this being repeated until the Et_2O ext. is only faintly tinged yellow. The combined Et_2O exts. are evapd. to a thick dark brown liquid, which on heating becomes more mobile, and on drying at 100° is converted into a viscous mass (III). Analysis gives the formula $\text{C}_6\text{H}_3\text{O}_2\text{NH}_2$ (mol. wt. 123). The yield is 18 g., which, computed on the basis of the aniline contained in the I used, is 75.7% of the theory. Thus about 25% remained in the alk. soln. combined as some phenolic substances not extractable with Et_2O . The presence of an amino group was shown by diazotizing and coupling with β -naphthol in alk. soln., giving a Bordeaux-red pigment. III was converted into HCl salts. The action of dil. HCl on heating is very slow with changes in color of the soln. from muddy black with dark granules through dark green to muddy violet until the mass on further heating becomes dry and free of excess of HCl. This mass of salts is either black or muddy gray, sol. in H_2O with muddy violet tinge, and is easily diazotized and coupled with β -naphthol in alk. soln., giving a Bordeaux-red pigment. These salts are fairly sol. in 95% alc. with muddy violet color; the last alc. ext. has a faint smoky color. On evapg. the excess of alc. and adding NaOH , the concd. soln. is blue. Not all of the salts are sol. in alc. and NaOH , there remaining some fraction sol. in glacial AcOH with dark green color, and in AcOEt with violet color. Besides, during the treatment of the salts with NaOH to liberate the bases there is formed free NH_3 . Such a behavior toward alc. and NaOH indicates that the black mass of salts is a mixt. of several compds. To obtain free bases from this mixt. of salts, the latter is treated with NaOH (1:2) at 60–70°; there is formed a supernatant oily brown layer contg. free bases, which was extd. with Et_2O and evapd.; the residue was dried first on the water bath and then in a dryer at 70°, resulting in a pitch-like black substance (IV). The yield was 14 g. from 46 g. of the mass (about 30%). The NaOH became brown, and on addn. of HCl pptd. a black powder, thus indicating the phenolic character of the substance. Analysis of IV dried in a desiccator over H_2SO_4 , gives the formula $\text{C}_6\text{H}_3\text{NO}_2$ or $\text{C}_6\text{H}_3\text{O}_2\text{NH}_2$. IV is a heavy mass sol. in AcOH with dark violet color, readily diazotized and coupled with β -naphthol in alk. soln., giving a Bordeaux-red pigment. Some of it was dissolved in 50 cc. alc., to which were added 10 cc. AcOH , 1–2 cc. HCl and 50 cc. H_2O . The soln. is readily reduced with Zn dust, $\text{Na}_2\text{S}_2\text{O}_4$, but less readily with NaHSO_3 , whereby the violet color of the soln. is changed to a faint yellow. On standing in the air the soln. reverts to the violet color. These properties indicated the presence in IV of compounds with NH_2 groups and of quinone character. Therefore

of the IV is satd. with HCl gas, whereby is formed a black cryst. ppt. of s. 14 g. of free bases yield 18 g. of carefully dried salts, which are readily sol. in) with muddy violet color. Analysis gave an av. of 10.6% N and 13.7% HCl. computation of the formula was impossible, for the salts on drying decomp. with tial volatilization. Attempts were made to obtain pure salts by sublimation which ms at 100° and proceeds at higher temp. with melting of the substance. The sub-
ing crystals deposit on the walls of the upper flask as a yellowish powder. When
ely heated there are formed needle-like yellow crystals and whitish scales. The
stals are never free of some moisture no matter how well the original mass of salts
ried. The yellow and the white sublimes in the air and in presence of moisture
one dark and then violet. At the bottom of the lower flask is formed a C-like
duc, *e. g.*, in one case this amounted to 4 g. from 18 g. of the original substance.
e subliming product is not uniform in appearance: in the upper parts of the flask
deposited a yellow cryst. powder; nearer the neck the crystals are green-yellow
ed with some white scales; in the bottom flask, carrying the charge, the upper
ts are coated with yellowish and whitish crystals. The entire sublimed product
carefully dried in a desiccator over H_2SO_4 , and then well ground in an agate mortar.
e tests showed that the product consisted of 3 components: one sol. in H_2O , the
er sol. in HNO_3 , while the 3rd imparted a faint azure blue color to HNO_3 without
solving. The mixed crystals were extd. in a Soxhlet with Et_2O , and the residue, a
yellow powder, was analyzed, giving the formula $\text{O}(\text{C}_6\text{H}_4\text{NH}_2 \cdot \text{HCl})_2$ (V) (mol.
136.5). It was expected that the free base could be isolated by treating the soln.
th solid Na_2CO_3 and extg. with Et_2O ; however, only a yellow oil denser than H_2O
is obtained, analyzing for $\text{H}_2\text{NC}_6\text{H}_4\text{OC}_6\text{H}_4\text{NH}_2 \cdot \text{HCl} \cdot 6\text{H}_2\text{O}$. It began to lose its
O only upon extended drying in a desiccator over H_2SO_4 . The Et_2O ext. on slow
apn deposits whitish scales becoming brown in the air. No analysis of them was
ide. By changing the conditions of sublimation of the black mass of salts [the free
ses of which have the formula $\text{C}_6\text{H}_3\text{O}_2\text{NH}_2$, (see above)], and pptg. from Et_2O soln.
th HCl gas, different results are obtained. The substance was placed between two
osely set watch glasses and dried slowly at 100° for a few hrs., whereby there were
rmed on the upper glass transparent crystals (VI) in the shape of elongated plates and
langles contg. 10.98% N and 28.5% HCl, *i. e.*, a substance of the compn. $\text{C}_6\text{H}_4\text{:}-$
H HCl (mol. wt. 127.5), and the structure

The free base when diazotized in HCl and coupled with β -naphthol in alk. soln. gives a
ponceau red (not a Bordeaux-red) pigment. The initial product of oxidation (III)
of I in alk. medium with I_2 , extractable with Et_2O , has the probable structure

Its salts on further treatment with NaOH give IV according to the equation: $\text{III} + \text{H}_2\text{O} \rightarrow \text{IV} + \text{C}_6\text{H}_4\text{O}_2 + \text{NH}_3$. The yield of IV is 30.4% (calcd. 44.15%). The IV gives salts which on sublimation under one condition give V and under another condition VI, depending upon the method of heating. The reaction of transposition in this can be thus formulated: $2 \text{IV} \cdot \text{HCl} = \text{C}_6\text{H}_3\text{O}_2 + \text{VI} + \text{NH}_4\text{Cl}$. The salts of IV diazotized and coupled in alk. soln. with β -naphthol give a pigment of Bordeaux-red color; when this pigment is dried and sublimed at 100° there are formed on the upper watch glass crystals of ponceau-red color identical with the pigment obtained under similar cond.
are 2 derivs
sublimed un
intermediate products obtained in the course of all the reactions of transposition from

one deriv. to another are phenolic substances, the nature of which was not detd. as their isolation from ferric-ferrocyanide medium presented difficulties. The use of $K_3Fe(CN)_6$ as an oxidizing agent proved to be unfavorable, and $KMnO_4$ should be substituted, also in alk. soln. This would make it possible to isolate also the intermediate products of the 1st reaction of oxidation, i. e., the products of dihydroxy-quinone nature. The investigation was not completed, yet it indicated that it will be possible to study the transition stages from aniline to quinone and imidoquinones by the use of more suitable oxidizing agents, preferably $KMnO_4$ in alk. soln. The expts. show the possibility of producing from the products of the reactions valuable red pigments directly on the fiber.

CHAS. BLANC

Tautomerism of *o*-nitrobenzaldehyde. II. Response to objections of Henry Gilman, Robert Fothergill and F. Arndt. IOAN TANASESCU. Chem. Inst. Cluj, Roumania. *Bull. soc. chim.* 43, 1117-22(1928); cf. *C. A.* 22, 236, 2932.—**Polemical. III. The action of diazomethane on *o*-nitrobenzaldehyde.** *Ibid* 1264-9.—Nitraldine, the product obtained from the action of CH_2N_2 upon $o-O_2NC_6H_4CHO$, was treated with dimethylhydroresorcinol in concd. HCO_2H and boiled. Pouring this reaction mixt. into cold H_2O , gave methylenbisdimethyldihydroresorcinol and a small amt. of methylenbisbenzisoxazolone. The latter suspended in 10% $HCHO$ and dil. HCl gave *N*-hydroxybenzisoxazolone. T. explains these reactions by the tautomerism of $o-O_2NC_6H_4CHO$.

R. C. ROBERTS

Succinic acid derivatives from acylbenzyl cyanides. GUSTAV HELLER, HELMUT HERRMANN AND GERHARD SPIELMEYER. Univ. Leipzig. *J. prakt. Chem.* 120, 193-8 (1928).—Oxidation of acetobenzyl cyanide (I) with $NaNO_2$ in $AcOH$, HNO_3 or $MeONa$ and I gives a small yield of diacetodiphenylsuccinodinitrile, m. 173° ; the purification is rendered difficult by the formation of by-products and stereoisomeric compds. Using a greater diln. of $MeONa$ there results diphenylsuccinonitrile. I yields an anil, m. $102-3^\circ$, and a phenylhydrazone, m. 114° . Similarly benzoylbenzyl cyanide yields dibenzoyldiphenylsuccinodinitrile, m. 207° ; in 1 expt. sapon. gave the anhydride, m. 243° .

C. J. WEST

Velocity of esterification of anisic and gallic acids in ethylene glycol and glycerol. ANTON KAILAN AND AURELIE BRABBÉE. Univ. Wien. *Monatsh.* 50, 149-80(1928). The velocity of esterification of anisic (I) and gallic acids (II) at 25° in anhyd and moist $C_2H_4(OH)_2$ (III) and $C_3H_5(OH)_3$ (IV) in the presence of HCl as catalyst has been measured and the unimol. velocity coeffs. have been expressed as a function of the concn. of $H_2O(w)$ and of $HCl(c)$ in intrapolation formulas. The velocity coeffs., even at small H_2O concns., increase more rapidly than the concns. of HCl . The ratios of the velocity coeffs. in $EtOH(k_a)$ in $IV(k_g)$ and in $III(k_\gamma)$ are for I at $c = 0.166$ mol./l., k_a/k_g 1.53, k_γ/k_g 0.87, and at $c = 1.35$, 0.34 and 1.64. The corresponding figures for II are 1.90, 1.06, 0.41 and 1.25. Thus II, like most of the acids already investigated, is more rapidly esterified in III than in IV but this is the case with I only at high concns. of H_2O . In III and IV, as in $EtOH$, the effect of methylation of a *p*-HO group is small. In the case of II, as of all disubstituted $BzOH$ so far investigated, the velocity coeff. of the esterification catalyzed by HCl is less than that calcd. on the assumption that the effect of substituents is simply additive. At 183° the uncatalyzed esterification of I in IV, similarly to previously investigated acids, follows the equation for a "sesquimol." reaction. The coeffs. in IV when $w = 1$ are about 20% less than in anhyd IV. Increase of w to 2 causes no further decrease. In the uncatalyzed reaction at 183° the back-reaction cannot be neglected as in the catalyzed reaction at 25° .

C. J. WEST

Constitution of β -resodicarboxylic acid. KARL BRUNNER, NIKOLAUS MADERSBACHER AND ERWIN GORITSCHAN. Univ. Innsbruck. *Monatsh.* 50, 216-24(1928).— β -Resodicarboxylic acid, first prepd. from 3,5-(HO) $_2C_6H_2CO_2H$ by Senhofer and Brunner (*Sitzber. Akad. Wiss. Wien.* II, 80, 519(1879)), has now been prepd. by an improved method; from its method of formation, the non-formation of an anhydride or imide and comparison of the di-Me ether of the acid with 3,5-(MeO) $_2C_6H_2(CO_2H)_2$, it is concluded that it is 3,5-dihydroxyterephthalic acid (I). 3,5-(HO) $_2C_6H_2CO_2H$, prepd. from $BzOH$ and fuming H_2SO_4 contg. 50% SO_3 and HCl or by heating with $ClSO_3H$, and sepd. as the di-K salt, yields 3,5-(HO) $_2C_6H_2CO_2H$, subliming at $190-5^\circ$ and 14 mm., when fused with KOH . Heated with $KHCO_3$ and $C_6H_5(OH)_3$ in CO_2 , there results I, sepd. as the mono-*NH* $_4$ salt, crystg. with $1H_2O$; the di-Me ester, m. $151.5-2^\circ$, gives with MeI and KOH Me 3,5-dimethoxyterephthalate, m. $121.5-2^\circ$, which is hydrolyzed to the free acid, m. 285° .

C. J. WEST

Mono- and sesquiterpene series. IV. (1) West Indian sandalwood oil. ERNST DEUSSEN AND A. AWRAMOFF. Univ. Leipzig. *J. prakt. Chem.* 120, 119-44(1928);

cf. *C. A.* 22, 954.—Previous work by v. Soden and Rojahn (*Pharm.-Ztg.* 45, 229, 878 (1900)) and by D. (*Arch. Pharm.* 238, 149(1900); 240, 288(1902)) indicates that the oil contains a mixt. of sesquiterpene hydrocarbons and alcs. The hydrocarbon fraction contains at least 2 isomers, 1 being β -caryophyllene; the other is now shown to be *d*-cadinene (I). By repeated fractionation in a vacuum over K, 2 fractions, b_{10-11} 131–3.5° and b_{11} 138–40°, of almost pure I were obtained, which, when dehydrogenated with S yielded cadalene, b_{11} 159–63°, identified as the picrate, m. 114.5°, and the styphnate, m. 138°; catalytic reduction with Pt black in 96% EtOH gives tetrahydrocadinene, b_{14} 135–7°, $d_{15.2}$ 0.8874, $n_D^{16.2}$ 1.48157. The sesquiterpene alc. fraction appears to consist of 2 alcs., $C_{15}H_{24}OH$ (termed amyrol by v. S. and R.) and $C_{15}H_{23}OH$, the former predominating, which can be only imperfectly sepd. by fractionation owing to the proximity of their b. ps. After removal of the latter alc. by oxidation, the resulting amyrol has been shown to consist of a mixt. of 2 isomeric alcs., $C_{15}H_{23}OH$, called α - and β -amyrol. A fraction consisting mainly of amyrol, b_{15} 160°, d_{22} 0.972, on dehydrogenation with S, yielded cadalene. Na did not react with amyrol in $C_6H_5Me_2$ but K gave a *K deriv.*, which reacted with MeI, yielding KI; no other product was isolated. On treatment with $PhNCO$, 1 mol. of H_2O was eliminated, yielding $(PhNH)_2CO$ and a sesquiterpene hydrocarbon, $C_{15}H_{24}$. Attempted benzoylation of amyrol using Einhorn's method led to the production of a sesquiterpene hydrocarbon, $C_{15}H_{24}$, b_{12} 130.2°; by the Ruzicka-Stoll method a small amt. of an impure *Bz deriv.* was obtained. Zn dust at 100–60° under pressure had no effect, but at 220° loss of 1 mol. of H_2O occurred, yielding cadinene. Similarly 85% HCO_2H , with amyrol, yields a sesquiterpene hydrocarbon, $C_{15}H_{24}$, b_{21} 157–60°, d_{15} 0.9192. By treatment of amyrol with $KMnO_4$ in dil. Me_2CO at 0° and fractionation of the product were obtained α -amyrol, b_5 137–8°, $d_{17.5}$ 0.9814, $n_D^{17.5}$ 1.51147, catalytically reduced in EtOH by Pd- $CaCO_3$ to the *dihydro deriv.*, b_4 134–6°, d_{15} 0.9659, n_D^{13} 1.50068, and β -amyrol contaminated with a little of the α -isomer, b_{10} 149.5–50.5°, $d_{15.2}$ 0.9463, $n_D^{15.2}$ 1.50158. (2) Nomenclature of the caryophyllene series. In reply to Chapman (*C. A.* 22, 2377), D. admits the identity of humulene and α - or inactive caryophyllene but suggests that the latter name be retained for the hydrocarbon to avoid confusion. The work of Henderson (*C. A.* 20, 1072) in the caryophyllene series is criticized on the ground of nomenclature and the apparent non-acquaintance of H. with the work of Deussen and Ober and of Ashina and Tsukamoto.

C. J. WEST

Fun, i dyestuffs. VI. Constitution of atromentin. FRITZ KÖGL, HANS BECKER, J. DETZEL AND G. DE VOSS. Univ. Göttingen. *Ann.* 465, 211–42(1928); cf. *C. A.* 20, 225. The fungus dyestuff, atromentin (I) (*C. A.* 19, 639; 20, 406) was regarded as having the formula $C_{20}H_{14}O_7$ and as being a deriv. of 2,5-diphenylbenzoquinone onto a 3,2'- $HOCH_2C(OH)$: bridge linkage. The analogy between I and polyporic acid, which has been shown (*C. A.* 20, 1225) to be 3,6-dihydroxy-2,5-diphenylbenzoquinone, has, however, suggested a reinvestigation of I, which is now found to have the formula $C_{18}H_{12}O_7$. The structure now favored is that of 3,6,4',4''-tetrahydroxy-2,5-diphenylbenzoquinone. The penta-Ac deriv., m. 242°, is now found to be a *tetra-Ac deriv.* (II) and heptaacetylleucoatromentin, m. 236°, to be the *hexa-Ac deriv.* Reduction of II by Zn and AcOH yields 3,6,4',4''-tetraacetylleucoatromentin, m. 248°. Sapon of II (1 g.) with 10 cc. *N* MeOH-KOH gives a *mono-Me deriv.* (III), reddish brown, m. 239°; since this is easily hydrolyzed it contains the Me group in position 3, the tri-Ac deriv., yellow, m. 202°; reduction of III with $NaHSO_3$ and acetylation gives methylpentaacetylleucoatromentin, m. 196°. The di-Me ether (IV) of I is easily hydrolyzed, supporting the 3,6-structure; with Ac_2O and concd. H_2SO_4 it yields a di-Ac deriv., orange, m. 212°, oxidized by CrO_3 in AcOH to *p*- $AcC_6H_4CO_2H$ (no anisic acid); reduction and acetylation gives 1,4,4',4''-tetraacetylleucoatromentin 3,6-di-Me ether, m. 263.1°. Complete methylation of I is effected by the action of CH_3N_3 on leucoatromentin or of Me_2SO_4 on IV in MeOH-KOH; I *tetra-Me ether* (V), red, m. 199°. If IV is suspended in EtOH during the methylation, there results 3-ethyltrimethylatromentin, orange, m. 186°, readily converted into V by heating with 0.1 *N* MeOH-KOH. V is slowly decompd. by MeOH-KOH, giving 3,4',4''-trimethylatromentin, reddish brown, m. 167°, which in turn is hydrolyzed by satd. Na_2CO_3 to the 4',4''-di-Me ether, brown, m. 290°. Methylation in MeOH-KOH gives the *hexa-Me ether*, m. 238°. All these compds. agree with the formulation $C_{18}H_{12}O_6$ for I, which cannot be considered to have degraded in any way during methylation. Oxidation of I by alk. H_2O_2 normally yields *p*- $HOC_6H_4CO_2H$. In hot AcOH, however, a small quantity of HCl and H_2O_2 to furnish 4 atoms O cause the sepn. of the atromentic acid lactone (VI), $C_{18}H_{12}O_6$, yellow, m. 346° (decompn.); di-Ac deriv., yellow, m. 271°; standing in EtOH gives

the *Et* ester, orange, m. 346°, of *atromentic acid* (VII), crystg. with 1 mol. H₂O, red, m. 332°. CH₃N₃ converts VII into the *tri-Me ether* (VIII), yellow, m. 170°, while VI in MeOH gives *Me atromentate tri-Me ether*, yellow, m. 167°. Oxidation of VIII with CrO₃ gives anisic acid and *Me p-methoxyphenylglyoxylate*, m. 54°, which is also obtained by the oxidation of *p*-MeOC₆H₄Ac and methylation. Hot 50% KOH converts VII into *p*-HOC₆H₄CH₂CO₂H; this can be explained on the assumption that it is *p,p'*-dihydroxypulvinic acid, HOC₆H₄C:C(OH).C:C(CO₂H)C₆H₄OH, and the VI is the

corresponding dilactone. Since no other aromatic degradation product is obtained, it is established that the Ph groups of I carry only *p*-HO groups; the old bridge formula is thus excluded. The action of boiling 10-5% aq. KOH on polyporic acid gives rise to 3 products: the known α -benzylcinnamic acid, m. 158°; a new isomeric acid, m. 100.5°; and phenylbenzylsuccinic acid. The action of alkali on I follows a similar course; the action of 30% alkali at 100° gives α -keto- β -*p*-hydroxyphenyl- γ -*p'*-hydroxybenzylbutyrolactone- γ -carboxylic acid, C₁₈H₁₄O₇, crystg. with 3 H₂O, m. 202°. At 140-65°, 50% alkali gives 2 acids, m. 183° and 164°; the former is 4-hydroxy- α -[*p*-hydroxybenzyl]cinnamic acid, whose *Me ether*, m. 161°, was synthesized. Since the 2 acids yield the same Ac deriv., the acid, m. 164°, may be an *allo form*. VII. Synthesis of atromentin. Atromentic acid. F. KÖGL, H. BECKER, G. DE VOSS AND E. WIRTH *Ibid* 243-58.—Atromentin (I) is synthesized by condensing *p*-MeOC₆H₄CH₂C(OMe)Me with (CO₂Me)₂, using Na in Et₂O, which gives the 4',4"-di-Me ether (3,6-dihydroxy-2,5-bis-[*p*-methoxyphenyl]benzoquinone), from which the tetra-Me ether is prepd., and by the use of HI, I itself. A 2nd synthesis consists in heating 2,5-bis-[*p*-hydroxyphenyl]benzoquinone with MeOH and ZnCl₂ at 160°; I 3,6-di-Me ether is thus obtained and is identified as the di-Ac deriv. Free I is obtained by heating with satd. Na₂CO₃ soln. The yield is poor but is better than in the 1st described method. Completely methylated atromentic acid is synthesized as follows: (CO₂Et)₂ is condensed with *p*-MeOC₆H₄CH₂CN by use of Na, giving *p,p'*-dimethoxydiphenylketipinodinitrile, yellow, m. 260° (decompn.); sapon. with 60% H₂SO₄ and EtOH gives *p,p'*-dimethoxy-

pulvinolactone, O.C(C₆H₄OMe).C.CO.O.C:C(C₆H₄OMe).CO, m. 268.5° (which has not

been demethylated). Soln. in MeOH-KOH and acidification gives *p,p'*-dimethoxypulvic acid, orange-red, m. 174.5°, whose *Me ether*, m. 168°, is identical with *Me atromentate tri-Me ether* (see above). In an attempt to hydrolyze this ester by MeOH-KOH there results a yellow compd., C₂₀H₁₄O₆, which is regarded as 3-hydroxy-4-methoxy-2,5-bis-[*p*-methoxyphenyl]cyclopenta-2,4-dien-1-one, m. 174°. Similarly vulpinic acid *Me ether* gives the corresponding 2,5-diphenyl deriv., m. 94-5°, identical with "oxalyl-dibenzyl ketone *Me ether*" (Claisen, *Ann.* 284, 250(1894)). Pulvinone *Me ether*, m. 104-5° (obtained by C. as an oil), gives with MeOH-KOH the same compd. Atromentic acid forms red crystals contg. 1 mol. H₂O, lost at 100° to give yellow crystals which very rapidly absorb H₂O, becoming red, loss and reabsorption of H₂O occurring without loss of transparency.

Acid from the oxidation of α -naphthol. OTTO DISCHENDORFER. Techn. Hochschule Graz. *Monatsh.* 50, 97-104(1928).—The acid obtained by Henriques (*Monatsh.* 9, 527(1888)) by the oxidation of α -C₁₀H₇OH with alk. KMnO₄, to which he assigned the formula C₂₀H₁₄O₆, is identified as benzil-2,2'-dicarboxylic acid (Graebe and Juillard, *Ann.* 242, 229(1887)); *Ag* and *Ba* salts; di-Et ester, m. 154-5°. It is suggested that its formation from α -C₁₀H₇OH proceeds through the stages di- α -naphthol, di- β -naphthoquinone, a compd. of *o*-carboxycinnamic acid type being a possible intermediate compd. in the last stage. Observations made by H. of the reactions of the acid were repeated and corrected. When heated for a few min. above its m. p., the acid yields the anhydride, m. 164°, probably C₆H₄.CO.O.CO.CO.C₆H₄.CO, which decomp. on

further heating with the formation of diphthalyl and C₆H₄(CO)₂O. Heated with PhNHNH₂ in EtOH, the acid yields a *bisphenylhydrazone*, decomp. 175°; when the heating is prolonged, the *bisphenyllactazam*, m. 305-6°, is formed.

Thiophenols. XII. Triphenylmethane series. K. BRAND AND HEINRICH PABST. Univ. Giessen. *J. prakt. Chem.* 120, 199-213(1928).—4,2-Cl(H₂N)C₆H₃OMe, through the diazo reaction, gives 65% of 2-bromo-4-chloroanisole (I), *bis* 127-30°, m. 29-30°, *d*₄²⁰ 1.6170, *n*_D²⁰ 1.58025, 1.58592, 1.60078 for α , D and β . 2-Cyano-4-chloroanisole, m. 99° (60-70% yield); hydrolysis gives 2-methoxy-5-chlorobenzoic acid, m. 82°; *Me*

ester (II), b. 235–40°. The Grignard reagent from I and PhBz give 50–60% of 2-methoxy-5-chlorotriphenylcarbinol, m. 124°; reduction gives 2-methoxy-5-chlorotriphenylmethane, m. 120°. The Grignard reagent from I and BzOEt give 60–70% of 2,2'-dimethoxy-5,5'-dichlorotriphenylcarbinol, m. 190°, reduced to the corresponding triphenylmethane, m. 144–5°. Using II and the Grignard reagent from I there results 2,2',2'-trimethoxy-5,5',5"-trichlorotriphenylcarbinol, m. 165°; the corresponding methane m. 212°. If the basicity of Ph₃COH is called 1, that of the 3 Cl derivs. are: 5-Cl, 0.62; 5,5'-Cl₂, 0.38; 5,5',5"-Cl₃, 0.24.

C. J. WEST

Bathochromic action of the methylthiol group in azo dyes. I. EUGEN BLUMEN-TOCK-HALWARD AND EGON JUSA. Univ. Wien. *Monatsh.* 50, 123–38(1928).—Advantage is taken of the bathochromic action of the MeS group observed by Brand to rep. from 3,6,8-trimethylthiol-β-naphthol and p-O₂NC₆H₄N₂X a reddish violet azo dye, markedly deeper in shade than the other dyes of this class ("ice colors"). The shade deepens successively in the dyes derived from the trisulfonic acid, trithiol and trimethylthiol derivs., corresponding with the change from sexavalent to bivalent S and methylation resp. The poor yields of the trithiol derivs. obtained makes tech. application impossible in this case. K O-Carbethoxy-β-naphthol-3,6,8-trisulfonate, heated with PCl₅, gives the trisulfonyl chloride (I), m. 195°. The action of PhNH₂ causes partial hydrolysis of the CO₂Et group, completed on recrystn., and yields β-naphthol-3,6,8-trisulfonanilide. O-Carbethoxy-3,6,8-trithiol-β-naphthol, m. 80–6° (decompn.), which could not be obtained pure, was formed in 15–20% yield by the reduction of I by adding HCl to the EtOH soln. contg. Zn dust in suspension. It is readily oxidized to polysulfides, and yields, with simultaneous hydrolysis of the CO₂Et group, a dark red azo dye, with p-O₂NC₆H₄N₂X, slowly formed in neutral soln., rapidly in alk. soln. The orange-red Pb salt of the trithiol was obtained with EtOH-Pb(OAc)₂. The action of ClCO₂Et yields O-carbethoxy-6,8-dithiol-3-carbethoxythiol-β-naphthol, m. 115–20° (decompn.). Hydrolysis with KOH yields 2,2'-dihydroxy-6,6',8,8'-tetrahydiodinaphthalene-3,3'-disulfide (Pb salt), which yields 3,6,8-trithiol-β-naphthol (Pb salt) on reduction. O-Carbethoxy-3,6,8-trimethylthiol-β-naphthol, resinous, has no characteristic m p, accompanied in certain cases by 2,2'-di(carbethoxyoxy)tetramethylthiodinaphthalene disulfide, it was obtained from the trithiol with Me₂SO₄ and Na₂CO₃, and yields 3,6,8-trimethylthiol-β-naphthol, m. 140°, on hydrolysis with EtOH-KOH. II. EUGEN RIESG. *Ibid* 139–43.—The azo dye derived from 3,6-dimethylthiol-β-naphthol and p-O₂NC₆H₄N₂X has a similar dull reddish violet color to the 3,6,8-trimethylthiol deriv., the 8-MeS group thus appears to have no influence on the color of the dye. Carbethoxy 3,6-dithiol-β-naphthol, m. 117° (from the disulfonyl chloride); hydrolysis with dil alkali yields 3,6-dithiol-β-naphthol, m. 152°. 3,6-Dimethylthiol-β-naphthol, m. 125° (Me ether, m. 93°); 1-p-nitrobenzeneazo-3,6-dimethylthiol-β-naphthol, m. 258°. Combined reduction and acetylation of O-carbethoxy-β-naphthol-3,6-disulfonyl chloride & treating with Ac₂O, AcOH, Zn and AcONa gives O-carbethoxy-3,6-diacylthiol-β-naphthol, m. 120°.

C. J. WEST

Indene and styrene. Crude materials in industrial quantities. RALPH L. BROWN. U. S. Bureau of Mines, Pittsburgh. *Ind. Eng. Chem.* 20, 1178–80(1928).—Fractional analyses of 13 representative samples of the oily condensate (drip oil) from carbureted water-gas mains and attached appliances such as meters are presented. For fresh dry oil the indene content is normally about 35%, the styrene content is about 15%. Crude supplies of either indene or styrene of about 75% concn. are possible: the other 25% is almost entirely stable aromatic hydrocarbons. Industrial supplies of crude indene and styrene can be produced from the drip oil and holder oil from systems distributing carbureted water-gas. These 2 hydrocarbons can be used in the production of resins and plastics. Styrene is interesting for the rubber and the perfume industries. The present potential supply is about 8,000,000 lbs. styrene per year and about twice that of indene.

ALBERT L. HENNE

Stereochemistry of aromatic compounds. VII. Inclination of rings in α-dinaphthyls. RICHARD KUHN AND OTTO ALBRECHT. Techn. Hochschule, Zurich. *Ann.* 465, 282–7(1928), cf. C. A. 22, 3654.—1,1'-Dinaphthyl-2,2'-dicarboxylic acid (I), m. 268.5–70° (cor.), obtained from 1,2-ClC₁₀H₇COCl through 1,2-ClC₁₀H₇CO₂Me, has been resolved by means of its quinine salt, m. about 202° (decompn.), [α]_D²⁵ 230.4° (CHCl₃), which is sepd. by crystn. from Et₂O into the salt, m. 197.5–8°, [α]_D²⁴ 301.6° (CHCl₃) of l-I, m. 177°, [α]_D²⁵ –101.6°, and the impure salt, m. about 230°, [α]_D^{22.6} 15.4°, of the d I, m. 339–48°, [α]_D²² 46° (0.1 N NaOH). The d-I when treated with H₂SO₄ gives anthanthrone with no apparent optical rotation. It thus appears that the effect of the 2,2'-di-CO₂H groups is to cause the C₁₀H₇ rings to assume a multi-

planar configuration, not adopted by α -dinaphthyl itself, nor by anthanthrone. Attempts to racemize the *l*-I were unsuccessful.

C. J. WEST

Condensation of chloroindan with the phenols. CH. COURTOT. *Compt. rend.* 187, 661-3(1928).—The recent French Patent assigned to the I. G., F. P. 636,606 is based on work of G. (C. A. 18, 252). It was shown that indanyl chloride or bromide reacts in the cold with phenols splitting out HCl or HBr. Further incomplete work along this line carried out in 1924 is published to avoid the loss of all the benefit of these observations. α -Chloroindan (I) reacts with PhOH in C_6H_6 or Et_2O at 15° to form α -chloroindanyphenol (II), m. $92-3^\circ$, b_D $190-3^\circ$, b_{14} 200° ; benzoate, m. 108° ; *m*-nitrobenzoate, m. $96-7^\circ$. II with diazotized p - $O_2NC_6H_4NH_2$ or p - $HO_3SC_6H_4NH_2$ gives a brown or an orange dye. II with Me_2SO_4 forms the Me ether (III), b_D $187-8^\circ$, b_{14} $201-2^\circ$, m. 40° . I condensed with p - $MeOC_6H_4MgBr$ gives a compd. identical with III, proving the MeO group to be in the *p*-position. I also reacts with *o*- and *m*-cresol and slowly with *o*- $HOC_6H_4CO_2Me$. In the reaction of I with PhOH, a vitreous mass, b_D 293° , is isolated which is probably the condensation product of I with II.

D. H. POWERS

The derivatives of β -methylantracene obtained with oxalyl chloride. D. BUTESCU Industrial Chem. Inst., Univ. Bucharest. *Bull. soc. chim.* 43, 1269-72(1928).—Nascent $(COCl)_2$ prepd. by allowing a mixt. of 1 mol. anhyd. $(CO_2H)_2$ and 2 mols. PCl_5 stand for 24 hrs. was treated with a CS_2 soln. of β -methylantracene contg. some $AlCl_3$. From this reaction, besides β -methylantracene- γ -monocarboxylic acid, 10-chloro- β -methylantracene-9-carboxylic acid, m. 158° , and β -methyl-9,10-dichloroanthracene, m. 214° , were obtained.

R. C. ROBERTS

Perylene and its derivatives. XVII. ALOIS ZINKE, A. DADIEU, K. FUNKE AND A. PONGRATZ. Techn. Hochschule, Graz. *Monatsh.* 50, 77-86(1928); cf. C. A. 2: 3162.—3,9-Dichloroperylene is not changed by the action of Zn and HCl. When the compd. $C_{20}H_{11}Cl_2$ was similarly treated, with the hope of prepg. a mono-Cl deriv. the resulting product consisted of a mixt. of about equal parts of perylene and the di-Cl deriv. (analysis and absorption spectra); therefore the compd. $C_{20}H_{11}Cl_2$ is a mixt. of the compds. $C_{20}H_{12}Cl_{10}$ and $C_{20}H_{10}Cl_8$; since this cryst. in needles of const. compn., this must be a mol. compd. or a case of isomorphism. Reduction of the compd. $C_{20}H_8Cl_4$ also gives the di-Cl deriv., and is thus a mixt. of $C_{20}H_8Cl_8$ and $C_{20}H_{10}Cl_4$. Bromination of perylene gives a mixt. of the 3,9- and 3,10- Br_2 derivs., while the mother liquor contains a tri-Br deriv., since with CuCN in boiling quinoline there results the dark brown *tricyano deriv.*, sapond. by MeOH-KOH to an amorphous red brown tri- CO_2H acid, whose Na salt is cryst.; the orange-brown Ag salt and EtI gives the *tri-Et ester*, yellow, m. 252° ; the $C_6H_5Me_2$ soln. is golden brown with a deep green fluorescence. The cyanide and concd. H_2SO_4 give *peryene-3-anhydrocarboxylic acid-4-sulfinide-9,10-dicarboxylic anhydride*, deep red; H_2SO_4 gives a red soln. with a red fluorescence; $PhNO_2$ a deep orange-red soln. with a green fluorescence. XVIII. ALFRED PONGRATZ. *Ibid.* 87-96.—3,9-Dichloro-4,10-diacetylperylene contg. aliphatic acyl groups yield, when boiled with CuCN in quinoline, vat dyes having the constitutions I or II, of which I is supported by the absence of detectable alkylimino groups and II by the non-reactivity of BzH with the dyes from the propionyl and butyryl derivs. 3,9-Dichloro-4,10-dibutyrylperylene, m. $258-9^\circ$, was prepd. by a Friedel-Crafts reaction from 3,9-dichloroperylene and $PrCOCl$. The dyes from the 4,10-diacetyl-, dipropionyl- and dibutyrylperylene were colored dark violet. They were purified by reduction to the vats (red) and reoxidation. The dye from the di-Ac deriv. was also formed in C_6H_5N at 200° under pressure. Oxidation of the dyes by $KMnO_4$ or CrO_3 yielded perylene-3,4,9,10-tetracarboxylic acid. The dye from the di-Ac deriv. yielded a *tetra-Bz deriv.*, which did not form a vat and reacted with BzH to form a *benzylidene deriv.*, which was reduced to a vat with difficulty.

C. J. WEST

Anthocyan. II. Zurich investigations. J. DUKKER, *Pharm. Zen*

89-94(1928).—In a former paper it was shown (cf. *C. A.* 22, 1437) that the anthocyanins are hexosides which on acid hydrolysis are resolved into a sugar residue and an glucone, the dyestuff anthocyanidin. In a few cases anthocyan in addn. to free anthocyanidin was detected in flowers. In this connection the most important results of Karrer's studies in anthocyan chemistry are pointed out. In conclusion the conditions under which salt formation of anthocyanins and anthocyanidins takes place are discussed.

W. O. E.

Bicyclic 2,6-methylenepiperidine. JULIUS V. BRAUN, WERNER HAENSEL AND FRIEDRICH ZOBEL. Univ. of Frankfurt. *Ann.* 462, 283-300(1928).—*m*-C₆H₄(OH) (800 g.), in 2.5 l. EtOH and 175 g. Na, treated with 1 kg. iso-AmBr, gives 40% of *esorcinol iso-Am ether*, *b*₁₂ 165° (*benzoate*, *m.* 31-2°); reduction by Sabatier's method gives 55-70% of the *hexahydro deriv.*, *b*₁₆ 140°, which is then oxidized by CrO₃ to *β*-*isoamyloxycyclohexanone*, *b*₁₆ 128-30°, *d*₄¹⁸ 0.9421, *n*_D¹⁸ 1.4518 (65% yield); *semicarbazone*, *m.* 146°; *oxime* (I), *b*₁ 162°; the compd. is easily decompd. by alkali, giving a *ketone*, C₈H₈O, *b.* 170-2°. A mixt. of Mg and BrCH₂CO₂Et gives about 50% of a *hydroxy ester*, C₁₄H₂₀O₄, *b*₁₂ 175°; heating at 150° for 2 hrs. with KHSO₄ splits off H₂O, giving 60-70% of the *compd.* C₁₄H₂₀O₃, *b*₁ 170°, *d*₄²³ 0.9740, *n*_D²³ 1.4670. Reduction of the ester with Na and EtOH gives about 10% of the corresponding *acid*, *b*₁₁ 190°, and *β*-3-*isoamyloxycyclohexylethyl alc.*, *b*₁₁ 162°, *d*₄²⁴ 0.951, *n*_D²⁴ 1.474. Reduction of the same ester with Pt or Pd in MeOH produces 3-*ethylcyclohexyl isoamyl ether*, *b*₁₂ 110-20°, together with *β*-3-*isoamyloxycyclohexylethyl alc.*, *b*₁₂ 160°, *d*₄²¹ 0.941, *n*_D²¹ 1.468 (yield, 7 g. from 500 g. *m*-C₆H₄(OH)(OC₆H₁₁)); PBr₃ in CHCl₃ gives the corresponding *bromide*, *b*₁₆ 155°, which is converted by MeNH₂ in C₆H₆ at 100° into *β*-3-*isoamyloxycyclohexylethylmethylamine*, *b*₁₄ 140°; the latter, with concd. HCl at 125° yields the HCl and then the *chloroplatinate* of *β*-3-chlorocyclohexylethylmethylamine, *m.* 171-3° (obtained only in minute amounts). Na and EtOH reduce I with a 60-70% yield of 3-*isoamyloxycyclohexylamine*, *b*₁₃ 120°, *d*₄¹⁷ 0.898 (HCl salt, *m.* 134-6°; *chloroplatinate*, yellow, decomp. 240-3°; *Ac deriv.*, *b*₁₃ 190-2°; *Bz deriv.*, *m.* 61-4°). When the base is heated with concd. HBr at 100°, it is converted into 3-*bromocyclohexylamine-HBr*, *m.* 206-8° (corresponding *picrate*, *m.* 175-7°). Cold alkali, or warm alkali for only a short time liberates the free base, but prolonged action of warm alkali gives a mixt. of the following substances: tetrahydroaniline (II), giving a *p*-toluenesulfonyl *deriv.*, *m.* 75°; 2,6-methylene-piperidine (III), whose HCl salt *m.* 258°; *picrate*, *m.* 158-62°; *N*-*p*-toluenesulfonyl *deriv.*, *m.* 123°, reduced by H and Pd-charcoal to cyclohexylamine; *N*-cyclohexenyl-1,3-diaminocyclohexane, *b*₁₁ 112-5° (*di-Bz deriv.*, *m.* 188-9°), giving when exhaustively methylated (one stage) a salt from which a *chloroplatinate*, C₁₇H₂₄N₂Cl₂Pt, *m.* 185-6°, is isolated; finally a *base*, (C₈H₁₁N)₂, *b*₁₄ 140-5°. II yields a *methiodide*, *m.* 241-2°; III a *iodide*, *m.* 206-8°. When the above isoamyloxycyclohexanone is treated with HNHI, etc., in the course of a dihydrocarbazole synthesis, AmOH is eliminated. removal is much less ready in the case of 2-*isoamyloxycyclohexanone*, *b*₁₃ 116°, 19377 (*semicarbazone*, *m.* 166°; *oxime*, *b*₁₄ 155°), which may be obtained by oxidizing *hexahydroprocatechol iso-Am ether*, *b*₁₁ 122°.

C. J. WEST

Triphenylmethanes whose benzene nuclei are bound with each other. IV. Preparation of an iminophenyleneacridine derivative; dependence of color of compounds

... give 2 g. 2-tolyl-5-anilinoanthranilic acid, *m.* 190-3° (decompn.); 1 g. with ZnCl₂ in AcOH gives 1-anilino-4-methylacridone, brownish red needles (1 AcOH or 1 mol. EtOH, *m.* 140-60°; the action of POCl₃ on the acridone gives 1-aminophenyleneacridine, deep blue, does not *m.* 355°; HCl gives a H₂O sol. salt (a. blue). Thus the replacement of a ring-closing CO group by an NH group causes considerable deepening of the color. 2-Methyl-5-nitrodiphenylamine-2'-carboxylic acid, from 2,5-Me(O₂N)C₆H₄NH₂ and *o*-ClC₆H₄CO₂H, *m.* 220-1°; *Me ester*, *m.* 153-5°; reduced with SnCl₂ in HCl-AcOH gives 2-methyl-5-aminodiphenylamine, 93-5°.

C. J. WEST

Stereochemistry of the saturated tervalent nitrogen atom. VIII. Methylisopelletierine. JACOB MEISENHARTER AND EMIL MAHLER. Univ. of Tübingen. *Ann.* 462, 1-16(1928); cf. *C. A.* 20, 1081.—Methylconhydrinone (I) and methylisopelletierine (II), regarded by Hess and Grau as stereoisomers (*C. A.* 19, 1290), are shown to be actual isomers. I is, as these authors suppose, *α*-2-*N*-methylpiperidylpropan-*α*-(2-propionyl)-methylpiperidine) but II is now shown to be *α*-2-*N*-methylpiperidyl-

propan- β -one(2-acetonyl-1-methylpiperidine). If H. and G.'s contentions were correct I and II should give 1 and the same MeI deriv. but 2 distinct MeI derivs. are obtained. Further, I and II differ greatly in their reactions as ketones. II is readily reduced to an alc., I is not, and so on. Hess' supposed II is shown to be a mixt. The pure II has been synthesized as follows: 2- β -hydroxypropylpyridine (for which preparative details are given) is converted into the Me_2SO_4 deriv., which is catalytically reduced (Pt-Pt oxide) to 1-methyl-2- β -hydroxypropylpiperidine (III), b_p 110-20°. Oxidation of the latter with CrO_3 in AcOH at the b. p. gives II, identified by conversion into various salts and other derivs. Catalytic reduction of 2- β -hydroxypropylpyridine yields 2- β -hydroxypropylpiperidine (IV), m. 69-70°; oxidation with CrO_3 in AcOH gives isopelletierine, whose picrate m. 147-8°. The Me deriv. of IV is identical with III; the picrate m. 145° and the semicarbazone-HCl decomps. at 210°. C. J. W.

Industrial ethylation. Manufacture of dionin. JOH McLANG. *Chem. Trade J.* 83, 143-4(1928).—Dionin is a trade name for ethylmorphine-HCl. Directions are given for the manuf. of $p\text{-MeC}_6\text{H}_4\text{SO}_3\text{Et}$, Et_2SO_4 , ethylmorphine and its HCl salt in batches of about 20 kg. No novel feature is included in the directions. A. L. H.

The optical activity of pseudomorphine. A. K. BALL AND WILLIAM A. WOLFF. Univ. of Pa., Philadelphia. *J. Biol. Chem.* 80, 403-11(1928).—The optical rotations of pseudomorphine solns. and the effect of the addn. of KOH to such solns. were detd. It is shown that for a given ratio of pseudomorphine and alkali the same rotation is observed, independent of the actual concns. The results follow the equation $M[(f(a)/c) + 10]^{0.435} = -572$, in which f is the activity coeff. of the KOH; (a) , its molar concn.; c the molar concn. of pseudomorphine, and M , the optical rotation.

ARTHUR GROLLMAN

Lupines. P. KARRER, F. CANAL, K. ZÖHNER AND ROSE WIDMER. *Helv. Chim. Acta.* 11, 1062-84(1928).—Lupine, $\text{C}_{10}\text{H}_{19}\text{ON}$, contains an unsatd. alc. $\text{C}_{10}\text{H}_{19}\text{O}$ and a satd. alc. $\text{C}_{10}\text{H}_{21}\text{O}$. By CrO_3 oxidation the unsatd. alc. yields γ - or δ -lactone. Therefore the OH group in lupine is in the γ - or δ -position and both alcs. turn the plane of polarized light. The satd. alc. is by PBr_3 changed to the bromide. One-half is reduced to the satd. hydrocarbon $\text{C}_8\text{H}_{18}\text{CHMe}$, one-half to the quaternary NH_4 salt $\text{C}_8\text{H}_{18} > \text{CHCH}_2\text{NMe}_3\text{Br}$ which on distn. gives the unsatd. hydrocarbon $\text{C}_{10}\text{H}_{18}$. The satd. hydrocarbon and NH_4 salt are optically active but the unsatd. hydrocarbon possesses no rotating power. The unsatd. hydrocarbon $\text{C}_8\text{H}_{18} > \text{C}:\text{CH}_2$ is decompd. with O_3 to an optically inactive ketone, AmCOPr . The N is now introduced into this C frame. The following two possible formulas are given.

Of these the 2nd appears the more probable and contains a ring system similar to that occurring in the berberine alkaloids. From this base by addn. of 5 carbon atoms and a tertiary N-atom a probable structural formula for sparteine can be derived. C. S.

Paprika coloring matters. III. Catalytic hydrogenation. Z. ZECHMEISTER AND L. V. CHOLNOKY WITH V. VRABÉLY. Univ. Pécs, Ungarn. *Ann.* 465, 288-99(1928); *C. A.* 21, 2919.—The method of isolation of capsanthin is improved and the new α -ula, $\text{C}_{44}\text{H}_{68}\text{O}_8$, is obtained. The strongly unsatd. nature of the compd., suspected from its ready resinification, is confirmed by catalytic reduction. In EtOH, or better, AcOH, reduction in the presence of Pt introduces 9 mols. H. A colorimetric survey of the reaction shows that 6 mols. of H are 1st introduced, removing all the color, which during reduction is constantly less than would be expected calcd. on the assumption that there are 9 conjugated ethylenic linkings present. The product, *perhydrocapsanthin*, is a liquid (perhaps a mixt. of stereoisomers), with $[\alpha]_D^{20} -23.3$ to -24.7° , possibly too low a value owing to racemization, since a prepn. kept for 2 hrs. at 80° had $[\alpha]_D^{23} -15.3^\circ$. The paprika pigment must be considered to belong to the class of natural "polyene" pigments; the l -rotation of its reduction product is compared with the similar property of perhydroxanthophyll. It is assumed that the deepening of color of paprika during ripening is due to dehydrogenation of the parent substance; attempts to influence this by injection were unsuccessful. C. J. WEST

Porphyrin syntheses. XVII. Syntheses of opso- and hemoporphyrin carboxylic acids. New synthesis of coproporphyrin II. H. FISCHER AND W. LAMATSCH. Techn. Hochschule, München. *Ann.* 462, 240-50(1928); *C. A.* 22, 2570.—The methods by which opso- and hemoporphyrin carboxylic acid (4-methylpyrrole-3-propionic acid) (I) was obtained are unsuitable for preparative work and other methods have been sought. Reduction of bis[5-carbethoxy-4-methyl-3- β -carboxyethylpyrrol]methane with HI and

AcOH gives 40–8% of I but, in addn., 80–4% of the theoretical yield of cryptopyrrole-carboxylic acid (II), so that this method is also unsuitable. The readily obtained 5-carbethoxy-2,4-dimethylpyrrole-3-aldehyde is convertible without difficulty into the 3-acrylic and thence into the 3-propionic acid, *viz.*, 5-carbethoxycryptopyrrolecarboxylic acid. The bromination of the latter is now under investigation; the resulting Br deriv. (readily characterized by heating it with EtOH, which converts it into 5-carbethoxy-4-methyl-2-ethoxymethylpyrrole-5-propionic acid, m. 152°) reacts with 3 mols. of SO_2Cl_2 in cold Et_2O to give 5-carbethoxy-4-methyl-3- β -carboxyethylpyrrole-2-carboxylic acid, m. 243°, hydrolyzed by 10% NaOH to 4-methyl-3- β -carboxyethylpyrrole-2,5-dicarboxylic acid, m. 220°. The latter, when heated *in vacuo* at 220°, passes into I, which is, however, better prepd. by heating the ester, m. 243°, with alkali at 175–80° under pressure. I resists all attempts at esterification and when treated with NaNO_2 gives, not the oxime of II, but 50% of hematic acid. When heated with HCO_2H and HBr I is converted into [3-methyl-4- β -carboxyethylpyrrol][3-methyl-4- β -carboxyethylpyrrolenyl]-methene-HBr, m. 194–5° (decompn.), which decomps. with glacial AcOH and HI at 100° into I and hemopyrrolecarboxylic acid (III). I in CHCl_3 and Et_2O reacts with HCN and HCl to give the expected imine (not isolated), which, when reduced by the Kishner-Wolff method at 160°, gives a good yield of III. Bromination of the methene-HBr affords [5-bromo-3-methyl-4- β -carboxyethylpyrrol][5-bromo-3-methyl-4- β -carboxyethylpyrrolenyl]-methene-HBr, which, when heated with II and $(\text{CH}_3\text{CO}_2\text{H})_2$ at 180°, is converted into the tetra-Me ester, m. 288°, of coproporphyrin II. When opsopyrrolecarboxylic acid methene-HBr is heated at 120° with HCO_2H and HBr, only traces of porphyrin are produced but the ester, m. 288°, results when the methene-HBr is heated with HCHO and HBr at 120–5°, the constitution of coproporphyrin II thus being definitely established. Opsopyrrolecarboxylic acid 2-aldehyde, when heated with HBr or with HCO_2H and HCl, gives a methene identical with that obtained from I (when the methene so formed is heated with HBr and HCHO, coproporphyrin II is formed and may be identified as the tetra-Me ester). XVIII. Syntheses of three tetraethylporphintetrapropionic acids (homologous coporphyrins), xanthoporphinogen from etioporphyrin III and a homologous opsopyrrolecarboxylic acid. H. FISCHER and G. STANGLER. *Ibid* 251–67.—Heating 5 g. 2-methyl-4-ethyl-5-carbethoxypyrrol-3-propionic acid with 30 cc. HI-AcOH for 2 hrs. on the boiling H_2O bath gives 2 g. 2-methyl-4-ethylpyrrol-3-propionic acid, m. 78° (picrate, yellow, m. 140°); 3 mols. Br transforms this into [2-bromo-3-ethyl-4-propionic acid pyrrol]-[2-methyl-4-ethyl-3-propionic acid pyrrolenyl]-methene-HBr, red, decomp. 230°; heating with $(\text{CH}_3\text{CO}_2\text{H})_2$ 0.5 hr. at 200° gives 34% of 1,3,5,7-tetraethylporphin-2,4,6,8-propionic acid (homocoproporphyrin), whose tetra-Me ester m. 193° (Cu salt, red, m. 265°; Fe salt, m. 170°). 2-Bromomethyl-4-ethyl-5-carbethoxypyrrole-3-propionic acid, m. 174°; heated with H_2O 4 hrs., there results bis-[3-propionic acid 4-ethyl-5-carbethoxypyrrol]-methane, m. 161°; sapon. with 5% NaOH gives bis-[3-propionic acid 4-ethylpyrrol]-methane-2,2'-dicarboxylic acid, decomp. 180°; HCO_2H transforms this into 1,4,5,8-tetraethylporphin-2,3,6,7-tetrapropionic acid, whose tetra-Me ester m. 170°. Bis-[2-bromo-3-ethyl-4-propionic acid pyrrol]-methene-HBr, red, decomp. about 200°. 2-Methyl-4-ethylpyrrol-3-propionic acid and HBr in HCO_2H , heated 1 hr., give bis-[2-methyl-3-propionic acid 4-ethylpyrrol]-methene-HBr, red, which gives with Br in AcOH the 2-bromomethyl deriv., red needles; a mixt. of the last 2 HBr salts, heated with $(\text{CH}_3\text{CO}_2\text{H})_2$ 0.75 hr. at 200°, gives 1,4,6,7-tetraethylporphin-2,3,5,8-tetrapropionic acid, whose tetra-Me ester m. 182°. The action of SO_2Cl_2 upon 2-bromomethyl-4-ethyl-5-carbethoxypyrrole-3-propionic acid in Et_2O gives 4-ethyl-5-carbethoxy-3-propionic acid pyrrol-2-carboxylic acid, m. 248 (decompn.), which, heated with 10% NaOH 1 hr. at 165–70°, gives 3-ethylpyrrol-4-propionic acid, m. 133°. Etioporphyrin III results by heating [2-bromomethyl-3-methyl-4-ethylpyrrol]-[2-bromomethyl-3-ethyl-4-methylpyrrolenyl]-methene-HBr and the methene from opsopyrrole with $(\text{CH}_3\text{CO}_2\text{H})_2$ 1 hr. at 195°; oxidation in CHCl_3 -AcOH with PbO_2 gives xanthoporphinogen, which may be reduced by Na-Hg to the etioporphyrin. XVIII (XIX?). Syntheses of coproporphyrin I and II and also mesoporphyrin II, V and XII. H. FISCHER, H. FRIEDRICH, W. LAMATSCH and K. MORGENROTH. *Ibid* 466, 147–78.—When the brominated methene from cryptopyrrolecarboxylic acid (I) is heated with $(\text{CH}_3\text{CO}_2\text{H})_2$ at 180–90°, HBr is eliminated and esterification of the resulting product with MeOH gives coproporphyrin tetra-Me ester (II), m. 252° (cor.), Mn complex, m. 267° (cor.); Zn complex, m. 299° (cor.); tetrahydride, does not m. 320°. The absorption spectra of the Mn and Zn salts are given. MeOH-HBr converts I into the compd. $\text{C}_{20}\text{H}_{24}\text{O}_4\text{N}_2\text{Br}$, m. 117° (cor.), which, treated with $(\text{CH}_3\text{CO}_2\text{H})_2$ or $(\text{CHOHCO}_2\text{H})_2$ at 180–200°, gives 3 or 6% of coproporphyrin (III). Treatment of III Fe salt, m. 240° (cor.) with hot 10% NaOH and then with $\text{C}_2\text{H}_5\text{N}$

and AcOH gives the *acetate* of the *Fe salt*. Similar treatment of coprohemin tetra-Me ester in HCl gives *coprohemin*, which, crystd. from Ac_2O , loses a part of its halogen. Oxidation of II with PbO_2 in CHCl_3 -AcOH yields *coproxanthoporphinogen tetra-Me ester*, m. 315° (decompn.), reduced by Na-Hg in AcOH to II. When [4-methyl-3-ethyl-5-carbethoxypyrrolyl][2,4-dimethyl-3-propionic acid pyrrolenyl]methene is heated progressively with MeONa at 130 – 210° a mixt. of NH_4OH -sol. and insol. porphyrins, m. 204° (cor.), is obtained. When heated with HCO_2H and HBr Et 2,4-dimethyl-3-propionic acid pyrrole-5-carboxylate and cryptopyrrolecarboxylic acid are converted into [3,5-dimethyl-4-propionic acid pyrrolyl][3,5-dimethyl-4-propionic acid pyrrolenyl]-methene-HBr, reddish yellow, m. 214 – 5° (cor.); HCl salt, yellowish red needles; *picrate*, red, m. 214° . When this is heated with [3-methyl-5-bromomethyl-4-propionic acid pyrrolyl][3-methyl-5-bromomethyl-4-propionic acid pyrrolenyl]methene-HBr, obtained by bromination of bis[2,4-dimethyl-3-propionic acid pyrrolyl]methene-HBr, in the presence of $(\text{CH}_3\text{CO}_2\text{H})_2$ at 140 – 50° , mesoporphyrin XII, whose Me ester m. 190 – 1° (*Cu complex*, red, m. 215° ; *hemin deriv.*, dark glistening needles); Et ester, m. 195 – 6° (cor.) (*Cu salt*, red, m. 203°); *ITCl salt*, red needles; *Cu complex*; *hemin*, glistening dark needles. Opsopyrrolecarboxylic acid aldehyde (IV) and hemopyrrolecarboxylic acid with HBr give [3-methyl-4-propionic acid pyrrolyl][3-propionic acid-4,5-dimethylpyrrolenyl]methene-HBr, red, m. 175° (decompn.), brominated to the 5-Br deriv., yellow leaflets; heated with $(\text{CH}_3\text{CO}_2\text{H})_2$ at 220° , coproporphyrin I (tetra-Me ester) is produced IV and cryptopyrrolecarboxylic acid aldehyde condense with HBr to give [3,5-dimethyl-4-propionic acid pyrrolyl][3-methyl-4-propionic acid pyrrolenyl]methene-HBr, yellow, m. 200° (decompn.); bromination gives the 5-Br deriv., red, which, heated with $(\text{CH}_3\text{CO}_2\text{H})_2$ at 220° gives 6% of coproporphyrin II. [3-Methyl-4-propionic acid 5-bromopyrrolyl][3,5-dimethyl-4-ethylpyrrolenyl]methene-HBr, m. 251° (decompn.), is converted by heating with $(\text{CH}_3\text{CO}_2\text{H})_2$ at 180° , into mesoporphyrin V (18% yield); *di-Me ester*, m. 274° ; *Cu salt*, red, m. 285 – 6° ; *hemin deriv.*, bluish black. [3,5-Dimethyl-4-ethylpyrrolyl][3-methyl-4-propionic acid pyrrolenyl]methene-HBr, yellow, m. 180 – 90° (decompn.); 5-Br deriv., orange-red needles; this also gives mesoporphyrin V. IV and hemopyrrole give [3-methyl-4-propionic acid pyrrolyl][3-ethyl-4,5-dimethylpyrrolenyl]methene-HBr, whose 5-Br deriv. yields with $(\text{CH}_3\text{CO}_2\text{H})_2$ mesoporphyrin II; *Me ester*, m. 233° ; *Cu salt*, m. 261° ; *hemin deriv.* This porphyrin is also obtained from the 5-Br deriv., light red, of [3-ethyl-4,5-dimethylpyrrolyl][3-methyl-4-propionic acid-pyrrolenyl]methene-HBr, red, m. 209° (decompn.). Et 4-n-ethyl-3-propionic acid-pyrrole-5-carboxylate, m. 106° , is prepd. by decarboxylation of the corresponding 2- CO_2H acid at 250° . 5-Carbethoxyopsopyrrolecarboxylic acid, with HCN and HCl, gives the 2-formyl deriv., m. 230° . 2,5-Dicarbethoxy-3-propionic acid-4-methylpyrrole, m. 147 – 8° . XIX (XX?). Synthesis of deuterohemin and deuteroporphyrin. H. FISCHER AND A. KIRSTAHLER. *Ibid* 178–8.—2,3-Dimethylpyrrole and 2,4-dimethylpyrrole-5-aldehyde are condensed by EtOH-HBr to give [4,5-dimethylpyrrolyl][2,4-dimethylpyrrolenyl]methene-HBr (I), brown, m. 217° (decompn.); the free base m. 115° (cor.); bromination in AcOH gives a compd (II) $\text{C}_{13}\text{H}_{15}\text{N}_2\text{Br}_2$, red, does not m. 300° . When a mixt. of I and bis[2-bromo-3-methyl-4-propionic acid pyrrolyl]methene-HBr (III) is heated with $(\text{CH}_3\text{CO}_2\text{H})_2$ at 180 – 90° , deuteroporphyrin is obtained (*Me ester* (IV), m. 219 – 20° , whose complex *Fe salt*, m. 250°). Similar treatment of a mixt. of II and III gives deuteroporphyrin together with another porphyrin, whose *Me ester* m. 232° . Treatment of deuteroporphyrin with $\text{Fe}(\text{OAc})_2$, AcOH, NaCl and HCl gives deuteroporphyrin with $\text{Fe}(\text{OAc})_2$, AcOH, NaCl and HCl gives deuteroporphyrin *Fe salt* (deuterohemin). $\text{C}_{30}\text{H}_{28}\text{O}_4\text{N}_4\text{FeCl}$. Bromination of IV in AcOH gives a *perbromide*, m. 138° , which on treatment with Me_2CO passes into *dibromodeuteroporphyrin di-Me ester*, m. 274° , which does not depress the m. p. of the natural product. The absorption spectra of the synthetic deuteroporphyrin and the above salts are tabulated. "Pryporphyrin" and deuteroporphyrin are identical.

C. J. WEST

Aminofibroin. A. MOREL AND P. SISLEY. *Bull. soc. chim.* 43, 1132–3(1928).—Diazotized fibroin, from wool or silk, was reduced to aminofibroin, which is easily diazotized and with amines and phenols gives the same colors as fibroin treated directly with HNO_3 .

R. C. ROBERTS

Constitution of chitin. KURT H. MEYER AND H. MARK. *Ber.* 61B, 1936–9 (1928).—M. and M. extend the theory of Fürth and Russo (*Beitr. chem. Physiol. Pathol.* 8, 161) that the acetylglucosamine residues in chitin consist of *amylenic oxide* rings linked glucosidically, by visualizing the 1,5-rings as being bound together through 1,4-O bridges, the rings being alternately rotated about 180° , and the so-formed principle valence chains being united to one another to form micelles. Gonell's theory (cf. *C. A.* 20, 1246) on the structure of the elementary groups in chitin is criticized

because the blotting-out of certain reflections demanded by this theory are not actually observed. M. and M. mention that the rhombic elementary grouping proposed by G. might be visualized as contg. 8 acetylglucosamine anhydrides. There may be also, spirial axis parallel to the fiber axis, thus making chitin differ in general structure from cellulose by its different edge length, *a* and *c*, and by its different edge angle.

Purification of benzene and trichloroethylene (Fr. pat. 641,836) 18.

Hydrocarbons. MICHAEL G. CORSON. Fr. 642,170, Oct. 11, 1927. Hydrocarbon derivs. of C_2H_2 are prepd. by heating to 150–300° under a pressure of 6–40 atm. simple org. substances contg. OH or Cl, but not COOH, and CaC_2 . The hydrocarbon obtained from a compd. contg. Cl may be hydrogenated in the presence of an active metal and HCl to a less complex mol. In examples, $(EtC\equiv)_2$ is obtained from EtOH, and this is hydrogenated to $EtCH_2CH_2Et$. $(PhC\equiv)_2$ is obtained from PhCl, and this may be converted to PhMe. Cf. C. A. 22, 2751.

Liquid hydrocarbons. I. G. FARBENIND A.-G. Brit. 291,137, Feb. 22, 1927. Liquid hydrocarbons of low b. p. are obtained by passing olefinic gases at elevated temps. and either at ordinary or increased pressure over catalysts such as Au, Ag or Cu, O-contg. compds. of alkali metals with addn. of other metal salts or oxides, or salts of the O acids of P, B or Sb with metals such as Ca, Zn or Cu or their reduction products or the solid acids or anhydrides themselves.

Synthesis of hydrocarbons. THE GENERAL CARBONALPHA CO. Fr. 641,520, Sept. 27, 1927. Hydrocarbons are formed by combining with or without heat, pressure and a catalyst, H and C obtained in an extremely active form, e. g. by dissociation CO or gases contg. it. Cf. C. A. 22, 2571.

Synthesizing hydrocarbons from carbon oxides and hydrogen. ALWIN MITTASCH, CARL MÜLLER, LEO SCHLECHT and WALTER SCHUBARDT (to I. G. Farbenind. A.-G.). U. S. 1,698,602, Jan. 8. A gaseous mixt. comprising oxides of C and somewhat less H than is theoretically necessary for the conversion of the oxides of C into CH_4 is subjected to the action of a metal catalyst such as Fe which is prepd. from the corresponding metal carbonyl.

Hydrogenation of organic substances. ADOLF SPILKER, CARL ZERBE and GESELLSCHAFT FÜR THERVERWERTUNG M. B. H. Fr. 641,035, Sept. 16, 1927. H is caused to act on distn. products of coal or on coal itself at a high temp. and pressure in the presence of I or other halogen or a halogen compd. which will liberate the halogen or halogen hydride at the temp. used. Examples are given of the hydrogenation of $C_{10}H_8$ using I or NH_4Cl as catalyst, of coal-tar pitch using I or KBr, of coal using KI, of crude lignite tar or coal using a mixt. of KI, NH_4Cl and Fe_2Cl_3 . Cf. C. A. 22, 2835.

Catalytic oxidation of organic compounds. A. O. JAEGER (to Selden Co.). Brit. 291,419, June 3, 1927. Various oxidations such as those effected by an oxidizing gas on vapors of org. compds. are controlled or limited to produce intermediate products by use, with the catalyzer, of a "stabilizer" which may be a salt or compd. of an alkali metal, alk. earth metal, some alk. earth metals or metals which form oxides not reducible by H. The salts may be acid or neutral sulfates, phosphates, halides, chlorates, nitrates, simple or complex cyanides, arsenates, antimonates, bismuthates, borates or carbonates. "Stabilizer promoters" also may be used which may comprise compounds of catalytic elements such as heavy metals and some amphoteric metals such as Al, Zn or Pb which are not catalysts or have only slight direct catalytic action on the reaction involved. Various examples are given among which are oxidation of C_6H_6 , toluene, phenols or furfural to maleic and fumaric acids, of cresols to salicylaldehyde and salicylic acid and of

$C_{10}H_8$ to naphthoquinone, phthalic anhydride and maleic acid and of ethylene chlorohydrin to chloroacetic acid.

Intermediate oxidation products from hydrocarbon oils. JOSEPH H. JAMES (to Clarence P. Byrnes, trustee). U. S. 1,697,653, Jan. 1. A liquid partial-oxidation product contg. org. aliphatic acids and intermediate oxidation products (with the oxidation products short of aldehyde fatty acids in excess of such acids) is obtained by catalytic oxidation at a temp. just below redness. An app. is described, and Mo or U compds. may be used as catalysts.

Olefins from carbon monoxide and hydrogen. A. W. NASH, A. R. BOWEN and O. C. ELVINS. Brit. 291,867, March 9, 1927. A mixt. of H with an excess of CO is passed at atm. pressure and at a temp. of 280–300° over a catalyst comprising a mixt. of the reduced oxides of Co, Cu and Mn. Various details are given.

Ethylene and other olefins. SYNTHETIC AMMONIA & NITRATES, LTD., AND G. F. HORSLEY. Brit. 291,186, March 30, 1927. Gas mixts. contg. CO such as coal gas, after removal of S compds., are scrubbed to sep. C_2H_4 and other olefins with an acid soln. of $AgNO_3$ under ordinary or increased pressure and at a temp. of 0–10° and the absorbed olefins are removed by heating to 50–70° with or without reduction of pressure.

Separating paraffin constituents from fluid hydrocarbons. ERIK A. FORSBERG, (to Aktiebolaget Separator-Nobel). U. S. 1,699,286, Jan. 15. A liquid is added such as CCl_4 which acts as a selective solvent for liquid hydrocarbons from which paraffin constituents are to be sep'd. and the associated materials are then subjected to a special centrifugal sepn. which is described.

Methylol compounds of organic acid amides. G. WALTER. Brit. 291,712, Nov. 29, 1926. Methylol compds. of org. acid amides are made by the method employed according to Brit. 284,272 (C. A. 22, 4538) for production of methylol compds. of urea and like compds. (treating the amide at about ordinary temp. with CH_2O in an org. solvent and in the presence of an inorg. base). An example is given of the production of methylol-acetamide by dissolving polymerized CH_2O in EtOH contg. a small quantity of KOH and adding acetamide.

Alkylated aromatic compds. I. G. FARBERIND. A.-G. Fr. 33,067, Feb. 26, 1927. Addn. to 608,949. Alkylated, aralkylated or cycloalkylated compds. are obtained by causing sulfuric esters of alcs. which contain 3 or more C atoms to react with aromatic compds. Under energetic conditions sulfonation also takes place. In an example the sulfuric ester of BuOH is heated with $C_{10}H_8$. Other alcs. such as PrOH, AmOH, cyclohexanol or its homologs may be used.

Organic arsenic compounds. DEUTSCHE GOLD- UND SILBERSCHEIDENANSTALT VORM. ROESSLER (August Albert and Wilhelm Schulenburg, inventors). Ger. 468,403, Feb. 4, 1923. Bromine substituted mixed aliphatic-aromatic ketones, e. g. 4-bromoacetophenone or 3-amino-4-bromoacetophenone react with arsenites in hot solution to form mixed aliphatic aromatic ketone arsonic acids. Cf. C. A. 22, 4128.

Unsymmetrical arseno compounds. JOHANNES PFLEGER and AUGUST ALBERT. U. S. 1,688,351, Oct. 23. Unsym. arseno compds. are produced which contain carbonyl groups in non-cyclical linkage by subjecting different arseno-carbonyl compds. in combination to reduction (suitably with hydrosulfite); or in place of As compds. having free carbonyl groups their condensation products with amino compds. of any kind contg. amino groups susceptible of reaction such as hydrazine derivs., hydroxylamine and its derivs., amino sulfonic acids, amino carboxylic acids, amino aldehydes and ketones, acid amides, urea, etc. can be used. Also, As compds. with free carbonyl groups may be reduced together with condensation products as mentioned; or, As compds. having free carbonyl groups or their condensation products with amino compds. may be reduced with any other tervalent or quinquevalent As compds., such as halogen-, nitro-, hydroxy-, aminoarylsarsine oxides or carboxylated or sulfonated arsonic acids, glycine arsonic acids, urea derivs. of arsonic acids, etc. Thus there may, e. g., be produced unsym. As compds. which are on the one side of the formula free from carbonyl groups and contain on the other side this therapeutically valuable group either in the free state or combined by condensation with an amino compd.

Production of alcohols. OSKAR LOEHR (to I. G. Farbenind. A.-G.). Can. 285,921, Dec. 25, 1928. Primary alcs. are produced by reacting upon an olefin oxide of primary structure with H in the presence of a hydrogenation catalyst, a carrier and a promoter. *Example.*—A catalyst is prepd. by pptg. a soln. of 291 parts of $Ni(NO_3)_2$ in 5000 parts of H_2O by means of 89 parts of NaOH, decanting, filtering, washing at first with water until the last traces of nitrate ion have disappeared, and then with a 0.1% NaOH soln. and drying the alk. reacting ppt. at about 100°. The dry ppt. is introduced into a tube, reduced with pure H at 250° to 300° to Ni metal and then a mixt. of H and the vapors of

propylene oxide is passed over the catalyst at about 170°. The products of reaction are condensed. The unchanged propylene oxide is distd. off and again passed through the tube, while the residue (35 to 40%) consists of *propyl alc.* A Co catalyst which is obtained by reducing an alk. Co hydroxide at 400° also yields *propyl alc.* by passing H and the vapors of propylene oxide thereover at about 250°. Cf. C. A. 22, 2753.

Esters of hydrogenated aromatic alcohols. ROBERT H. VAN SCHAACK, JR. (to Van Schaack Bros. Chemical Works). U. S. 1,697,295, Jan. 1. Esters of monocarboxylic acids such as stearic acid which contain more than 7 C atoms in their mol., with hydrogenated aromatic alcs. such as cyclohexanol are produced by heating the acid with an excess of the alc.

Separation of amines. SILESIA VERBIN CHEM. FABRIKEN. Fr. 642,630, Oct. 20, 1927. See Brit. 280,877 (C. A. 22, 3417).

Glycol esters of abietic acid. ARTHUR LANGMEIER (to Hercules Powder Co.). U. S. 1,697,530, Jan. 1. Abietic acid is heated with an alkali such as alc. NaOH and an olefin dihalide such as ethylene dichloride or amylene dichloride to produce esters, Cf. C. A. 23, 848.

Alkyl chlorides. I. G. FARBERIND. A.-G. (Otto Ernst and Walter Berndt, inventors). Ger. 467,185, Dec. 19, 1929. Addition to Ger. 444,799. The process of the main patent (which applies to MeCl) is extended to the reaction of dilute HCl with other alcohols boiling below 110°, e. g. EtOH and PrOH to form ethyl and propyl chlorides.

Alkyl resorcinols. ALFRED R. L. DOHME (to Sharp & Dohme). U. S. 1,697,168, Jan. 1. An acyl resorcinol such as hexylresorcinol is subjected to reduction with Zn amalgam and HCl (using not over 2.5 times as much Zn amalgam as acylresorcinol) with vigorous agitation at a reactive temp. (suitably about 105°). Cf. C. A. 22, 434.

Aromatic mercaptans. I. G. FARBERIND. A.-G. Fr. 642,128, Oct. 8, 1927. See Brit. 279,136 (C. A. 22, 2754).

Aromatic polysulfides. R. EDER. Brit. 291,100, May 27, 1927. Aromatic mercaptocarboxylic acids or esters are treated with S halides to produce polysulfides in which 2 aromatic nuclei each contg. a carboxylic group are connected by a bridge of S atoms. With S dihalides, trisulfides are produced, and with S monohalides tetrasulfides are formed. Alternatively, the mercaptocarboxylic acids may be treated with S halides and the product then esterified. Examples are given of the production of compds. such as dibenzoic acid 3,3'-tri- and tetra-sulfide, dibenzoic acid ethyl ester 3,3'-tri- and tetra-sulfide, disalicylic acid 5,5'-tri- and tetra-sulfide and similar compds.

Aldehydesulfoxylates. I. G. FARBERIND. A.-G. Fr. 641,509, Sept. 27, 1927. Aldehydesulfoxylates are prepd. by reducing aldehyde bisulfites with H in the presence of catalysts such as Ni, Co or Pt, preferably under pressure and heat. Examples are given of the prepn. of formaldehyde- and benzaldehydesulfoxylates from the corresponding bisulfites.

Dinitrohaloaryls. I. G. FARBERIND. A.-G. Fr. 642,420, Oct. 14, 1927. Dinitrohaloaryls of the formula 1-halo-2-nitro-4-X-6-X-benzene where one X represents either SO₂-N (aryl) R or ---CO-N (aryl) R, R being an alkyl, aryl or aralkyl group, and the other X a nitro group, are prepd. by treating 1-halo-2-nitro-4-X'-6-X'-benzene, where one X' represents a SO₂-halogen or CO-halogen and the other X a nitro group. The products are *intermediates for dyes* and other products. In examples, 1-chloro-2,6-dinitro-4-sulfonic acid chloride is heated in water or other diluent with Ph-NHMe, the SO₂Cl group being replaced by a phenylmethylsulfamide group, which product has a feeble yellow color, m. 161° (not corrected). The formulas of other products which may be obtained in the same way are given.

Acidyl naphthalenes and acenaphthenes. I. G. FARBERIND. A.-G. Brit. 291,347, May 30, 1927. Diacidyl derivs. of the naphthalene and acenaphthene series are made by treating the hydrocarbon with an aromatic or aliphatic acid chloride in the presence of an acid condensing agent such as AlCl₃ (suitably is the presence of a solvent such as CS₂). 1,5-Dibenzoylnaphthalene is prepd. from C₁₀H₈ and benzoyl chloride and dichloroacetyl chloride and diacetylnaphthalene from acenaphthene and monochloroacetyl chloride and acetyl chloride, resp.

Diazo compounds. I. G. FARBERIND. A.-G. Swiss 127,705 and 127,706. Mar. 24, 1927. Addns. to 126,406. The method of Brit. 268,789 (C. A. 22, 1365) for the manuf. of a diazo compd. from 2,5-dichloroaniline is now applied to 2,5-dichloro-4-methylaniline (127,705) and to 2,3-dichloro-4-methylaniline (127,706).

Stable diazo compounds. SOCIÉTÉ ANON POUR L'INDUSTRIE CHIMIQUE À BÂLE. Swiss 127,430 to 127,437. Nov. 18, 1926. Addns. to 108,486. Stable diazo compds. are prepd. by treating with naphthalene-1,3,6-trisulfonic acid the diazo compds. prepd. from (1) 4-chloro-o-anisidine (127,430); (2) 5-nitro-o-anisidine (127,431); (3) 4-nitro-

o-anisidine (127,432); (4) *m*-nitroaniline (127,433); (5) 2,5-dichloroaniline (127,434); (6) 4-chloro-2-nitroaniline (127,435); (7) 5-chloro-2-toluidine (127,436); (8) 4,4'-diamino-3,3'-dimethoxydiphenyl (127,437). The dried products may be mixed with acid-binding agents.

Formates of the cyclic series. RUDOLF WIETZEL and FRANZ KREMP (to I. G. Farbenind. A.-G.). U. S. 1,698,573, Jan. 8. In producing formates such as those of cyclohexanol or benzyl alc., alcs. of cyclic compds. such as cyclohexanol or benzyl alc. are treated with CO at elevated temp. (suitably about 80–90°) in the presence of alcoholates such as those of Na or K, under 200 atm. pressure.

Cyclohexyl alkyl phthalic esters. ROGER ADAMS and JAMES F. HYDE (to Newport Co.). U. S. 1,689,761, Oct. 30. Liquid compds. of high b. p., which dissolve cellulose acetates and nitrates and can be used with other solvents in the prepn. of pyroxylin and similar lacquers, are made by heating phthalic anhydride with 1 mol. equiv. of cyclohexanol or substituted cyclohexanol such as hexahydro-*p*-cresol to produce a cyclohexyl acid phthalate and then further reacting with an alc. and a catalyst such as a small quantity of HCl or H₂SO₄. Examples are given of the production of the following phthalates: cyclohexyl Et, cyclohexyl Me, cyclohexyl Pr, cyclohexyl isopropyl and cyclohexyl Bu. U. S. 1,689,762 relates to the prepn. of similar compds. among which are *o*-, *m*- and *p*-methylcyclohexyl Et phthalates and *o*-, *m*- and *p*-methylcyclohexyl Bu phthalates.

Ethylene derivs. HANS FINKELSTEIN (to I. G. Farbenind. A.-G.). Can. 285,920, Dec. 25, 1928. Derivs. of ethylene, propylene and butylene are obtained from waste gases from cracking operations after a previous sepn. of the readily condensable constituents, the corresponding chlorohydrins, by treating HClO with the remaining olefins, converting the chlorohydrins by treatment with milk of lime into a mixt. of olefin oxides, sepg. the individual oxides by fractional distn. under super-atm. pressure and converting each olefin oxide into the corresponding olefin glycol by treating it with water contg. small quantities of strong acid.

Halogenation of benzene, etc. MARTIN BATTEGAY. Fr. 641,102, April 29, 1927. C₆H₆ or its derivs. are halogenated in the presence of concd. H₂SO₄. Examples are given in which Cl is passed into C₆H₆ mixed with concd. H₂SO₄ to obtain mixts. of chlorinated compds.

Benzene-containing product. I. G. FARBENIND. A.-G. Swiss 127,690, July 7, 1926. Addn. to Swiss 123,330. Xylene is treated with H at a high temp. in the presence of a catalyzer, which may be a contact mass including a dehydrogenating element or oxide.

Toluene sulfochlorides. IGNAZ KREIDL. Austrian 110,128, June 15, 1927. Toluene is introduced into chlorosulfonic acid cooled to about -7°, and the cooling is intensified so as to maintain that temp. throughout the reaction.

Alkali metal salts of halogenated amides of aromatic sulfonic acids. HEINRICH GÜNZLER (to Winthrop Chemical Co.). U. S. 1,699,888, Jan. 22. An amide of an aromatic sulfonic acid compd. such as *p*-toluenesulfonamide is decomposed in concd. aq. soln. by bleaching powder and reaction is then effected between an alkali metal salt such as Na₂CO₃ or Na₂SO₄ and the Ca compd. formed by the first reaction.

Alkaline earth metal salts of alkali metal derivatives of chlorosulfamyl aromatic carboxylic acids. FRANZ PROSCHKO (to Esseff Chemische Industrie- und Handels-A.-G.). U. S. 1,697,139, Jan. 1. An aromatic sulfamyl carboxylic acid such as *p*-H₂NO₂SC₆H₄CO₂H is treated with CaOCl₂ or other suitable alk. earth metal hypochlorite and the salt thus produced is then treated with an alkali metal salt such as NaCl. An example is given of the formation of (ClNaNO₂SC₆H₄CO₂)₂Ca.

Benzanthrone derivatives. I. G. FARBENIND. A.-G. Brit. 201,131, Feb. 21, 1927. *Bz*-1-methoxybenzanthrone and its derivs. are obtained by treating benzanthrone derivs. contg. an interchangeable negative substituent in the *Bz*-1-position (such as halogen or a nitro, sulfonic or sulfone group) with MeOH in the presence of alk. agents (suitably by boiling under reflux or in an autoclave). In cases where nitrites are likely to be formed during the reaction substances which destroy the nitrites are added such as Na₂SO₃ or urea. Several examples are given. Cf. C. A. 23, 847.

Benzanthrone derivatives. I. G. FARBENIND. A.-G. Brit. 286,685, March 9, 1927. By reactions similar to some of those described in Brit. 268,830 (C. A. 22, 1366), condensation is effected between O-contg. reduction products of the anthraquinone series with α,β -unsatd. carboxylic acids contg. either H or mono-valent substituents such as alkyl, aryl or halogen in the positions R' and R² (of the formula given in the previous pat.). The process is also applicable to similar unsatd. carboxylic acids in which the double bond has been opened by the addition of H halide, water or the like, such as β -hydroxybutyric acid or β -chloropropionic acid. The *Bz*-1-hydroxybenzanthrone

can be obtained directly or the intermediate products obtained during the reaction can be isolated and closure of the benzene ring of the benzanthrone molecule effected by condensing agents such as oleum or chlorosulfonic acid; sulfonation of the products can be avoided by the addition of a diluent such as Ac_2O . Examples are given of the production of *Bz*-1-hydroxybenzanthrone, a sulfonic acid deriv. of *Bz*-1-hydroxybenzanthrone, β -anthronyl- β -methylcrotonic acid and *Bz*-1-hydroxy-*Bz*-3-phenylbenzanthrone-sulfonic acid, and, by treatment of the latter with NH_3 in the presence of ZnCl_2 , *Bz*-1-amino-*Bz*-3-phenylbenzanthrone (from which the NH_2 group can be eliminated by the diazo reaction, so as to obtain *Bz*-3-phenylbenzanthrone).

Pyridine and its homologs. H. TH. BÖHME A.-G. Fr. 642,391, Oct. 10, 1927. Pyridine and its homologs are prepd. by passing aldehydes or components forming them with NH_3 over catalysts such as oxides or carbides of Fe, Al, Cr, W, U or of rare earths under pressure of about 50 atm. and between 200° and 400° . In an example a mixt. of AcH , or C_2H_2 and steam, and NH_3 using as catalyst W carbide, gives a product composed principally of picolines.

Pyridine derivatives. DEUTSCHE GOLD- UND SILBERSCHNEIDANSTALT VORM. ROESSLER. Fr. 641,422, Sept. 18, 1926. New derivs. of pyridine are obtained by treatment, at ordinary or raised temp. 3-hydrazinopyridine or derivs. of 3- or of 2-hydrazinopyridine with aliphatic, aromatic or mixed aliphatic-aromatic aldehydes or ketones. In examples, *BzH* is poured on to pyridylhydrazine obtained by diazotizing and reducing α -aminopyridine; light colored crystals are obtained, m. $165\text{--}166^\circ$. A product, m. $127\text{--}124^\circ$, is obtained from α -chloro- β -hydrazinopyridine and acetoacetic ester, one, m. $93\text{--}95^\circ$, from α -hydrazino- β' -nitropyridine (I) and acetoacetic ester, one, m. 163° , from I and acetone, one, m. 151° , from I and propionaldehyde, one, m. $226\text{--}228^\circ$, from I and *BzH*.

Halogenating perylene. ALFRED PONGRATZ and ALOIS ZINKE (to Felice Bensa). U. S. 1,697,137, Jan. 1. Perylene is dissolved in a solvent such as PhNO_2 which is inert to the nascent and elementary halogens to be used and a halogen compd. such as HCl is gradually introduced together with a substance such as H_2O_2 which serves to liberate nascent halogen; these compds. are added in calcd. quantities to effect halogenation to the desired extent and the quantity of solvent used and its temp. are sufficient to hold the product in soln.

Dinitroperylene and its derivatives. FELICE BENSA. Ger. 468,453, Dec. 12, Austrian application Oct. 28, 1925). See U. S. 1,688,837 (C. A. 23, 155).

Naphthalene derivatives. I. G. FARBENIND. A.-G. Brit. 291,965, June 16, 1927. 2-Hydroxynaphthalene-6-carboxylic acid is sulfonated with H_2SO_4 of at least 1.82 sp. gr. The normal salts are formed by adding Na_2CO_3 and the less sol. normal di-Na salt of 2-hydroxy-3-sulfo-6-carboxylic acid is sepd. by fractional crystn. from the more sol. normal di-Na salt of 2-hydroxynaphthalene-8-sulfo-6-carboxylic acid. 2,3-Dihydroxynaphthalene is made by fusing 2-hydroxy-3-sulfo-6-carboxylic acid with alkali and splitting off the carboxylic group. Cf. C. A. 22, 3669.

Chlorinating naphthalene. BRITISH DYESTUFFS CORP., LTD., J. B. PAYMAN and W. GIBSON. Brit. 292,056, March 4, 1927. Cl is passed into a soln. of C_{10}H_8 in CCl_4 or similar solvent at a temp. of about 5° in the presence of a small quantity of an inorg. Cl carrier such as FeCl_3 , with or without use of light. The product is distd. under reduced pressure.

Chlorinating naphthalene. BRITISH DYESTUFFS CORP., LTD., J. B. PAYMAN and W. GIBSON. Brit. 291,849, March 4, 1927. Cl gas is passed into molten C_{10}H_8 at ordinary pressure and at temps. of $130\text{--}160^\circ$ in the presence of a small quantity of an inorg. Cl carrier such as FeCl_3 , either with or without exposure to light. After the desired reaction the product is distd. under reduced pressure.

Producing products such as heptaldehyde from heavy vegetable oils. HAROLD S. AVERY and LUDWIG MEUSER (to Naugatuck Chemical Co.). U. S. 1,697,337, Jan. 1. Oil such as castor oil is introduced into a heated zone such as an elec. heated nichrome pipe in the absence of air or catalytic agents and maintained at a relatively high temp. (sufficiently about $500\text{--}600^\circ$) to effect substantially complete decompn. of the oil with production of heptaldehyde. An app. is described.

Making preparations for the condensation of phenols with aldehydes. A. K. PETROV and G. S. PETROV. Russ. 4592, Feb. 29, 1928. Phenolic solns. of alk. earth metals are concd. in the presence of a small quantity of HCHO .

Condensation product from *m*-cresol and acetone. SCHERING-KAHLBAUM. A.-G. Swiss 127,722, May 31, 1927. The two substances are heated to 100° in the presence of a condensing agent. The product can be distd. without decompn. at 0.8 mm. and 187° and is a clear highly refractive liquid which congeals to a resin-like solid when cold. It

can be crystd. from a soln. in petrol ether of low b. p. to give crystals m. 82–83°. The formula is

Condensation products from reaction products of disulfur dichloride and primary arylamines. RICHARD HERZ (to Grasselli Dyestuff Corp.). U. S. 1,699,432, Jan. 15. Various new aromatic substances contg. N, S and Cl are formed by the action of S_2Cl_2 on primary arylamines and their substitution products which contain in their mol. at least one amino group and one unsubstituted H in *o*-position to the amino group, *e. g.*, aniline and its homologs, α - and β -naphthylamine, aminophenols, aminoaryl hydroxyalkyl and aminoaryl thioalkyl ethers, *m*- and *p*-aryldiamines, such as *m*- and *p*-phenylenediamine, benzidine, tolidine, dianisidine and the acyl derivs. of these bases preferably as the dry mineral acid salts and also the substitution products of all these arylamino compds., including the sulfonic and carboxylic acids. Probably the S—S—Cl group enters in the *o*-position to the amino group, or amino groups, resp., forming with same a new ring, consisting of N, S_2 and Cl; in some cases there occurs also a chlorination of the aromatic nucleus. The new substances, possessing probably the general chemical

constitution, $R.N:S(Cl).S(R = \text{aryl})$, are useful as raw materials for the production of dyes and pharmaceutical compds. They are in a dry state yellow, to orange, to red, to brown, to dark colored substances sol. with their own color in water and alc. and are distinguished by the following characteristic properties: (1) When brought into contact with aromatic bases such as aniline, toluidine, etc., most of them yield red, to violet, to blue, to green colorings, which represent unstable basic dyestuffs contg. S. (2) By reaction with H_2O OH is substituted for Cl. (3) If the original substances or these latter products of transformation are treated in a suitable manner with alkalies, the ring is split and new compds. result which when condensed in an alk. soln. with monochloroacetic acid form new condensation products having the character of *o*-aminoarylthioglycolic acids. These latter reactions together with the converting of these condensation products into vat dyes form the subject matter of U. S. Pats. 1,243,170 and 1,243,171. The process may be worked with or without the addition of a suitable diluent which takes no part in the reaction as, for instance, benzene, naphtha, glacial acetic acid or formic acid free from water. When free amino bases are used which react rather violently with the S_2Cl_2 , the reaction should be restrained by adding such a suitable dilg. agent. The temp. of the reaction must be kept below the b. p. of S_2Cl_2 and preferably not below about 40°, as at more elevated temps. more complicated substances result. Cf. C. A. 22, 1365.

Water-soluble condensation products. I. G. FARBENIND. A.-G. (Karl Daimler, Gerhard Balle and Franz Marschall, inventors). Ger. 466,361, July 24, 1924. Addn to Ger. 436,881. *Polynuclear aromatic hydrocarbons, e. g.* naphthalene or tetrahydronaphthalene, and *aryl alkyl halides, e. g.* benzyl chloride, benzyl bromide, xylyl chloride or bromide, nitrobenzyl chloride, chlorobenzyl chloride or tetrahydronaphthalene chlorinated in the hydrogenated ring, or condensation products from these components, are treated with strong sulfonating agents, *e. g.* oleum or mixts. thereof with chlorosulfonic acid, to obtain water soluble condensation products.

Monocarboxylic acids. I. G. FARBENIND. A.-G. Brit. 291,326, Nov. 22, 1926. Monocarboxylic acids are prepd. by passing dicarboxylic acid vapors (alone or with water vapor) or dicarboxylic acid anhydride vapors together with water vapor, at elevated temp. and at ordinary or increased pressure, over oxides of Zn, Cd, Pb or Bi which may also be mixed with other oxides, hydroxides or silicates. Examples are given of the production of benzoic acid from phthalic acid with different catalysts; phthalic anhydride directly as produced from $C_{10}H_8$ may be used.

Sulfonated hydroxy fatty acids. CARL DREYFUS. Fr. 636,488, June 23, 1927. Sulfuric esters of di-, tri-, and polyhydroxy fatty acids are produced by introducing H_2SO_4 contg. 5–10% SO_3 in a very fine mist from spraying nozzles into cooled and agitated hydroxy fatty acids. Ricinoleic acid is converted into sulfodihydroxystearic acid prepd. by oxidizing isoleic acid. Trihydroxy- and polyhydroxystearic acids are converted into their sulfuric esters without the use of solvents. Sativic acid prepd. from linoleic acid by permanganate may be esterified in this way.

Extracting anhydrous fatty acids from aqueous solutions. SOC. ANON. DISTILLERIES

DES DEUX-SÈVRES. Swiss 127,254. June 27, 1927. Anhyd. fatty acids are extd. from their aq. solns. with an ester of AcOH, alone or mixed with a hydrocarbon such as benzene, the ext. being distd. so as to sep., in turn, an aq. ester, the rest of the ester, and the anhyd. acid. Examples are given.

Concentrating volatile aliphatic acids. ADOLF GORHAM (to Holzverkohlungs-Industrie A.-G.). Can. 285,930, Dec. 25, 1928. Dil. volatile aliphatic acids are converted into concd. form, by passing the dil. acid in vapor form through a column in contact with a salt (AcOK) which is capable of forming with the acid an acid salt, and extg. the acid in concd. form from the acid salt which is formed by distn. without isolation.

Concentration of volatile aliphatic acids. ADOLF GORHAM (to Holzverkohlungs-Industrie A.-G.). Can. 285,928, Dec. 25, 1928. Dil. volatile aliphatic acids are concd. by treating solns. of the acids in org. solvents (acetone or wood spirit, oils, ether, butyl alcs.) with salts (AcOK, acetates of the other alkali metals or of the alk. earths, also mixts. of such salts) which are capable of forming with the acid in question acid salts, and heating the acid salts, without isolation, to temp. at which the acid distills off in concd. form. Cf. C. A. 23, 605.

Extraction of concentrated volatile aliphatic acids. ADOLF GORHAM (to Holzverkohlungs-Industrie A.-G.). Can. 285,929, Dec. 25, 1928. Concd. volatile aliphatic acids are extd. from dil. solns. thereof by treating solns. of fatty acids in org. solvents with salts capable of combining with the acids and having a low m. p. so that they remain substantially liquid during the subsequent decompn. process and decompg. the acid salts thus obtained by heating.

α -Aminoanthraquinone- β -carboxylic acids. KARL WILKE (to Grasselli Dyestuff Corp.). U. S. 1,698,900, Jan. 15. 1-Aminoanthraquinone-2-carboxylic acid is prepd. by subjecting anthraquinone-1,2-isoxazole to the action of a saponifying agent such as a hot soda soln. Cf. C. A. 23, 395.

Acetic acid. HENRY DREYFUS. U. S. 1,697,109, Jan. 1. Me formate is isomerized by heating it in vapor form under pressure in the presence of a catalyst comprising $Zn(OAc)_2$ or other metal acetates which decompose with formation of HOAc at temps. not exceeding about 450° or metal compds. such as metal oxides or methylates which are capable of forming such acetates.

Acetic acid, etc. HOLZVERKÖHLUNGS-INDUSTRIE A.-G. Brit. 291,433, June 2, 1927. Aq. HOAc or similar acid is vaporized and caused to react with a salt such as NaOAc or KOAc capable of combining with the acid to form an acid salt and the latter is either directly used for reactions such as production of esters or is heated to effect sepn. and recovery of the acid itself. Brit. 291,434 specifies treatment of the aq. acid with an org. solvent such as acetone or "wood spirit oils," ether, BuOH or mixts. such as "acetone oil" or BuOH and benzene, followed by treatment of the soln. thus formed with a salt such as KOAc or other alkali or alk. earth acetates which form acid salts with the acid.

Apparatus for continuous rectification of acetic acid. GEORGES F. LEGENDRE (to Soc. des Établissements Barbet). U. S. 1,698,798, Jan. 15. An app. with 2 rectifying columns and various auxiliary app. is specified.

N-(Carbamylmethyl)-2-chloroarsanilic acid. ÉTABLISSEMENTS POULENC FRÈRES and ERNEST FOURNEAU. Fr. 636,658, Oct. 21, 1926. See C. A. 22, 2755.

Maleic acid. I. G. FARBERIND. A.-G. Swiss 127,034, Mar. 21, 1927. Maleic acid is obtained by heating C_6H_6 with oxidizing gases in the presence of an oxidation catalyst, subjecting the reaction products, without sepn., to decarboxylation with the aid of catalysts such as ZnO or a mixt. of CdO and Al_2O_3 , and then again oxidizing the products as before. Cf. Brit. 268,775.

Hydroxybenzoylbenzoic acid. THE NEWPORT CO. Fr. 641,145, Sept. 17, 1927. See U. S. 1,654,289 (C. A. 22, 788).

4'-Halo-2-benzoylbenzoic acid intermediates. WILHELM MÜLLER and ERNST APFENZELLER (to Grasselli Dyestuff Corp.). U. S. 1,699,671, Jan. 22. Phthalic anhydride, monohalobenzene and anhydrous $AlCl_3$ are mixed in approx. equimol. proportion and the oily reaction product is slowly heated to between 40° and 209° (suitably about 80–100°) until evolution of HCl ceases, to obtain a product which by dil. acid is converted into 4'-chloro-2-benzoylbenzoic acid.

Methanol. SOCIÉTÉ ANON. DES CHARBONS ACTIFS ÉDOUARD URBAIN. Fr. 641,195 Mar. 2, 1927. A mixt. of CO and H for the production of MeOH is obtained by passing over known catalysts a mixt. of a hydrocarbon such as CH_4 , CO_2 and steam at temps. between 600° and 1200°.

Phenethyl alcohol. EDGAR C. BRITTON (to Dow Chemical Co.). U. S. 1,698,932,

Jan. 15. In order to purify synthetic phenethyl alc., the crude alc. is converted into a monophenethyl phthalate, and after steam distn. the phthalate is hydrolyzed.

Formaldehyde. I. G. FARBENIND. A.-G. Fr. 641,750, Oct. 3, 1927. Solus. of CH_2O are obtained by heating polymerized formaldehydes with water above 100° .

Formaldehyde from methane. FRANCIS J. CARMAN and THOMAS H. CHILTON U. S. 1,697,106, Jan. 1. A gaseous mixt. comprising CH_4 , O and a halogenating agent such as Cl is heated above 500° but below ignition temp. An app. is described.

Producing formaldehyde or other partial oxidation products of hydrocarbons. FRANCIS J. CARMAN. U. S. 1,697,105, Jan. 1. A gaseous mixt. comprising a hydrocarbon material such as CH_4 together with O and a halogen such as Cl is heated to a temp. suitable for effecting limited oxidation and a desired oxidation product such as CH_2O is sep'd. from the products leaving the reaction chamber, and at least a portion of the halogen is rendered available in the oxidation and used for reaction with further quantities of hydrocarbon. An app. is described.

Acetaldehyde. I. G. FARBENIND. A.-G. Fr. 641,406, Sept. 26, 1927. See Brit. 278,324 (C. A. 22, 2573).

α -Amylcinnamaldehyde. I. G. FARBENIND A.-G. Swiss 127,159, Mar. 1, 1927. Addns. to 125,473. PhCH:CAmCHO is prepd. by the method described in Brit. 284,458 (C. A. 22, 4725).

5-Nitro-1-aminoanthraquinone-2-aldehyde. I. G. FARBENIND. A.-G. Swiss 127,165, Mar. 7, 1927. Addn. to 125,967. 5-Nitro-1-aminoanthraquinone-2-aldehyde is prepd. by reduction of 5-nitroanthraquinone-1,2-isoxazole, suitably with FeSO_4 in dil. H_2SO_4 suspension.

1,5-Diaminoanthraquinone-2,6-dialdehyde. I. G. FARBENIND. A.-G. Swiss 127,166, Mar. 7, 1927. Addn. to 125,967. 1,5-Diaminoanthraquinone-2,6-dialdehyde is prepd. by reduction of anthraquinone-1,2,5,6-diisoxazole, suitably with FeSO_4 in dil. H_2SO_4 suspension.

1,8-Diaminoanthraquinone-2,7-dialdehyde. I. G. FARBENIND. A.-G. Swiss 127,167, Mar. 7, 1927. Addn. to 125,967. 1,8-Diaminoanthraquinone-2,7-dialdehyde is prepd. by reduction of anthraquinone-1,2,8,7-diisoxazole, suitably with FeSO_4 in dil. H_2SO_4 suspension.

Ketene from acetone. KETOID Co. (D. A. Nightingale, inventor). Ger. 468,402, June 27, 1925. See U. S. 1,602,699 (C. A. 20, 3697).

1-Aminoanthraquinone-2-methylketone. I. G. FARBENIND. A.-G. Swiss 127,168, Mar. 7, 1927. Addn. to 125,967. 1-Aminoanthraquinone-2-methylketone is prepd. by reduction of anthraquinone-1,2-methylisoxazole, suitably with $\text{Na}_2\text{S}_2\text{O}_4$ in dil. NH_4OH suspension.

Methyl ether. DELCO-LIGHT Co. Fr. 641,580, Sept. 27, 1927. See Brit. 278,353 (C. A. 22, 2573).

Methyl formate. CONSORTIUM FÜR ELEKTROCHEM. IND., G. M. B. H. (Martin Mugdan and Josef Wimmer, inventors). Ger. 466,516, Jan. 23, 1925. CH_2O or, preferably, a dried polymerization product, *e. g.*, paraformaldehyde, is vaporized and fed over finely divided copper catalyst prepd. by pptg. Cu oxide on pumice and reducing it. The reaction is exothermic with small decompn. below 250° . The formaldehyde may be vaporized with the help of an indifferent gas or vapor, *e. g.*, Me formate. The yield approximates 90%.

Butyl acetate. ROBERT H. VAN SCHAAK, JR. (to Van Schaack Bros. Chemical Works). U. S. 1,700,103, Jan. 22. Butyraldehyde is condensed with acetaldehyde in the presence of Al butoxide which serves as a promoter.

Carbazole. SOCIÉTÉ ANON. POUR L'INDUSTRIE CHIMIQUE À BALE. Fr. 641,674, Sept. 30, 1927. Carbazole is extd. from residue of $\text{C}_{10}\text{H}_{18}$ by a fractional distn. followed by a treatment with solvents such as xylene or toluene. If the content of $\text{C}_{10}\text{H}_{18}$ is low the distn. may be omitted.

Thymol and its homologs. CHEM. FABRIK AUF ACTIEN VORM. E. SCHERING. Fr. 641,437, Aug. 9, 1927. Thymol, and its homologs and their hydrogenation products are prepd. by treating the condensation products of alkyl phenols and ketones in the presence of catalysts with H, until they have absorbed 4 or 6 atoms of H. In examples, the condensation product of *m*-cresol and acetone is heated with H in the presence of 1% of Ni to a temp. of 180 - 190° until 14 atoms of H are absorbed. Thymol is sep'd. in known manner. Similarly, 4-methyl-6-isopropylphenol is obtained from the condensation product of *p*-cresol and acetone; if the hydrogenation is continued 4-methyl-6-isopropylcyclohexanol is obtained. Other examples are given.

Chlorothymol. F. RASCHIG. Swiss 127,035, Mar. 23, 1927. Chlorothymol (1-methyl-3-hydroxy-4-isopropyl-6-chlorobenzene) is obtained by condensing the corre-

sponding chloro-*m*-cresol with suitable isopropyl derivs., such as the chloride. Cf. *C. A.* 22, 1366.

Butadiene and its homologs. I. G. FARBENIND. A.-G. Brit. 291,748, June 7, 1927. 1,3-Butylene glycol or a homolog is passed in vapor form (and preferably mixed with a diluent gas or vapor such as steam) over dehydrated alum (suitably at a temp. of 240–250°).

Isatins. KARL SCHIRMACHER and KONRAD RENN (to Grasselli Dyestuff Corp.). U. S. 1,698,894, Jan. 15. Isatins or N-arylsulfo compds. of isatins are obtained by causing oxalyl chloride to react upon a salt of a N-aryl-sulfoanilide (or a homolog, deriv. or substitution product) in the presence of an indifferent solvent such as CS₂ and treating the oxamic acid chlorides thus obtained (which also may be isolated in substance) with an acid condensing agent such as AlCl₃. N-arylsulfo compds. of the isatins which are produced may be treated with a suitable saponifying agent such as H₂SO₄ to convert them into the corresponding isatins. Several examples are given and the process is applicable to the prepn. of isatins heretofore difficult of production.

Benzanthrone. I. G. FARBENIND. A.-G. Swiss 127,032, Feb. 28, 1927. Benzanthrone is made by fusing with AlCl₃, preferably in presence of NaCl, the anthrone-cinnamic aldehyde condensation product described in Swiss 126,579, (*C. A.* 23, 611).

Bz-1-Methylbenzanthrone. I. G. FARBENIND. A.-G. Swiss 127,206, April 2, 1927. Bz-1-Methylbenzanthrone is prepd. by condensing anthrone with methyleneacetone in the presence of an acid condensing agent.

Bz-1-Phenylbenzanthrone. I. G. FARBENIND. A.-G. Swiss 127,033, Feb. 28, 1927. Bz-1-Phenylbenzanthrone is made by heating, preferably at 240–260° in an org. solvent or in suspension, the anthronecinnamic aldehyde condensation product described in Swiss 126,579, (*C. A.* 23, 611).

Nitroanthrone and 2,7-dinitroanthraquinone. I. G. FARBENIND. A.-G. Brit. 291,886, March 11, 1927. Anthrone is nitrated with strong HNO₃ and the product, which contains the nitro groups mainly in the β -positions, yields 2,7-dinitroanthraquinone by boiling in an indifferent solvent such as glacial HOAc or Ac₂O.

4,8-Dimethylamino-1,5-dihydroxyanthraquinone. ROBERT E. SCHMIDT (to Grasselli Dyestuff Corp.). U. S. 1,700,083, Jan. 22. 4,8-Dimethylamino-1,5-dihydroxyanthraquinone-2,6-disulfonic acid is reduced to the corresponding hydro compd. by treatment in a substantially neutral medium such as water with an alkali metal hypsulphite and the resulting hydro compd. is heated in an aq. alk. soln. at 80–95°.

Tetranitrodianthrone and 2,7-dinitroanthraquinone. I. G. FARBENIND. A.-G. Brit. 289,958, Feb. 4, 1927. See Swiss 126,196 and 126,403 (*C. A.* 23, 613).

Chlorinated 1-amino-2,4-dimethylbenzene. I. G. FARBENIND. A.-G. Fr. 641,498, Sept. 26, 1927. See Brit. 278,720 (*C. A.* 22, 2573).

1-Hydroxyethylamino-4-hydroxybenzenes. I. G. FARBENIND. A.-G. Brit. 290,997, May 23, 1927. Mono and di-N hydroxyethyl derivs. of 4-amino-1-hydroxybenzene are made by condensing 4-amino-1-hydroxybenzene with ethylene oxide, suitably in the presence of a diluent and a catalyst such as CaCO₃ or aq. NaOH. Various details are given.

3-Nitropyridine. CURT RATH. Swiss 127,257, Mar. 18, 1927. 3-Nitropyridine is prepd. by oxidation of 2-hydrazino-5-nitropyridine, suitably with CuSO₄ soln.

α -Tetrahydro- α -naphthylamine. I. G. FARBENIND. A.-G. Swiss 127,524, April 28, 1927. Acetyl- α -naphthylamine is treated under pressure with H in the presence of a metal contg. catalyzer, and the Ac group split off from the hydrogenated compd. by sapon. The substance is an oil, b. 275°.

α,α' -Dimethyl- γ -benzoyloxypiperidine- β -carboxylic acid methyl ester. I. G. FARBENIND. A.-G. Swiss 127,127, May 2, 1927. Me α,α' -dimethyl- γ -hydroxypiperidine- β -carboxylate is benzoylated. Cf. Brit. 271,467 (*C. A.* 22, 1054).

Purifying carbon tetrachloride. WALLACE B. VAN ARSDEL and HAROLD P. VANNAH (to Brown Co.). U. S. 1,697,483, Jan. 1. Crude CCl₄ is treated with an alkali metal salt soln. in order to remove volatile "side reaction" products. An app. is described.

Aluminum chloride fusions. FELICE BENSA. Austrian 110,530, April 15, 1928. Improved yields are obtained in fusion reactions in which AlCl₃ takes part by including in the reaction mixt. an oxidizing substance such as MnO₂, Fe₂O₃, FeCl₃, CuO, KNO₃ and N₂SO₄. Reference is made particularly to the manuf. of vat dyes and examples are given in which perylene, dibromoperylene, chloroperylene and tetrachloroperylene are heated with benzoyl chloride and AlCl₃, and also examples in which dibenzoylperylene and dibenzoyldioxyperylene are heated with AlCl₃, in each case in presence of one of the reagents named above.

Tetraethyl lead. HERBERT W. DAUDT. Fr. 642,120, Oct. 8, 1927. EtCl is mixed

with Mg turnings suspended in ether contg. MeI and a crystal of I. This soln. is added to a suspension of PbCl₂ in ether and allowed to remain for 5 hrs., after which it is poured into water. After removal of ether PbEt₄ is obtained.

11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

A—GENERAL

FRANK P. UNDERHILL

Glucemin and insulin. O. LOEWI. *Klin. Wochschr.* 6, 2169-76(1927).—The mechanism of the fixation of dextrose by insulin and its conversion into lactic acid is discussed. Diabetic plasma contains an inhibitor, "glycemin." This antagonistic substance is dialyzable, is not decomposed when the dialyzate is dried, and is sol. in abs. alc. Diabetic hyperglucemia is ascribed to an increased secretion of glucemin, and a deficient secretion of insulin. B. C. A.

Taka-invertase. II. R. WEIDENHAGEN AND B. B. DEY. *Z. Ver. deut. Zucker-Ind.* 1928, 242-61; cf. *C. A.* 22, 4134-5.—Comparison of the rates of inversion of sucrose by taka-invertase and by invertase from a top-fermentation yeast showed that as the reaction proceeded the velocity coeff. decreased in the former, but increased in the latter case. These departures from the unimol. form of the reaction may be characteristic of invertases from the two sources. Contrary to the statement of Leibowitz and Meehlinski (*C. A.* 20, 3173), taka-invertase hydrolyzed raffinose more than twice as fast as did yeast invertase of a similar sucrose-inverting power. This reaction closely followed the unimol. form. The action of taka-invertase on sucrose and raffinose was markedly inhibited by α -glucose, less by β -glucose, and only slightly by levulose; in fact, levulose was without influence in the case of sucrose. The action of yeast invertase was most strongly inhibited by β -glucose; α -glucose had the least effect on its hydrolyzing action on sucrose, levulose least on its action on raffinose. Since the inhibiting effect of the hexose was found to increase with decreasing amts. of substrate, it is concluded that the effect is due to affinity between hexose and enzyme. B. C. A.

The problem of the bioelectric model. R. BEUTNER AND TAKEO KANDA. *Z. physik. Chem. Abt. A., Haber Bd.* 139, 107-16(1928).—Höber (*C. A.* 18, 3131) had maintained that by means of proteins exclusively the production of elec. currents by tissues can be reproduced. This cannot be true in all cases as the relation of e. m. f. to concn. which is observed on plants can never be reproduced satisfactorily by those proteins, like gelatin or albumin, which Höber uses. This is shown by the fact that the e. m. f. of a cell—concd. salt soln. | gelatin | dil. salt soln. + is only $\frac{1}{4}$ of the e. m. f. of the cell—concd. salt soln. | plant | dil. salt soln. +. A few selected water-immiscible substances or mixts. only exhibit the same extraordinarily large variability of the e. m. f. as plants. According to Michaelis and Fujita (*C. A.* 20, 1015), one of these substances is a dried collodion membrane. The present authors show that collodion is the only substance to reproduce also the typical effect of amines on the e. m. f. of plants. The systems: NaCl soln. plant (or collodion) | amine HCl soln. + have an e. m. f. in the same direction, while all other substances known so far to reproduce the typical effect of the concn. produce an e. m. f. in the opposite direction with amines. R. BEUTNER

The specificity and mode of operation of proteolytic enzymes and their importance for the determination of the structure of proteins. ERNST WALDSCHMIDT-LEITZ. *Collegium* 1928, 543-54.—A lecture. I. D. CLARK

The problem of the specific action of erepsin and trypsin or trypsin-kinase. The inhibiting effect of various additions, e. g., α - and β -amino acids, amines, etc., to the substrate enzyme mixture. EMIL ABDERHALDEN, HERMBRECHT RINDTORFF AND ADOLF SCHMIDT. *Univ. Halle. Fermentforschung* 10, 233-50(1928).—The fact that cleavage of polypeptides by erepsin is dependent on the presence of a free NH₂ group, and the cleavage by trypsin kinase on the presence of a free COOH, suggested the possibility that inhibition of enzymic cleavage would be different for the 2 enzymes, according to the presence of NH₂ or COOH in the added substance. A study was made of the rate of cleavage of the 2 dipeptides, *dl*-leucylglycine and glycyl-*dl*-leucine, and their Bz and PhNCO derivs., in 0.1 M soln. in the presence of various concns. of amino acids and amines. The extent of cleavage after a given period was measured by the increase in amino N as detd. by the Willstätter titration method. The substances examd. for inhibiting power were β -aminobutyric acid, *l*-leucine, glycine, *l*-valine, *l*-alanine, β -alanine,

d-alanine, sarcosine, *l*-phenylalanine, hippuric acid and the amines α - and β -C₁₀H₇NH₂, *p*-MeC₆H₄NH₂ and cholamine. Not only the naturally occurring amino acids, but also their optical isomers and even the isomeric β -amino acids were found to be inhibitory. Ereptic action on the 2 dipeptides was inhibited most strongly by hippuric acid and *l*-phenylalanine, while β -aminobutyric acid in contrast to β -alanine had a slightly favorable influence. Of the amines, α -C₁₀H₇NH₂ inhibited the cleavage of one peptide and cholamine that of the other, while the other amines had very little effect. With the Bz and PhNCO derivs of the 2 dipeptides, cleavage by trypsin-kinase was inhibited by these amino acids in a different order. For example, *d*-alanine was inert, while β -aminobutyric acid, *l*-alanine and glycine were inhibitory toward the cleavage of benzoyl-*dl*-leucyl-glycine, and all 4 of the amines inhibitory. With the PhNCO deriv. of glycyl-*dl*-leucine the greatest inhibition was produced by phenylalanine, glycine and hippuric acid. α - and β -C₁₀H₇NH₂ caused a slight inhibition, but *p*-toluidine, cholamine and urea none at all. The relationship between constitution and specific inhibition evidently depends upon too many factors to permit of generalizations.

A. W. DOX

Starch hydrolysis as affected by polarized light. ALBERT E. NAVEZ AND B. B. RUBENSTEIN. Harvard Univ. *J. Biol. Chem.* 80, 503-13(1928).—Ordinary and polarized light, of the same intensity and spectral compn., have the same effect on the starch-*diastase* system. Light increases the rate of hydrolysis of this system over that of the same reaction in the dark. Contrary results reported by previous observers were due to faulty exptl. control.

ARTHUR GROLLMAN

The rate with which tryptophan is liberated from proteins by enzymes. IDA KRAUS RAGINS. Univ. of Chicago. *J. Biol. Chem.* 80, 551-6(1928).—Pepsin does not liberate tryptophan, nor does erepsin do so, after the action of pepsin on casein, edestin or squash seed globulin. Trypsin liberates tryptophan more readily from casein than from edestin or squash seed globulin.

ARTHUR GROLLMAN

Structure of silk fibroin. KURT H. MEYER AND H. MARK. *Ber.* 61B, 1932-6 (1928).—Analogous to their theory on the constitution of cellulose (see p. 1263), the authors visualize silk as consisting of 4 principle valence chains of glycyl-alanyl residues. The length of the micelle, and therefore of the principle valence chains, is 150 Å which corresponds to a polypeptide of at least 20 glycyl-alanyl residues. The elementary size and the symmetry of suitable arrangements of such chains are discussed. As with cellulose, rhombic and monoclinic symmetry are discussed, but in this case a greater no. of assumptions are required, because the spiral axis is lacking, and therefore the Weissenberg building principles for chain building units are not applicable. It may be possible, however, to prove that in the case of silk, by a special form of glycyl-alanine anhydride, the translation very nearly agrees with the spiral of the half glycyl-alanyl residues, so that the total character of the structure still comes near to that of cellulose and rubber.

FREDERICK C. HAHN

The second protein (livetin) of egg yolk. HERBERT D. KAY AND PHILIP G. MARSHALL. London Hospital. *Biochem. J.* 22, 1264-9(1928).—K and M. confirm Plimmer's statement (*C. A.* 3, 445) that another protein beside vitellin is present in the yolk of the hen egg. The substance has the properties of a pseudoglobulin. *

BENJAMIN HARROW

Structure and enzyme reactions. VII. The system glycogen-*amylase*-liver tissue. STANISLAUS J. PRZYŁECKI AND JOSEPH WÓJCIK. Warsaw Univ. *Biochem. J.* 22, 1302-6(1928); cf. *C. A.* 22, 4543. Liver tissue has a high adsorptive action on glycogen. This adsorption is reversible, elution taking place when the concn. of glycogen falls. Glycogenolysis is the resultant of the reactions: adsorbed glycogen \rightleftharpoons free glycogen \rightleftharpoons glucose.

BENJAMIN HARROW

The oxidation of cholesterol by molecular oxygen. GUNNAR BLIX AND GERHARD LÖWENHEIM. Univ. of Upsala. *Biochem. J.* 22, 1313-22(1928).—Atm. O converts cholesterol into oxycholesterol on heating in air at temps. slightly above the m. p. This is not true, however, of pure cholesterol. The catalytic impurities probably have a peptizing action.

BENJAMIN HARROW

Oxidizing enzymes. X. The relationship of oxygenase to tyrosinase. MURIEL W. ONSLOW AND MURIEL E. ROBINSON. Biochem. Lab., Cambridge. *Biochem. J.* 22, 1327-31(1928).—The authors do not agree with Pugh and Raper (*C. A.* 22, 909) that "tyrosinase has all the properties ascribed by Onslow to oxygenase."

B. H.

Poisonous matter of toads. VI. Poisonous constituents of *Bufo bufo japonicus*. MUNIO KOTAKE. *Bull. Inst. Phys. Chem. Research* (Tokyo) 7, 1244-8(1928); *Abstracts* 1, 117. A correction to the author's previous papers (cf. *C. A.* 22, 3066). The toad investigated was *Bufo vulgaris formosus* instead of *Bufo bufo japonicus*. Crystals of bufotalin have been sep'd. from the alc. soln. and several derivs. prep'd. ALBERT L. HENNE

Proteolytic enzymes of the liver. O. A. STEPPUN AND K. UTKINA-LYUBOVITZOVA. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* No. 13, 35-46(1926).—The authors investigated the autolysis of the liver of a rabbit at various p_H concns. after various time intervals. The detn. of N in the samples served as the basis for following up the autolysis reaction. To some substrates casein was added. **Conclusions.**—(1) The intensity of the breaking down of the proteins of liver as well as of casein in autolysis varies with the reaction. Proteolysis slows down gradually at an acid reaction (p_H 3.8); at a neutral reaction the intensity of proteolysis slows down more rapidly but there is always a phase of increased proteolysis. This seems to indicate the presence of at least 2 enzymes. (2) The explanation for this fact may be this: the antitrypsin, which reacts only in a neutral medium, is destroyed during autolysis; trypsin is also destroyed, because of unfavorable conditions and because of the action of pepsinase. J. S. JOFFE

The protease of liver. L. M. UTKIN-LYUBOVITZOV. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 13, 47-62(1926).—The effect of the reaction on the protease of rabbit liver was investigated and the conclusions are: (1) At p_H 4.7-5.0 the ppt. from macerated liver contains 70% of the N and the proteolytic enzymes are distributed between the ppt. and the soln. (2) The action of such a soln. on casein has 2 maxima: at p_H 5.2-5.4 and 3.0-3.4; it has a well defined min. at the isoelec. point of casein. (3) With edestin this soln. shows a max. at p_H 4.0. (4) The action of the soln. on casein begins at p_H 7.5; no decompn. of casein takes place at more alk. reaction. (5) The pptd. proteins from liver, treated with acetone, break down casein in an alk. medium with a max. at p_H 7.5-7.6. (6) On the basis of the results obtained one may postulate the existence of 3 enzymes in the liver which are capable of decompg. casein. In autolysis all 3 are probably active, depending on the reaction. J. S. JOFFE

Denaturation of insulin protein by concentrated sulfuric acid. FRITZ BISCHOFF AND MELVILLE SAHYUN. Potter Metabolic Clinic, Santa Barbara, Cal. *J. Biol. Chem.* 81, 167-73(1929).—"Concd. H_2SO_4 at a low temp. dissolves insulin and renders it H_2O -insol. at a p_H more acid than 4.8. Half the potency is retained. NaCN and Me_2SO_4 in concd. H_2SO_4 do not augment inactivation while HCHO completely destroys the potency. The same concn. of aq. HCHO only partially destroys the potency. Nitrite in several instances produced a biuret-free product, retaining half the original potency." Murlin's biuret-free insulin is regarded as a denatured protein. Insulin denatured by concd. H_2SO_4 is not reactivated by standing in dil. alk. soln. A. P. LOTHROP

The mode of action of ultra-violet light in decreasing sugar metabolism. G. C. WICKWIRE AND W. E. BURGE. *Proc. Am. Physiol. Soc., Am. J. Physiol.* 81, 514(1927).—A decreased metabolism in paramecia subjected to ultra-violet light was attributed to the destruction of insulin in the paramecia by the ultra-violet radiation. J. F. LYMAN

The osmotic pressure of egg albumin. JOHN MURRACK. *Proc. Physiol. Soc., J. Physiol.* 66, V(1928).—The osmotic pressure of isoelec. egg albumin, using solns. of NaCl buffered with AcONa and AcOH as external fluid, corresponded with a mol. wt. of 43,000. J. F. LYMAN

The loosely bound sulfur in the white of eggs. W. D. TREADWELL AND W. EPPENBERGER. *Helv. Chim. Acta* 11, 1035-42(1928).—The white of eggs was hydrolyzed at 78° by 0.05 N NaOH in an atm. of N_2 to prevent oxidation. The reaction followed the bimol. law and reached an end value of 0.266% sulfide S at the end of 3 hrs. Of the total S $\frac{1}{2}$ can be easily hydrolyzed. If there are 6S atoms in the egg-albumin mol., the min. mol. wt. is about 12,000. J. G. McNALLY

Studies on buffered solutions. X. The buffering of feces. 2. M. KARTAGENER. *Helv. Chim. Acta* 11, 1084-94(1928); cf. *C. A.* 22, 3671.—NaOH solns. ranging in concn. from 0.00015 to 1N were shaken with $CaHPO_4$ and $Ca_3(PO_4)_2$ and the p_H values of the solns. detd. with the H electrode. These solns. gave p_H values far below those for the corresponding concn. of pure NaOH; the decrease depended on both the concn. of NaOH and the nature of the salt. Titration curves are given for the system AcOH- $Ca_3(PO_4)_2$. The importance of the Ca salt present is pointed out in connection with p_H detn. in feces. J. G. McNALLY

The hydrolysis of protein material by hydrofluoric acid. E. CHERBULIEZ AND R. WAHL. *Helv. Chim. Acta* 11, 1252-5(1928).—It is stated in the literature that HF may be used to advantage in hydrolyzing substances contg. protein if it is desired to avoid the formation of humin or carbohydrate resins. The expts. of C. and W., however, on the hydrolysis of casein by 25% HF at 100° showed a greater yield of humin than is obtained with HCl. The NH_3 yield was also higher which was proved by control expts. with amino acid mixts. to be caused by the decompn. of NH_2 groups to form NH_3 . To investigate the action of HF on carbohydrate material, glucose was boiled with HF in

the presence of amino acids, the HF eliminated by pptn. of CaF_2 and glucose estd. in the liquor. A loss of 36% of the original glucose was found. J. G. McNALLY

The structure of living matter in the light of colloid research. J. SPEK. *Kolloid Z.* 46, 314-20(1928).—Expts. with micro-dissection methods on *Opalina ranarum* are described. The effect of dissection in physiol. KCl soln. is different from that in water in that the plasma remains firm although turbid in the soln. In water the plasma is a sol and in KCl soln. it is a gel which is capable of swelling, indicating osmotic effects. Apparently all protoplasm has the same elementary structure. The plasma is on the border between sol. and insol. and the structure is only evident through differences in soly. of the protoplasm. A factor to be detd. is the way in which the different phys. properties coöperate in the cell. L. F. MAREK

Action of suprarenal tissue on lecithin. ANSELMO DA CRUZ *Compt. rend. soc. sci. 99*, 1530-2(1928).—Expts. with guinea pigs proved that suprarenal tissue and hepatic tissue can hydrolyze lecithin, the intensity of the action being exceedingly variable. The addn. of cholesterol increases the lecithinase action. Liver tissue is not superior to suprarenal tissue in lecithinase action. L. W. RIGGS

The qualitative reaction of protein. I. Reaction of acid in the acetic acid-sodium chloride test. SUN OGATA. Hokkaido Imp. Univ. *Hokkaido J Med.* 6, 26-36 (1928).—The quantity of NaCl required to ppt. gelatin from its soln. decreases with the addn. of AcOH but becomes const. at a certain concn. This const. quantity of NaCl differs with different concn. of gelatin, the increase of the latter causing the decrease of NaCl; but at a concn. above 3%, the quantity of the necessary NaCl is independent of the gelatin concn. The above phenomenon is related to the change in p_H , the increase of the latter to a certain degree facilitating the pptn. by NaCl. Increase of acid above $p_H = 9.6$ can cause no difference upon the action of NaCl. K. SOMEYA

Products of partial decomposition of hair. JUNJIRO MOTOMURA. Hokkaido Univ. *J. Agr. Chem.* 4, 384-93(1928).—M. decompd. hair by heating it with 1% HCl in a steam oven for 6 hrs. and the decompd. soln. was concd. under reduced pressure and extd. with Et_2O . From the resulting soln. the following substances were obtained: *cryst. product A*, m. 226°. This gave by hydrolysis with concd. acid *leucine* and *valine*, and considering the analysis also *A* was concluded to be *valylleucine anhydride*. Next, the soln. was extd. with AcOEt and a sirup was obtained, which M. concludes from its reactions contains an anhydride and an amino acid. On extg. with CHCl_3 , *A* was again obtained. The mother liquor from the CHCl_3 ext. was evapd. under reduced pressure, extd. with MeOH, the extd. product being recrystd. from MeOH, whereby a crystal product *C* was obtained. Analysis and the detn. of the amino radical showed it to be *glutamine* or *leucylglycine*. The extd. residue and the alc. mother liquor was extd. with alc. The ext. was inferred from the hydrolytic product of the anhydride to contain *alanine*. When measured potentiometrically with a Pt-quinhydrone electrode, it was shown that the production of the acid is always greater in the male than in the female. Detn. of N, S and P in the muscular fibers shows that S is more plentiful in male than in female, while the opposite is true for P. Detn. of the amino acid no. by the Van Slyke method shows that a considerable difference in the values with male and female exists. In the case of male, *arginine* and *lysine* N are always richer, while in the case of female, the monoamino and *histidine* N are richer. The above facts are in good agreement with the observations made by M. with serum albumin, globulin and myogen of male and female animals. In general, more strongly acidic proteins contain more P than do more weakly acid ones, and are poor in arginine and lysine N, while they are richer in monoamino and *histidine* N. This phenomenon is considered by M. to be common to all of the vegetable and animal proteins of a more acidic nature. K. SOMEYA

The erythrocytes as a colloid-chemical system. II. The isoelectric zone of the erythrocytes. A. KONIKOV. *Med. Acad., Kyoto. Zhurnal expil. biol. med.* 6, 408-20(1927); *Ber. ges. Physiol. expil. Pharmacol.* 44, 598-9(1928).—The method is one of acid agglutination. To an 8% cane sugar soln., buffer mixts. (acetate or phosphate buffer) of p_H 3.7 to 7.2. are added and this mixt. is divided in a series of test tubes. In each test tube there is placed 1 drop of the blood to be examd. After 1 hr. or more it is noted in which tube an agglutination occurs and the degree of agglutination. At the same time the influence of the p_H on hemolysis is noted. K.'s studies show that the agglutination of red corpuscles proceeds in low electrolytic levels within definite p_H limits which are characteristic for each type of animal although the range of the limits is very different: in certain species of animals it is very small (rabbits, between p_H 5.0 and 5.6) and in others very large (man, between p_H 4.0 and 7.0). The intensity of the agglutination is very different in different species. Similarly the resistance of the erythrocytes to the H ions shows a large difference, wherein a reciprocal relation exists

between the acid hemolysis and acid agglutination: the stronger the agglutination, the weaker the hemolysis, and *vice versa*. K. explains the differences in the agglutination by the assumption that the stroma of the erythrocytes is composed of a series of more or less closely related proteins with diff. isoelectric points, whereby the inequality of the isoelectric zones of the blood corpuscles of the different species of animals must result. He assumes that the stroma which is less capable of agglutination must be more strongly hydrophilic and thereby promote the hemolysis.
R. C. WILLSON

Porphyrin syntheses (FISCHER, *et al.*) 10. Constitution of hexosediphosphoric acid. II. The dephosphorylated α - and β -methyl hexosides (MORGAN, ROBISON) 10. Constitution of chitin (MEYER, MARK) 10. Odor and molecular structure (BOGERT, GOLDSTEIN) 10. The specific mode of linkage between substrate and enzyme complex which initiates the hydrolysis of polypeptides (ABDERHALDEN, BROCKMANN) 10. Comparative studies on the cleavage of polypeptides and their derivatives (ABDERHALDEN, HERRMANN) 10. Comparative studies on the influence of *N* alkali, erepsin and trypsin-kinase on polypeptide-like compounds containing β -alanine (ABDERHALDEN, REICH) 10.

Die Methodik der Fermente. V. Edited by C. Oppenheimer and L. Pincussen. Leipzig: G. Thieme. pp. 1265-1578. R. M. 28. Cf. C. A. 23, 859.

RUSSELL, ELEANOR H. AND RUSSELL, W. KERR: Ultra-violet Radiation and Actinotherapy. Edinburgh: E. and S. Livingstone. 648 pp. 21s. net. Reviewed in *Brit. J. Actinotherapy* 3, 163(1928).

Promoting action of enzymes. F. F. NORD. *Brit.* 291,443, June 3, 1927. In order to increase the speed of enzymic reactions, the surface of the colloiddally dissolved enzyme is increased, as by freezing and subjecting it to the action of an easily adsorbed substance which acts as a protector against the deleterious effects of the end or intermediate products of the reaction. Examples are given of the use of ethylene for the treatment of yeast, zymase extd. from yeast and catalase of tobacco leaves. N_2O , C_4H_2 , propylene, butylene or amylene or their mixts. with each other or with ethylene also may be used as treating agents.

B—METHODS AND APPARATUS

STANLEY R. BENEDICT

A method for microdetermination of the coagulation velocity of blood. G. C. VAN WALSEM. *Nederland Tijdschr. Geneeskunde* 72, II, 4944(1929).—A micropipet is used.
R. BRUTNER

Physicochemical principles of the mastic reaction. II. The reactions of serum albumin and mastic suspension in alkaline medium. K. SAMSON. Univ. Staatskrankenanstalt, Hamburg-Friedrichsberg. *Z. ges. expil. Med.* 60, 1-10(1928).—Changes in salt concn. and p_H do not change the position of the max. pptn. but only the intensity. Albumin protects against salt and albumin flocculation. Increasing the proportion of globulin to mastic shifts the flocculation to greater dilns.
F. L. DUNN

Urinary calcium. C. H. COLLINGS. *Chem. News* 137, 263-5(1928).—A description of a method which depends on the pptn. of Ca as CaC_2O_4 and titration with $KMnO_4$.

Stomach diseases. VII. Investigation of the gastric contents. WALTER ZWEIF. Kaiser Franz-Joseph-Spitals und Ambulatoriums, Wien. *Deut. med. Wochschr.* 54, 2179(1928).—A review of the various lab. procedures used in investigating the gastric contents.
ARTHUR GROLLMAN

The further application of the vanillin-hydrochloric acid reaction in the determination of tryptophan in proteins. IDA KRAUS RAGINS. Univ. of Chicago. *J. Biol. Chem.* 80, 543-50(1928).—The vanillin-HCl reaction previously described (C. A. 19, 1438) is slightly modified to save time and material. Applied to 16 purified proteins, satisfactory results were obtained. The filtrate from the Hg-tryptophan ppt. was shown to contain no tryptophan. Peptide tryptophan reacts like the free amino acid; proline or proline-contg. proteins, in small concns., do not affect the color reaction; $[Cl^-]$ or $[Na^+]$ in high concns. interferes with the pptn. of tryptophan by $HgSO_4$.
ARTHUR GROLLMAN

Determination of carnosine. WINIFRED MARY CLIFFORD AND VERNON H. MOTTRAM. King's College of Household and Social Science, London. *Biochem. J.* 22, 1240-

(1928).—Despite criticism of Clifford's method (*C. A.* 15, 3856) by Hunter (*C. A.* 16, 2), C. and M. claim good results with C.'s method. BENJAMIN HARROW

Use of the Hildebrand hydrogen electrode in biological solutions. ROBERT E. FINISH. Univ. California. *J. Am. Chem. Soc.* 50, 3310-1(1928).—An ordinary rubber bulb from an atomizer is inserted in the hydrogen supply line. By simply passing H₂ through the electrode, the correct e. m. f. will not be obtained before several hours, but if rubber bulb is pressed a few times while H₂ is being passed, the correct reading will arrive at almost instantaneously. ALBERT L. HENNE

Citric acid metabolism. The effect of citric acid and citrates on the determination of "acetone body" content by the Van Slyke method. B. E. CLARKE AND H. HANSMANN. *Arch. Path.* 6, 881-4(1928).—Sodium citrate used as an anticoagulant is a source of error in the detn. of "acetone body" content in blood by the method of Van Slyke. Citric acid administered by mouth does not have any effect on either the "acetone body" content or the power of the blood to combine with CO₂. Citric acid and its salts are not a source of error in the detn. of "acetone body" content in urine by this method. HARRIET F. HOLMES

A colorimetric method for the determination of lipoidal phosphorus in blood. J. LERNOFF. Lebanon Hosp., N. Y. *J. Biol. Chem.* 80, 211-4(1928); cf. *C. A.* 22, 331-2(1928).—The lipoids are extd. from blood with an alc.-Et₂O mixt. and, after evapn. of the solvent, the org. matter is destroyed with concd. H₂SO₄ and H₂O₂; the phosphate is pptd. as ammonium phosphate and detd. colorimetrically. It is recognized that other substances containing phosphorus but not lipoidal in character are extd. by the alc.-Et₂O mixt. but this is the only means available, since isolation of lipoids in a pure state is utterly impossible in small quantities of blood. A. P. LOTHROP

The colorimetric determination of blood calcium. JOSEPH H. ROE AND BERNARD KAHN. George Washington Univ. Med. School. *J. Biol. Chem.* 81, 1-8(1929); cf. *C. A.* 20, 3474.—The colorimetric method for the detn. of blood Ca has been simplified and shortened and is adaptable to the detn. of as little as 0.02 mg. of Ca. There is no possibility of compensating errors as is found in other methods. The Fiske and Subbarow method of detg. inorg. P has been substituted for the Benedict and Theis method although the latter procedure has been retained as an optional method where a reagent of greater keeping qualities is desired. A. P. LOTHROP

The amide nitrogen of blood. II. A quantitative method. SIDNEY BLISS. Cornell Univ. *J. Biol. Chem.* 81, 129-35(1929); cf. *C. A.* 22, 2605.—The proteins are pptd. from blood by H₂WO₄ and the ppt. is washed with H₂WO₄ to remove traces of urea. The ppt. is worked up into a smooth emulsion with H₂O and dissolved by the addn. of 2 N NaOH. An aliquot portion of the soln. is subjected to hydrolysis with 4 N H₂SO₄ in a boiling water bath. After neutralization, the mixt. is aerated with an excess of acOH and the NH₃ isesslerized as in the standard microaeration method of Folin and Wallace. The unavoidable error is less than 1%. The amide nitrogen content of normal human blood drawn from the cubital vein varies from 134 to 144 mg. per 100 cc. of blood. A. P. LOTHROP

The fluctuation in the composition of the alveolar air during the respiratory cycle in muscular exercise. R. S. AITKEN AND A. E. CLARK-KENNEDY. London Hosp. *J. Physiol.* 65, 380-411(1928).—An app. was devised for collecting the respired air from a single expiration during moderate work and dividing it into 6 successive portions. From the CO₂ content of the different portions the varying concn. of CO₂ in the alveolar air during expiration was deduced and found to rise steadily at the rate of about 0.5% per l. of air expired. The physiol. dead space was calcd. to vary between 300 and 400 cc., increasing slightly with increase in vol. of tidal air. The av. CO₂ concn. in the alveolar air by this method was about 10% lower than that obtained by Henderson's method for alveolar CO₂. J. F. LYMAN

The influence of activity on the Manoïlov reaction in blood and tissue extracts. OSCAR FIDDLE AND WARREN H. REINHART. *Proc. Am. Physiol. Soc., Am. J. Physiol.* 81, 500(1927). Blood and tissues of active pigeons give a lighter color in the Manoïlov reaction than do those of inactive animals. The reaction is primarily a better indicator of metabolic rate than of sex. J. F. LYMAN

The isolation and estimation of serum globulin by electrodialysis. L. REINER AND H. KEMP. *Kolloid-Z.* 46, 99-107(1928).—The pptn. of globulin during the electrodialysis of serum is related to the quantity of protective colloid present and alterations produced in this by changes in pH and salt concn. caused by the dialysis. Colloidion is impregnated with protein were satisfactory membranes. J. G. McNALLY

Studies on microchemical cholesterol determinations. YORISADA HORIYU. Univ. Bern. *Biochem. Z.* 202, 403-8(1928).—A comparative investigation of the titrimetric

and gravimetric methods of Szent-Györgyi (*C. A.* 17, 3197) shows that while the first gives consistently high results which are about 14% in excess of the theoretical values and therefore entirely unreliable, the gravimetric procedure yields results which are quite acceptable.

S. MORGULIS

Remarks on the work of W. Blumenberg "On the indole titer according to Gersbach in water analysis." M. NEISSER. Stadt. Hyg. Univ. Inst. Frankfurt a. M. *Centr. Bakt. Parasitenk.*, I Abt., 109, 346-50(1928); cf. *C. A.* 22, 3473.—The method is useful in water analysis and in pure bacteriology.

JOHN T. MYERS

Hydrogen-ion determinations of streaming fluids. KL. GOLLWITZER-MEIER AND W. STEINHAUSEN. Univ. Frankfurt a. M. *Arch. ges. Physiol.* (Pflüger's) 220, 551-7 (1928).—With Sb or Mn electrodes connected with the carotid changes in p_H corresponding to pulse were observed.

G. H. SMITH

Apparatus for the study of the hearts of warm-blooded animals according to the procedure of Langendorff. W. HEURNER AND R. MANCKE. Pharm. Inst. Göttingen. *Arch. expil. Path. Pharmacol.* 137, 257-63(1928).—The app. described permits, with the heart of warm-blooded animals, detns. of the effects of different concns. of a poison upon the organ.

G. H. S.

Metallic expansion clinical thermometer. PIERONI & CORI. *Brit.* 292,018, Nov 19, 1927. Structural features.

C--BACTERIOLOGY

C. B. MORREY

Relationships between oxybiotic and anoxybiotic metabolism of culture yeasts. FRITZ WINDISCH. Inst. Gärungsgewerbe, Berlin. *Z. physiol. Chem.* 179, 88-98(1928).—Parallel fermentations with brewery yeast under aerobic and anaerobic conditions show a distinct difference with respect to rate of fermentation and cell proliferation and morphological aspects of the cells. With air access the disappearance of sugar and reproduction of cells is greater than when air is excluded by CO_2 pressure, but the morphological appearance, as judged by form and size of cells, vacuole formation, granulation and increase in fat content, is less favorable. The rate of sugar consumption becomes more nearly equal for the aerobic and anaerobic cultures after repeated cultivations under the same conditions. If the 2 series of cultures are transferred to eudiometers contg. a 5% sucrose soln. and the fermentations allowed to proceed under identical conditions, a greater vol. of CO_2 is produced by the culture that has previously been anaerobic. Pasteur's view, deduced from his expts. on *Mucor*, that fermentation is the consequence of life without air finds corroboration in these expts. with yeast. A. W. D.

Disinfectants retard bacteria in incubators. J. L. BOYD. Mich. Agr. Expt. Sta., *Quart. Bull.* 11, 79-83(1928).—Comparisons between untreated and variously disinfected chicken incubators showed a marked reduction in bacterial count where 3% NaOCl, 5% I-suspensoid, 0.0015% "sterilac" or .037% chlorinated lime were used. Thorough cleaning of the incubators was the greatest factor in reducing bacterial count. Infection increased as the period of incubation progressed. Broken eggs form a very favorable medium for the development of bacteria.

C. R. FELLERS

Reactivation of culture media. II. Higher alcohols. V. CIANCI. *Boll. soc. ital. biol. sper.* 3, 712-4(1928).—*B. coli*, *B. lactis aerogenes* and *B. paratyphosus* B were used, and for reactivating the media mannitol and dulcitol; the technic used was the one previously reported (cf. *C. A.* 23, 408). Definite reactivation was obtained, although at times it was rather slow. There is a direct relation between capacity and velocity of attack of a sugar or alc. by an organism, and the reactivation of the respective culture media.

PETER MASUCCI

The bactericidal power of boiled linseed oil. I. GIUSEPPE MAZZETTI. *Boll. soc. ital. biol. sper.* 3, 747-9(1928).—Sterile pieces of pressed brick were satd. with boiling commercial linseed oil. Other pieces of brick were sterilized but not immersed in oil; these served as controls. All the pieces were cooled, allowed to dry, and then by means of a small sterile brush painted with an emulsion of the organism to be tested. After various times of contact, the surface of the brick previously painted with the organism was scraped with a sterile knife and 2 loopfuls of this material were introduced into nutrient broth. The latter was incubated at 37° for 5 days. The pieces treated with the oil had a strong bactericidal action towards *B. typhosus*, *B. diphteriae*, *B. tuberculosis*, *B. anthracis* and *Staph. aureus*. This bactericidal power was due to the presence of commercial linseed oil in the bricks; pure, unheated linseed oil did not possess this action, but if heated for a long time at a high temp. it readily acquired this property. II.

The bactericidal power of heated linseed oil on tuberculous excretions. *Ibid* 749-54.—By the technic described above, M. found that bricks satd. with heated oil had a definite bactericidal action toward *B. tuberculosis* when this organism was present in non-homogenized excretions. The bactericidal power was revealed by cultural tests 48 hrs. after contact and by biol. tests 72 hrs. after contact. III. Further observations on the bactericidal power of boiled linseed oil and other vegetable oils. *Ibid* 754-8.—Further studies were made to det. (1) whether the bricks satd. with boiled linseed oil retained their bactericidal power over long periods of time; (2) if this bactericidal power could be used for practical purposes such as in the destruction of anthrax spores in the skins of animals infected with this organism and (3) if other vegetable oils had any bactericidal action. (1) The oil-treated bricks showed a bactericidal action for long periods of time against saprophytes found in the air; a few pieces gave a positive cultural test but the organism found was usually *B. subtilis*, which forms very resistant spores. Against *Staph. aureus* there was a gradual loss of activity, but the activity was still evident 10 months after treatment. (2) With the technic used, it was found impossible to sterilize anthrax-infected skins with boiled linseed oil. (3) The other vegetable oils tested were raw, crude linseed oil, almond oil, soy-bean oil and castor oil. Only the crude linseed oil showed a slight action against *Staph. aureus*. However, if the oils are heated to 280°, then they all acquire more or less this bactericidal property. In the case of olive oil, this may be of importance in the culinary art. PETER MASUCCI

Respiration and glucolysis of trypanosomes. II. B. VON FENYVESSY AND L. REINER. Elizabeth Univ., Pec's. *Biochem. Z.* 202, 75-80(1928).—Trypanosomes degrade sugar added to Ringer soln. partly through oxidation and partly through glucolysis. The aerobic and anaerobic glucolysis are approx. equal. Neither HCN nor germanin has any effect on oxidation and glucolysis. In media of p_{H} 7 to 8, oxidation predominates in the alk. solns. while glucolysis in the acid solns. The shift toward the acid reaction and the corresponding diminution in oxidation and rise in the respiratory quotient could be demonstrated together

S. MORGULIS

The production of acids by the mold *Aspergillus fumigatus*. REINHOLD SCHREYER. Tech. Hochschule, Hannover. *Biochem. Z.* 202, 131-56(1928).—The mold loses in course of time the ability to produce fumaric acid and assumes the character of a citric and gluconic acid producer. The nature of the N compds. has no influence on the kind or quantity of acid produced. Sugars with 3, 5, 6 or 12 C atoms serve to form citric acid; likewise lactic acid, glycerol or mannitol is utilized. Only the salts of glyceric and, to a limited degree, of gluconic acid give rise to citric acid. The mold causes an accumulation of gluconic acid in young CaCO_3 cultures, which is much increased by better supply of O_2 , improved conditions for diffusion and removal of CO_2 . In BaCO_3 cultures very little gluconic acid is produced. The max. acid formation by the mold is between 17° and 22°. The mold utilizes for its growth all carbohydrates, including lactose and starch, also glycerol and mannitol, or salts of gluconic acid. The growth optimum is at 21-23°; the min. at 6° and the max. at 31-32°. NH_4NO_3 as the source of N yields the largest growth in the shortest time.

S. MORGULIS

The chemistry of citric acid formation by molds. III. Various hypotheses of citric acid formation and the appearance of acetaldehyde in mold cultures. K. BERNAUPE AND K. SCHÖN. Chem. Lab. deut. Univ., Prag. *Biochem. Z.* 202, 164-79(1928).— As_2SO_3 being used, small quantities of AcH were found, but not exceeding 0.6% of the amt. of sugar used up, glycerol giving the lowest while sucrose and fructose gave the highest results. However, because of the alky. caused by the Na_2SO_3 , little citric acid was produced while dimedon could not be employed at all as it is toxic. Dimedon could not be used in expts. with *Aspergillus niger* to combine with AcH because this mold destroys it. Nevertheless the conclusion seems justified that the formation of AcH and the transformation processes leading to citric acid production are independent of each other, and the expts. fail to substantiate hypotheses which derive the citric acid from methylglyoxal or pyruvic acid.

S. MORGULIS

Biochemistry of *Penicillium glaucum*. A contribution to the problem of methyl ketone formation from triglycerides and fatty acids in the metabolism of molds. OSKAR ACKLIN AND WALTER SCHNEIDER. Tech. Hochschule, Zürich. *Biochem. Z.* 202, 246-83(1928).—In unbuffered glucose-peptone nutrient media molds do not grow when the p_{H} falls below 2.8. The optimum condition for growth, however, is detd. by the nature of the source of C and N. The mannitol-peptone system permits the growth of *Penicillium glaucum* with the least effect on the H-ion concn. With a concn. of nutrient stuffs C:N = 1:0.3 the optimum conditions for the growth of the mycelium is between p_{H} 3.8 and 5.0, but the actual increase will be much greater when the C:N = 2:0.6. A study of the catalytic action of ionogenic Fe and of Fe in the form of hemin on growth shows

that while the former has practically no influence, the latter exerts an unquestionable influence between p_H 5.8 and 7.4 and with a concn. of foodstuff C:N = 2:06.

S. MORGULIS

Comparative studies on the resistance of different leptospiras to outside influences. SABURO ANJOW. Kaiserlichen Univ. zu Tokyo. *Centr. Bakt. Parasitenk.*, I Abt., 109, 61-80(1928).—The saprophytic water leptospiras were more resistant to the "oligodynamic" influence of Fe, Pb, Cu and Hg, than were the pathogenic varieties. Fe had the least effect. There was little difference in the effect of colloidal Ag and Se. The saprophytes grew in smaller concns. of serum and in higher concns. of NaCl than did the parasites. The parasites were more resistant to bile and bile salts. All leptospiras were distinctly and equally sensitive to HOAc.

JOHN T. MYERS

Investigations on the action of light on bacteria. FRITZ V. GUTFELD AND LUDWIG PINCUSSEN. Stadt Krankenhaus am Urban zu, Berlin. *Centr. Bakt. Parasitenk.*, I Abt., 109, 107-15(1928).—The action of ultra-violet light on *B. coli*, *B. typhosus*, *B. paratyphosus* B and *B. dysenteriae* Shiga-Kruse was studied. Suspensions were made in distd. water and in 0.2 and 0.1 N solns. of KCl, NaCl, MgCl₂ and CaCl₂. With these organisms the type of salt had no effect. With *Staphylococcus aureus*, the effect in the presence of CaCl₂ was about 3 times that in distd. water, but the other salts were without influence. CaCl₂ had a protective effect on *B. diphtheriae*, the action being about 4 times greater in distd. water.

JOHN T. MYERS

Amino nitrogen determination with ninhydrin in the Abderhalden reaction or in the investigation of bacterial metabolism. E. KUSTER AND K. KOULON. Inst. für Exper. Therapie, Frankfurt-a.-M. *Centr. Bakt. Parasitenk.*, I Abt., 109, 135-43(1928).—The methods of Herzfeld-Klinger and of Riffert for the colorimetric detn. of amino N with ninhydrin may be combined. This makes a very sensitive and reliable technic. It is useful in studying N changes in bacterial cultures. The Abderhalden method is not practicable.

JOHN T. MYERS

The demonstration of bacterial flagella on living cells in the dark field. II. FRANZ NEUMANN. Univ. Giessen. *Centr. Bakt. Parasitenk.*, I Abt., 109, 143-80(1928).—The visibility of bacterial flagella in the dark field depends on their thickness. The index of refraction of the medium plays no part. If the width of the flagella is about 0.05 μ they can be seen in any medium; below this size they cannot be thus demonstrated. The addn. of 5 to 10% of gelatin or of a gum aids in demonstration. There is a mass of detail as to number, size and shape of flagella. There is a good bibliography.

JOHN T. MYERS

The action of bile on *B. rhinoscleromatis*. B. J. ELBERT AND W. M. GERKES. Weissruss. Microbiol. Inst. in Minsk. *Centr. Bakt. Parasitenk.*, I Abt., 109, 310-20(1928).—Ox bile inhibits the growth of *B. rhinoscleromatis* *in vitro*, but not that of other members of the capsulated group of bacteria. Hence it has considerable value as a differentiating characteristic.

JOHN T. MYERS

Esculin media. KURT MEYER. Rudolph Virchow-Krankenhaus, Berlin. *Centr. Bakt. Parasitenk.*, I Abt., 109, 350-2(1928).—Hiss serum water medium contg. 0.2% of esculin and 0.8% of tincture of litmus is very useful for bacterial differentiation. The addn. of a drop of an Fe salt to a culture will produce a black color if the glucoside is split; hence the detection of cleavage is easier than in most org. substances.

JOHN T. MYERS

Several varieties of agar-splitting marine bacteria isolated along the Norwegian coast. JON LUNDESTADT. Univ. Oslo. *Centr. Bakt. Parasitenk.*, II Abt., 75, 321-44(1928).—Agar-splitting bacteria were easily isolated from sea water. Preliminary enrichment cultures of sea water contg. Floridean algae were made. From these the bacteria were plated on a medium contg. fish, of sea water and agar; or ext. Floridean algae and agar. By these methods, 7 species of agar-splitting bacteria were isolated which had not been previously described, all of which produced gelase. One variety was found which corresponded with *B. gelaticus* of Gran. A fluorescent variety was isolated which produced a green pigment on fish gelatin. One species, *Bact. granii*, can completely liquefy gelatin. Undoubtedly other gelase-producing varieties will be found. It was not possible to demonstrate the formation of reducing sugars. With agar as the sole source of food there is no change in reaction.

JOHN T. MYERS

Decomposition of fatty acid salts and carbohydrates by thermophilic bacteria. II. The cleavage of starches and sugars by thermophilic bacteria. C. COOLHAAS. Landwi. Hochschule zu Wageningen, Holland. *Centr. Bakt. Parasitenk.*, II Abt., 75, 344-60(1928); cf. C. A. 22, 4146. —Several carbohydratolytic thermophilic organisms were isolated from mud. The following medium was best for starch-splitting species: Agar 2%, starch 2%, NH₄Cl 0.1%, K₂HPO₄ 0.1% and MgSO₄ 0.05%. The most active starch-

splitting species was named *Bact. thermoamylolyticus*. It produced characteristic colonies in 24 hrs. at 55° to 60°, the cells penetrating the starch grains. In 24 hrs. the starch is largely dissolved, and in 9 days, 80% is changed to maltose. Acids appear in very slight amts. only, and no gas is evolved. When 1% dextrose and 1% CaCO₃ was substituted for starch, and the medium inoculated and incubated 24 hours at 60°, CO₂ was formed. From starch, dextrose or sucrose these organisms produce CO₂, H₂, large amts. of butyric acid, small amts. of acetic acid and traces of propionic acid. One facultative, anaerobic, spore-forming bacillus was named *Bact. thermobutyricus* because of its outstanding production of butyric acid. The K salt of pyroracemic acid is fermented by these organisms, it being apparently an intermediate product in the carbohydrateolytic action previously mentioned. III. The cleavage of cellulose by thermophilic bacteria. *Ibid* 76, 38-44(1928).—Suspensions of filter paper in salt mixts., inoculated with mud and incubated at 55° to 60°, almost always showed methane production. Cultures which were pasteurized and reinoculated produced H and CO₂. It is probable that the metabolism of certain thermophiles produces substances from cellulose which serve as sources of food for other bacteria which produce CO₂, the latter not being able to attack cellulose directly. A thermophilic, aerobic, cellulose-splitting bacterium was isolated and named *Bact. thermocellulolyticus*. There is a good bibliography.

JOHN T. MYERS

Remarks on the paper "Cellulose as a source of energy for free living nitrogen-binding microorganisms," by Dr. Paoli Tuorile. HANS PRINGSHEIM. *Centr. Bakt. Parasitenk.*, II Abt., 75, 459(1928); cf. Tuorila, *C. A.* 22, 4147.—Similar results had been published in this Journal in 1909 and 1910; (cf. *C. A.* 6, 877).

JOHN T. MYERS

The thermophilic flora of sugar in its relation to canning. E. J. CAMERON AND C. C. WILLIAMS. Natl. Canners Research Lab., Washington, D. C. *Centr. Bakt. Parasitenk.*, II Abt., 76, 28-37(1928).—Three groups of thermophilic spore-bearing bacteria are of major importance in the spoilage of non-acid canned vegetables: (1) the flat sour bacteria producing acid but no gas; (2) thermophilic anaerobic bacteria producing acid and gas but no H₂S; (3) thermophilic anaerobic bacteria producing H₂S with little change in reaction. Most of these reach the canning plant in the sugar. Group (1) was present in every sample of cane sugar examd. Group (2) was present periodically. Group (3) was rare. These organisms were all less common in beet sugar. Contamination was very high in the vacuum evapn. pans in one sugar factory examd.

JOHN T. MYERS

The course of dextrose metabolism and nitrogen fixation by *Azotobacter*. P. G. KRISHNA. Cornell Univ. *Centr. Bakt. Parasitenk.*, II Abt., 76, 228-41(1928).—The accumulation of metabolic products does not depress N fixation by *Azotobacter*. Varying numbers of cells in the inoculum had no effect on N fixation during 2 weeks incubation. Varying concns. of dextrose had no effect. The quantities of N fixed and dextrose utilized increased progressively as the incubation period was prolonged, and continued as long as energy material was available. But the quantities of N fixed and dextrose utilized from day to day were quite variable. The period of intense activity was followed by a slow or decreased activity. There was a good correlation between the amts. of N fixed, of dextrose consumed and of CO₂ evolved each day, showing that the greatest cell multiplication and energy utilization coincides with the period of largest N fixation. The max. CO₂ evolution was reached between the third and sixth days for 3 strains of *Azotobacter*. The optimum range or reaction was between p_H 6.3 and 8.4, and the limiting reaction on the acid side was between p_H 5.8 and 5.9. Between 65 and 70% of the C in the dextrose consumed was given off as CO₂, the values being quite const. The ratio between total C assimilated and N fixed was between 35 and 36:1. The C:N ratio within the *Azotobacter* cells was between 6.5 and 8:1.

D—BOTANY

THOMAS G. PHILLIPS

Effects of external conditions on diastatic and peroxidatic activity in plants. HEINRICH KERN. Botan. Inst., Erlangen. *Z. Botan.* 21, 193-252(1928).—K. studied the effects of heating, desiccation and ether narcosis on the diastatic and peroxidatic activity of seedlings of *Zea mays* and *Avena*. Seeds were washed with sterile water as a protection against molding and germinated on moist filter paper. Seedlings 5 to 12 days old were used in most of the expts. Detns. were made both on root tips (0.5 cm.) and whole seedlings. The enzyme solns. were prepd. by grinding 10 g. fresh plant material and 90 cc. of distd. water with quartz sand in a porcelain mortar. One % toluene was added as a preservative. The mixt. was filtered through hard filter paper, which retained any starch that was present. The enzyme solns. were used fresh. It was not necessary to use buffers as the p_H in all cases was around 5.4, which is assumed to be near the optimum for amylase. For the estn. of diastatic activity the 24-hr. iodine method of Wohlgemuth (Grundriss der Fermentmethoden. Berlin, 1913) was used. The number of cc. of 1% starch soln. which could be hydrolyzed by 1 cc. of the enzyme soln. in 24 hrs. at 38° was calcd. This value is denoted as diastatic activity or D_{24}^{38} . It was confirmed that enzymes of dormant seeds are more resistant against heating than after germination. During germination the enzyme activity was found to increase greatly. For dormant corn seed, D equals approx. 20. For corn seedlings 5-12 days old D equals 1280 to 2560. Diastatic activity of the root tips was much less than that of the seedling as a whole. Heat treatments were carried out in a thermostat. Two-hrs. heat treatment of seedlings at 60° weakened their diastatic activity. Activity returned slowly (24 to 48 hrs.) after heating in spite of cessation of growth. However, normal diastatic power was rarely reached. Root tips on the other hand, after similar treatment, showed no lessening of diastatic activity. Twenty-four to 48 hrs. after treatment the diastatic activity of these treated root tips rose to 2 to 4 times that of controls. Similar results were reached after 1.5 hrs. at 50°. However, the development ability of these seedlings was only slightly impaired. Other expts. were tried which showed that in general heat stimulation of the diastatic activity of root tips is more rapid, stronger, and is retained longer than with the seedling as a whole. Peroxidatic activity was detd. by the method of Willstätter and Stoll (*C. A.* 13, 453). The amount of purpurogallin was detd. by comparison with a standard soln. in a colorimeter (cf. *C. A.* 18, 236). In contrast to diastatic activity, the peroxidatic activity of root tips is 2 to 3 times greater than that of the seedling as a whole. During germination, in both the seedling as a whole and in the root tips, there is an increase of peroxidatic activity up to a max. on the 8th to 9th day. Heating for 1.5 hrs. in a moist atm. at 50° lessened the peroxidatic activity in both the seedling as a whole and in the root tips. Twenty-four to 48 hrs. after heat treatment peroxidatic activity had returned to normal. A different behavior of the peroxidatic activity of the seedling as a whole as compared with the root tips was not observed in any of the expts. tried. In general it is shown that external factors can affect the activity of the enzyme system of the living plant, even if the external influence is only of short duration and the development ability of the plant is not impaired. On the other hand, where the lethal temp. is exceeded, in spite of complete cessation of growth, strong enzyme activity often still persists. Further, the different effects of external conditions on diastatic and on peroxidatic activity show that the enzyme system of the plant does not react as a unit.

R. C. BURRELL

Investigations on the fruits of *Schinus molle*. ACHILLE CREMONINI. Reale Univ., Bari. *Ann. chim. applicata* 18, 361-5(1928).—A preliminary note. The difference of opinion in the literature regarding the presence or absence of piperine in the fruit (cf. Wittstein, *Vierteljahrsschr.* 9, 72; *Repl. chim. appl.* 4, 288(1862); *Jahresber. Chem.* 1862 514; *Gazz. chim. ital.* 14, 199(1884); Villavecchia, *Dizionario di Merceologia* 3, 373 (1925); cf. *C. A.* 20, 1875; *Dizionario di Chim. A. Wurtz* 3(1889); *Enc. del Selmi* 8, 978; Guareschi, *Nuova Enc. Chim.* 10, 781(1927)) induced C. to study the problem. The present paper deals with ripe fruit with the epicarp removed. The fruit reduced boiling Fehling soln. A sugar and a bitter cryst. substance were obtained, which, however, were not identified. This sugar had a neg. α value, but after treatment with hot acids this rotation became positive, which, coupled with the fact that it did not contain mannose or fructose and with certain other evidence, indicated the presence of a glucoside. No piperine was detected. The yield of ethereal oil was 3-4%, and it was a mobile, refragent liquid, with odor resembling turpentine or pepper, and turned brown on exposure to light and air. In it were found β -phellandrene, pinene, transterpine and carvacrol, but no thymol and no limonene. The drupe also contained a small quantity of ferrojone, indicating

the presence of aeroöxidases. The alc. ext. of the fruit did not reduce Fehling soln., evapd. it yielded a yellowish red resin, which was neutral, without taste, had an aromatic odor, was insol. in water, was partially sol. in caustic alkalies, could not, after purification, be crystd. and did not contain N. The portion sol. in KOH gave a yellow soln., from which by addn. of HCl was pptd. a light yellow substance, m. approx. 102°.

C. C. DAVIS

The growth of the tomato as correlated with organic nitrogen and carbohydrates in roots, stems and leaves. G. T. NIGHTINGALE, L. G. SCHERMERHORN AND W. R. ROBBINS. N. J. Agr. Expt. Sta., *Bull.* 461, 1-38(1928).—Fresh greenhouse-grown tomato plant tissue only was employed for the N dissections and carbohydrate detns. Plants were grown both with and without light. The N fractions which were detd. in various parts of the plant were total nitrate-free, protein, nitrate-free sol., proteose, basic, amide, amino, NH_2 , humin and nitrate. The carbohydrate fractions were reducing sugars, sucrose, starch and dextrin and total carbohydrates. The roots are low in carbohydrates but very high in protein N, indicating that the roots do not serve chiefly for storage. In vigorously growing tomato plants the assimilated N is high in all parts of the stem, but protein N is low except in tissue of the growing point and closely adjacent cells. In meristematic cells of the growing point of the tomato stem, and in adjacent tissue made up of thin-walled cells with dense contents, assimilated N is high and much of it is in the form of protein. There is some fluctuation in quality of carbohydrates, but in general sucrose, starch and dextrin do not accumulate unless reducing sugars are high. Petioles and veins appear to correspond very closely to stems in % and quality of carbohydrates and nitrate-free N. Blades are exceedingly high in assimilated N in the form of proteins. In general, throughout the plant, proteose, basic, amino, amide and NH_2N increased during the period of darkness, doubtless at the expense of the protein. In the upper stems, however, the catabolic action included a decrease in proteose and basic N as well as protein. Associated with the loss in protein, proteose, and basic N in the upper stems, amino, amide and NH_2N greatly increased. Accompanying this increase were very weak vegetative growth and eventually death at the growing point of the stem and tips of young leaves of plants that were allowed to remain in darkness after other plants were either analyzed or shifted to light conditions. Before death of any tissue, some plants were returned to the light, following which carbohydrates and protein increased, all forms of nitrate-free sol. N decreased, and the plants again became vigorous.

C. R. F.

Effect of sulfate on lemon leaves. A. R. C. HAAS AND E. E. THOMAS. Univ. of Calif. *Bot. Gaz.* 86, 345-54(1928).—In controlled sand cultures it was found that large concns. of sulfate in the soln. bathing lemon-tree roots may bring about toxic effects in the leaves. A reduction in toxicity may be brought about by increased concns. of phosphate and nitrate.

BENJAMIN HARROW

Relation of phosphorus content to shrivelling of walnut kernels. A. R. C. HAAS AND L. D. BATCHELOR. Univ. of Calif. *Bot. Gaz.* 86, 448-55(1928).—The degree of shrivelling has no effect on the total P content of mature walnut kernels obtained from trees growing on a given soil type. There is a progressive increase in the total P of the kernels as they increase in age.

BENJAMIN HARROW

Effect of hydrogen ion on the protoplasm of root hairs of *Hordeum vulgare* L. SOEFRIED STRUGGER. *Sitzb. Akad. Wiss. Wien* 137, 143-69(1928); cf. *C. A.* 22, 101.—The effect of H-ion concn. from p_{H} 6.8 to p_{H} 7.55 upon the protoplasm of the root hairs of barley (*Hordeum vulgare* L.) was studied with dark field illumination. Changes in the protoplasm resulting in an increase in microsomes, in vol. and linking of morphological structures as related to the H-ion concn. fall into 3 distinct max. Three max. for pptn. are (1) p_{H} 6.85 to 6.90, (2) p_{H} 7.00 to 7.05 and (3) p_{H} 7.35; for rate of protoplasmic streaming (1) p_{H} 6.85 to 6.90, (2) p_{H} 7.00 to 7.05 and (3) p_{H} 7.35. This offers an explanation for the periodic pptn. of protoplasm as found by Sakamura and Loo (*Bot. Mag. Tokio* 39, 61).

H. R. KRAYBILL

Coumarin in the genus *Rudbeckia*. ALEXANDER V. LINGELSHHEIM. *Ber. deut. botan. Ges.* 46, 593-4(1928); cf. *Ibid* 44, 641.—Through the microsublimation methods of Nestler and Molisch and Tunmann the presence of coumarin in *Rudbeckia speciosa* Wenderoth was established.

LAWRENCE P. MILLER

The physics of stomatal transpiration. I. The maximum diffusion ability of porous membranes. BRUNO HUBER. *Ber. deut. botan. Ges.* 46, 610-20(1928).—After a study of evapn. through Cu foil pierced with holes of varying diam. and representing in area various percentages of the total surface, the early conclusions of Brown and Escombe were substantiated. It was further shown that the stomatal areas of plants are such that for the highest values they allow a diffusion which is practically that of a

free surface, while each decrease of this area brings about a marked lowering of diffusion. Were the stomatal area of plants larger, not only would the amt. of diffusion be scarcely increased but the ability of the plant to regulate it would be impaired because a greater decrease in stomatal area would be required to bring about a corresponding lowering of the amt. of diffusion.

LAWRENCE P. MILLER

Photoperiodic adaptation of plants. V. N. LYUBIMENKO AND O. A. SZEGLOVA. *Jardin Botan., Leningrad. Rev. gen. botan.* 40, 513-36, 577-90, 675-89, 747-68 (1928); cf. *Compt. rend.* 176, 1915.—The periodicity of light which is found in natural conditions has caused specific adaptation of green plants to various lengths of day. Of the plants investigated it seems that those whose natural habitat is the tropics are short-day plants, while arctic plants require a long day, and those of the temperature zone are intermediate. The length of day at which a plant will show a max. increase of dry wt. per hr. of illumination is less than the length of day required for optimum growth. A detn. of the respiratory activity and the amt. of starch present before and after the period of illumination in plants belonging to various length of day groups shows that a fundamental physiological difference between these plants is the specific ratio between the energy of the respiratory processes and the processes of photosynthesis. The periodicity of light affects not only the total production of dry wt. but also its distribution among different organs of the plant; it seems that there is an optimum length of day for each organ of the plant. The amt. of chlorophyll attains its max. at a certain length of day; an increase or a decrease of length of day results in a lowering of chlorophyll content. The intensity of the light must also be considered; if it is artificially diminished the results are affected.

LAWRENCE P. MILLER

The biochemistry of the growth-stimulating action of warm bath. II. KARL BORESCH. *Deut. tech. Hochschule Tetschen-Liebwerd. Biochem. Z.* 202, 180-201 (1928); cf. *C. A.* 19, 2688; 21, 115.—The detn. of the alc. and acetaldehyde formed in walnut plants treated with warm baths shows that fermentation cleavage takes place in the quiescent buds. This is due to the injury of respiration which manifests itself also in a diminished O_2 consumption.

S. MORGULIS

The aromatic oils of germinating anise fruits which undergo no alteration. NICOLAIN IVANOV AND V. F. GRIGOREVA. *Biochem. Lab., Inst. Applied Botany, Leningrad. Biochem. Z.* 202, 284-93 (1928).—During 12-20 days of germination in the dark the aromatic oils of anise fruits are entirely unaffected, both quantitatively and qualitatively. The aromatic oils are regarded as by-products of the plant cell metabolism which like the alkaloids or rubber cannot be used by the organism after they have once been formed.

S. MORGULIS

The enzyme action of *Alternaria solani*. GEZA V. SZELENYI AND GEORG V. BEEZE. *Tech. Univ. Budapest. Centr. Bakt. Parasitenk., II Abt.,* 76, 121-4 (1928).—*Alternaria solani* produces the exoenzymes, invertase, maltase and lactase, and the endoenzyme invertase.

JOHN T. MYERS

Boron: Its importance in plant growth. EARL S. JOHNSTON. *Maryland Univ. J. Chem. Education* 5, 1235-42 (1928); cf. *C. A.* 22, 1994.—One-half part of B in a million parts of soln. brought about a wonderful transformation in tomato plants. Care should be exercised not to contaminate the solns. or plant containers with B. Distd. H_2O should be used in making up the solns. rather than tap H_2O and the plant containers should be made of substances free from B. The use of Pyrex vessels or glazed pottery should be avoided. Expts. show that tomato plants apparently obtain enough B from the glaze of new jars. If tap water instead of distd. H_2O was used in making up nutrient solns. it was found possible to grow tobacco plants to maturity. In all of the expts. the growing points and other meristematic tissue seem to be greatly affected by a deficiency of B. Microscopic examn. and chem. analyses point to the breaking down of the conducting system. In the tomato plant it was found that starch and total sugars were more abundant in the leaves and stems of B-deficient plants than in the corresponding tissues of normal plants. The plants were apparently able to manuf. starch and sugars, but because of broken down or undeveloped conducting systems these products remained in the leaves and stems. Care should be taken not to add too much B since a concn. of only 5 p. p. m. is extremely toxic. Although the amt. of B used by plants is extremely small it appears necessary to include this element among those essential for plant growth.

Terminology of vitamin B. E. C. VAN LEERSUM. *Nederland. Tijdschr. Geneeskunde* 72, 5905-7(1929).—To discriminate the various B vitamins, L. terms them vitamin B₁, B₂, etc. Also in *Science* 69, 166-7(1929). R. BEUTNER

The absorption spectra of irradiated and unirradiated ergosterol. ALEXANDER SMAKULA. *Nachr. Ges. Wiss. Göttingen* 1928, 49-64.—The absorption spectra of ergosterol, when in soln. in the presence of O, reduced on standing for some time. By excluding O from the soln. in a special sealed cell this effect was greatly decreased. In this cell a study was made of the absorption spectra of ergosterol and of irradiated solns. of ergosterol, the data being recorded by a photoelec. method. Irradiated ergosterol can be preserved for some time by the exclusion of O. The irradiated ergosterol produces a vitamin which is decomposed by prolonged irradiation. (Cf. Morton, *et al.*, *C. A.* 21, 3937.) WALLACE R. BRODE

The antirachitic action of bone marrow. GERTRUD FUCHS AND RICHARD PRIESEL. Univ.-Kinderklinik in Wien. *Z. ges. expil. Med.* 61, 539-48(1928).—Red bone marrow in small amounts will heal rickets in rats produced by feeding them the McCollum diet. The curative effect depends upon the cholesterol content. Radiating the bone marrow before feeding with a quartz lamp for a half hour at 70 cm. did not change its healing power. F. L. DUNN

The effect of the cow's ration on the food value of milk. W. E. KRAUSS. Ohio Agr. Expt. Sta., *Bimonthly Bull.* 13, 195-8(1928).—A complete diet is defined as contg. adequate amts. of energy-producing substances, protein of good quality, certain minerals such as Ca, P and Fe, and also vitamins. Cows do not need vitamin B in their food inasmuch as it can be synthesized in the rumen. Vitamin A potency in milk increases with the richness of the feed in this vitamin. Milk is at best a rather poor source of vitamin D. For feeding milk cows, a good grain mixt. supplemented with some form of well-cured leafy roughage and silage in the winter and with pasture in summer is recommended. C. R. F.

The effect of the cow's ration on the vitamin A and vitamin B content of milk. W. E. KRAUSS. Ohio Agr. Expt. Sta., *Bimonthly Bull.* 13, 198-201(1928).—Detns. by the usual animal technic of vitamins A and B in the milk of cows fed on high-protein and low-protein rations showed differences too small to be of any practical significance. Apparently a cow can tolerate extreme levels of protein feeding without materially affecting these 2 factors of the milk. C. R. F.

The effect of inadequate vitamin B upon sexual physiology in the male. HERBERT M. EVANS. Univ. of Calif., Berkeley. *J. Nutrition* 1, 1-2(1928).—The invalidation of most previous researches because of non-assurance of the presence of vitamin E caused the author to conduct carefully controlled expts. with rats. The source of vitamin E was purified wheat-germ oil. The animals were not allowed access to their feces. In 1 series, inadequate sources of vitamin B along with an abundance of vitamin E were used while in other series vitamin B was suddenly withdrawn from adult animals properly nourished, and continuing to receive a nutrition adequate in every respect, especially as regards E, and suffering merely deficiency in B. In the first series, sex interest as well as anatomical and functional integrity of the male cell were studied by biweekly or monthly matings, after the 60th day of life, with vigorous females known to be in the estrous stage. Approx. 40 copulations were studied. In all cases, the sexual physiology of rats fed on vitamin-B-deficient diets was practically normal up to within a few days of actual death. The normality of the testis and its secretion did not depend on adequate levels of vitamin B but solely on the presence of vitamin E. Copulations occurring during the last stages of beriberi resulted in normal offspring. The second series of expts., i. e., the sudden withdrawal of vitamin E from an otherwise adequate diet, resulted in immediate and precipitous drop in body wt. Weekly matings with females in estrous gave frequent copulations which practically all resulted in vigorous offspring. Providing vitamin E is adequately high, injury to the productive function in the male caused by

inadequate B would appear to be due solely to this interference with behavior and to no extent to actual injury of the male germinal elements. C. R. F.

Relation of vitamin E to growth and vigor. HERBERT M. EVANS. Univ. of Calif., Berkeley. *J. Nutrition* 1, 23-8(1928).—Vitamin E is concerned not only with the physiology of reproduction, i. e., the degeneration of the fetal placenta and testis in its absence, but also that lack of E in mother's milk entails a peculiar paralytic disease in the suckling young. As a result of numerous expts. conducted over a period of 3 yrs. with rats, uniformly improved growth and vigor occurred in animals receiving vitamin E in the form of wheat-germ oils as contrasted with their litter-mate sisters or brothers on identical dietary regimes, save for the omission of E. Even though fertility could be resuscitated in only 25% of the cases where sterility existed, vitamin B (wheat-germ oil) gave a clear response in improved growth and constitutional state of the animals so treated. This improvement was not sex-linked for it continued even after removal of the testes. The improvement was likewise attained by feeding a highly concd. sterol-free fraction of the non-saponifiable part of wheat germ oil, though the growth increase occurred largely after 8 months. There was little difference in growth curves among animals fed E-high or E-free diets up to 90 days. It is concluded that vitamin E does not exert its favorable effects upon growth and the general state of the animal indirectly through its established value to the sex glands but in some other, possibly more direct, way. The diminution in sex activity late in life of males held upon E-free diets may not be due to impairment of the testes, but may result from the constitutional inferiority of such animals. C. R. F.

Supplementary values among foods. II. Growth and reproduction on white bread with various supplements. MARY SWARTZ ROSE AND GRACE MACLEOD. Columbia Univ. *J. Nutrition* 1, 29-38(1928); cf. Rose and McCollum, *Proc. Soc. Exptl. Biol. Med.* 25, 697(1928).—Using 3 samples of bread, a diet composed of dried bread 70%, and dried whole milk 30% gave normal growth in rats, excellent health and good reproduction in females. However, lactation was poor and only 5 young were successfully weaned out of a total of 81. When dried egg powder was substituted for the milk, similar though less encouraging results were obtained. Signs of rickets and general weakness were evident and only one-half of the animals made normal gains from the 3rd to 6th month. Using 90% bread with 10% milk or 70% bread with 30% carrot gave even poorer results. Growth was poor and only 1 mother on the carrot diet bore young. Diets contg. dried bread 70% and almond meal 30% or dried bread 90% and spinach up to 10% did not allow animals to maintain health in spite of good food consumption. At the end of 6 to 8 months most of them had a wt. which they should have had in 2 months. Reproduction was nil. The poorest records of all were made on bread and lean beef even when fed *ad lib.* Normal growth took place for 5 weeks only, after which serious decline in wt. and health occurred. The addn. of butter equiv. to 9% of the wt. of the bread or Calactate 2.6% had little effect on growth but 2% cod-liver oil was slightly beneficial. All the animals were crippled and could scarcely move. Of 13 animals, only 8 lived 8 months. No marked differences were attributed to differences in compn. of white breads. C. R. F.

The distribution of vitamin E. NINA SIMMONDS, J. ERNESTINE BECKER AND E. V. MCCOLLUM. Johns Hopkins Univ. *J. Nutrition* 1, 29-47(1928).—The authors withdraw their previous conclusions (*C. A.* 21, 2495) that wheat germ oil because of its content of vitamin E, protected animals against the injurious effect of feeding FeSO_4 . The injury due to FeSO_4 is now interpreted as a result of destruction of vitamin A. There is no evidence that vitamin E has any role in Fe assimilation. — Certain samples of lard and of cod-liver oil promote fertility to an extent which compels the conclusion that they contain considerable amts. of E. The study of the distribution of E is complicated by the considerable variation in the degree to which individual male rats withstand the effects of diets low in E. Some remain potent much longer than others. C. R. F.

A detailed study of the role of vitamin B in anorexia in the albino rat. BARNETT SURR. Univ. of Ark., Fayetteville. *J. Nutrition* 1, 49-56(1928).—Using avitaminized albino rats, various vitamin-B-rich concentrates gave striking curative results even after the animals had developed severe symptoms of beriberi. In nearly every case after the animals had failed to eat for 1 or more days following the use of prolonged vitamin-B-free diets, there was a sharp rise in food consumption which lasted only a day or two. This is attributed to the liberation of B by the breaking down of the depots in the body during the advanced stages of catabolism. The liver is a depot of vitamin-B storage and where it is absent, the liver shows atrophy, capillary congestion, marked vacuolization and an edematous condition. It is concluded that vitamin-B deficiency is a detg. factor in the development of anorexia, even complete cases of which may be entirely cured by

vitamin-B therapy using highly concd. yeast preps. Since the calorific intake of the American people has as its source mainly degerminated cereals, sugar and meat, and since their diet is not balanced by sufficient amts. of fresh vegetables to insure an optimum vitamin-B intake, it is suggested that the org. and functional anorexias so frequently encountered in the human may be largely attributable to cumulative effects of vitamin-B deficiency.

C. R. F.

The character of energy metabolism during work. M. ELIZABETH MARSH. Univ. of Rochester, N. Y. *J. Nutrition* 1, 57-89(1928).—The old question of carbohydrate and fat utilization by muscles during work is critically reviewed, M. leaning to the theory that fats are not transformed to carbohydrates in higher animals under normal conditions. Extensive exptl. data using Prony-brake and Krogh magnetic-brake types of ergometers are described. Boys and young men were used as subjects. Chem. data were taken. The respiratory quotient (R. Q.) of the excess metabolism was obtained by deducting from the total CO_2 and O_2 of the work and recovery period, the CO_2 and O_2 obtained in the previous resting period. About 100 expts. were made on subjects subsisting on uncontrolled diets. The work varied in intensity from 0.76 to 1.4 Cal. per min. and continued for from 5 to 20 mins. With 2 boys the av. R. Q. of the excess metabolism due to the work, in 41 out of 49 and in 15 out of 18 expts., resp., was lower than the R. Q. of the previous resting period, the av. being 0.78. With the mature, athletic subject, this was true in 15 out of 16 trials, giving an av. of 0.95. With the mature subject on a high, carefully controlled carbohydrate diet, the recovery to the pre-work level of O_2 absorption and CO_2 elimination was much slower than on high carbohydrate. The av. excess R. Q. of work and recovery on both diets was higher than the R. Q. of the previous resting period, but the abs. level of the excess R. Q. was influenced very clearly by the diet. The alveolar values in these expts. on special diets showed more CO_2 in circulation at the end of work and recovery on high carbohydrate than previous to work, and either no change or less CO_2 in circulation at the same time on high fat. Acetoacetic acid was present in the urine on high fat diet. The presence of acidosis explains the higher R. Q. of the work metabolism on this diet. In general, the evidence from this study lends support to the belief that the human body uses for the energy muscular work, both carbohydrate and fat. A bibliography of 21 references is appended.

C. R. F.

Muscular efficiency on high-carbohydrate and high-fat diets. M. ELIZABETH MARSH AND JOHN R. MURLIN. Univ. Rochester. *J. Nutrition* 1, 105-37(1928).—Relative efficiency of carbohydrate and fat diets in muscular work was studied by performing 47 expts. on 1 subject riding the bicycle ergometer. In 12 trials, a normal unrefined diet was used as a basal series to compare with the high-fat and high-carbohydrate diets. The work period was 8 mins. followed by a recovery period of from 17 to 25 mins. nine samples were collected in the pre-work, work and recovery periods. The av. net efficiency on the normal diet at the rate of 1.4 Cal. of work per min. was 22.1%; on high carbohydrate at the same rate 22.7% and on high fat at the same rate 21.5%. At the lower rate of 1.1 Cal. of work per min. the av. net efficiency on the same high-carbohydrate diet was 23.4%, and on the high fat 22.6%. The av. difference in efficiency between high carbohydrate and high fat first series, calcd. to pure carbohydrate and pure fat combustion, was 11 or 12%. A difference in the diminution of N excretion from pre-work to work and recovery periods was noted on the high-carbohydrate as compared with the high-fat diet. The difference is due to the greater sparing effect of increased carbohydrate combustion.

C. R. F.

Vitamin requirements of nursing young. III. A quantitative biological method for the study of vitamin B requirements of nursing young of the albino rat. BARNETT SURE, DOROTHY J. WALKER AND E. H. STUART. Univ. Ark., Fayetteville, and Eli Lilly Co., Indianapolis, Ind. *J. Nutrition* 1, 139-53(1928).—A technic is described for determining the vitamin-B requirements of nursing young which is sensitive to the extent of 1 mg. per nursing per day. A vitamin-B unit, applied to nursing young, is defined as the daily amt. of vitamin-B which must become available to a nursing young of the albino rat weighing 30 g., in order to permit a gain of 10 g. in from 7 to 10 days. Several vitamin B concns. when tested by the biol. method of assay showed variations of from .44 to .25 units per g. IV. Vitamin B versus vitamins A and D requirement for growth of nursing young of the albino rat. *Ibid* 155-64.—Nursing young need approx. 100 times as much vitamin B, calcd. in terms of dehydrated baker's yeast, as vitamins A and D (from cod-liver oil), for continuous growth during the nursing period.

C. R. F.

Improved rate of growth of stock albino rats. ARTHUR H. SMITH AND FRANKLIN BING. Yale Univ. *J. Nutrition* 1, 179-89(1928).—A biometrical study indicating

that evolution is occurring in this species because of the more perfect mode of nutrition now used by this animal. Care will be required in properly evaluating data obtained in expts. involving the use of the albino rat.

C. R. F.

Nutritional significance of our present knowledge of the multiple nature of vitamin B. H. C. SHERMAN. Columbia Univ. *J. Nutrition* 1, 191-9(1928).—A review of the more important investigations on vitamin B.

C. R. F.

What do we know of the chemistry of vitamins? L. ILOSVAY. *Termesztud. Közlöny* 60, 313-24(1928).—A summary on the chemistry of vitamins.

S. S. DE FINÁLY

Raw and cooked hen egg as the exclusive diet of growing rats. FOLKE STENQVIST. Med.-chem. Inst., Lund. *Deut. med. Wochschr.* 54, 1920-3(1928).—Raw and cooked eggs were compared as to their relative value when used as the exclusive diet of young rats. The cooked egg is superior to the raw in so far as its food value is concerned and also because of the absence of the toxic effect which raw eggs are said to possess. A. G.

Further experiments on the effective value of raw and cooked foods. E. FRIEDBERGER, A. ABRAHAM AND S. SEIDENBERG. Forschungsinst. für Hyg. und Immunitätslehre, Berlin. *Deut. med. Wochschr.* 54, 2092-3(1928).—Owing to the toxic effect of the fresh white of egg, when fed to rats, cooking improves the apparent food value of eggs.

ARTHUR GROLLMAN

The effects of protein-split products upon metabolism. III. Further investigation of the fractionated protein hydrolyzates and of amino acids, and their relation to the specific dynamic action of the proteins. DAVID RAPPORT AND HOWARD H. BEARD. Western Reserve Univ., Cleveland. *J. Biol. Chem.* 80, 413-30(1928); cf. *C. A.* 22, 3686.—Both the dicarboxylic acid and the diamino acid fraction of casein and gelatin hydrolyzates increased the total metabolism of a dog. Glutamic acid, aspartic acid, arginine and cystine had a specific dynamic action while histidine did not. The specific dynamic action of the proteins was fully accounted for by the summated actions of their constituent amino acids.

ARTHUR GROLLMAN

The destruction of vitamin E in a ration composed of natural and varied foodstuffs. J. WADDELL AND H. STENBOCK. Univ. of Wis. *J. Biol. Chem.* 80, 431-42(1928).—The vitamin-E potency of a ration of natural and varied food materials was completely destroyed by treatment with FeCl₃. The vitamin-A content was unaffected. A. G.

Studies on the metabolism of Eskimos. PETER HEINBECKER. Washington Univ., St. Louis. *J. Biol. Chem.* 80, 461-75(1928).—The diets of Polar and Baffin Island Eskimos are described. Glucose tolerance curves showed these people to have a high tolerance for carbohydrate, which was decreased after fasting. Despite their habitually high-protein diets, the non-protein nitrogen of blood is the same as that of other races. Very small amts. of acetone bodies are excreted in the urine in fasting. The basal metabolism of Eskimos is higher than that of persons living in temperate zones. During fasting the R. Q. may reach values as low as 0.45.

ARTHUR GROLLMAN

The intestinal p_H in experimental rickets. BERNARD L. OSER. Food Research Labs., N. Y. *J. Biol. Chem.* 80, 487-97(1928).—Expts. on rats indicated that the fecal p_H test for vitamin-D potency was faulty. The reaction of the feces was not uniform and fluctuated considerably. The decreased alkyl. of the colonic contents is attributed to inadequate P reabsorption at this level of the intestinal tract. ARTHUR GROLLMAN

The effect of scurvy-producing diets and tyramine on the blood of guinea pigs. MILTON T. HANKE AND KARL K. KOESSLER. Univ. of Chicago. *J. Biol. Chem.* 80, 499-502(1928).—Tyramine injected subcutaneously into guinea pigs caused no anemia. An exclusive diet of autoclaved soy beans and minerals led to scurvy and death. In these animals an abnormal blood picture, associated occasionally with anemia, was obtained.

ARTHUR GROLLMAN

The manganese-copper-iron complex as a factor in hemoglobin building. R. W. TITUS, H. W. CAVE AND J. S. HUGHES. Kansas Agr. Expt. Sta., Manhattan. *J. Biol. Chem.* 80, 565-70(1928); cf. *C. A.* 23, 422.—Mn and Cu are both effective, in the formation of hemoglobin, when added to the milk-iron diet of rats. When both Mn and Cu are added, the response is quicker than when either is added alone to the diet. A group of substances, rather than a single substance, seems to be active in hemoglobin building.

ARTHUR GROLLMAN

The influence of fasting and creatine feeding upon the creatine content of the tissues and blood of the white rat. ALFRED CHANUTIN AND HERBERT SILVETTE. Univ. of Va. *J. Biol. Chem.* 80, 589-608(1928).—The creatine content of rat muscle is progressively increased during fasting or after feeding high-creatine diets. The creatine content of the kidney is also increased early in fasting. The heart, testes, liver and brain show little change in creatine content. The total solids of muscle are increased

in the early part of fasting but decreased at the close of fasting. The creatine reservoirs in muscle and liver are shown to be quite flexible, being easily affected by the exptl. conditions. Blood studies during and after fasting, and during creatine feeding were also made.

ARTHUR GROLLMAN

Bile salt metabolism. I. Control diets, methods and fasting output. H. P. SMITH, A. H. GROTH AND G. H. WHIPPLE. Univ. of Rochester. *J. Biol. Chem.* 80, 659-69(1928).—Bile salt secretion in dogs was uniform during the 24 hrs. despite a single daily feeding. The output of bile salt on a diet of standard salmon bread is 80 to 130 mg. per kg. of body wt. per 24 hrs. but is fairly const. for any given dog. Fasting reduces the bile salt output to 30 to 40 mg. Sugar feeding reduces it to a still lower level.

II. Influence of meat and meat extractives, liver and kidney, egg yolk and yeast in the diet. H. P. SMITH AND G. H. WHIPPLE. *Ibid* 671-84.—Meat and meat products fed to bile fistula dogs increase the bile salt output 2- or 3-fold. Feeding of cholesterol, alc. extractives of meat or yeast nucleic acid cause no change in the bile salt output. "Food protein is of primary importance and detcs. the level of the exogenous bile salt output."

III. Tryptophan, trysoine and related substances as influencing bile salt output. G. H. WHIPPLE AND H. P. SMITH. *Ibid* 685-95.—Gelatin feeding, supplemented with tyrosine, gives a bile salt output of only 70 mg. per kg. per 24 hrs. Tryptophan added to gelatin gives a sustained rise to the low meat-diet level. Isatin and indigo may also cause a rise but this effect is inconstant. *p*-Hydroxyphenylglycine like tyrosine is inert. Tryptophan, isatin or indigo has a cholagog effect, even when combined with sugar feeding. This cholagog effect may be completely dissociated from the bile salt effect. Tryptophan added to a sugar diet is inert except for its cholagog effect. Some other substance present in gelatin is thus needed together with tryptophan to complete the cycle of bile salt production.

IV. How much bile salt circulates in the body? G. H. WHIPPLE AND H. P. SMITH. *Ibid* 697-707(1928).—Daily bile re-feeding of all bile secreted from a bile fistula raised the bile salt secretion to a stable plateau level of 700 to 800 mg. of bile salt per kg. of body wt. per 24 hrs. Injection of bile salts leads to prompt secretion in the bile. Supplementary feeding raised the level of bile salt secretion to high levels but the output always fell behind the intake. The fate of this surplus could not be detd.

ARTHUR GROLLMAN

Protein and vitamin B. GLADYS A. HARTWELL. King's College for Women, London. *Biochem. J.* 22, 1212-20(1928).—For normal metabolism edestin requires more vitamin B than does caseinogen or egg-albumin (cf. *C. A.* 22, 615). On a diet of 20% edestin and 5 g. yeast ext. per 100 g. dry solid, many young rats die, showing kidney abnormality. More yeast prevents these symptoms. The yeast "protective" factor is not destroyed by autoclaving at 120° for 4½-5 hrs.

BENJAMIN HARROW

Minimum amount of vitamin D required for a positive antirachitic effect in the "line" test. KATHERINE H. COWARD. Pharmaceutical Society of Gt. Britain, London. *Biochem. J.* 22, 1221-2(1928).—C. is in agreement with Steenbock (*J. Biol. Chem.* 64, 243(1925)) that the actual amount of vitamin D required to give a positive reaction in the "line" test is 2×10^{-8} g.

BENJAMIN HARROW

Note on quantitative methods of measuring the nutritive value of proteins. HAROLD HANSON MITCHELL. Univ. of Illinois. *Biochem. J.* 22, 1323-26(1928).—Polemical. An answer to Kon's paper (*C. A.* 22, 2399).

BENJAMIN HARROW

Protein metabolism in infancy. PHILIP S. POTTER. *Arch. Pediatrics* 45, 580-91 (1928). A review with chapters devoted to digestion of protein, N retention and absorption, dynamic action, protein requirement, respiratory quotient, the feces, uric acid and creatinine and a bibliography of 49 references.

JOSEPH S. HEPBURN

Mineral salt and water metabolism in infancy. PHILIP S. POTTER. *Arch. Pediatrics* 45, 633-52(1928).—A review with sections on (1) Ca, Mg, K, Na, Fe, S and P, (2) mineral salts in relation to food, stools, fever and nutrition, (3) water metabolism, and (4) a bibliography of 33 references.

JOSEPH S. HEPBURN

Nutrition of the world in past, present and future. MAX RUBNER. *Naturwissenschaften* 16, 713-20(1928).—Statistical considerations on types of food, especially cereals as used by various peoples.

B. J. C. VAN DER HOEVEN

The influence of certain foods on the wool growth of Angora rabbits. J. N. PICKARD. Univ. Edinburgh. *Scottish J. Agr.* 11, 344-6(1928).—Addn. of a few drops of cod-liver oil to the daily ration increased the growth of wool on Angora rabbits. The 28 rabbits which acted as controls yielded 1364 g. of wool, while the same no. which were also given cod-liver oil produced 1806 g. of wool. Addn. of mineral mixts. decreased the yield of wool as compared with the yields obtained from the control animals and from those receiving cod-liver oil. The expts. are being continued.

K. D. JACOB

Cancer as a result of vitamin deficiency. ORTO STRYER. *Mitt. Lebensm. Hyg.* 19,

388-91(1928).—A discussion of the different cancer theories. Autopsy of animals fed on a vitamin-free or vitamin-poor ration usually showed infection of the lungs caused by *staphylococci*. With a certain number of animals, however, this lung infection changed partly or entirely into a cancer swelling. According to S. this infection had its origin in decayed teeth, which can be traced to lack of vitamins. The vitamins A and C are the ones referred to. They retard growth of the different glands and cause only partly developed cells of an embryonic nature, the so-called cancer cells. S. recommends nutrition as a starting point in the study of human cancer. J. C. JURRIJENS

Nutritional chemistry of raw food substances. I. Banana. KINSUKE KONDO, MICHIO NAKAJIMA AND TETSUO SUZUKI. *Mem. Coll. Agr. Kyoto Imp. Univ.* 1928, No. 6, 23-53.—The compn. of banana fruit produced at Inrin, Formosa, and after ripened at Kyoto was detd. About 70% of the edible part consists of H_2O and a greater part of the solid matter is invert sugar and sucrose. One banana may supply about 75 Cal. of energy on the av. The green banana fruit consists of a large amt. of starch beside 70% of H_2O . The amt. of invert sugar is small. During ripening about 10% of the carbohydrate is lost. The amt. of pectin, fiber and tannin may not be changed. The presence of glucose and fructose was shown by the osazone test and detd. to be in the ratio of 4:1. Dextrin and sucrose may be present in the after-ripened banana fruit, but their amts. are varying. The riper the fruit, the more these sugars change to monosaccharides. The carbohydrates (diastase, maltase and sucrase) were detected in banana flesh. All of them are pptd. by the addn. of alc. to their aq. soln. The banana diastase and sucrase may be extd. with water from the banana flesh. If the banana mash be mixed with a suitable amt. of $CaCO_3$ and toluene, the banana maltase will go into soln. in a few days. Treatment of the banana mash with $CaCO_3$ and $CHCl_3$ or with water only may not result in isolation of a powerful maltase. The optimum p_H and temp., resp., of the banana carbohydrates are: diastase 6.4, 30-40; maltase 4.88, 37; invertase 4.5, 30-50. Banana fruit will supplement and raise the nutritive value of a diet. The methods used in all detns. are given. Analysis of the ash is tabulated. The ash consists principally of K_2O and Na_2O . MgO and P_2O_5 are high but CaO is low. Cu was found in both flesh and peel. II. Watermelon. KINSUKE KONDO AND TSUNETOMO HAYASHI. *Ibid* 55-72.—The general compns. of the watermelons, Yamato, Kurobe, Taisen and Kaho, were detd. The edible portion of the Taisen is only about 50% but that of the Yamato or Kurobe is about 70%. The edible portion consists of about 92% H_2O . The principal constituent of the solid matter is sugar, which amounts to about 6-8% in the juice. The amt. of sugar varies with the melon and in its location in the melon. The greater amt. of sugar may be found in the center of the edible portion. The mineral constituent in the watermelon juice amounts to only about 0.3%, of which more than 50% consists of K_2O . Na_2O , P_2O_5 , SO_3 and MgO are high. The amt. of CaO is low. Fructose was confirmed by the formation of phenylosazone and methylphenylosazone. Under the assumption that the juice contains a certain amt. of glucose and sucrose besides the fructose, the amts. of these sugars were detd. and it was found that the solid matter of the watermelon juice consists principally of sugar, two thirds of which is fructose. Therefore, it may be reasonable for watermelons to be taken by kidney-diseased persons, as a medicine. The presence of sucrase in the juice was detected and its optimum p_H detd. The juice of the watermelon inhibits the action of the digestive enzymes. J. A. KENNEDY

Vitamins and their relationship with fruit and vegetable products. JIRÍ KRASL. *Chem.-obzor* 3, 311-3, (313 English)(1928).—General JAROSLAV KERČERA

A new process for the separation of the vitamin fraction from cod-liver oil. JOSEPH K. MARCUS. Pitman-Moore Co. Research Labs., Indianapolis. *J. Biol. Chem.* 80, 9-14(1928).—The success of the new process is due to physical condition of the cod-liver oil soap produced by its H_2O and alc. content and to the sp. properties of $C_2H_4Cl_2$ used to ext. the vitamin fraction. All operations are carried out under anaerobic conditions wherever possible in order to safeguard vitamin A from oxidation. A. P. LOTHROP

Antirachitic substances. VIII. Studies on highly purified ergosterol and its esters. CHARLES E. BILLS AND EDNA M. HONEYWELL. Mead Johnson Co. Research Lab., Evansville, Ind. *J. Biol. Chem.* 80, 15-23(1928); cf. *C. A.* 22, 801.—Crude sterol from the common yeast, *Saccharomyces cerevisiae*, is a mixt. of ergosterol and 2 other sterols, one dextrorotatory and probably identical with MacLean's zymosterol and the other, *cervisterol*, m. above 240° , levorotatory. Ergosterol may be purified by recrystn. from a boiling 3:1 alc.- C_6H_6 mixt. (an exceptionally effective solvent) or by sapon. of purified ergosterol isobutyrate. The pure ergosterol has a value $[\alpha]_D^{20} - 132^\circ$, the highest ever ascribed to yeast ergosterol and identical with Tanret's ergot ergosterol. The m. p. is of little value as a test of purity as it varies from 166° to 183° according to the hydration of the sample. The spectrographic and physiol. properties associated with

ergosterol of ordinary purity are exhibited by the highly purified prepn. Three new esters were prepd. and purified: *ergosterol isobutyrate*, $[\alpha]_D^{25} -84^\circ$ when $c = 1$ in CHCl_3 , sinters 146° , becomes a viscous turbid liquid 148° , becomes a thin turbid liquid 159° , m. clear 162° ; *ergosteryl isovalerate*, $[\alpha]_D^{25} -82^\circ$, sinters 135° , becomes a viscous turbid liquid 138° , becomes a thin turbid liquid 157° , m. clear 160° ; *ergosteryl cinnamate*, $[\alpha]_D^{25} -22^\circ$, sinters 175° , liquefies 177° , m. clear 179° , the melt solidifies on cooling at $145-40^\circ$ with a beautiful play of colors. IX. Quantitative biophysical studies on the activation of ergosterol. CHAS. E. BILLS, EDNA M. HONEYWELL AND WARREN M. COX, JR. *Ibid* 557-63.—Parallel spectroscopic and biologic detns. on irradiated ergosterol showed that the reaction product exhibiting max. absorption at 248μ is not vitamin D. Oxidation is a factor in the destruction of this substance which is suggested as having a mol. configuration similar to isoergosterol. ARTHUR GROLLMAN

The effect of hydrogen-ion concentration upon adsorption of the active factors of vitamin B complex by fuller's earth. W. D. SALMON, N. B. GUERRANT AND I. M. HAYS. Ala. Polytechnic Inst., Auburn. *J. Biol. Chem.* 80, 91-101(1928); cf. *C. A.* 22, 1383.—The max. adsorption of the B-P factor of dry bakers' yeast by fuller's earth was obtained between p_H 3.0 and 5.5 (equil. reaction) with the optimal point at p_H 4.0. The adsorption diminished rapidly beyond p_H 5.5, becoming negligible at p_H 9.0 and practically zero at p_H 11.0. Significant inactivation of the B-P factor occurred in the alk. solns. The max. adsorption of the P-P factor occurred at p_H 0.08 which was the most acid soln. tested. It decreased gradually to a min at p_H 6.3 and remained practically const. to p_H 12.07, the most alk. soln. tested. The B-P factor is more efficiently adsorbed by fuller's earth than the P-P factor. As there is increasing evidence that at least substances are involved in the dual function of the P-P fraction (a growth-stimulating and a pellagra-preventing action), there is the possibility that the adsorption of the P factor as detd. in these expts. represents a composite adsorption of more than one active substance. A. P. LOTHROP

The determination of vitamin A. E. M. NELSON AND D. BREESE JONES. U. S. Dept. of Agr. *J. Biol. Chem.* 80, 215-26(1928).—The U. S. Pharmacopeia X method vitamin A assay of cod liver oil does not eliminate vitamin D as a growth-promoting factor. When this factor is provided ophthalmia usually develops before growth ceases, that the curative test cannot be carried out on an animal free from disease. In curative tests on animals which have developed incipient ophthalmia permanent cure of ophthalmia does not take place unless the level of vitamin A fed is high enough to permit growth of the rat at or near its max. rate. In curative tests for vitamin A, although observations on the presence and change of severity of ophthalmia are essential, the growth response seems to offer a more tangible means of judging vitamin A potency. The vitamin A potency of a sample of butter fat was found to be approx. $1/16$ of that of a good grade of cod liver oil. A. P. LOTHROP

The metabolism of levulose with a colorimetric method for its determination in blood and urine. RALPH C. CORLEY. Tulane Univ. *J. Biol. Chem.* 81, 81-98(1929).—After enteral administration of levulose to rabbits, it appears in the blood in small amts. and mild poisoning with hepatotoxic agents has little influence on the amt. of levulose in blood after enteral ingestion. After intravenous injection of 2 g. per kg. of body wt., levulose practically disappears from rabbit blood in 90 mins. and liver poisons have little influence on the rate of disposal except in massive doses. If injected simultaneously with insulin, levulose protects the rabbit from the effect of insulin without there being any striking influence on the rate of removal of the circulating levulose. Insulin shock was observed on several occasions and levulose disappeared more rapidly from the blood if insulin was given subcutaneously or intravenously an hr. or more previous to the intravenous injection of levulose. In the colorimetric method for the determination of levulose in blood and urine the soln. to be analyzed is heated with concd. HCl and an alc. soln. of diphenylamine in a boiling water bath. The color is developed by the addn. of melted CaH_2OH and compared with a standard in a colorimeter. The method has been found satisfactory in the analysis of aq. solns., urine and H_2WO_4 blood filtrates. Recoveries of 97 to 103% of levulose added in aq. soln. have been made; 95 to 105% added to blood has been recovered; recovery from urine has been found to be more or less satisfactory. Glucose gives about 3% of the color of levulose. A. P. LOTHROP

The antirachitic effect of ergot. E. MELLANBY, E. M. SURIE AND D. C. HARRISON. Proc. Physiol. Soc., *J. Physiol.* 65, xxix(1928).—Ergot was found to have a definite antirachitic effect on dogs. The active fraction was sol. in alc. and in ether. When the active fraction was saponified and the soap soln. extd. with petroleum ether the active substance was left, for the most part, in the soap. It is suggested that the antirachitic

factor may be produced directly from ergosterol in ordinary growth independently of sunlight.

The presence of vitamins in certain canned vegetables. G. RIGOBELLO. *Boll. soc. ital. biol. sper.* 3, 422-5(1928).—The object was to det. to what extent the vitamins in certain vegetables and fruits survive the canning process, and if any can be activated by irradiation. Peas, tomatoes, tomato sauce, oranges in sirup, and marmalade tested on guinea pigs, pigeons and rats with the following results:

	Preserved vegetables					Fresh vegetables				
	A	B	C	D	E	A	B	C	D	E
Tomatoes	+++	+	++	++	++	+++	++	+++	++	?
Peas	+	++	+	+-	+-	+	+++	++	+	?
Peaches	+	-	-	-	+	+	?	+	?	?
Oranges and marmalade	+	-	++	+-	+	+	-	+++	?	?

There was a small fraction in the canned products which could be activated by ultra-violet rays. In general the vitamins remained unaltered if the products were heated under reduced pressure and at a temp. not exceeding 100°.

The effect of the ingestion of definite doses of glucose and alcohol on the glucemic and alcoholemic curve. A. GALAMINI. *Boll. soc. ital. biol. sper.* 3, 483-6(1928).—To 2 healthy men 40 g. of glucose was given in 1, 2, 4, 8 and 16 doses and 30 cc. of 95% EtOH was administered in 1 and 8 doses. Detailed analytical results show the effect of these 2 substances on the glucemic and alcoholemic curve.

Alimentary sucroseemia and physical exercise. III. U. CASSINIS AND L. BRACALONI. *Boll. soc. ital. biol. sper.* 3, 487-9(1928).—Sucrose was given to 5 healthy men in one lump dose in soln. and in fractional doses in cubes. Sucrose and glucose were detd. in the blood before and during a march of 4800 meters. When the sucrose was given in one large dose the % in the blood diminished continuously during the march. When the same amt. was given in fractional doses the sucrose in the blood approached that before the march. IV. *Ibid* 499-502. The march was increased to 9600 meters. The sucrose was ingested in the proportion of 1 g. per kg. body wt. and taken in 5 aliquots. The sucrose and glucose in the blood were detd. before and during the march. Detailed results are given. If one must resort to the use of sugar during excessive muscular work, the ingestion of this in cubes and in small doses is preferable to taking it in soln. form; in the first form absorption is regular; in the second form it is very irregular.

The glucemic curve after the ingestion of sucrose in fractional doses. A. GALAMINI. *Boll. soc. ital. biol. sper.* 3, 490-3(1928).—The administration of sucrose in fractional doses in the prop. of 1 to 1.5 g. per kg. body wt. has a tendency to raise the glucemic titer to higher levels than when the same amt. is ingested in one dose. The curve becomes more irregular; instead of reaching a max. 30-60 min. after ingestion and then gradually decreasing, the curve shows 2 or 3 max.

The utilization of certain carbohydrates. GIUSEPPE SUNZERI. *Boll. soc. ital. biol. sper.* 3, 793-4(1928).—If a concd. soln. of sucrose is administered to a pigeon that has been fed with corn, the utilization of the sugar is variable depending on the quantity given to the animal. One-third of the sucrose is found in the feces. Other carbohydrates tried were glucose, levulose, galactose and maltose. Of these lactose was the least utilized, followed by galactose, levulose, glucose and maltose. The amt. of carbohydrate in food utilized depends on its phys. state. The feces of pigeons fed with corn kernels had greater reducing power after hydrolysis, than the feces of pigeons fed with an equal wt. of corn meal.

Determinations of the organic acids in urine. ERIK M. P. WIDMARK. *Acta med. Scand., Suppl.* XXVI, 335-9(1928).—The author's method for extg. org. acids from urine was applied to the study of org. acid excretion under different conditions. On Petré's carbohydrate-free diet as well as on a vitamin-B-free diet considerable org. acid production has been found.

Studies on the hydrogen-ion concentration in the different regions of the intestinal canal in animals on a normal diet and a diet containing no vitamin B. NIELS SCHOUVE. *Acta med. scand., Suppl.* XXVI, 537-46(1928).—The reaction in both portions of the rat stomach was p_H 2-3. In the small intestine there is a rise in p_H from pylorus to Bauhin's valve, and in the last portion of the ileum there is actually a change to the alk. side. The reaction reached p_H 7-8, in the lower ileum, but over the larger portion of the intestinal canal the contents remained acid. In rats exhibiting B avitaminosis the highest alk. is found in the cecum, the p_H decreasing in the large intestine to p_H 6-7.

J. MORGULIS

Studies on the biochemistry of avitaminosis. XI. The effect of scurvy and starvation on the chemical composition, especially the creatine content of the brain. ALEXANDER PALLADIN AND E. SAVIN. *Ukraina Biochem. Inst., Charkow. Biochem. Z.* 200, 244-9(1928).—The brain of the guinea pig contains much creatine, the cerebellum being richer in this substance than the hemispheres. The creatine content of the guinea-pig muscles is 1.6 times as great as that of the cerebellum and 2.3 times as great as that of the hemispheres. Scurvy produces certain alterations in the chem. compn. of the brain, both the hemispheres and the cerebellum becoming richer in water and N but poorer in P. The creatine content, however, remains normal on the av. Scurvy affects the dry residue and P content of the brain as does polyneuritis, but the creatine content is influenced differently by these 2 forms of avitaminosis. Scurvy differs from starvation in its influence on the P content of the brain.

S. MORGULIS

Studies on the in vitro respiration in beriberi pigeons. MARGRET GUGLER. *Physiol. Inst., Univ. Zürich. Biochem. Z.* 200, 340-50(1928).—The respiration of the breast muscle extd. with water was measured by means of the Barcroft method on 13 beriberi pigeons, and parallel with this the respiration was detd. in fresh muscles. A similar number of healthy pigeons furnished the control material. Washed muscle gives more const. results than the unwashed muscle, but both give lower results as far as O_2 consumption is concerned in the beriberi animals. The difference is 25 and 10%, resp., for the washed and fresh muscle. With phosphate buffering the respiration of fresh muscle as well as the difference between normal and beriberi muscle is greater than with bicarbonate buffering, but the water-extd. muscles respire equally well in both buffers. The O_2 consumption is not proportional to the mass of the tissue. The interval between the killing of the pigeon and the respiration expt. diminishes the respiration but no definite relationship to the duration of the interval could be found. S. M.

Metabolism studies on the protein gain in suckling pigs. WERNER WÖHLBIER. *Friedrich Wilhelm Univ., Breslau. Biochem. Z.* 202, 29-69(1928).—Growing suckling pigs excrete progressively increasing amts. of N metabolic products so that continually a smaller fraction of the consumed food protein is retained by the growing organism. The protein gain during the first 4 weeks of life was found to be: 89.1, 84.8, 74.7 and 67.7%. The reason for this has been found partly in the diminishing protein content of the mother's milk, but more especially in the fact that on the av. the same amt. of protein per unit of body wt. undergoes destruction and, therefore, larger quantities of N are excreted with increasing wt. This relationship, however, is greatly obscured by individual variations not easily interpreted, so that the only definite finding is really the coincidence of the max. protein catabolism and the max. gain in wt. The N excretion was 0.957 g. per 100 g. gain in wt. and similar results are obtained if the calcn. is made on the basis of body surface of the animal. Per kg. gain in wt. the caloric expenditure was for the first week 3776 cal., for the second week 5032 cal., for the third week 5156 cal. and for the fourth week 5628 cal. The milk compn. showed the following variation: colostrum 13.58% protein and 3.65% fat; 1 and 2 days of lactation 8.56 and 3.08%, resp.; 3 to 5 days of lactation 6.17 and 7.65%, and from 6 to 50 days 5.50 and 9.12%, resp. The total daily output of milk varied from 4.5 to 4.9 kg.

Mineral nutrition of agricultural animals. II. The effect of calcium carbonate on the development of calves. I. ZAVKOVSKII AND A. KRASNOKUTSKA. *Zoötech. Expt. Sta., Detskoje Selo, Leningrad. Biochem. Z.* 202, 239-45(1928).—Numerous data are given in the text. The addn. of $CaCO_3$ to the food had no effect upon the growth of calves.

S. MORGULIS

The vitamin B content of wheat bread baked with the addition of different quantities of yeast. ARTHUR SCHEUNERT AND MARTIN SCHIEBLICH. *Univ. Leipzig. Biochem. Z.* 202, 380-6(1928).—With the use of increasing amts. of the com. Melasse press yeast employed in bread making it is possible to produce from practically vitamin-B-free wheat flour bread of greater vitamin B content, but the quantities of yeast must be much larger than the usual (5 g.) and should be at least 15-30 g. Of course, with such large quantities of yeast the resulting bread is really no longer wheat bread. S. MORGULIS

An experience with a ketogenic dietary in migraine. TRUMAN G. SCHNABEL. *Ann. Internal Med.* 2, 341-7(1928).—Nine cases out of 23 showed some improvement on a ketogenic diet. This is sufficiently encouraging to warrant further study of high-fat diets.

JOHN T. MYERS

The influence of diet on natural immunity. YUKITAKA HOTTA. *Staatl. Kontrolle am Serotherapeutischen Inst. Wien. Contr. Bakl. Parasitenk., I Abt.* 106, 413-30(1928). White mice on a salt-poor or a vitamin-free diet showed a definitely increased susceptibility to infection with *B. typhi-murium*. This change was not parallel to growth rate.

JOHN T. MYERS

Nomenclature of the accessory food factors. ROBERT L. JONES. *Science* 68, 480-1(1928).—McCarrison's term *adivant* is favored as a class name to replace "vitamin." It is proposed to name the individual factors by the use of prefixes indicative of the diseases for which they are preventive, with *-amin* as a provisional ending. As soon as the chem. nature is known, this ending would be replaced with a more appropriate one. Thus, "vitamin A" would yield to *ophthalamin*, "vitamin B" to *polyneuramin* and *pellagamin*, "vitamin C" to *scorbutamin*, "vitamin D" to *rachilamin* (and this, if the sterol nature is established, to *rachitasterol*), and "vitamin E" to *sterilamin*. A. M. P.

A new method for characterizing the immediate physiological action of water-soluble vitamins. N. BEZSSONOV. *Bull. soc. chim. biol.* 10, 1179-98(1928).—More than 40 references are made to the literature. In previous studies of exptl. vitamin deficiency at least 14 days has been allowed for the appearance of characteristic symptoms. This paper gives details for conducting expts. in a manner to show certain effects of vitamin deficiency in the exptl. animal within 48 hrs. The method is based on the comparison between the state of animals subjected for 48 hrs. to a diet deprived of the vitamin in question but contg. an excess of all other vitamins, and the state of animals receiving the same ration made complete by the addn. of a sufficient quantity of the vitamin in question. The variations in body wt., food consumed and the character of the urine as shown by its Br-fixing power and its blue reaction with monomolybdophosphotungstic acid were selected as measures of the changes caused by the absence or presence of the vitamin. **Immediate physiological effects of avitaminosis C.** *Ibid* 1199-1212.—These tests were made with guinea pigs in lots of 6 to 14 animals each. With adult animals avitaminosis C within 48 hrs. diminishes the urinary excretion of phenol and paracresol and of C compds. generally as shown by a lowering of the Br absorption value of the urine. Vitamin C activates the urinary excretion of phenol and paracresol. With young full grown animals vitamin C helps to maintain the normal content of C compds. in the blood and favors their utilization by the tissues. It has both excretory and plastic functions. The increase of phenols in the blood in avitaminosis C causes an intoxication, which is accompanied by a diminution of appetite and inanition. The dose of vitamin C for the best health of the animal is equiv. to at least 4 times the dose which is just sufficient to maintain animals, which are on a scurvy-producing ration, in good health for 80 to 100 days. This method is of equal application to the study of avitaminosis B. L. W. RIGGS

Conditions of formation and destruction of vitamin D in the course of irradiation of ergosterol. (Mlle.) D. VAN STOLK, E. DUREUIL AND HEUDEBERT. *Compt. rend.* 187, 854-6(1928).—Pure ergosterol shows 4 absorption bands with max at 2932, 2815, 2700 and 2600 A. U., resp. During irradiation with the Chalonge and Lambrey hydrogen lamp, the first 3 bands disappear, the 4th band increases in intensity and, simultaneously, 2 new bands appear at 2503 and 2405. The band at 2600 is common to ergosterol and vitamin D. The band at 2503 develops an intensity equal to that of 2815 and 2700 of ergosterol. On continuing the irradiation these 3 bands do not disappear. The ultra-violet irradiation

conclusion is that the reaction ergosterol $\xrightarrow{\text{ultra-violet}}$ vitamin D \rightarrow decomposition product is a phenomenon of oxidation. The final destruction of vitamin D by the irradiation of the Hg lamp is not due to harmful radiations but to an oxidation, which, in alc. soln. cannot be avoided entirely, but which may be retarded by operating in an atm. of N. L. W. RIGGS

Variations of the urinary carbon-nitrogen ratio in the rat during starvation and deficiency of factor B. Differentiation of death by starvation and death by avitaminosis B. JEAN ROCHE. *Compt. rend. soc. biol.* 99, 671-3(1928).—Starvation in the rat causes a pronounced lowering in the urinary C/N ratio due to hypocarbonuria and hyperammonuria. During the first 10 to 15 days on a diet deficient in factor B the urinary C/N ratio remains about normal. From the beginning of loss of wt. there is a mild hypercarbonuria with an increase of C/N of about 0.2, which persists until about 8 days before death when a nervous crisis appears and the C/N ratio increases to 1.2 or 1.3 instead of the normal figure 0.8 to 0.9. The mechanism of death by starvation is not identical to that of death by avitaminosis B. L. W. RIGGS

Influence of food on the consistence of butter of cows. Chemical interpretation of the variations of consistence. A. TAPERNOUX AND M. LORCY. *Compt. rend. soc. biol.* 99, 1329-31(1928).—Two cows previously fed pasturage received a mixed ration of pasturage and pea hulls, a waste product of canning peas, during 18 days. The following figures give the usual chem. factors of the butter before and after 18 days of consumption of more or less pea hulls: water 19.3, 12; sol. volatile acids 27.94, 29.92; Reichert index (calcd.) 30.73, 32.9; insol. volatile acids 1.71, 3.53; iodine index 38.98, 20.57; sapon. index

218.4, 238; Crismer index (calcd.) 52.77, 50.6. The figures for the butter of the second cow were closely parallel to those of the first. The increased hardness of the butter, its changes in compn., notably of the iodine index, and the changes in the food of the cows appear to be closely related.

L. W. RIGGS

Influence of minute doses of iodine and iron on the growth of rats fed a vitamin-free diet. F. E. CHIDESTER, A. G. EATON AND G. P. THOMPSON. W. Va. Univ. *Science* 68, 432(1928).—These authors believe that the benefits ascribed to the "vitamins" are really due to minerals, and that these minerals acting as catalyzers make available the proteins, carbohydrates and fats supplied with them. The expts. are still in progress.

L. W. RIGGS

Changes in the hemoglobin and water contents of the blood of rabbits caused by differences in diet. HIROSHI TACHI. Tohoku Univ. *Tohoku J. Exptl. Med.* 11, 366-73(1928).—Two series of rabbits were kept in metal and wood cages, resp., and each were fed daily about 250 g. of "tōfukara." The rabbits in the metal cages were without straw, while those in the wood cages had an abundance of straw of which the animals ate freely. Other conditions were identical. Rabbits in the metal cages showed more hemoglobin and less water in the blood than those in the wood cages with straw.

Water economy. II. Effect of diet upon the amount of plasma. CARL KORTH AND HELLMUT MARX. Univ. Bonn. *Arch. exptl. Path. Pharm.* 136, 120-8(1928).—Considerable changes in plasma vol. can be brought about in dogs by the administration of NaCl and water.

G. H. S.

Effect of a continued dietary regimen on the secretory activity of the stomach. H. S. KOSHTOYANTZ. W. A. Obuch-Inst. z. Gewerbekrankh. in Moscow. *Arch. ges. Physiol.* (Pflüger's) 220, 642-52(1928).—Secretory activity depends upon the changes induced by a continued diet of a given type. With a meat diet the first phase of secretion is characterized by a prolonged latent period and a diminished secretion of gastric juice, while in the second phase the amt. secreted is increased, secretion continues for a long time and the acidity is increased. With a carbohydrate diet the latent period is shortened, the amt. of juice secreted in the primary phase is increased, while in the second phase the amt., duration, and acidity are all diminished.

Decomposition of uric acid in blood. MARIE GOMOLINSKA. Biochemical Lab., Warsaw Univ. *Biochem. J.* 22, 1307-11(1928).—Uric acid is oxidized by blood at 37°. The products are allantoin, urea and ammonia.

BENJAMIN HARROW

Glucose in normal urine. ALI HASSAN. Faculty of Medicine, Cairo. *Biochem. J.* 22, 1332-40(1928).—Provided the necessary precautions are taken (such as removal by charcoal of certain substances which interfere with the osazone test), it can be shown that glucose is a constituent of normal urine.

BENJAMIN HARROW

New observations on the decomposition of "phosphagen" in the muscle. O. MEYERHOF AND O. NACHMANSOHN. Kaiser Wilhelm Inst. f. Biologie Berlin-Dahlem. *Naturwissenschaften* 16, 726-7(1928).—It was found recently that the phosphagen (guandimosphoric acids) decompn. during activity of the muscle is not directly related to the contraction, but is to the excitation process. During curare condition of the muscle (no excitation) only $\frac{1}{2}$ of the phosphagen decomposed with unchanged energy yield and lactic acid formation (cf. C. A. 23, 877). In a more marked degree the same effect appears on paralyzing the muscle with Me.NCl. During a 5-sec. tetanus which normally causes $\frac{1}{2}$ of the phosphagen to decompose only a trace of decompn. occurred after nerve paralysis. During the height of contraction a part of the phosphagen is

cleaved but it is restored almost completely as soon as limpness sets in. This amt. is the same which ordinarily is restored by anaerobic condition. Hill (*Proc. Roy. Soc. (London)* B103, 134(1928)) and Stella (*J. Physiol.* 1928) have found a favorable influence of phosphate in Ringer soln. on the excitability of the muscle. This action seems to be due to the restoration and maintenance of the phosphagen content; PO_4 in the soln. higher than in the muscle may even give synthesis of up to 95% of the creatine present to creatine phosphoric acid (normal 75 to 80%). The previous views on the energetics of the phosphagen problem need to be revised. B. J. C. VAN DER HOEVEN

Changes in the hemoglobin content of the blood of dogs following splenectomy. G. B. RAY AND B. STIMSON. *Proc. Am. Physiol. Soc., Am. J. Physiol.* 81, 506(1927).—Following splenectomy in dogs there was a gradual decrease in blood pigment and in the O_2 capacity of the blood. J. F. LYMAN

The constancy of amino acids in the sweat of normal individuals. G. A. TALBERT AND C. HAUGEN. *Proc. Am. Physiol. Soc., Am. J. Physiol.* 81, 510(1927).—Sweat contained from 1.66 to 4.76 mg. amino acids per 100 cc. There was no const. relation between the amino acids in the sweat and urine. J. F. LYMAN

Partition of potassium in the animal organism. ALBERT LEULIER, LÉON VELLUZ AND HENRI GRIFFON. *Compt. rend.* 187, 957-9(1928); cf. C. A. 23, 627.—With the authors' recent method for the microdetn. of K, the results showed that for the guinea pig the K in g. per kg. of dried tissue averaged: small intestine 18.4, heart 20.2, thigh muscle 23.1. In 5 analyses the wt. of K in g. per kg. of fresh small intestine muscle ranged from 2.49 to 2.67, in 8 analyses of heart muscle the range was 3.88 to 4.15, and in 9 analyses of thigh muscle the range was 5.06 to 6.10. L. W. RIGGS

Action of glutathione and hemoglobin on the growth of fibroblasts in vitro. ILLIAN E. BAKER. Rockefeller Inst. *Science* 68, 459-61(1928); cf. C. A. 20, 3467; Hart, C. A. 22, 3199.—Recent work is reviewed. It seems probable that hemoglobin and glutathione function, not only by regulating the respiratory oxidations or reductions within the cell, but also by causing a desirable oxidation-reduction potential in the medium. Without doubt they furnish constituents which are essential as foods for the synthesis of cell protoplasm. Further work is in progress. L. W. RIGGS

Transplantation of preserved ovaries. I. Endocrine effect of ovaries preserved on ice. ALEXANDER LIPSCHÜTZ. Univ. Concepcion, Chile. *Arch. ges. Physiol. (Pflüger's)* 220, 11-28(1928).—Guinea pig ovaries are so injured by exposure to temps. below 0° that transplantation is impossible, but if held at temps. between $+1^\circ$ and 3° the transplants take, even though the ovaries have been preserved for as long as 16 days, and the characteristic endocrine effect becomes manifest. II. Endocrine effect of ovaries preserved at room temperature. *Ibid* 29-34.—When preserved at temps. between 14° and 20° ovaries retain for 8 days their capacity to undergo transplantation and to induce endocrine effects. III. Microscopic studies. *Ibid* 321-8.—Microscopic studies of ovarian transplants showed that the results with ovaries which have been preserved on ice or at room temp. prior to implantation were the same as those obtained when fresh tissues were transplanted, although as regards follicles the implanted ovary was less active than is the normal organ. G. H. S.

Digestion leucocytosis. B. SZABUNIEWICZ. Univ. Krakau. *Arch. ges. Physiol. (Pflüger's)* 220, 35-43(1928).—Digestion leucocytosis begins in 1-3 hrs. after the ingestion of a protein-contg. meal and persists for from 10 to 30 hrs. The intensity and duration of the leucocytosis depend upon such factors as age, the leucocyte count at the beginning of the expt., and the quantity of food ingested. G. H. S.

Influence of the adrenals on the urea-forming and barrier functions of the liver. N. V. PUCHKOV AND V. V. KRASSNOV. Kasaner Staatl. Univ. *Arch. ges. Physiol. (Pflüger's)* 220, 44-55(1928).—After the extirpation of the adrenals the N of the blood and urine is considerably increased. This change chiefly involves the amino acids and the biogenic amines. Simultaneously there is an abrupt reduction in the quantity of urea. These changed relations as regards nitrogenous substances are referable to a loss in liver function, and are identical with the disturbances associated with removal of the liver. The increased values for amine N occur chiefly at the expense of the biogenic amines, and to them can be ascribed the death of the animal in cases where the choline accumulation is not pronounced. Isolated liver from an animal deprived of adrenals is far less active than is the liver from a normal animal in attacking NH_4 salts and biogenic amines, and it is considerably less effective in producing urea. Thus, the increased amines of the blood and urine are due to a loss in the barrier function of the liver. Exts. of fresh adrenals will restore the liver functions. The active principle to which these activities are due is sp. for the adrenal but it is not adrenaline. It is extremely labile and decomposes within 15 to 20 min. G. H. S.

The heart hormone. R. RIGLER AND R. SINGER. Univ. Wien. *Arch. ges. Physiol.* (Pflüger's) 220, 56-68(1928).—There is no conclusive evidence that the substance described by Haberlandt is a hormone in the strict sense of the word. G. H. S.

Permeability of striated muscle to ions. RUDOLF MOND AND KLAUS AMSON. Univ. Kiel. *Arch. ges. Physiol.* (Pflüger's) 220, 69-81(1928).—From perfusion expts., the frog leg being used, it appears that resting, uninjured muscle fibers are impermeable to anions and to the cations Ca, Li and Na. They are, however, permeable to K and Cs. When perfusion takes place with the amt. of K in the Ringer soln. at about 13 mg. % the amt. of K in the muscle increases, but when there is less K in the perfusion fluid K is given up by the muscle. G. H. S.

Mechanism whereby the blood sugar is changed by hypophysis extract. GUSTAV FRITZ. Péter Pázmány Univ. of Budapest. *Arch. ges. Physiol.* (Pflüger's) 220, 101-6(1928); cf. C. A. 22, 1405.—Intramuscular injections of exts. of the posterior lobe of the hypophysis increase the blood sugar in mammals, but only in a secondary or indirect fashion through their effect on the mobilization of adrenaline. This latter action is in turn due to a general stimulation of the sympathetic. G. H. S.

Electrolyte equilibrium in membranes with an elective permeability to ions, and its biological significance. HANS NETTER. Physiol. Inst. Kiel. *Arch. ges. Physiol.* (Pflüger's) 220, 107-23(1928).—A discussion of the questions of permeability and electrolytic equil. in relation to metabolic processes. G. H. S.

Effect of thyroid on the higher nerve functions in dogs. I. Influence of single doses of thyroid upon conditioned reflexes under simple experimental conditions. B. M. SAVADOVSKII AND A. L. SACK. Kommunistischen J. M. Swerdlow Univ. *Arch. ges. Physiol.* (Pflüger's) 220, 155-75(1928).—During the first few days after the exptl. administration of thyroid dogs exhibit a phase of generalized suppression of their conditioned reflexes. This phase is followed by one in which irritability is increased and the latent period is shortened. These effects are clearly shown in expts. involving the secretion of saliva. G. H. S.

Effect of frog blood on vagus substance and on acetylcholine. F. PLATTNER AND R. BAUER. Univ. Innsbruck. *Arch. ges. Physiol.* (Pflüger's) 220, 180-2(1928).—Both mammalian blood and frog blood destroy the activity of vagus substance and acetylcholine. G. H. S.

Glycogen content of cartilage and its significance. AUGUSTE HOFFMANN, G. LEHMANN AND ERNST WERTHEIMER. Univ. Halle a. S. *Arch. ges. Physiol.* (Pflüger's) 220, 181-93(1928).—The quantity of glycogen to be found in cartilage varies very greatly (0.02 to 0.6%), being dependent upon such factors as age and the type of cartilage as well as upon individual characteristics of the animal. The amt. of glycogen present is directly related to the changes which cartilage undergoes. Thus, in young animals and in older embryos the cartilages of the ribs undergoing slow calcification show definitely lower values for glycogen in those portions where the calcification is most advanced. In older animals this difference becomes less marked, or the relationship may even be reversed. In general, increased calcification, and increased age correlate with a diminished glycogen content. G. H. S.

Hormone of heart activity. X. Action of the hormone on warm-blooded animals. HABERLANDT. Univ. Innsbruck. *Arch. ges. Physiol.* (Pflüger's) 220, 203-11(1928); cf. C. A. 22, 4159.—With isolated, as well as with *in situ* exposed rabbit hearts the hormone prepn. in dilns. up to 1:100 caused a strengthening, and an accelerating effect. It activates the pulse and favors rhythmic action. Higher concns. of the hormone cause a transitory fall in blood pressure because of vasodilatation. G. H. S.

Hypodynamic heart conditions and the heart hormone. ALFRED TRITTEL-BERNARD. Univ. Bukarest. *Arch. ges. Physiol.* (Pflüger's) 220, 212-9(1928).—Distention of the hypodynamic frog heart by inflation with air or other mechanical means expresses from the heart musculature an active substance, of hormonal nature but not identical with Loewi's accelerans substance, which favors heart activity. G. H. S.

Strict connection between contractility and irritability. Origin of stimuli in contracting heart muscle during different stages of the contraction. S. DE BOER. *Arch. ges. Physiol.* (Pflüger's) 220, 220-33(1928).—Contractility and irritability are not based upon two different processes. G. H. S.

Quantitative relation between hemoglobin content and the oxygen supply of the body. FRITZ MAINZER. Med. Abt., Städtischen Krankenhause, Altona/Elbe. *Arch. ges. Physiol.* (Pflüger's) 220, 234-42(1928).—Detns. of the hemoglobin under different degrees of satn. showed that with increasing concn. of hemoglobin the fall in the O pressure in the capillaries is at first very abrupt and then diminishes, so that it appears

that increases in hemoglobin exert less effect upon the O supply of the tissues when the initial hemoglobin concn. is high. G. H. S.

Mechanism of hypotonic hemolysis. JULIUS BARON. *Arch. ges. Physiol.* (Pflüger's) 220, 243-50(1928).—During partial hypotonic hemolysis only a fraction of the red cells are disintegrated, the majority of them yielding up a portion of their hemoglobin without being destroyed. G. H. S.

The so-called reversion of hemolysis. JULIUS BARON. *Arch. ges. Physiol.* (Pflüger's) 220, 251-67(1928).—The clearing of a blood corpuscle suspension is not necessarily identical with hemolysis. The transformation of a laked soln. to an opaque condition does not represent a true reversion of hemolysis. G. H. S.

Hemolytic function of the spleen. III. Relation between erythrocyte resistance and blood cholesterol, as modified by splenectomy. GEORG FRENKEL AND V. N. NEKLUDOV. Leningraden Med. Inst. *Arch. ges. Physiol.* (Pflüger's) 220, 356-60(1928).—In dogs, cats and rabbits splenectomy is followed by an increase in the cholesterol content of the blood, and in some instances the resistance of the erythrocytes is also increased, but the latter change takes place only when the hypercholesterolemia is marked. G. H. S.

Reflex origin of digestion leucocytosis. B. SZABUNIEWICZ. *Physiol. Inst. Krakau Arch. ges. Physiol.* (Pflüger's) 220, 366-70(1928).—Digestive leucocytosis can occur only through nervous activity. When dogs are fed regularly a leucocytosis develops after each feeding, and after this reflex has become established the leucocytosis will appear even though feeding does not take place, indicating the conditioned reflex character of the leucocytosis. G. H. S.

Formation of urine in the frog kidney. XV. Microscopic observation of glomerulus function in the perfused frog kidney. HEINZ BRÜHL. Univ. Kiel. *Arch. ges. Physiol.* (Pflüger's) 220, 380-98(1928); cf. C. A. 22, 4161.—By direct observation it appears that during artificial perfusion the no. of glomeruli involved in activity is relatively const., and that any gradual reduction in this no. is indicative of damage. By means of the addn. of caffeine or glycocoll (after a lack of glycocoll) glomeruli which have become inactive may be restored to function. In reversible cyanide asphyxia urine formation diminishes, although the circulation in the glomeruli is unchanged. Caffeine dilates the glomerular capillaries, while a lack of glycocoll completely stops the glomerular circulation. The addn. of glycocoll restores circulation but not urine formation. Increasing the pressure of the perfusion fluid augments perfusion but causes very little change in the glomeruli, and usually there is no increase in the formation of urine. G. H. S.

The carbohydrate of the skeletal muscles in normal rabbits. HANS HANDOVSKY AND KURT WESTPHAL. Univ. Göttingen. *Arch. ges. Physiol.* (Pflüger's) 220, 399-409(1928).—In the healthy adult rabbit the quantities of carbohydrate and of lactic acid in the muscles vary only within narrow limits, although each of them may be varied independently. Seasonal changes in the amts. of carbohydrate and lactic acid may be detected. A transformation of carbohydrate into lactic acid during the killing of the muscle probably does not take place and changes in the glycogen or lower sugar content of muscle referable to treatment of the animal must be regarded with suspicion unless the values depart widely from normal or the expts. are abundantly controlled. G. H. S.

Acid-base composition of gastric secretions. JAMES L. GAMBLE AND MONROE A. McIVER. Harvard Med. School. *J. Exptl. Med.* 48, 837-47(1928).—The chief inorg. factors in secretion obtained from isolated pouches constructed in the fundus and in the pyloric antrum of the cat's stomach were found to be Cl ion and fixed base. In a series of samples obtained from the fundic pouch, Cl ion was approx. stationary at 165 cc. 0.1 N per 100 cc. During digestion of food in the stomach, secretions from the pouch contained fixed base in amts. varying considerably from an equiv. of 47 cc. 0.1 N per 100 cc. Material allowed to remain in the pouch after the completion of food digestion in the stomach showed an increasing content of fixed base, to as much as 140 cc. 0.1 N per 100 cc. The alk. secretion taken from a pyloric pouch contained fixed base in excess of Cl ion. C. J. WEST

Acid-base composition of pancreatic juice and bile. JAMES L. GAMBLE AND MONROE A. McIVER. Harvard Med. School. *J. Exptl. Med.* 48, 849-57(1928).—Pancreatic juice contains fixed base at approx. the concn. found in the blood plasma. Cl-ion is present in concns. varying from 25 to 50% of the fixed base value and the remainder of the acid equiv. is composed of HCO_3 ion. In bile, as delivered by the liver, both the fixed base and Cl-ion values correspond closely with their respective concns. in blood plasma. In gall bladder bile, however, the concn. of fixed base is,

roughly, double that in hepatic duct bile and Cl ion has been almost entirely removed.

C. J. WEST

Body fluid changes due to continued loss of the external secretion of the pancreas. JAMES L. GAMBLE AND MONROE A. McIVER, WITH PAULINE MARSH AND DOROTHY SLOAN. Harvard Med. School. *J. Exptl. Med.* 48, 859-69(1928).—Explanation of the effects of continued loss of the external secretion of the pancreas is offered. C. J. W.

Calcium and inorganic phosphorus in the blood of rabbits. IV. Influence of light environment on normal rabbits. WADE H. BROWN AND MARION HOWARD. Rockefeller Inst. Med. Research. *J. Exptl. Med.* 49, 103-26(1929); cf. *C. A.* 22, 1800-1.—A study was made of whether a light environment comprising radiations of comparatively long wave length and only a small amt. of energy was capable of affecting the chem. equil. of the blood as indicated by the Ca and inorg. P content of the blood of normal rabbits. The effects produced by prolonged exposure to neon light and darkness were compared with a varying environment of diffuse, filtered sunlight and a change from 1 environment to another. The chem. equil. of the blood was definitely affected by the conditions employed and the effects produced could be correlated with differences in org. constitution on the 1 hand and, on the other, with certain differences in the functional activity of the same animals, involving nutrition and growth and the proliferative activity of hair follicles.

C. J. WEST

Calcium and phosphorus metabolism. V. Study of the bone trabeculae as a readily available reserve supply of calcium. WALTER BAUER, JOSEPH C. AUB AND FULLER ALBRIGHT. Mass. Gen. Hosp. *J. Exptl. Med.* 49, 145-61(1929).—Bone trabeculae are easily depleted by the prolonged administration of parathormone, long-continued negative Ca balance and growth. A long-continued high Ca diet results in a rapid accumulation of the trabeculae. Alizarin red is deposited in newly formed bone; its use has made clear that easily mobilizable Ca is not deposited in the shafts of adult animals but in the trabeculae of bone; they therefore serve as the storehouse of readily available Ca. The shafts have a slow progressive exchange of inorg. salts and are not influenced except in the case of unusual body demands. Parathormone administration to growing or adult cats has been without effect. Daily injection of parathormone in growing rats results in an increased no. of trabeculae and smaller bones.

Studies of urea excretion. IV. Relationship between urine volume and rate of urea excretion by patients with Bright's disease. E. MÖLLER, J. F. McINTOSH AND D. D. VAN SLYKE. *J. Clin. Investigation* 6, 485-504(1928).—The diurnal variation of urea excretion in normal individuals and patients with Bright's disease. E. M. MACKAY. *Ibid* 505-16.

ARTHUR GROLLMAN

Uranin as a means of diagnosing meningitis. J. C. SCHIPPERS AND HENDRIKA PETERS. *Nederland. Tijdschr. Geneeskunde* 72, II, 4514-25(1929).—Uranin, given by mouth in a dose of 20 mg. per kg. body wt., passes over into the cerebrospinal fluid in a concn. of more than 0.04×10^{-4} , which is not the case in any other affection of the central nervous system.

R. BEUTNER

The sugar cure of epilepsy. G. C. VAN WALSEM. *Nederland. Tijdschr. Geneeskunde* 72, II, 4673-5(1929).—Epileptics have a higher blood-sugar content during those periods which are free from fits.

R. BEUTNER

A study of the chlorine interchange between red blood cells and plasma in asphyxia. T. KUBO AND T. MITSUI. Hokkaido Imp. Univ. *Japan Med. World* 8, 259-61(1928).—From detns. on the blood of normal rabbits by Rusznyak's method for estn. of chlorides in the blood, it was concluded that the chlorides of whole blood and erythrocytes always increase while those of plasma decrease.

N. K.

Carbohydrate metabolism of certain pathological overgrowths. HERBERT G. CRABTREE. Imperial Cancer Research Fund, London. *Biochem. J.* 22, 1289-98(1928).—C. finds that the magnitude and relationships of the respiratory and glycolytic processes, found by Warburg to be characteristic of malignant tissues (see Warburg, "Ueber den Stoffwechsel der Tumoren," Springer, Berlin, 1926), are not sp. for malignant tumors but are a common feature of pathol. overgrowths.

B. H.

The distribution of the globulin and albumin fractions in the blood and in the urine in nephrosis. F. W. SCHULTZ AND M. R. ZIEGLER. Univ. of Minn. *Am. J. Diseases Children* 36, 756-63(1928).—The changes in the blood plasma which accompany nephrosis in children are: a decrease in the total concn. of protein; an increase in the concn.

of cholesterol; and a lowering or an inversion of the albumin-globulin ratio. The non-protein N content of the blood varies from 19.6 to 43.2 mg. per 100 cc. during nephrosis. The urine may contain fat and globulin as well as albumin, with the concn. of the globulin eventually exceeding that of the albumin. The kidney appears to maintain its ability to secrete the end products of protein metabolism, but loses some of its selectivity.

E. R. MAIN

Observations on the chloride, sugar and calcium contents of the cerebrospinal fluid in children. A. VICTOR NEALE AND MARION S. ESSLEMONT. *Arch. Disease Childhood* 3, 243-56(1928).—The chloride, sugar and Ca contents of the cerebrospinal fluid in children, in diseases with symptoms referable to the nervous system and not involving the meninges, are usually normal, but may become subnormal during pneumococcal infections. The chloride and the sugar contents of the cerebrospinal fluid in both tuberculous and meningococcal meningitis fluctuate with the progress of the disease. Tuberculous meningitis is assocd. with low concns. of the sugar and chloride during the early stages of the disease and with concns. approaching the normal during the later stages. The concns. tend to decrease progressively during fatal meningococcal and pneumococcal meningitis, but in recoverable cases, the early, low concns. may be followed by a gradual rise to the normal. The Ca content of the cerebrospinal fluid becomes slightly increased from the normal value in diseases involving the meninges and may become markedly increased during convulsions.

E. R. MAIN

The influence of experimental leucocytosis on the production of hemolytic amboceptors. ROBERTO FRANZA. *Boll. soc. ital. biol. sper.* 3, 714-9(1928).—Rabbits injected daily with nucleic acid, Na nucleinate and NaI, followed by injections of a suspension of beef red blood corpuscles at a time when leucocytosis was the greatest, showed a noticeable increase in the production of hemolytic amboceptors as compared to the control animals. The increase in the value of the hemolytic serums was not proportional to the degree of leucocytosis observed in each individual animal. The production of hemolysins was almost the same in those rabbits which showed only a moderate increase in leucocytes as in those which presented a very marked leucocytosis.

PETER MASUCCI

The relation between the urinary carbon : nitrogen and of the "vacat oxygen : nitrogen" quotients in phlorhizin diabetes. A. ROBERT PESKIN. Univ. Berlin. *Biochem. Z.* 202, 5-13(1928).—In phlorhizin-diabetic dogs and rats there are eliminated through the urine increasing amts. of dysoxidizable substances beside sugar. These substances must be particularly rich in H and, therefore, have nothing in common with ketone bodies. The exptl. animals showed absence of glycogen in their livers and in dogs in addn. there was fatty degeneration of the organs.

S. MORGULIS

The treatment of acid mouth. J. E. RUSH AND W. W. ZWICK. Univ. of Kentucky *Ann. Internal Med.* 2, 550-1(1928).—The oral administration of HNaCO_3 and the use of an alk. mouth wash increased the acidity and consequent erosion of teeth in a case which was studied. Dobell's soln. decreased it. The acid was apparently due to bacterial action. An alkali neutralized the free acid, thus allowing more to be produced in accordance with the law of mass action. Dobell's soln. decreased the acidity by slowing bacterial action.

JOHN T. MYERS

The influence of parenteral injections of lipoids on hemolysin formation in rabbits. HANS GROSS. Inst. für Exptl. Therapie, "Emil von Behring," Marburg-Lahn. *Centr. Bakt. Parasitenk.*, I Abt., 109, 8-10(1928).—Simultaneous parenteral injections of cholesterol, lecithin or ext. of beef heart together with sheep erythrocytes had no augmenting influence on hemolysin production.

JOHN T. MYERS

Plasma coagulase and the pathogenicity of staphylococci. B. KREMKES. Stadtischen Hyg. Univ.-Inst. zu Frankfurt a. M. *Centr. Bakt. Parasitenk.*, I Abt., 109, 11-6(1928).—The plasma coagulase reaction was pos. only with pyogenic staphylococci, not with non-pathogenic varieties or with other bacteria. It paralleled a pos. Dreyer virulence test, and hemolysis production. Neither normal human nor horse serum, or human serum from staphylococcus diseases, which was high in antistaphylococcal activity inhibited the coagulase.

JOHN T. MYERS

Immunization against trypanosome infection in stallions with the help of Bayer 205 (Naganol). V. L. YAKIMOV, V. S. PELAVINE AND S. F. RUBKEVICH. Veterinar Bakteriolog. Inst. zu Leningrad. *Centr. Bakt. Parasitenk.*, I Abt., 109, 48-50(1928).—Three injections of from 3 to 3.5 g. of Naganol conferred a definite resistance to trypanosome infection.

JOHN T. MYERS

Phagocytosis-inhibiting substances from bacteria, especially "coccoimmunogens" or "immunological trias." S. FUJITSUNA. Univ. Kyoto. *Centr. Bakt. Parasitenk.*, I Abt., 109, 93-8(1928).—The centrifuged supernatant fluid from cultures of cholera

vaccine mixed with NaCl soln. suspensions of staphylococci and injected into guinea pig increased phagocytosis and decreased the usual leucocytic response to the staphylococcus. Boiling for 20 min. increased the effect of the cholera exts. Such exts. increased the amt. of antistaphylococcus agglutinins as well as producing anti-cholera agglutinins. Without phagocytosis no immune bodies are formed, the 2 processes going hand in hand. These substances sol. in NaCl soln. are called "immunological trias."

JOHN T. MYERS

The role of the lipoids of bacteria to their phagocytosis in the circulating blood of experimental animals. II. The influence of homologous and heterologous lipoids on phagocytosis, in the blood stream. Y. ISCHIMOTO. Univ. Kyoto. *Centr. Bakt. Parasitenk.*, I Abt., 109, 100-7(1928).—The addn. of homologous or heterologous lipoids to suspensions of staphylococci decreases the toxicity of these organisms, as manifested by a less marked leucocytosis. Phagocytosis is more active. Antigenic power is increased. The effect of homologous lipoids was greater than that of heterologous lipoids. Proteins make the specificity of an antigen while lipoids increase antigenic power.

JOHN T. MYERS

Can the administration of narcotics weaken a positive Wassermann reaction or Meincke flocculation test or make them entirely negative? F. WEYRAUCH. Univ. Jena. *Centr. Bakt. Parasitenk.*, I Abt., 109, 129-34(1928).—A positive Wassermann reaction may be weakened or become entirely negative following the administration of paraldehyde or alc. The Meincke flocculation reaction was not thus influenced. This might influence a diagnosis especially in psychiatry.

J. T. M.

The meaning of the spleen in spirochetal infections. P. REGENDANZ. Inst. für Schiff- u. Tropenkrankheiten zu Hamburg. *Centr. Bakt. Parasitenk.*, I Abt., 109, 321-7(1928).—Removal of the spleen almost prevents antibody formation against spirochetes; hence it must be the principal site of antibody formation in these infections.

JOHN T. MYERS

Investigation on the individual variations in hemolysin production in rabbits and the possible influence of the oral administration of lipoids. HANS GROSS. Inst. für Exptl. Therapie "Emil von Behring," Marburg-Lahn. *Centr. Bakt. Parasitenk.*, I Abt., 109, 339-41(1928).—Rabbits under 1 year of age do not produce nearly as much hemolysin as do older rabbits. There are some species differences, "hasen" rabbits producing a low titer. Sex or pregnancy made no difference. The daily oral administration of 1 g. of either cholesterol or lecithin during immunization had no influence.

JOHN T. MYERS

Normal hemolysins in animals and the erythrocyte content of heterologous antigens. E. V. EKSEMPLIARSKII. Microbiol. Forschungsinst. des Volksbildungskommissariats in Moskau. *Centr. Bakt. Parasitenk.*, I Abt., 109, 341-4(1928).—No normal hemolysins were found in the blood of the sheep, chicken, turtle or cat, for these or other species, even in cases where heterologous antigens exist in the erythrocytes.

JOHN T. MYERS

Studies in serum calcium. II. Experimental tuberculosis—intraperitoneal inoculation. J. C. HOYLE. Pharmacol. Lab., Cambridge. *J. Pharmacol.* 34, 259-76 (1928), cf. C. A. 22, 1806.—Rabbits given intraperitoneal injection of bovine *B. tuberculosis* show a fall in serum Ca. When the inoculating dose is small and life after inoculation is more prolonged, changes in serum Ca show three stages: (1) a slight rise, followed by a slight fall (both within the physiological range) during the 1st 3 weeks; (2) a slight rise during the 4th week of disease; (3) a progressive fall in serum Ca during the terminal stages. Changes in wt. were also observed during these three periods, there occurring first a slight increase, then a period when the weight was more or less constant, and finally a steady decline. III. Experimental tuberculosis—subcutaneous inoculation. *Ibid* 317-24.—Changes in serum Ca after subcutaneous inoculation with *B. tuberculosis* were as follows: during the 1st 3 or 4 weeks a slight rise; from the 4th to 10th week a fall of 16 to 37%; from about the 8th or 10th week to death a rise to normal or slightly higher. These changes coincide with definite stages of the disease—(1) a local lesion which finally ulcerates and discharges caseous material, (2) "open" lesion, which discharges freely, and (3) healing of local lesion, which may or may not be complete before the animal dies from generalized disease.

C. RIEGEL

Physiology of fever. Importance of the thyroid and of the adrenals in fever. Relation of the adrenals to the leucocytosis and the hypothetical leucocytosis nervous center. W. BORCHARDT. Inst. Schiff- u. Tropenkrankh., Hamburg. *Arch. expil. Path. Pharmacol.* 137, 45-70(1928); cf. C. A. 22, 4617.—Apparently diverse fever-producing agents operate through the same physiol. mechanisms. Decapitate or decerebrate cats fail to respond to stimuli, such as tetrahydronaphthylamine, which induce

fever. The thyroid glands and the adrenals are not essential to the development of fever, but the adrenals are requisite for the appearance of a neutrophile leucocytosis.

G. H. S.

Excretion of choline in the urine. PH. KLEE AND S. PETROPULIADES. Med. Klin. München. *Arch. expil. Path. Pharmacol.* 137, 129-42(1928).—Studies conducted upon rabbits, dogs and man showed that the amt. of choline excreted in the urine is governed by the diet and the mode of life. During hunger it falls and with the addn. of lecithin to the diet it increases, as it does also after athletic activity. In those diseases which are characterized by severe tissue destruction extremely high values are found. Choline chloride introduced into the stomach or the duodenum does not increase the amt. to be found in the urine, but if administered intravenously or per rectum excretion is increased.

G. H. S.

Cause and origin of pathologic hemagglutination (panagglutination). JENO KRAMÁR AND LADISLAUS R. LINER. Elizabeth-Univ. in Pécs. *Arch. expil. Path. Pharmacol.* 137, 315-28(1928).—In chronic inflammatory diseases attended by considerable destruction of tissue, the serum acquires an agglutinating property, unrelated to group-sp. agglutination, active upon the red cells of all human groups. This behavior is due to the formation during the disease of auto-lipoid-antibodies directed against the lipoids of the erythrocytes. These panagglutinins may be adsorbed from such sera by lipoids derived from pus.

G. H. S.

Irritability and inflammation. I. Gas metabolism. F. BRICKER. Med. Inst. in Charkow. *Arch. expil. Path. Pharmacol.* 137, 329-38(1928).—Inflammatory reactions were induced by chem. agents, such as xylol; by hot water, and by mere mech. friction, and detns. of the CO_2 and O_2 of the blood were made. The response to chem. irritation was of two types; either the O_2 content of the treated ear was greater, and the CO_2 content the same as that of the untreated ear, or the O_2 might be changed but little while the CO_2 was markedly increased. Two types of response were also found to result from the application of heat: the first showing an increased CO_2 in the treated ear with but little change in O_2 ; the second showing but little difference between the bloods taken from both ears. To mech. stimulation no change in gas relationships resulted. **II. Sugar metabolism.** *Ibid* 339-42.—The inflammatory response was characterized by an increased dissimilation and a reduced assimilation.

G. H. S.

Anoxemia and the circulation. KL. GOLLWITZER-MEIER. Univ. Greifswald u. Frankfurt a. M. *Arch. ges. Physiol.* (Pflüger's) 220, 434-47(1928).—Reduction of the O pressure of the inspired air from 160 to 120 mm. causes but slight changes in the circulation of dogs in the acute expt. Both the arterial and venous pressures remain unchanged while the frequency and min.-vol. of the heart are increased. When the O pressure is reduced below 100 mm. the arterial pressure is increased as is both the frequency and the min.-vol. Venous pressure does not fall, but rather tends to increase also. When the O satn. is below 40 mm. the min.-vol. falls below normal values while the frequency is further increased. In the final stages of anoxemia the heart rate falls as does the arterial pressure and the min.-vol. while venous pressure augments. A parallelism exists between respiratory regulation and circulation. The regulatory mechanism is central, the stimulus being changes in the p_{H} .

H—PHARMACOLOGY

A. N. RICHARDS

New experimental data on the biochemistry of the heart. R. AGNOLI. *Boll. soc. ital. biol. sper.* 2, 1049-52(1927).—In the abstract in *C. A.* 22, 2410, the author name is incorrectly given as Messini.

E. H.

New means of adsorption therapy. H. BECHHOLD. Inst. f. Kolloidforschung, Frankfurt a. M. *Japan Med. World* 8, 262-6(1928); cf. *C. A.* 22, 4136.—A silver chloride silicic-acid-gel called "Silargel" and a silver chloride silicic-acid-silver charcoal called "Adsorgan" have been developed which show much greater adsorptive capacity than other materials ordinarily employed for the adsorption of toxins, bacteria, etc., in the intestinal and other tracts.

N. K.

The influence of epinephrine and insulin upon the distribution of glycogen. N. R. BLATHERWICK AND MELVILLE SAHYUN. Potter Metabolic Clinic, Santa Barbara, Calif. *J. Biol. Chem.* 81, 123-7(1929).—"Epinephrine, when injected into rabbits, causes glycogen to be deposited in the liver. The muscle glycogen appears to decrease at the same time. The amt. of epinephrine used and the time chosen for the expt. undoubtedly have a great bearing upon the result. The diminished resistance of rabbits to insulin following the injection of epinephrine cannot be attributed to a depletion of

liver glycogen." These results support those recently reported by Cori and Cori (C. A., 22, 4590) in similar expts. on rats.

A. P. LOTHROP

The influence of choline upon blood-sugar content. FRANK P. UNDERHILL AND JOSEPH PETRELLI. Yale Univ. *J. Biol. Chem.* 81, 159-62(1929).—Choline administered subcutaneously to fasting rabbits in suitable doses produces a significant hyperglucemia without glucosuria. The hypoglucemia reported by previous investigators was never encountered. Comparable doses of choline injected into fasting dogs does not appreciably alter the content of blood sugar.

A. P. LOTHROP

The influence of alcohol on absorption of glucose. Part I. NORA EDKINS. Bedford College, London. *J. Physiol.* 65, 381-4(1928).—Glucose placed in the cat stomach with the pylorus ligated disappeared at the rate of 0.3 g. per hr. When alc. (10% soln.) was also present the rate was more than doubled, 0.67 g. per hr. In a ligated segment of the small intestine 100 cm. long glucose was absorbed at the rate of 0.59 g. per hour without alc. and 0.78 g. per hr. with alc. **The effect of alcohol on the absorption of glucose from the alimentary tract. Part II.** NORA EDKINS AND MARGARET M. MURRAY. *Ibid* 66, 102-8(1928).—When EtOH and glucose were introduced together into the digestive tract of an animal under amylal anesthesia the EtOH accelerated the rate of glucose adsorption as shown by the increase in blood sugar in these animals in comparison with controls that were given EtOH alone or glucose alone.

J. F. LYMAN

Experiments with tar or mice stained with trypan blue. G. A. KREUZWENDEDICH VON DEM BORNE. *Nederland. Tijdschr. Geneeskund.* 72, II, 5689-96(1929).—It is impossible to produce blastoma by tarring the back of mice which have been injected with trypan blue, using 0.25 cc. of a 1% trypan blue soln. 6 times. Even after tarring 30 times during 27 weeks no trace of blastoma was formed.

R. BEUTNER

The dosage of standardized ovarian preparations containing menformone. E. LAQUEUR, A. H. M. J. VAN ROOY, K. DE SNOO, S. E. DE JONGH AND I. A. WIJSENBECK. *Nederland. Tijdschr. Geneeskunde* 72, II, 6184-8(1929).

R. BEUTNER

Chronic poisoning from potassium cyanide administered in a single dose by mouth. RAESTRUP. Univ. Leipzig. *Deut. med. Wochschr.* 54, 2179(1928).—The case of chronic or delayed poisoning by KCN, as described by Ernst (C. A. 23, 198), is considered as obviously due to acute poisoning.

ARTHUR GROLLMAN

The pharmacodynamical action of chloralose. SWALE VINCENT AND J. H. THOMPSON. Middlesex Hosp. Med. School. *J. Physiol.* 65, 449-55(1928); cf. C. A. 22, 1627.—Chloralose introduced intravenously raised blood pressure, inhibited the sciatic and anterior crural nerves to all stimuli, augmented the vasomotor reflexes of a depressor character and exaggerated the effect on blood pressure obtained by stimulating the peripheral end of the divided left splanchnic nerve. Chloralose is believed to stimulate the production and discharge of adrenaline from the adrenal gland.

J. F. LYMAN

The effect of morphine on the adrenaline content of the suprarenal glands. G. P. CROWDEN AND M. G. PEARSON. *Proc. Physiol. Soc., J. Physiol.* 65, xxxii(1928).—Morphine alone did not cause exhaustion of the adrenaline content of the adrenal gland; but morphine plus excitement or morphine given to a cold animal brought about a depletion of the innervated gland.

F. L. LYMAN

The biological action of iodides. JOHN FREUD. *Proc. Physiol. Soc., J. Physiol.* 65, xxviii(1928).—Injection of KI in Ringer soln. into the jugular vein of dogs gave an increase in O₂ consumption of about 30%. Injection into the saphenous vein had but little effect. Of 8 thyroidectomized dogs 3 reacted to large doses of KI intrajugularly.

J. F. LYMAN

The influence of ethyl alcohol upon the oxidative metabolism and the mechanical efficiency of the dog's heart. M. B. VISSCHER. *Proc. Am. Physiol. Soc., Am. J. Physiol.* 81, 512(1927).—The presence of EtOH in the circulating blood caused a marked dilatation of the ventricles of the dog heart and a reduction in its mechanical efficiency.

J. F. LYMAN

The comparative toxicity of quinine and quinidine. P. M. NICCOLINI. *Boll. soc. ital. biol. sper.* 3, 698-9(1928).—Most treatises state that quinidine is less toxic than quinine. N. calls attention to a fatal case of poisoning in a normal human being by the ingestion of 10 g. quinidine sulfate. Statistical studies showed that an equal quantity of quinine sulfate had not been fatal to normal human beings. Quinidine is probably more toxic because it is less completely and less rapidly transformed and fixed by the parenchyma. The organ most affected is the heart. The ever-increasing use of quinidine in therapy makes it necessary to correct the error that it is less toxic than quinine.

PETER MASUCCI

Variations in muscle phosphagen caused by strychnine and by dissection of the nerves. G. ZANGHI. *Boll. soc. ital. biol. sper.* 3, 723-6(1928).—Five white rats were

injected with a soln. of strychnine nitrate graduated in strength so that the animal died only after repeated spasms. Before the injection, one of the soleus muscles was removed and its normal inorg. phosphoric acid and phosphagen were detd. After the death of the animal, the corresponding muscle from the other side was removed. The results show that the phosphagen content of the muscles diminished more or less markedly until it disappeared as a result of strychnine spasms. The diminution was 3-17%. There was a corresponding increase in inorg. phosphoric acid. Ten rats were operated on and a unilateral dissection of sciatic nerve was made. By the technic already described detns. of phosphoric acid and phosphagen were made. During the first 72 hrs. of muscular inactivity the phosphagen increased; this increase was greater compared with the 20-24-hr. test, but smaller after the 72-hr. test. From the 5th to the 90th day after the operation there was a gradual diminution of phosphagen in the paralyzed muscle.

PETER MASUCCI

The effect of thyroxine on the glycogen content of skeletal muscles and of the liver in guinea pigs. O. BÖSL. Univ. München. *Biochem. Z.* 202, 299-319(1928).—A subcutaneous injection daily of 5-6 doses of 0.2 mg. thyroxine each into young as well as grown guinea pigs causes a marked drop in wt. on a diet sufficient to maintain the body wt. of untreated normal animals. The skeletal muscles do not lose any glycogen under the condition of the expt. but the liver glycogen content is diminished, though this varies in each individual. The effect on the liver glycogen of small thyroxine doses can be compensated by increasing the amt. of food. By reducing the quantity of food to $\frac{1}{2}$ of the normal need the glycogen content of the skeletal muscles is diminished in the thyroxine-treated animals, the decrease being greater than in the control animals. The liver, under these expt. conditions, becomes glycogen-free. Increased muscle work with unlimited supply of food leads to an increase in the glycogen of the muscles and especially of the liver as compared to the resting animals. The increase occurs in both control and thyroxine-treated animals, but more in the former.

S. MORGULIS

The renal blood-flow of the bird. O. S. GIBBS. Dalhousie Univ. *J. Pharmacol.* 34, 277-91(1928).—The renal blood flow of the bird as measured in these expts. was at least 10 cc. per g. min. The action of adrenaline, ergotoxine, amyl nitrite, choline, acetylcholine, pituitrin, histamine, Ringer soln., soln. of Na_2SO_4 , and of uric acid, as well as the effect of CO_2 and stimulation of the vagus, are discussed in relation to blood flow and urinary secretion. No relation was found between blood pressure and rate of blood flow in kidney, blood pressure or blood flow and functional activity of the kidney (measured by uric acid removal), secretion of water and of uric acid.

C. R.

The stimulating effect of alcohol and the depressing effect of anesthetics on sugar utilization directly determined. W. E. BURGE AND D. J. VERDA. Univ. of Ill. *J. Pharmacol.* 34, 299-303(1928).—The % decrease of sugar from oxygenated sugar soln. in which were placed 2 gold fish was greater for a given period of time when MeOH , EtOH , or glycerol was added to the soln., and less when CHCl_3 , ether, or ethylene was added. Nitrous oxide had no effect.

C. RIEGEL

The renal excretion of chlorides and water. A. R. FEE. Univ. College, London. *J. Pharmacol.* 34, 305-16(1928).—After CHCl_3 , ether, morphine, urethan, paraldehyde, or amylal the diuresis following water ingestion found in normal unanesthetized dogs is absent, although there is a fall in urinary chloride concn. and a decrease in blood concn. Hypotonic and isotonic salt solns. cause no diuresis and bring about blood diln. This inhibiting effect of anesthetics is not due to thirst or to loss of consciousness, as in man the taking of large amts. of water after injection of atropine, which causes thirst, brings about diuresis, and no blood diln. Taking of water after morphine injection does not result in diuresis, although there is a slight blood diln., with an increase and then a decrease in chlorides in the urine. These results are not explainable on the basis of phys. theories of renal excretion, and it is suggested that there is present in normal animals a mechanism which inhibits the output of pituitary hormone (absence of which causes increase in urine flow) during ingestion of large amts. of water, and that this mechanism is disturbed by anesthetics.

C. RIEGEL

Thermal conductivity methods of gas analysis in the study of pharmacological problems. P. D. LAMSON AND B. H. ROBBINS. Vanderbilt Univ. *J. Pharmacol.* 34, 325-31(1928).—Description of the app. and its application to the study in dogs of absorption of CCl_4 by analysis of expired air.

C. RIEGEL

The effect of colloidal sulfur (sulfosolo) on the blood sugar level of normal men and animals. GIULIO BUCCIARDI. Univ. Modena. *Arch. farmacol. sper.* 46, 90-114(1928); cf. *C. A.* 21, 773.—The question was investigated whether colloidal S is acting similarly to insulin in respect to its effect on the blood sugar and the liver glycogen. B. experimented on guinea pigs, rabbits, dogs, sheep and humans. In the animal

expts., the S was administered intraperitoneally, intramuscularly, or perorally, using a 0.5% soln. It was found that small doses produce hypoglycemia (max. 25–30%). Large doses give rise to hyperglycemia (max. 60–100%) followed by a slight hypoglycemia; besides, they have a toxic effect causing loss of strength, reduction of mobility and respiratory disturbances in the animals. The min. doses capable of producing hypoglycemia or hyperglycemia, resp., vary for the different species of animals examd. The sheep was most sensitive; then came the dog, rabbit and guinea pig. In the guinea pig, doses smaller than 0.0005 g. per kg. body wt. are ineffective, while doses between 0.0007 and 0.01 g. often produce a hypoglycemia lasting for 1–3 hrs. With larger doses than 0.013 g. a hyperglycemia is caused, which lasts for 2–3 hrs. In the rabbit, the blood sugar level is not influenced by doses smaller than 0.0005 g. Doses varying between 0.0006 and 0.0065 g. may cause hypoglycemia, while with doses larger than 0.0065 g. rise is given to hyperglycemia. In case of intramuscular injection, approx. the same dose is required to produce a similar effect as in case of intraperitoneal injection. Application by mouth had only a slight effect in the animals. In man, oral administration of small doses was not followed by definite changes of the blood sugar. Detn. of the liver glycogen of guinea pigs showed that it was not noticeably influenced by either small or large doses. B. concludes from his expts. that the hypothesis of the parallelism in action of insulin and colloidal S is unproved as yet. G. SCHWOCH

Action of nicotine on the blood-sugar level. CAPONNETTO ANDREA. Univ. Catania. *Biochim. terap. sper.* 15, 376–82(1928).—The expts. were carried out on 4 normal and 3 diabetic persons, some of whom were smokers. First the normal curve of the fasting blood sugar was established with blood samples taken at intervals of 30 mins. for at least 3 hrs. The next day, the test was repeated after the persons had smoked a certain no. of cigarets. While under normal conditions the curve showed a slow decrease, a sudden rise was observed after the smoking. The blood sugar increased for about 2–2½ hrs. When nicotine hydrochloride (1 mg.) was injected intramuscularly, an increase lasting for 1–1½ hrs. and amounting to 70–95 mg. % was noticed. The nicotine, whether inhaled or injected, produced the same effect in every instance. When ergotamine (1 cc. gynergen Sandoz) or neutral atropine sulfate (1 mg.) was injected intramuscularly 30 mins. after administering the nicotine hydrochloride, the blood sugar ceased rising and returned to the initial level. The action of nicotine was also neutralized in regard to its effect on the pulse, respiration and blood pressure. Numerous references are given. G. SCHWOCH

Acetylcholine contraction of the musculature of frogs. KIKUO TODA. Univ. Greifswald. *Arch. expil. Path. Pharmacol.* 137, 71–95(1928).—As has been previously shown irritability is not changed by prolonged exposure to contraction-producing concns. of acetylcholine. Not only is the neural region susceptible to acetylcholine and K salts, but it is also sensitive to NaOH, HCl and caffeine, and the so-called initial shortening of contraction is apparently the reaction of these particularly susceptible tonus fibers. Acetylcholine contraction as an expression of a reaction of the neural region is intensified by heat, diminished by cooling. Narcosis with alc. frequently paralyzes elec. irritability more strongly than acetylcholine contraction. It is not possible to eliminate the Tiegel contraction of isolated muscle by concns. of atropine or novocaine which completely abolish acetylcholine contraction, and unlike the latter it is not intensified by KCl. This suggests that the Tiegel contraction is not due to the formation of acetylcholine-like substances in the muscle. Not only does O reduce the concn. threshold of a number of contracting agents but N and CO₂ exert a similar effect, apparently because diffusion processes are favored. G. H. S.

Hydroxyquinoline (chinosol). CARL GRABBE. Pharm. Inst. Göttingen. *Arch. expil. Path. Pharmacol.* 137, 96–115(1928).—Hydroxyquinoline is absorbed quickly from the intestine (in dogs) and is promptly eliminated by way of the urine. A small amount is excreted through the bile. It is almost completely transformed into the H₂SO₄ ester, this change taking place to some extent within the lumen of the intestine. The chief effect of hydroxyquinoline upon metabolism is in its effect upon the excretion of N in the urine, but this influence becomes apparent only after a latent period of from 1 to 2 days and attains its max. after by far the greater portion of the hydroxyquinoline has been excreted. This effect is most marked in dogs which have been deprived of food and in such animals the excretion of hydroxyquinoline is retarded. G. H. S.

Relation of season to the susceptibility of the frog heart to magnesium salts and to lack of oxygen. BRUNO KISCH. Univ. Köln a. Rh. *Arch. expil. Path. Pharmacol.* 137, 116–28(1928).—From the end of May until the middle of July the frog heart exhibits an increased sensitivity to Mg salts. The ventricle is more sensitive than is the auricle, both reacting to concns. which are without effect on skeletal muscle. At this

time the Mg effect cannot be abolished by increasing the concn. of CaCl_2 although acetaldehyde is effective. The changed susceptibility to Mg is independent of temp. and is not modified by atropine. Although during this period contractility is altered, stimulus formation is unchanged. Susceptibility to a lack of O is also increased, and a synergism between Mg and lack of O is evidenced. G. H. S.

Tests of commercial ovarian preparations. M. KOCHMANN. Friedrichs-Univ. Halle-Wittenberg. *Arch. exptl. Path. Pharmacol.* 137, 187-200(1928).—Tabulated data are presented which bear upon the results of tests made by injection and by ingestion of a number of ovarian preps. of com. manuf. P. TRENDELENBURG AND H. GREMELS. Univ. Berlin. *Ibid* 201-2.—Detns., similar to those reported by Kochmann, were made and were confirmatory. G. H. S.

Sclerotic changes in organs, particularly in arteries. I. Experiments with activated ergosterol. H. KREITMAIR AND U. HINTZELMANN. Univ. Göttingen. *Arch. exptl. Path. Pharmacol.* 137, 203-14(1928).—The administration of irradiated ergosterol to lab. animals caused a deposition of Ca in the organs, a preliminary necrosis of the cells or tissues not being requisite. **II. Vascular changes in rabbits induced by irradiated ergosterol.** HEINZ WENZEL. *Ibid* 215-49.—In arteries, as in other organs, the deposition of Ca follows the administration of irradiated ergosterol. G. H. S.

Fixation of suspension colloids by anesthetizing and narcotizing substances. G. SPAGNOL. Univ. Padua. *Arch. exptl. Path. Pharmacol.* 137, 250-6(1928).—See C. A. 22, 3230. G. H. S.

Chronic effects of irradiated saponin and irradiated ergosterol. HANS HANDOVSKY. Pharm. Inst. Göttingen. *Arch. exptl. Path. Pharmacol.* 137, 264-8(1928); cf. C. A. 23, 207.—While the continued administration of saponin causes a reduction in the carbohydrate and cholesterol of the muscle, a like treatment with irradiated saponin results in an increased carbohydrate content, the reduction in cholesterol is less marked, the serum cholesterol is increased, and blood sugar values are changed. With irradiated ergosterol the carbohydrate and cholesterol of the muscle are likewise reduced, the cholesterol content of the liver is increased, but the blood sugar is unchanged. G. H. S.

Effect of blood and iron in anemia in dogs due to bleeding. GEORG STIEGER. Pharm. Inst. Göttingen. *Arch. exptl. Path. Pharmacol.* 137, 269-304(1928); cf. C. A. 23, 189.—The formation of blood in dogs rendered anemic by bleeding is accelerated by both ferrous and ferric compds. The nature of the therapeutic effect of bloods is complex. G. H. S.

Pharmacology of lead. III. Distribution of lead between the blood and the tissues after intravenous injection. BEHREND BEHRENS AND GÜNTHER ANTON. Univ. Heidelberg. *Arch. exptl. Path. Pharmacol.* 137, 305-10(1928); cf. C. A. 22, 275.—The curve expressing the distribution of Pb between tissues and plasma parallels that expressing the distribution between erythrocytes and plasma. **IV. Mechanism of lead poisoning in fish.** BEHREND BEHRENS. *Ibid* 311-14.—The lethal effect is due primarily to damage to the branchial app. G. H. S.

Effect of ephedrine upon adrenaline hyperglucemia. EDMUND HAINZ. Univ. Budapest. *Arch. exptl. Path. Pharmacol.* 137, 343-7(1928). Having no effect in causing hyperglucemia, ephedrine administered prior to adrenaline causes but a slight reduction in the hyperglucemia caused by the latter. G. H. S.

Tonus of heart muscle. Influence of poisons on resting elasticity. G. WEISMAYER AND H. QUINCKE. Med. Klin. Heidelberg. *Arch. exptl. Path. Pharmacol.* 137, 362-79(1928).—The resting elasticity of the heart can be modified by a variety of agents. Marked fatigue reduces the tonus, while glucosides which act on the heart, and cardiazole increase elasticity, as does adrenaline. Caffeine and atropine are without effect upon tonus. G. H. S.

Secretory activity of the isolated frog liver. FRIEDRICH HOFFMANN. Univ. Kiel. *Arch. ges. Physiol.* (Pflüger's) 220, 124-31(1928).—Phenylurethan and KCN inhibit, while caffeine and theophylline stimulate secretion through the biliary ducts in the isolated, artificially perfused frog liver. These agents exert a like effect upon the secretion of indigo-carmin. Thus, the secretion of dissolved substances and of solvent as well is a function of living liver cells, and this function can be stimulated or inhibited by pharmacol. agents. G. H. S.

Potential toxic effects. G. FRITZ. Univ. Berlin. *Arch. ges. Physiol.* (Pflüger's) 220, 495-511(1928).—With the isolated rabbit intestine prepn. adrenaline does not exhibit a potential toxic effect. The transitory effect of adrenaline is due to the fact that the adrenaline is in large part destroyed. Considerable amts. of undestroyed adrenaline are absorbed by organs. When large doses of pilocarpine, physostigmine or arecoline are used a second stimulation may be noted after washing. G. H. S.

Permeability and narcosis. KARL J. ANSELMINO. Univ. Kiel. *Arch. ges. Physiol.* (Pflüger's) 220, 524-38(1928).—With collodion membranes narcotics cause a reversible change in permeability, as evidenced by their behavior with respect to the passage of water. G. H. S.

Fate of acetylcholine in the blood. VI. Influence of various narcotics on the splitting of acetylcholine. F. PLATTNER AND O. GALEHR. Univ. Innsbruck. *Arch. ges. Physiol.* (Pflüger's) 220, 606-11(1928); cf. *C. A.* 22, 4161.—Acetone, acetamide and methyl, ethyl, propyl, butyl and amyl alcs. cause a reversible inhibition of the splitting of acetylcholine by red blood cells and by serum. This inhibition represents a suppression by the narcotic of adsorption. G. H. S.

Changes in the circulation of the mesentery of living cats following the intravenous injection of adrenaline. FRANZ KISCH. Univ. Wien. *Arch. ges. Physiol.* (Pflüger's) 220, 612-22(1928).—In the normal animal the capillary circulation of the mesentery is largely independent, as to vol., of the vol. of the total circulation, apparently being detd. by the nutritional needs of the tissues. After the injection of adrenaline this independence is lost. G. H. S.

Effect upon the blood sugar of insulin and adrenaline administered to angiotomized dogs during the digestive period. NINA KOCHNEVA. Inst. exptl. Med. Leningrad. *Arch. ges. Physiol.* (Pflüger's) 220, 628-32(1928); cf. *C. A.* 22, 4660.—Alimentary hyperglucemia does not take place when adrenaline is injected and food is given, but with insulin injection the hyperglucemia occurs. Under normal conditions sugar is present after a meat feeding to the same degree in all vascular beds, but after insulin injections there is a marked retention of sugar by the kidney. With carbohydrate administration and intravenous injection of insulin a diminished absorption from the intestine accompanies the increased retention by the kidney. With meat feeding and adrenaline injection the moderate sugar mobilization in the liver is not accompanied by a retention by the intestine and the muscles but is held back only by the kidney. When carbohydrate is given and adrenaline is injected subcutaneously no absorption from the intestine takes place, the increase in blood sugar being a sugar mobilization by the liver with a complete lack of retention by intestine and muscle. The kidneys retain less sugar than after injections of insulin. The mobilization of sugar in the liver caused by adrenaline during the digestive period is of adrenalinogenic origin exclusively. G. H. S.

Changes in the electromotive activity of collodion membranes by narcotics. KARL J. ANSELMINO. Univ. Kiel. *Arch. ges. Physiol.* (Pflüger's) 220, 633-41(1928).—Changes in potential resulted from the use of salicylamide and compds. of the urethan series. G. H. S.

Effect of intravenous injections of histamine and peptone upon the pressure in the portal vein in dogs. W. FELDBERG, E. SCHILF AND H. ZERNIK. Univ. Berlin. *Arch. ges. Physiol.* (Pflüger's) 220, 738-59(1928).—In histamine shock in dogs the liver plays no particular role, but in peptone shock the importance of this organ is considerable. G. H. S.

Validity of the all-or-none law of stimulation. I. G. MANSFELD AND ANNA LINGGERS. Univ. Pécs. *Arch. ges. Physiol.* (Pflüger's) 220, 760-73(1928).—The results of narcosis expts. with nerves indicate that the all-or-none law of stimulation is not valid. G. H. S.

Effect of insulin on regeneration. Biologic role of potassium and calcium ions in these processes. B. A. SHAZILLO AND M. YE. KSENDISOVSKII. Odessaer Med. Inst. u. Odessaer Wissenschaftl. Forschungsinst. d. "Ukrnauka." *Arch. ges. Physiol.* (Pflüger's) 220, 774-81(1928).—Insulin stimulates the regeneration of bone, and the restorative processes are modified if in conjunction with the insulin isotonic KCl or CaCl₂ solns. are injected subcutaneously, KCl exerting an inhibition, CaCl₂ causing an acceleration. G. H. S.

Effect of internal secretions and of poisons upon the chemistry of muscle. HANS HANOVSKY. Univ. Göttingen. *Arch. ges. Physiol.* (Pflüger's) 220, 782-813(1928).—In skeletal muscle the content of lactic acid is detd. solely by processes within the muscle, but the amt. of glycogen or lower sugars is modified by processes, such as glycogenolysis and liver fermentation, taking place without the muscle. The factors which det. the lactic acid and carbohydrate content of muscle are (1) the general metabolic level, (2) the activity of the central nervous system, (3) the presence of internal secretion, and (4) the integrity of the enzymes active upon carbohydrates. G. H. S.

Mercuration of aromatic amines and the problem of substitution (ALBERT, SCHNEIDER) 10.

I—ZOOLOGY

R. A. GORTNER

Purinolytic enzymes of the leech (*Hirudo medicinalis*) and the fresh-water mussel (*Anodonta*). RICHARD TRUSZKOWSKI. Warsaw Univ. *Biochem. J.* 22, 1299-1301 (1928).—Purine-N detns. before and after autolysis indicate that the end product of purine catabolism of leeches and mussels is xanthine and hypoxanthine. B. H.

Studies on the evaporation of nectar. O. W. PARK. Iowa Agr. Expt. Sta. *J. Econ. Entomol.* 20, 510-6(1927).—No concn. of nectar occurs within the body of the honey bee (*Apis mellifera*) from the time it leaves the flower until it enters the hive. Evapn. within the hive accounts fully for the rate of nectar concn. **Further studies on the evaporation of nectar.** *Ibid* 21, 882-7(1928).—Further expts. agree with those reported above. C. H. RICHARDSON

Water conservation in insects. WM. ROBINSON. Univ. of Minn. *J. Econ. Entomol.* 21, 897-902(1928); cf. *C. A.* 23, 440. C. H. R.

Responses of insects to smell and taste and their value in control. N. E. MCINDOO. U. S. Bur. of Entomology. *J. Econ. Entomol.* 21, 903-13(1928).—A review of the literature with bibliography covering: uses of smell in bee-keeping, attractive baits and attractants, chemotropism and repellents. C. H. RICHARDSON

12—FOODS

F. C. BLANCK AND H. A. LEPPER

Formol test for distinguishing artificial from natural foodstuffs. H. E. HILL. *Chem. Eng. Mining Rev.* 20, 401-2(1928).—The test was applied to orange juice, lemon juice, lime juice, several kinds of grape juice and vinegar. The test is applied as follows. The fruit juice and a 40% HCHO soln. are neutralized separately to phenolphthalein with 0.1 N NaOH. The 2 neutralized solutions are then mixed and if the color fades, more NaOH is added to bring back the color. The test depends upon the fact that when protein material is present, as is the case with the natural products, HCHO reacts with the protein and sets free an acid group. With an artificial product the color either does not disappear on mixing or but very little NaOH is required to bring it back. W. T. H.

Salicylic acid and preserved foods. T. GIGLI. *Boll. chim. farm.* 67, 616-7(1928).—G. condemns the use of salicylic acid for preserving tomato juice and instead recommends sterilization by heat. G. SCHWOCH

Adsorption phenomena (with wheat). G. TESTONI. *Rev. gén. colloïdes* 6, 8-15 (1928).—In an attempt to decide whether gluten is already existent in wheat flour, or whether it is produced during the mixing with water, T. has studied the colors produced in a wheat grain by adsorption of various natural and artificial org. coloring matters. It is concluded that gluten is not pre-existent in wheat flour, but is formed under the influence of Ca salts, when mixed with water. The sensitivity of indicators is diminished by adsorption of the indicator at a surface, and measurement of the decrease in sensitivity provides a means of characterizing the adsorbent surface. The values are expressed as "adsorption values," and some of the proteins of wheat have been characterized in this way. Ferric and cupric salts are adsorbed by gluten and gliadin, and the colorless products fail to give reactions for the respective metal ions except towards $K_4Fe(CN)_6$. The product of adsorption of Ni salts fails to give a reaction for Ni ions with any reagent. It is suggested that reaction can take place only when the second substance also is adsorbed, and that this condition is realized in the case of $K_4Fe(CN)_6$. B. C. A.

Modern baking powders. R. M. LADD. *Can. Chem. Met.* 12, 308-9(1928).—The compn. of modern baking powders is considered, and equations are given illustrating the chemistry of these compds. Baking powder should be capable of producing 14% of its wt. of CO_2 . The presence of 20% of starch is essential if the minimum of safe buffer action, resulting in reduction of quantity of CO_2 to that portion required by standard practice, is to be had. $KHC_4H_4O_6$ is so weak in acidic properties that $H_2C_4H_4O_6$ must be used in conjunction with it. Observations on the employment of the various compds. used in baking powders are furnished. The physiol. action of the residue remaining in the finished product is discussed. References are given and authorities quoted. Attention is directed to the famous "Alum War" which, after 50 years, is as yet unsettled. FREDERICK G. GERMUTH

The refractometer in milk analysis. G. D. ELSDON AND J. R. STUBBS.—Lancashire Co. Council Lab., Liverpool. *Chemistry and Industry* 47, 1145-6(1928).—Polemical. J. A. KENNEDY

The lactometer as used in the determination of solids-not-fat in milk. C. F. HOYT, N. C. SMITH, L. M. LAMPERT AND L. G. SAYWELL. Dairy Lab., State Dept. Agr., Calif. Dept. Agr., *Mo. Bull.* 17, 594-603(1928).—Numerous data compiled in 8 tables show that the lactometer reading should be made at the top of the meniscus. Calibration of the lactometer may be made in milk of known sp. gr. Unless the prior treatment of a sample of milk is known, an element of uncertainty is present in values of solids-not-fat derived by formula from the sp. gr. with samples having their max. sp. gr., the av. of results obtained by the Babcock formula from the lactometer readings and the % of fat as detd. by the Rocse-Gottlieb (Mojonnier) method agree fairly well with the av. gravimetric results. With samples in which the original sp. gr. has been restored by heating the av. of results obtained by the formula $S - F = (L/4) + (L/5) + 0.2$, in which $S - F$ = solids-not-fat, L = lactometer reading and F = % fat agrees well with the av. gravimetric results. Values on individual samples obtained by formula may vary considerably from values obtained gravimetrically. The correction table for temp. gives accurate results except at 21°. At that point the values tend to be somewhat low. C. R. F.

Heat coagulation of evaporated milk as affected by mixing different grades of raw milk. BYRON H. WEBB. Bur. of Dairy Ind., U. S. Dept. Agr. *J. Dairy Sci.* 11, 471-8(1928).—Skim milk, aged until positive to 74% EtOH, was mixed in varying amts. with good skim milk heated to 95° for 10 mins., evapd. *in vacuo* to 18% total solids and sterilized at 120° until coagulated. The heat stability of the milk (measured by the time necessary for coagulation) varied with each addn. and each sample of milk. No method is available by which the result of such mixing can be foretold. There is apparently an optimum pH for each milk at which the greatest heat stability is obtained. This may be reached by aging the sample, adding milk which has developed acidity or adding lactic acid. F. L. SEYMOUR-JONES

Studies on the bacteriological content and keeping quality of milk. S. B. THOMAS AND J. LEWIS. Univ. Coll., Aberystwyth. *Welsh J. Agr.* 4, 147-457(1928).—This paper gives the results of the bacteriol. examn. of 908 samples of milk from 141 farms in Mid and West Wales. The keeping quality of the milk decreased as the bacterial count increased and the presence of *B. coli* had a further deleterious effect on the keeping quality. Coliform organisms were detected in only 57% of the samples examd. An increase from 53° to 63° F. in the temp. of the milk during transit decreased the keeping quality by 24 hrs. A difference of 18 hrs. in keeping quality could be accounted for by the variation in personal efficiency during milking alone. K. D. JACOB

The bacterial content of dried milk. H. MACV. Univ. of Minnesota. *J. Dairy Sci.* 11, 516-26(1928).—Spray- and drum-dried milk powders were bacteriologically examd. fresh and on storage up to 6 yrs. Original counts per g. on spray samples varied from 4400 to 5 1/2 million, av. over 50,000; on drum samples, 40 to 7900, av. below 500. There is a decrease of over 90% on 1 yr. storage and a greater decrease with increase of storage temp. up to 37° with spray process powders. The types of bacteria present in the dried milk vary with the drying process. F. L. S.-J.

The cause of the fluorescence of milk and wine irradiated by ultra-violet rays. D. MIGLIACCI. *Boll. chim. farm.* 67, 673-4(1928).—Review of the investigations of Schmetzer (*Milchwirtschaftl. Forsch.* 1927, 359) and of Haitinger and Reich (*C. A.* 22, 4373).

Phosphates and milk production. ERNEST VANSTONE. Seale-Hayne Agr. Coll. *Fertiliser, Feeding Stuffs and Farm Supplies J.* 13, 847-51(1928).—The relation of phosphates to animal nutrition is discussed with particular reference to the production of milk. K. D. JACOB

Relation of soy-bean hay and ground soy beans to flavor and composition of milk and butter. W. B. NEVENS AND P. H. TRACY. Univ. of Illinois. *J. Dairy Sci.* 11, 479-87(1928).—Soy-bean hay and ground soy beans fed to cows had no effect on the flavor or acidity of the milk (raw or pasteurized), skim milk, cream or butter. The body of the butter was somewhat gummy on this ration and the I no. increased slightly. F. L. SEYMOUR-JONES

The present status of density of ice cream. G. D. TURNBOW. *Ice Cream Rev.* 7, 60-3(1927).—Efforts to standardize the weight or density of ice cream as conducted at the Univ. of Cal. are reported. With slow agitation the mix developed nearly twice as much viscosity during aging as with severe agitation. A more stable viscosity was secured by aging the mix at from 83° to 84° F. than by aging at higher temps. Ice

cream aged at this temp. developed superior body and texture. The higher the total solids the less difference there was between the wt. of the first, second and fourth cans of ice cream drawn off. A table illustrates three possible standards for ice cream wts.

H. F. ZOLLER

Effect of lecithin in dairy products upon butter fat determinations. O. W. CHAPMAN. Iowa State College. *J. Dairy Sci.* 11, 429-35(1928).—The ether ext. by the Mojonnier method of various milk products gave av. lecithin percentages: milk 0.0447, cream 0.1981, skim milk 0.0165, buttermilk 0.1302. These represent 1.6, 0.43, 10.78 and 20.25%, resp., of the total ether ext. On adding egg-yolk lecithin to buttermilk, very varying amts. were recovered as "fats" by the Babcock, butyl alc. and Mojonnier methods, averaging 70-75%. Conclusion: About 0.13 of the fat found in buttermilk is lecithin.

F. L. SEYMOUR-JONES

The care of cheese during storage. L. J. LORD. *Food Manuf.* 4, No. 1, 5-6, 10 (1929).—This article is an account of the factors which affect the keeping qualities of cheese in storage such as temp., light, moisture, ventilation and the presence of cheese mites and flies. Practical advice on how to provide the most suitable storage conditions is given.

J. A. KENNEDY

Proximate composition of fresh fruits. CHARLOTTE CHATFIELD AND LAURA McLAUGHLIN. Bur. of Home Economics. U. S. Dept. Agr., *Circ.* 50, 1-19(1928).—Data on the compn. of 65 fresh fruits or their products have been compiled and analyzed. The tabulated results include values for refuse, water, protein ($N \times 6.25$), fat, ash, total carbohydrate, fiber, sugar, total free acid and fuel value per 100 g. and per lb. When justifiable, the following values are given: av., probable error of av., max., min., the compn. of the edible constituent expressed as percentages of the purchased wt. and no. of analysis concerned.

PAUL E. HOWE

Sugars used in the fruit products industries. W. V. CRUESS. Univ. Cal. *Fruit Products J. and Am. Vinegar Ind.* 8, No. 5, 16-9(1929).—A discussion from the point of view of statistics, kinds and compn., fermentations and sirups

J. A. KENNEDY

Chemical examination of finger limes (*Citrus australasica*). G. R. GANNON. *J. Proc. Sydney Tech. Coll. Chem. Soc.* 3, 29-32(1927).—The chief constituents of the juice are water 90.5%, pectin matter (per 100 cc. of juice) 1.23 g., dextrose 0.45 g., citric acid 5.6 g. and unidentified acids 0.25 g. The presence of hesperidin is suspected.

B. C. A

Hydrogen swelling of canned ready-to-serve prunes. E. M. MRAK AND P. H. RICHERT. Univ. of Calif. *Fruit Products J. and Am. Vinegar Ind.* 8, No. 5, 11-3, 15(1929).—The rate of spoilage due to H swells decreased when the wt. of fruit per can was increased above 120 g. in 8 oz. cans; also with increase in concn. of sugar sirup added at time of canning. The kernels in the pits showed no noticeable changes or signs of growth. Visible corrosion was most apparent in the cans having water and 12.5° Balling sirup. The rate of formation of visible H swells decreased as the head space at time of sealing was increased. Increasing the length of time of exhaust slightly decreased the rate of formation of H wells, probably by increasing the vacuum and head space, and thereby requiring the production of more H for the formation of visible swells. The writers do not subscribe to the common belief that long exhausting reduces corrosion by removal of O_2 from prunes as their expts. indicate that a large head space filled with air at the time of sealing retarded swelling of the cans and, secondly, they have found the least Sn in the prunes and sirup in those cans with the greatest head space (greatest initial O_2 supply). **The effect of blanching on the hydrogen swelling of canned ready-to-serve prunes.** E. M. MRAK AND P. H. RICHERT. *Ibid* 14-5(1929).—The rate of formation of H swells in canned ready-to-serve French variety prunes is increased when the blanch is increased; however, the rate of swelling is not in direct proportion to the length of the blanch. The length of blanch is also dependent on the condition of the prunes to be blanched; however, it is recommended that it be not more than 10 nor less than 3 min. in boiling water. The use of a heavy sirup did not counteract the accelerating effect of a long blanch on the rate of swelling. The rate of swelling resulting from steam-blanched prunes increased when the length of blanch was increased. The steam-pressure blanches showed no obvious difference although there was a slight tendency for the rate of swelling to increase when the severity of the blanch was increased.

J. A. KENNEDY

The determination of honey in honey cakes. R. T. A. MEES. *Chem. Weekblad* 25, 674-6 (1928).—On theoretical grounds, the % of fructose is accepted as a unit to express the amt. of honey in sugar mixt. as used in honey cakes. M. has worked out a simplified Kolthoff method as follows: grind 30 g. with water in a mortar and bring to vol. of 200 cc., centrifuge and filter and det. the sp. gr., from which the % ext. can

be calcd. Dil. 10 cc. of this soln. with H_2O to 100 cc., pipet 20 cc. of this soln. into a 200-cc. flask contg. 2.5 cc. $N I$ and 3 cc. $N NaOH$, put in the dark for about 5 min., then acidify with 1 cc. 4 $N HCl$, remove carefully excess I with 10% Na_2SO_3 soln., neutralize with 1 cc. $N NaOH$ add 20 cc. Fehling soln. and det. reducing power according to Schoorl; express as % fructose based on the ext. J. C. JURRIJENS

Studies in the jowars of Gujarat. I. The jowars of the Surat district. M. L. PATEL AND G. B. PATEL. Agr. Research Inst., Pusa. *Mem. Dept. Agr. India, Botanical Ser.* 16, 1-57(1928).—Grain of the *budh perio*, *chapti*, *sholapuri* and *vani* types of jowar (sorghum) grown in the Surat district of the Gujarat area, India, had the following compn.: H_2O 11.7, 11.8, 11.4 and 11.0%; Et_2O ext. 3.1, 2.7, 3.6 and 4.3%; albuminoids 8.2, 6.5, 6.5 and 10.5%; digestible carbohydrates 74.4, 76.1, 75.9 and 69.8%; woody fiber 1.3, 1.2, 1.1 and 2.4%; and ash 1.3, 1.7, 1.5, 2.0%, resp. K. D. JACOB

Protein digestion. J. WILSON. *Food Manuf.* 4, No. 1, 11-12(1929).—This is a review of the knowledge so far accumulated concerning the scientific principles underlying the manufacturing processes available for the prepn. of predigested proteins.

J. A. KENNEDY

Feeding experiments at Karnal, 1925-26 and 1926-27. F. J. WARTH AND F. J. GOSSIP. Agr. Research Inst., Pusa. *Mem. Dept. Agr. India, Chem. Ser.* 10, 1-24 (1928).—A study was made of the value of wheat and rice straw, and sorghum and *dhub* hay as winter feeds for calves. Good sorghum hay and rice straw were approx. equal in nutritive value and rice straw produced better growth than wheat straw. Digestion of protein and carbohydrate increased with the amt. of protein present, and rice straw and sorghum rations gave almost identical digestion results. There was a direct relation between the N content of the rations and the quantity of N present in the feces and this relation may prove valuable in differentiating foders. The most serious fluctuations in fodder consumption occurred with rations low in protein. In general this observation may prove important in indicating that the protein supply is insufficient when serious fluctuations in fodder consumption commence. K. D. J.

Factors that influence the chemical composition of hay. T. W. FAGAN. Univ. coll., Aberystwyth. *Welsh J. Agr.* 4, 92-102(1928); cf. *C. A.* 22, 3468.—Hay cut a few days after it has reached its stage of max. flowering and before seed formation begins, has the highest nutritive value. Further delay in cutting results in deterioration in quality as shown by its chem. compn. Analyses of Italian rye-grass at the end of 2, 4 and 10 weeks of growth showed that as the grass increases in age a considerable fall in protein occurs, accompanied by a rise in fiber content as detd. on the dry matter. The silica free ash in 10 weeks' growth was only about 0.5 that found in the 2 weeks' growth, this being reflected in all the mineral constituents detd., with the exception of CaO . Inclusion of clover in the hay increases the protein and mineral content, especially CaO . Figures are given on the chem. compn. of the dry matter of the hay of Meadow Foxtail, Italian and perennial rye-grasses, and English late flowering and Broad Red clovers, and also on the compn. of the stems, leaves and flower heads of Montgomery red clover and the stems and leaves of Timothy. Fertilization of Italian rye grass with $NaNO_3$ increased the protein content of the stems and leaves and slightly decreased the fiber content of each, while in both cases the P_2O_5 and K_2O appeared to be depressed. Application of K_2O in the form of sylvinit did not have any pronounced effect on the compn. of the hay but caused some increase in the SiO_2 -free ash, CaO , Cl and K_2O . Beyond increasing the protein content, applications of farmyard manure had no effect on the compn. of the hay, while liquid manure increased the protein, SiO_2 -free ash, CaO , Cl and K_2O but had no effect on the P_2O_5 content. Exposure of hay to heavy rains resulted in pronounced loss of all constituents except fiber and P_2O_5 , the former being increased and the latter remaining const. K. D. J.

The feeding value of meadow hay cut at different dates. C. BRYNER JONES. *Welsh J. Agr.* 4, 75-92(1928).—The compn. of the dry matter of meadow hay cut during the months of June, July and August is given for a 4-year period. In general, the % of true protein was fairly const. for the different months, while the % of crude protein was lowest in the August hay. The sol. carbohydrates and Et_2O ext. diminished as the season advanced. The fiber content remained at about the same level in the June and July hay but increased markedly in the August hay in each of the 4 years. Feeding expts. with lambs showed that hay left uncut until the middle of August is decidedly inferior in nutritive value, while owing to variations in weather conditions July hay had a higher feeding value in some years while the reverse was true in other years. K. D. JACOB

Some factors affecting the composition of roughage. R. B. BECKER. Okla. Agr.

and Mech. College. *Proc. Oklahoma Acad. Sci., Univ. Oklahoma Bull.* 1928, New Series, No. 409, Studies Series, No. 29, 188-97.—The compn. of plants depends upon the following factors: inherited characteristics (species and variety), soil, application of fertilizing elements, seasonal rainfall or water supply, stage of development of the plant when harvested, and leaching caused by rain or dew. RUSSELL C. ERB

The occurrence and destruction of gossypol in cottonseed products. WILLIS D. GALLUP. Okla. Exptl. Sta. Stillwater, Okla. *Proc. Oklahoma Acad. Sci., Univ. Oklahoma Bull.* 1928, New Series, No. 409, Studies Series, No. 29, 182-7.—Gossypol probably occurs throughout the cotton plant and accumulates in the seeds. It is destroyed by heat and moisture under favorable conditions as autoclaving. Cottonseed meal so treated is non-toxic and is valuable as a feed. RUSSELL C. ERB

The microflora of Italian ensilage. (Lactic acid ensilage). COSTANTINO GORINI. Der landwirtschaftlichen Hochschule zu Mailand. *Centr. Bakt. Parasitenk.*, 2 Abt., 76, 45-8(1928). JOHN T. MYERS

The bacteriology of silage, 1926-27. J. H. WALTON. Agr. Research Inst., Pusa, *Bull.* 182, 13 pp.(1928).—A study was made of the bacterial content and acidity of maize and juar (*Sorghum vulgare*) silages prepd. in glass jars. There did not appear to be any close relation between the p_H and the total acidity of the juice of maize silages. The acidity increased with age but was not the same at any particular age when different series of silages were compared. With p_H 4.1 the acidity of 6 samples varied from 1.73 to 2.43 g. lactic acid per 100 cc. of juice. Maize silages incubated at 30° had much higher bacterial counts and content of acid than those incubated at 40°. In general, juar silages were less acid and contained fewer bacteria than maize silages, and again there was no close relation between p_H and total acidity. The juar silages never acquired such a pleasant, clean aroma as that of the av. batches of maize silage and were much more liable to possess an unpleasant odor. Whenever there was a good development of acid-forming bacteria, producing over 2% of acid in the juice within 3 to 5 days, the silage produced was always of high quality. *Streptococcus lactis* was almost entirely responsible for formation of acid in the silages. An acid-forming, slender rod organism, apparently belonging to the *Lacto-bacillus* group, was occasionally found. *Achromobacter fermentationis* was also identified in the silages. K. D. J

Fat determination in cacao products (Lang) (HEIDUSCHKA, MUTH) 27. Tea in northeast India (CARPENTER) 15. The presence of vitamins in certain canned vegetables (RIGOBELLO) 11E. The mineral content of feeds, soils and waters of South Carolina (MITCHELL, *et al*) 15. The thermophilic flora of sugar in its relation to canning (CAMERON, WILLIAMS) 11C. The microscopic detection of substances which by the action of certain reagents yield aldehydes or ketones (chloral hydrate, glycerol, lactic, citric and malic acids) (GRIEBEL, WEISS) 7. Steamed straw (RIEFGGERSTE) 23. Treatment of fish (Can. pat. 285,632) 27. Non-alcoholic beverages (Austrian pat 110,543) 16. Clarifying apple juice or other solutions containing tannin (U. S. pat 1,698,985) 13. Use of bakelite or a similar product for making closures of receptacles for foods, etc. (Brit. pat. 291,403) 18. Device for breaking down foam formed on skimmed milk in bulk (U. S. pat. 1,699,196) 1.

Food product. SIMOND GELFAND. U. S. 1,697,312, Jan. 1. A product suitable for use as a dressing is formed by emulsifying oil and egg yolk material and a cultured milk product and adding sufficient edible org. acid material such as vinegar to stabilize the product.

Bread. ALBERT K. EPSTEIN. Can. 285,804, Dec. 25, 1928. A mixt. of urea in combination with $KClO_3$ and $MgSO_4$ is used with yeast and assimilable carbohydrates in dough fermentation.

Apparatus for pasteurizing milk. THE CREAMERY PACKAGE MFG. CO. Fr 641,003, Sept. 29, 1927.

Milk sterilizer. BERGEDORFER EISENWERK A.-G. Ger. 468,431, July 3, 1924. Structural features.

Manufacture of concentrated milk. SALAMON SZEKELY. Austrian 109,670, Jan. 15, 1928. Colloidal solns. of casein salts prepd. in known manner from milk are dissolved in natural milk, to which other nutrients such as yolk or egg, carbohydrates, and cream may be added as required.

Yoghurt. MAX WINCKEL. Ger. 470,035, Nov. 2, 1924. A vitamin contg. yoghurt prepn. is made by mixing milk contg. yoghurt bacteria with $CaCO_3$ and dried yeast. The product may be dried in the usual way.

Concentrated ice cream mix. DEAN W. FISHER (to General Ice Cream Corp.). U. S. 1,699,526, Jan. 22. Milk is heated to a pasteurizing temp. and sugar and pasteurized cream are added to the milk, the emulsion thus formed is condensed in a partial vacuum at a reduced temp. (suitably about 55°) until most of the water is expelled and the concd. product is then cooled. An app. is described.

Beverages containing cocoa and milk. C. E. NORTH. Brit. 291,124, Jan. 19, 1927. In prepg. beverages suitable for sale in glass bottles, the milk or mixt. of cocoa and milk is subjected to heat and pressure under conditions varying with the acidity of the compn. in order to produce a definite increase in the viscosity by partly coagulating the casein and albumin without effecting curdling or sepn. A detailed example is given.

Meat paste. RICHARD W. DYER. U. S. 1,697,857, Jan. 8. Chickens or other domestic fowls are cooked under such conditions as will soften the gelatinous constituents of the bones and leave the phosphate of lime bone framework in a friable condition, the flesh and bones are comminuted by grinding and the ground flesh, softened bones and marrow are formed into a homogeneous paste suitable for packing in sealed containers.

Fish powder. FRANÇOIS BILLON. Fr. 641,887, Mar. 11, 1927. See Brit. 286,709 (C. A. 23, 454).

Sausage casing. BERNARD JOSEPH MUMM and BERNARD JOHN MUMM. U. S. 1,699,076, Jan. 15. Animal intestines of irregular diam. are expanded and contracted at different portions to render them of uniform diam. and are permanently fixed in this configuration (suitably by tanning).

Lard-refining (cooling and washing) devices. JAMES S. HUNTER. U. S. 1,698,756, Jan. 15.

Nutritive vegetable juices. JOHANNES KORSELT. Ger. 470,012, Jan. 18, 1927. Juices rich in vitamins are prepd. from chlorophyll-contg. vegetable matter by pressing and then heating to 100° with a Ca salt such as the citrate, lactate, or carbonate, together with a non-injurious aliphatic oxy acid. The ppt. is filtered off and the liquid reheated in a closed vessel in an atm. of inert gas to 100°.

Removing the skin from vegetables. MINNIE B. TAYLOR. U. S. 1,699,456, Jan. 15. Vegetables are treated with a boiling aq. soln. of NaCl and NaHCO₃ and are then chilled in cold water and the skin is removed by hand friction.

Preventing discoloration of canned foods. GEORGE S. BOHART (to National Canners Association). U. S. 1,699,274, Jan. 15. The inner surface of tinned cans is coated with a lacquer contg. ZnO or other suitable substantially insol. compd. of a metal the sulfides of which are not dark colored.

Apparatus for macerating grain. I. G. FARBERIND. A.-G. Fr. 641,172, Sept. 20, 1927.

Apparatus for moisture determination in grain and for the determination of uniformity of the moisture by the hardness of the grain. V. A. ROMAN. Russ. 5151, April 30, 1928.

Fertilizer and food for animals from vegetable refuse. J. JACKSON. Brit. 291,514, March 2, 1927. Fruit refuse or other refuse is pulverized, washed and floated with water, drained, pressed and dried, for use as a poultry or animal feed or for a fertilizer depending on its character. An app. is described.

13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

American chemical industry. JOSEF SCHNEIDER. *Chem. obsor* 3, 286-90(1928).—Description of some American industrial processes. JAROSLAV KUČERA

Trends in industry and expansion. E. W. McCULLOUGH. *Chem. Markets* 23, 607, 8(1928).—In considering the question of bringing new plants to a community, attention should be given first to the interests of the factories already there, and whether the newer plants will compete with them or complement them. With the increased competition among manufacturers, increased selling costs, etc. there have come also decreased profits. Greater efficiency of operation, increased mechanization, better planning are all necessary to meet the demands of changed styles and customs, newer lines and commodities replacing the old, and modern methods of selling and distribution. Help through investigations carried on through coöperating agencies, trade associations, etc. leads to practical results of value. W. C. EBAUGH

Gantt's graphical methods in the chemical industry. M. BORNSTEIN. *Przemysl Chem.* 12, 647-54(1928).—Principles and illustrative examples. A. C. Z.

Accidents in the chemical industry. LEYMANN. *Chem. Fabrik* 1928, 704-6.—Discussion of 22 accidents in the chem. industry due to carelessness of chemists in charge. Instruction for chemists in the university in protection against and prevention of accidents is advocated. A. WHITE

Patent office of the Czechoslovakian Republic. J. SOUČEK. *Chem. Obzor.* 3, 346-8 (348 English), (1928).—Activities and progress of Czechoslovakian Patent Office are described. JAROSLAV KUČERA

Legal protection for originality. GEOFFREY W. TOOKEY. *India Rubber J.* 76, 1044-6, 1082-4(1928). C. C. DAVIS

An economic discussion of the nitrogen situation with regard to its future development. FIRMAN E. BEAR. Ohio State Univ. *Chem. Markets* 23, 594-7(1928).—Instead of fear of the starvation of the race because of the insufficient supply of N fertilizers, there is now a question of methods of use to secure the best results. The farmers of the world will be asked to increase their annual consumption of fertilizer N by 1,000,000 tons within a period of 4 yrs. When Europe doubles its N consumption it imports less foodstuffs; if we in America double ours, we produce a greater surplus at lower prices. Expts. are cited to show the increases expected by using more N fertilizer per acre. The most important problem still to be solved is that of detg when the N should be applied under our climatic conditions. Apparently only a part should be used at the time of planting a crop, but when the remainder should be applied is not known. Practices within the corn belt and in the area beyond it, less subject to drought, will necessarily be different. W. C. EBAUGH

The relations between specific volume, voids and size composition in systems of broken solids of mixed sizes. C. C. FURNAS. *Bur. of Mines Repts. of Investigations*, No. 2894(1928).—A mathematical theory and method are developed to permit easy and accurate prediction of a compn. of max. d. for a system of broken solids of various mixed sizes. Min. voids are obtained by piling the materials in layers with 2 sizes, one large and one small in each layer. These data are generalized into 3 sets of curves showing the relation between size ratio, voids, sp. vol. and compn. of 2-component systems. Such data can be applied to the *handling of sludges*, to *lubricants* made of solid material suspended in liquids, or to the *storage of coal* or other broken material. T. P. KELLER

Low-temperature evaporation to prevent decomposition. ERNST JANTZEN AND HANS SCHMALFUSS. *Chem. Fabrik* 1928, No. 50, 701-3.—Description of lab. app. for rapid evapn. (7.5 liters of water per hour) with a small temp. difference between evaporator and condenser (6°). Vacuum evapn. of solns. of org. substances that decompose on heating is discussed. A. WHITE

Possibilities of high-pressure steam in chemical works. H. GRIFFITHS. *Ind. Chemist* 4, 461-2(1928).—New materials and new types of construction should hasten progress in the use of high-pressure steam in chem. works. From the point of view of economy, the use of exhaust steam for heating is advantageous. By raising the initial pressure from 150 lbs. per sq. in. to 300, the back pressure may be raised from 30 lbs. per sq. in. abs. to approx. 60 without any change in the steam consumption per h. p. hr., and by raising the initial pressure to 600 lbs. the back pressure may be raised to 120 lbs. without any increase in the steam consumption of the power plant. High temp. of exhaust steam permits an increase in the number of effects in multiple-effect evapn. Of all known substances satd. steam has the max. carrying capacity for heat. The thermal efficiency of superheated steam when used for heating is low. Temps. up to 300° can be obtained with satd. steam at about 1500 lbs. per sq. in. Such pressures present no difficulty from a constructional point of view and temp. control is secured simply by the use of a reducing valve. E. G. R. ARDAGH

The mathematical theory of filtration. A. J. V. UNDERWOOD. *Ind. Chemist* 4, 463-6(1928).—The factors to be taken into account in calcg. the rate of flow through the cloth and cloth + cake in a filter press are discussed. Equations are developed for calcg. the relation between vol. filtered and time of filtration for incompressible and compressible ppts. A list of references is included (cf. *C. A.* 22, 127). E. G. R. ARDAGH

Metafiltration. J. A. PICKARD. *Ind. Chemist* 4, 505-8(1928).—Some objections to filter presses are discussed. The metafilter, a development of Danchell's edge filter, as designed by P., is described and illustrated, and examples of its effectiveness in filtering finely divided BaSO₄, beer and hot boiled linseed oil, with a filter bed of kieselsguhr, are given. E. G. R. ARDAGH

Evaluating grinding efficiency by graphical methods. WILL H. COGHILL. *Eng. Mining J.* 126, 934-8(1928).—A graphical method is given for evaluating the efficiency of grinding machines. The data of a screen sizing analysis are laid off as hypothetical forces on a force diagram to det. *mean mesh* and *mean surface*. The mean mesh is used to det. the reduction ratio obtained by grinding and the mean surface as the basis for calcg. work done.

T. P. KELLER

Local examination of the tensile strength of textile fabrics, rubber, etc. A new method instead of the ordinary tearing test. F. SCHUBERT. *Forschungsinst. für Textil-Ind., Wien. Chem.-Ztg.* 52, 913-5(1928).—The fabric is weighted by a bolt producing a fissure of only a few mm. The new process is rapid and exact; it is very economical on account of the smallness of the fissures, thus enabling one to do numerous tests with little material.

G. SCHWOCH

Pulverizing hard materials. H. VON WARTENBERG WITH BR. STRZELCZYK AND G. BORRIS. *Tech. Hochschule, Danzig. Chem. Fabrik* 1928, 617-9.—Comparative tests under carefully controlled conditions as to sizes of particles used and quantities and sizes of particles produced, together with their degrees of contamination by the mortars employed, were made with SiO_2 (quartz), ZrO_2 (fused, pure) and Al_2O_3 (fused). These were ground by hand in mortars of (1) chrome-plated steel, (2) "hard metal" (a W carbide in Co), (3) 12% Mn-steel, (4) agate and (5) porcelain. The losses of weight of mortars, in mg. per g. of material ground, showed 5, 6 and 13 for (1); 6, 4 and 9 for (2); 7, 9 and 15 for (3); 12, 17 and 21 for (4); and 43, 55 and 102 for (5); for SiO_2 , ZrO_2 and Al_2O_3 , resp. The Cr-plated steel is recommended as best, not only because its wearing qualities are so excellent, but because it can be detected very easily as an impurity in the product, Cr is found so rarely in materials to be ground, and its ease of removal by use of HCl if needed. For the opposite reasons agate is the least desirable material for use in making mortars. Since contamination took place in all grinding mortars, the use of (impact) diamond mortars was studied. Only about 30% of the charge can be reduced to an impalpable powder in a 12%-Mn-steel mortar without contamination from the mortar resulting.

W. C. EBAUGH

Condensate and hot water systems in Cuba. GEORGE W. CONNON. *Facts About Sugar* 23, 1168-9(1928).—This is a very general discussion with few engineering details.

M. J. PROFFITT

Glycerol and glycols. J. H. FRYDLENDER. *Rev. prod. chim.* 31, 772-5, 805-8 (1928).—The uses of these products in industry are described, also the substitutes employed.

P. THOMASSET

War-time chemical progress and peace-time chemical products. ALAN A. CLAFLIN. *Chem. Markets* 23, 471-5, 579-82(1928).—The war brought a succession of new experiences to the military authorities, and at first the Germans showed more initiative in meeting them, as is evidenced by their use of high explosives, gas attacks, etc. This advantage was later overcome by the superior potential resources of the Allies. An outline of gases used, their classification, measures to combat them, protective devices and similar matters is given. The war-time production of acetone was very important because of its use as a solvent for nitrocellulose, as a raw material for making "tear gas" and as a solvent for airplane dope. Methods of its manuf. are reviewed. The prepn. of butyl alcohol by fermentation processes led to the *synthesis of rubber* by the isoprene process. The development of atm. N plants and their conversion to peace-time purposes has been slower in the United States than in Europe, as the aim has been rather to get the most efficient processes instead of simply any process at all that would work. Coal-tar intermediates and dyestuffs; lacquers consisting of a pigment, a plastic and a solvent, with plasticizers such as triphenyl and tricresyl phosphates replacing camphor; Et and Bu phthalates; the sepn. of C_4H_4 from coal- and natural-gas; the refining of petroleum by better methods, etc., have led to the formation of many compds. on a commercial scale that were not looked upon heretofore as being particularly available. Many improvements of technical processes can, therefore, be traced directly to the intensive research devoted to the production of war-time necessities.

W. C. EBAUGH

Thermal insulation. VILÉM I.ÖVY. *Chem. Obzor.* 3, 37-40, 170-5, 316-9(1928).—A review of the insulators used in industry with theoretical and practical considerations. An English summary is included with each article.

JAROSLAV KUČERA

PARTINGTON, F. B.: **Chemical Plumbing and Leadburning.** London: Allen Riversidge, Ltd. (Victoria Station House, Westminster, S. W. 1). 3s. 6d. Reviewed in *Chem. Trade J.* 83, 510(1928).

Finding and Stopping Waste in Modern Boiler Rooms. A reference manual to aid the owner, manager and operator in securing and maintaining boiler plant economy. Philadelphia, Pa.: Cochrane Corp. 788 pp. \$3. Reviewed in *Ind. Eng. Chem.* 21, 94(1929).

Purifying gases. JOSEPH G. DELY (to Atmospheric Nitrogen Corp.). U. S. 1,698,718, Jan. 15. A flowing gas (such as gas to be used for NH_3 synthesis) contg. CO and CO_2 is passed through 3 scrubbing stages. In the first stage water is continuously introduced; in the second stage ammoniacal cuprous liquor is continuously introduced without refrigeration; in the third stage ammoniacal cuprous liquor is introduced with refrigeration. An arrangement of app. is described.

Drying gases. DEUTSCHE GLÜHFADENFABRIK RICH. KURTZ & PAUL SCHWARZKOPF. Swiss 127,515, April 16, 1927. The gas is led through porous tubes passing through concd. H_2SO_4 .

Separating hydrogen from gaseous mixtures. H. M. R. BARJOT. Brit. 291,576, April 14, 1927. An app. is specified for sepn. of H from gaseous mixts., such as water gas or coke-oven gas, by diffusion through porous media. Several units are arranged in connected series.

Separating gases by liquefaction. GES. FÜR LINDE'S EISMASCHINEN A.-G. Ger. 469,446, Jan. 25, 1927. See Brit. 284,213 (*C. A.* 22, 4678).

Liquefaction of gases. EISEN- u. STAHLWERK HOESCH A.-G. Ger. 470,014, Aug. 6, 1922. Gases and gaseous mixts. which are not readily liquefied are subjected to a preliminary cooling in the compressed state by a heat-absorbing machine. The excess cold of the liquefied gases is used for cooling the condenser or absorber of the machine.

Effecting reactions between gases. VEREIN FÜR CHEMISCHE INDUSTRIE A.-G. Swiss 127,243, May 27, 1926. Reactions between gases are effected by supplying one of the reagents to each side of a porous wall, the gases meeting and reacting in the pores of the wall. Suitable app. comprises a porous tube arranged within an impermeable tube, connections being provided for passing gases, preferably in counter-current, through the porous tube and through the annular space between the tubes. The porous tube may be impregnated with a catalyst. Examples describe the prepn. of (1) CH_4 from CO and H_2O ; (2) MeOH from CO and H_2O ; (3) MeOH from $HCOOH$ and H; (4) MeOH from $HCOOMe$ and H; (5) Ac_2O from ethylidene diacetate and air; (6) AcOH from CH_3CHO and air; (7) SO_2Cl_2 from SO_2 and Cl.

Reactions between gases and liquids. SOCIÉTÉ GÉNÉRALE MÉTALLURGIQUE DE HOBOKEN. Fr. 641,796, Oct. 4, 1927. Means is provided in the reaction chamber for giving a whirling movement to the gas to increase its speed and the length of its path through the chamber.

Treating gases with liquids. EDOARDO M. SALERNI and F. M. S. INDUSTRIAL PROCESSES, LTD. Fr. 641,291, Sept. 21, 1927. See Brit. 282,493 (*C. A.* 22, 3556).

Extraction of suspended substances from gases or liquids. ADAM H. PEHRSON. Fr. 642,012, Oct. 6, 1927. Suspended substances are extd. by introducing the gas or liquid contg. them into a rotating cylinder containing a material which is turned over with a falling movement and the gas, etc., passed through it. The app. may be used for extg. chem. agents from paper pulp residues by means of wood to be used for the manuf. of pulp. Cf. *C. A.* 22, 2628.

Utilizing gases containing nitrogen, hydrogen and carbon dioxide. WILLIAM N. HENDERSON (to Solvay Process Co.). U. S. 1,698,722, Jan. 15. A gaseous mixt. contg. N, H and CO_2 , such as a gas to be used for NH_3 synthesis, is subjected to pressure and while under pressure is scrubbed with water to absorb CO_2 and the latter is made to react with Na_2CO_3 to produce $NaHCO_3$ and the gas remaining from this reaction is returned to the gas mixt. on its way to the water scrubber; the unabsorbed mixt. of H and N from the water scrubber is purified and used to produce NH_3 .

Detecting gas leakage. WILHELM GORLITZER. Austrian 100,988, Feb. 15, 1928. Odoriferous substances, such as residues from the manuf. of oil gas, are placed in the pipes near the points of use or just in advance of the points where the pipes enter rooms.

Recovering volatile substances from absorbents. CARBIDE & CARBON CHEMICALS CORP. Brit. 291,277, Oct. 22, 1927. In effecting the recovery of vapors such as those of ether or alc. from gaseous mixts. such as from air by absorption with liquids or solids from which the vapors are subsequently expelled by heating, the incondensable gases are removed from the system before regeneration of the absorbent commences (suitably by displacement with steam). Various details are given and an app. is described.

Comminuting and mixing materials. HERMANN HILDEBRANDT. Swiss 127,088, May 18, 1925. The materials to be treated, together with a large no. of loose balls,

are continuously projected by centrifugal force over a grinding track, or driven over the track frictionally or by impact, and continuously returned to the starting point. App. is described comprising deep shells, with steep upwardly and outwardly rising walls, which impart rotary and centrifugal movement to the balls and the materials, the balls and the materials being returned downwardly to the middle of the innermost shell. The app. can be used to prep. substances of colloidal fineness.

Mixing "wood wool" and "sorrel-cement" or other long-fibered and powdery materials. KONRAD ERDMANN. U. S. 1,698,881, Jan. 15. Mech. features.

Lixiviating materials. PAUL H. MULLER. Fr. 642,417, Oct. 14, 1927. In a lixiviating or the like app. in which the liquid and solid descend together in a wide chamber the liquid is sepd. from the solid and is pumped off, passed through a heat exchanger and aspirated into a tube below the chamber and draws the solid from the chamber with it, both being led into the chamber again at the top.

Solid carbon dioxide. SOC. ANON DES ATELIERS DE CONSTRUCTIONS MÉCANIQUES ESCHER WYSS & CIE. Fr. 642,057, Oct. 7, 1927. Solid CO_2 is obtained by cooling liquid CO_2 , before expansion, by means of a cooling agent which describes a closed cycle in a sep. refrigerating app.

Drying powdered metals with ethyl alcohol or similar reagents. RINGSDORFF WERKE A.-G. Brit. 291,949, May 28, 1927.

Dry separation of materials such as coal and slate. HENRY M. SUTTON, WALTER L. STEELE and EDWIN G. STEELE. U. S. 1,699,382, Jan. 15. An app. is described which effects sepn. by reciprocating action on an air cushion.

Device for separating dust from granular or piece materials. KARL ORTMANN. Ger. 468,560, Dec. 1, 1926, and 469,377, Sept. 2, 1927. Addn. to 468,560. The material falls through a casing traversed by a no. of horizontal hollow pieces of triangular cross-section. These pieces are open to the casing at their lower edges and are connected internally to a common conduit leading to a suction device, through which the dust is drawn off. In Ger. 469,377, baffles, which may be movable, are arranged over the open lower edges of the hollow pieces.

Filtering effluents. EUGEN GEIGER. Ger. 469,477, Mar. 8, 1925. The effluent is filtered through a traveling endless filter-band, the deposit on which is removed by a jet of water which is then filtered through a sec. band.

Steam supply to a vertical distilling chamber. FRANZ HERZBERG. Ger. 469,214, Jan. 7, 1926. Description of arrangement.

Molding difficultly fusible materials. ROBERT KOLB. Ger. 468,465, Dec. 8, 1926. The mold is arranged in an oven beneath a perforated crucible carrying the material, rotary motion being imparted to the oven in the line from the crucible to the mold.

Molding plastic substances. SOCIÉTÉ D'EXPLOITATION DES PROCÉDÉS HIDOUX. Fr. 642,538, Oct. 18, 1927. To remove air fissures the plastic substance is submitted to 2 successive compressions, so that the brick or the like coming from the first mold and contg. air fissures is compressed in a slightly larger mold, the air being expelled before the compression is complete.

Economical application of heat. HANS BRANDT. Fr. 640,945, Sept. 7, 1927. A system is described whereby heat in the form of very hot water or steam under pressure can be economically used at any required point, particularly in the chem. industries.

Sectional boiler with waste-gas-collecting chambers arranged under the heaters. ADOLF SCHULZE. Ger. 469,623, Aug. 10, 1926.

Waste-gas boiler for the simultaneous production of high- and low-pressure steam. RICHARD NÜBLING and ROBERT MEZGER. Ger. 469,607, Jan. 18, 1927.

Preventing incrustation and corrosion in boilers, condensers, etc. FRIEDRICH HAUPTVOGEL. Austrian 111,316, June 15, 1928. The boiler, etc., is included in an elec. circuit actuated by d. c. and comprising a regulable resistance in parallel with the boiler and lamp resistances between the regulable resistance and the source of current.

Purifying solutions containing dissolved salts and organic coloring substances. ARTHUR B. RAY (to Carbide and Carbon Chemicals Corp.). U. S. 1,699,449, Jan. 15. Soln., such as those of sugar are treated with a quantity of tri-Ca phosphate or other water insol. alk. earth metal phosphate adjusted for the pptn. of the principal portion of the salts present and with a quantity of absorptive C sufficient for removal of substantially all the coloring matter.

Purifying liquids such as oil mixtures which tend to emulsify. FORD H. McBERTY (to DeLaval Separator Co.). U. S. 1,698,270, Jan. 8. In treating used automobile crankcase oil, a liquid such as aq. Na_3PO_4 soln. is added which tends to agglomerate impurities present but which also tends to form a relatively persisting emulsion and the liquids are sepd. (suitably by centrifuging) before a "tight emulsion" is formed,

and may then be further admixed and reseed. until the desired purification is effected. An app. is described.

Methyl formate or similar formates as solvents in purifying oils. I. G. FARBENIND. A.-G. Brit. 291,817, Jan. 7, 1927. Mineral oils, fatty oils or oils formed by distn. or hydrogenation of coal may be treated with Me formate or like formates to ext. resinous or other constituents.

Removing liquids such as oil from wells. ROBERT DEMING. U. S. 1,697,856, Jan. 8. A column of liquid of relatively small diam. is subjected to a continuously applied gas pressure less than would be required to elevate out of the well a column of liquid lightened by the addition of gas, and a stream of gas is impinged upon the top portion of the column and above the liquid level of the well to disperse and remove the liquid as a mist suspended in a continuous phase of gas. An app. is described.

Solubilizing liquids. ROBERT HOUBEN. Fr. 642,449, Oct. 15, 1927. Liquids are made sol. in water by making a paste by sapon. a vegetable or mineral oil, mixing an org. solvent and water in approx. equal vols. with the paste, and then adding and mixing the liquid.

Dispersion of organic substances in liquids in which they are not readily soluble. I. G. FARBENIND. A.-G. Swiss 127,514, Mar. 8, 1927. The org. substance is treated with liquid in the presence of acid aryl phosphates. Thus, ditolyl Na phosphate is dissolved in water and mixed with cyclohexanone, giving a clear soln. which can be dild. with any quantity of water. Similarly, cyclohexanol, oleic acid, PhNH_2 and C_6H_6 can be dispersed in water.

Solutions of resins, dyes, cellulose esters and ethers, etc. I. G. FARBENIND. A. G. Swiss 127,241, Apr. 19, 1927. The water-sol. esters of polyhydric alcohols with fatty acids are used as solvents for org. or inorg. substances of diverse kinds. According to the examples, (1) shellac is dissolved in glyceryl formate and (2) acetylcellulose or benzylcellulose is dissolved in a mixt. of glycol mono- and di-formates.

Clarifying apple juice or other solutions containing tannin. WILLIAM A. BENDER (to Certo Corp.). U. S. 1,698,985, Jan. 15. Solid casein is added and the sediment which forms is removed.

Extracting sugar, etc. KARL KOMERS and KARL CUKER. Fr. 642,277, June 8, 1927. In a diffusion process for treating beet, sugar cane, wood, bark, etc., the material is given a gentle squeezing or suction without damaging the cell membrane and then subjected to an oxidizing current of gas, which dries the cells and concentrates their internal juices, thus raising the osmotic pressure and accelerating the diffusion. Centrifuges, etc., for the preliminary treatment may be interposed between some of the diffusers.

Large crystals from salt solutions. PAUL SEIDLER. U. S. 1,697,543, Jan. 1. Vegetable substances such as ext. of field hay are added to salt solns. such as NH_4Cl and the solns. are concd. by heating, allowed to cool slowly, and the crystals formed are removed from the mother liquor, centrifuged and dried.

Mining oil deposits and other lethal or combustible gas-producing deposits. EWART G. SINCLAIR (to Midwest Refining Co.). U. S. 1,697,788, Jan. 1. Gas-producing workings are isolated by suitable barriers and an atm. of gas is maintained in the workings under superatm. pressure to prevent entrance of air and excavating and removal operations are effected in the gas under pressure, e. g., by miners wearing respiratory app. An app. is described.

Electric cables. C. E. A. T. CONDUOTORI ELETTRICI ED AFFINITORINO. Brit. 291,416, June 3, 1927. A method of effecting controlled impregnation and drying of paper insulation in the manuf. of high-tension single-phase elec. cables comprises covering the central Cu of the cable with a porous paper layer on which is wound a Cu strip in a close continuous spiral, the edges of the turns of which do not touch, and a paper insulation is placed also around this strip. Insulation resistance, capacity, etc., measurements are made during impregnating and drying of the cable to serve for control of the process.

Luting. I. G. FARBENIND. A.-G. (Adolf Menger, inventor). Ger. 469,189, Nov. 6, 1925. Joints of tube systems are luted by applying liquid cellulose esters and then adding substances which improve the mechanical properties of the mass. Ethyl-acetanilide, with or without diethyldiphenylurea, and triphenyl phosphate are given as examples of the added substances.

Refrigeration plant. EUGENIO BIAGGINI. Ger. 469,557, Feb. 3, 1925. In plant in which a reducing nozzle of unvaried cross-section is arranged between the condenser and the evap. coils, a vessel of greater capacity than the total vol. in the liquid state

of the cooling medium circulating in the plant is arranged between the evap. coils and the compressor.

Refrigerating apparatus of the absorption type. I. AMUNDSEN (to Aktieselskabet Amundsen Refrigerator Co.). Brit. 291,039, Oct. 29, 1926.

Refrigerating apparatus of the absorption type. CARL HOCHHERZ. U. S. 1,697,187, Jan. 1.

Refrigerating system of the absorption type. FREDERICK G. KEYES (to National Refrigerating Co.). U. S. 1,698,847, Jan. 15. In utilizing absorption material such as CaCl_2 which is capable of forming with the refrigerant fluid such as NH_3 definite addn. compds. of higher and lower order, the alternating stages of emission and absorption are confined between limits corresponding to the higher-order and lower-order addn. compds. An app. is described.

Refrigerating apparatus of the compression type. EDWIN H. HULL (to General Electric Co.). U. S. 1,698,306, Jan. 8. Structural features.

Refrigeration apparatus of the compression type. EUGENE L. BARNES (to Barber Asphalt Co.). U. S. 1,699,681, Jan. 22.

Refrigerating apparatus of the compression type. ROSCOE R. STITT (to Stitt Refrigeration Co.). U. S. 1,698,350, Jan. 8.

Refrigerating apparatus of the compression type. FRANK W. SCHWINN. U. S. 1,697,542, Jan. 1. Structural features.

Refrigerating apparatus of the closed-cycle compression type. RANSOM W. DAVENPORT (to Chicago Pneumatic Tool Co.). U. S. 1,698,939-40-1, Jan. 15. Structural features.

Refrigerating system of the compression type. C. W. VOLLMANN. Brit. 291,856, March 7, 1927. Structural features.

Heat-exchange system suitable for use in connection with refrigerating systems. RANSOM W. DAVENPORT (to Chicago Pneumatic Tool Co.). U. S. 1,698,938, Jan. 15. A mixt. of CH_2Cl_2 and a lubricant may be used.

Thermostatic control for refrigerating apparatus. HERBERT W. WOLVERTON (to Frigidaire Corp.). U. S. 1,699,576, Jan. 22.

Device for indicating the pressure and temperature of a refrigerating machine. GES. FÜR LINDE'S KISMASCHINEN A.-G. Swiss 127,613, Jan. 12, 1927.

Preventing corrosion by salt solution of metal parts of refrigerators. ALFONS SPIZER. Austrian 110,863, May 15, 1928. An addn. of quinoline, suitably in amts. 10-5 1%, is made to the salt soln.

Liquefaction apparatus for refrigerators. DR. ING. SILLER & RODENKIRCHEN G. M. B. H. Fr. 642,495, Oct. 17, 1927.

Ice-making machine using liquid ammonia. MARCEL MOULIN. Fr. 641,448, Sept. 3, 1927.

Electric insulation. D. ANDERSON & SON, LTD., AND R. O. CHILD. Brit. 291,858, Aug. 16, 1927. Bituminous materials, tar, gutta-percha, rosin, varnish and the like are treated with a colloid such as casein, glue or starch in a partially coagulated condition and the mixt. is centrifuged to remove suspended matter. Heat and solvents may be employed and the casein may be partially coagulated by sulfonated oil or other slightly acid agent.

Insulating material. ISOLA-G. M. B. H. Ger. 469,073, Aug. 21, 1925. Mg-contg. minerals are first melted and then pulverized in a current of steam or compressed air. Cl. C. A. 22, 3719.

Insulating material. I. G. FARBENIND A.-G. Fr. 641,487, Sept. 23, 1927. An elec. insulating material for sepg. partitions is made from a fibrous inorg. substance mixed or not with other inorg. substance and treated before or after molding with a binder composed of a mixt. of nitrocellulose and a softening agent such as phenol ethers or phosphoric acid, with or without the addn. of resins. Examples are given in which slag wool and "asbestos" are used.

Electric insulating material. I. F. SLASTIKOV. Russ. 4799, Mar. 31, 1928. Equal quantities of SbCl_3 and S are melted and heated up to 400° without boiling, poured in a thin stream into cold water, taken out and left to harden. Three parts by wt. of the substance so obtained is then mixed with, e. g., 4 parts of wood tar, 2 parts of coal tar heated preliminarily to 200° until beginning darkening and 1 part of paraffin wax boiled until it starts to become brownish.

Insulating coating composition. SIDNEY M. HULL (to Western Electric Co.). U. S. 1,698,870, Jan. 8. A compn. suitable for use on wires comprises cellulose acetate 30, a phenolic condensation product 10 and furfural 300 parts.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Progress in chlorination of water, 1927-1928. L. H. ENSLOW. *J. Am. Water Works Assoc.* 20, 819-46(1928).—Following a discussion—strengthened by many successful examples—of prechlorination, there is also reference to super- and de-chlorination. The use of ammonia or permanganate with chlorination and the use of chlorine in algae control as well as preventing sludge putrefaction are considered.

D. K. FRENCH

Chlorine absorption as a substitute for oxygen consumed. HARRISON HALE, MAY SULLIVANT AND CHARLES B. DEWITT. *J. Am. Water Works Assoc.* 20, 847-53(1928).—A method using *o*-tolidine is described and recommended for the detn. of chlorine absorption. This method is rapid and a more accurate index to nitrogenous matter than O consumed.

D. K. FRENCH

Use of the physical qualities of a water in judging its quality. F. DIENERT. *Rev. hyg.* 50, 881-93(1928).—More extensive use of color, taste, odor, temp. and fluorescence in water examn. is advocated.

C. R. F

Electroosmotic water purification. II. A. H. W. ATEN. Gemeente Electriciteitswerken, Amsterdam. *Chem. Weekblad* 25, 646-48(1928); cf. *C. A.* 22, 2421. A calcn. shows that purification can also be obtained with diaphragms in which the ions have the same mobility as in water, providing the anolyte and catholyte are of a definite acidity and alky., resp.

G. CALINGAERT

The relationship between carbonates and p_H and conductivity in natural waters. RONALD SENIOR-WHITE. *Water and Water Eng.* 30, 455-6(1928).—It is difficult to det. carbonate, bicarbonate, and CO_2 content of waters in the field. If titrations are delayed until return to the lab., considerable change may take place. p_H is detd. with portable field app. and only small samples of water must be carried back to the lab. for the detn. of cond. Routine analyses of several waters show a close relationship existing between (1) p_H values and percentages of the free and half-bound carbonate (movable carbonate) and (2) the total carbonate, including dissolved free CO_2 , and the cond. of the water as measured by a Kohlrausch bridge and cell. The relations of (1) are shown to be reasonably accurate. The relations of (2) are open to sources of error except in pure waters of low cond., because of interference with chloride, sulfate, etc.

E. BARTOW

The problem of biochemical decomposition of phenol in natural water. H. BACH. *Gesundh. Ing.* 51, 773-4(1928).—Phenol finds its way into natural water from gas plants, coke plants, etc. Expts. were carried out in a glass vat of 210-l. capacity. The bottom was lined with sand and goldfish were placed in the water. When 10 p. p. m. was added, only a trace remained after 4 days. A second addn. of 10 p. p. m. gave similar results. Phenol in amts. up to 25 p. p. m. was rapidly destroyed. Further addns. resulted in retarded decompn. Addns. of 10 p. p. m. phenol seemed to have no harmful effect on the goldfish.

WAYNE L. DENMAN

Removing gas from water. M. EULE. *Gesundh. Ing.* 51, 801-6(1928).— CO_2 and O are known to be important in the corrosion of iron and steel. CO_2 is ordinarily removed by means of alkalis. O can be removed by chemical means. It is also removed by mechanical means. Illustrations of app. used in removing dissolved gas in water are given.

WAYNE L. DENMAN

Water works improvements on a cost plus basis. H. V. PEDERSEN. *J. Am. Water Works Assoc.* 20, 809-12(1928).—For reconstruction and questionable jobs, cost plus is recommended.

D. K. FRENCH

Hydrogen sulfide removal and water softening at Beverly Hills, Calif. R. L. DERBY. *J. Am. Water Works Assoc.* 20, 813-18(1928).—The problem involves removal of H_2S from air as well as from water. H_2S in the supply varied from 1 to 20 p. p. m. Aeration took care of the H_2S after which lime, alum and Cl are used. A clarifier is used between the primary and final coagulation.

D. K. FRENCH

Engineering problems in the water supply system of Chicago. LORAN D. GAYTON. *J. Western Soc. Eng.* 33, 561-5(1928); cf. *C. A.* 22, 3473.—In order to supply the more than three million people in Chicago and its suburbs, there have been constructed 6 intake cribs and 11 pumping stations. They are inter-connected. 1,070,000,000 gals. per day was pumped during August, 1928. The engineering features include cribs, pumping stations, both steam and electrically driven, tunnels and distribution mains. The drainage canal and the sewage treatment plants of the Sanitary District of Chicago protect the water supply.

EDWARD BARTOW

Water supply situation in Kentucky. E. E. JACOBSON. *J. Am. Water Works Assoc.* 20, 854-9(1928). D. K. FRENCH

Water supply purification in Tennessee. HOWARD R. FULLERTON. *J. Am. Water Works Assoc.* 20, 860-2(1928).—Advances have been made in iron removal, disinfection and filtration. D. K. FRENCH

Six years' operation of filter plant at Peterborough, Ont., Can. R. L. DOBBIN. *J. Am. Water Works Assoc.* 20, 795-805(1928).—The supply is river water. Its treatment includes aeration, sedimentation, filtration and chlorination. Treatment is primarily for color removal; 50% bacterial reduction is obtained at the filters. Every step is described in detail. D. K. FRENCH

History of Utica's water supply. F. E. BECK. *J. Am. Water Works Assoc.* 20, 806-8(1928). D. K. FRENCH

London water supply. HENRY E. STILGOE. *Water and Water Eng.* 30, 528(1928).—The drainage area is 558 square miles. The av. daily consumption is over 260 million gals. or 36 gals. per capita. There are 49 storage reservoirs with a capacity of 19,657 million gallons. 92 service reservoirs with a capacity of 321 million gallons, 176 acres of sand filters. 58% comes from the Thames, 25% from the Lea, and 17% from wells. Rapid filters and chlorination are used in some of the plants. EDWARD BARTOW

New waterworks for Scarborough. ANON. *Water and Water Eng.* 30, 506-10(1928).—The new works included a well 428 ft. deep and the covering of a reservoir to prevent discoloration of the water by the growth of algae. EDWARD BARTOW

Sheffield's water supply. WOMERSLEY, *et al.* *Water and Water Eng.* 30, 451-4(1928).—Sheffield's water supply includes 12 storage reservoirs with a capacity of 5745 million gals. and 18 service reservoirs with a capacity of 94 million gals. It supplies 336,000 people. All the water is filtered. The new works have a capacity of 4 million gals., an addition to the filter plant filters Derwent water. The plant contains suitable tanks and app. for the application of suitable doses of chemicals for removing color and neutralizing acidity. Lime and alumino-ferrie soln. are used. There are 32 filter units, 8 ft. in diam., giving a total filtering area of 1600 sq. ft. The water is soft, varying between 2° and 3° of Clark's scale. Since the soft water attacks metals, a small amount of lime is used to prevent corrosion in the mains. The new supply increases the resources by a little more than 12%. EDWARD BARTOW

The future of Berlin's water supply. A. FEILITZSCH. *Gesundh. Ing.* 51, 785-7(1928). The supply is largely surface water; it requires filtration and chlorination. It is estd. that the yearly demand in 1945 will be 400 million cu. m. Much descriptive material is present in this article. WAYNE L. DENMAN

The use of artesian water for the water supply of Mitau. G. THIEM. *Gesundh. Ing.* 52, 7-10(1929).—Mitau is a city of 40,000 inhabitants in Lettland. Hydrological charts show that Mitau is situated in the center of a concave fold in the earth's strata. The water is found in Devonian water-bearing sandstone; it enters this stratum from openings at much higher levels. Two borings of 186 meters and 205 meters yield artesian water. The normal capacity of these wells is about 2420 cu. m. per day. The first boring gives a water of 56 p. p. m. CaO temporary hardness and 64 p. p. m. permanent hardness, whereas the temporary hardness of the second well is 30 p. p. m. and the permanent hardness is 90 p. p. m. The total hardness of the two wells is the same. WAYNE L. DENMAN

Town water supply in India. J. W. MADELEY. *J. Roy. Soc. Arts* 77, 24-47(1929). Because of lack of funds and scarcity of good water, it is very difficult to obtain sufficient water to meet the needs of Indian towns. Water was supplied to Madras at the rate of 25 gals. per head for an estimated population of 600,000. Regular methods of purification including filtration, and chlorination are used. Slow sand filtration is not satisfactory. Chlorination is used as a second line of defense. Great difficulty is experienced in preventing waste of water. EDWARD BARTOW

Practical points on feed-water treatment. J. GUEST. *Blast Furnace and Steel Plant* 16, 1461-65(1928).—Water for the power plant should be (1) free from scale-forming solids, (2) free from corrosive properties gaseous or otherwise, (3) free from a high concn. of solid matter likely to cause foaming or priming and excessive blow-down. Treatment with lime and soda with or without coagulants, with zeolites or by combined methods are used in accordance with the character of the water to be treated. Dissolved gases are removed by increase of temp. either at atm. or reduced pressure. A const. check should be kept on the treated water. EDWARD BARTOW

Feed water and boiler efficiency. W. G. LEWIS AND G. S. IRVING. *Eng. and Boiler House Rev.* 41, 378, 380; *J. Am. Water Works Assoc.* 20, 157(1928).—A review

of a wide field, including references to the colloidal phases of water treatment.

Dissolved oxygen in boiler-feed water. WM. E. SMITH. *Facts About Sugar* 23, 1194-5(1928).—The corrosive effects of dissolved oxygen and methods of degasification of water are described. *Dissolved oxygen* is estd. by reduction with MnSO_4 and iodometric titration with $\text{Na}_2\text{S}_2\text{O}_3$.
D. K. FRENCH

Sodium-aluminate treatment for boiler-feed water. C. C. SPILMAN. *Power* 69, 94-6(1929).—A soln. of Na aluminate in NaOH and soda ash is a powerful coagulant. When daily tests are made on each boiler for reaction and hardness, it is possible to maintain boiler-feed water approx. const. despite large fluctuations in raw water compn. The advantages are less excess chemicals, less sol. salts, low hardness, less foaming and less scale than result from other methods of treatment. In a plant treating one million gals. per day the cost of chemicals ranges from \$0.0258 to \$0.0386 per thousand gals.
M. J. PROFFITT

Comparing detergents and wetting agents by their effects on the hardness test for water. H. PERNDANNER AND J. HACKL. *Melliand Textilber.* 9, 913-5(1928).—The presence of detergents other than soaps and of wetting agents cause a change in the apparent hardness of H_2O as estd. by the Clark test, and this may be suggestive of useful test methods for such products. Using a standard water of 12° (German) hardness, and solns. contg. 0.1 to 0.2 g. per 100 cc. of various products, apparent hardnesses of from 6.9° to 11.1° were obtained. The data were considered favorable to Nekal BX.
D. B. DILL

Dissolved iron and manganese in stored water at Kernersville, N. C. W. H. WEIR. J. N. Car. Section. *Am. Water Works Assoc.* 5, 119-26(1927); *U. S. Pub. Health Repts.* 43, 3265(1928).—A review of unusual problems developed at Kernersville, N. C., when a new filtration plant designed to treat a typical turbid water of a flowing stream was placed in operation to treat the same water after storage in a shallow reservoir contg. large quantities of org. matter. Storage of this water led to a marked change in its quality, leading to the soln. of Mn and Fe from mineral deposits at the site and to a large increase in the color of the water. Expts. conducted at the plant indicate that aeration of the water failed to ppt. the Fe and Mn, probably because of the large org. content. Prechlorination of the water led to the pptn. of the Fe and Mn, but the org. color remained unchanged. Addn. of lime to the raw water produced excellent flocculation of the Fe and Mn, but no change in the org. color. Subsequent coagulation with alum, however, resulted in a reduction of the color. Expts. were duplicated on a plant scale by the addn. of lime to the raw water entering the mixing basin. The dose of lime was detd. by the maintenance of a faintly caustic reaction to phenolphthalein. The formation of the $\text{Fe}(\text{OH})_3$ was extremely rapid, allowing the alum soln. to be added about half way down the mixing chamber. The alum dose was adjusted to maintain the optimum p_{H} for color coagulation. The sedimentation of the floc, however, was slow; so that the settled water was more turbid than desirable, thus requiring frequent washing of the filters and the use of large vols. of wash water. This situation indicates the great desirability of thoroughly studying the quality of raw water to be treated before the final plans for water-purification plants are completed, in order that the plant may be provided with the necessary auxiliary equipment, and for special treatment when such is necessary.
E. R. CLARK

Experiences with *Crenothrix* in ground water supplies. K. W. BROWN. *Munic. News and Water Works* 75, 93-4(1928); *U. S. Pub. Health Repts.* 43, 3267-8(1928) - *Crenothrix* infections in ground water supplies can be eliminated by application of either CuSO_4 or Cl in those systems operating pumping plants augmented by reservoirs of adequate capacity. It is advisable, however, in order to avoid occurrence of obnoxious conditions, that introduction of the chemical be made prior to the reservoir. For systems operating a series of scattered wells there is apparently little opportunity of destroying filamentous organisms; resorting to chem. treatment will occasion inevitably distressing features, the extent of which cannot be foretold. Combating algae by chem. application to water pumped directly to distribution from a system of scattered wells is, therefore, nothing less than a gamble, with odds somewhat in favor of the *Crenothrix* survival.
C. R. F.

A system of analysis for oil-field waters. C. E. REISTLE, JR., AND E. C. LANE. Bur. Mines, *Tech. Paper* No. 432, 14 pp. (1928); cf. *C. A.* 22, 4192.—Description of the Bur. Mines method for quantitatively detg., calcg. and reporting the characteristic constituents in oil-field water for the identification of waters from different strata. Tables show the relation between the sp. gr. and the quantity of water to be used for detg. the metallic ions and between the sp. gr. and the total solids. It is recommended

that the analyst report the characteristic constituents in the water in parts per million (mg. per l.) and reacting values in percentage.

L. MARSH

The dissolving of lead from water pipes. A. FARINE. *Tech. Ind. Schweiz. Chem.-Ztg.* 1927, No. 3/4, 29-32.—Theoretical deductions check with the lab. data in demonstrating that free CO_2 in water greatly accelerates the lead-dissolving action of that water. On the other hand, bicarbonates greatly reduce the action. A sample contg. only free CO_2 dissolved 10.5 mg. Pb per l., but when the CO_2 was replaced by bicarbonate the Pb content was only 0.6 mg. per l. Formulas are derived for calcg. the Pb-dissolving power of water.

C. R. F.

Modern sewage purification. F. EGGER. *Städt. Chem. Untersuchungsamt, Stuttgart. Tech. Ind. Schweiz. Chem.-Ztg.* 1927, 76-81; *Ibid* 93-6.—A description of the activated sludge system with diagrams for the city of Stuttgart.

C. R. F.

Modern sewage treatment plants in England and America and their importance to German municipal sewage treatment. F. LANGBEIN. *Gesundh. Ing.* 51, 738-42 (1928).—Activated sludge processes are finding greater favor in these countries. Milwaukee has built a plant which has a normal capacity of 386,000 cu.m. sewage daily, and many other cities operate large installations. Four schematic representations of this process are given and illustrations of plants in the principal cities.

WAYNE L. DENMAN

Theory and practice of sludge decomposition. M. PRÜSS AND H. BLUNK. *Gesundh. Ing.* 51, 769-73 (1928).—Artificial heating results in more rapid decomposition and as a result the min. retention period is lowered. Artificial circulation and mixing with fresh sludge results in more efficient operation (German patent 465,211). Also gas formation is greater.

WAYNE L. DENMAN

The purification of sewage from the city Elmshorn, with special reference to tannery wastes. A. SNOEK. *Collegium* 1928, 612-21.—Data on the quantity of sewage are given. Purification by sand filters or absorption on clay was not satisfactory. An exptl. activated-sludge plant operating on $\frac{1}{3}$ tannery waste and $\frac{2}{3}$ city sewage reduced the total bacteria from 970,000 to 375,000 and spore formers from 62,000 to 200. The effluent was optically clear and was discharged through a small tank contg. fish which remained healthy. The sludge in the putrifying room was soon reduced to a tenth of its original quantity; the end product was a black humus-like mass having an earthy odor and good fertilizing value. The gas which was given off was 90% CH_4 and in gas engines would supply enough power to operate the plant.

I. D. C.

The causes and prevention of hydrogen sulfide in abattoir sewage. A. B. PORTER AND J. A. CRESSWICK. Metropolitan Meat Ind. Board, Sydney. *J. Soc. Chem. Ind.* 47, 380-2T (1928).—A gravity sewer about 2 miles long leads the sewage into large collecting wells. From this point the sewage is pumped through a rising main about $\frac{1}{4}$ miles to one of the city trunk sewers, thence 12 miles to the Pacific Ocean. The abattoir waste is dild. with 60% of other sewage in the collecting wells where H_2S and other offensive gases created a serious nuisance to persons residing in a large area. Blood decomposed faster in salt than in fresh water. Paunch contents (manure) hastened decompn. but casing-refuse had no effect. The effect of increased temp. on decompn. was very marked, the same results being obtained in 1 hr. at 37° at 6 hrs. at 32° , or 24 hrs. at room temp. The principal source of the H_2S was the bacteria present in the paunch manure. The elimination of coarse paunch manure from abattoir sewage greatly improved conditions both as to H_2S evolution and accumulation of waste in the sewers. By keeping the waste at a cool temp., improvements were also effected. In order to combat rapid fermentations, all wastes are now treated with lime and FeSO_4 to fix any small amts. of sulfide as FeS and render them sufficiently alk. to prevent further bacterial action.

C. R. F.

Sanitary program of the Chicago district. LANGDON PEARSE. *J. Western Soc. Eng.* 33, 554-6 (1928).—The district takes the sewage in interceptors to the drainage canal and to treatment plants. The district is not allowed to take sufficient water for disposal by dildn. and is building treatment plants to make it possible to deliver the treated sewage into the Illinois River without nuisance. Plants to treat the sewage from two and a half million people are either built or under construction and the district has plans for treatment plants to serve the city for 10 years and interceptors for 40 years. The wastes from Packing Town are equiv. to 1,300,000 in addn. to the human population.

EDWARD BARTOW

Carbon monoxide hazard in city streets. JOEL I. CONNOLLY, MATHEW J. MARTINEK AND JOHN J. ARBERLY. *Am. J. Public Health* 18, 1375-83 (1928).—Analysis of 600 street air samples from Chicago, taken at the curb, 3 ft. above the sidewalk shows a distribution of CO according to the type of street. Analyses were by a modi-

fied iodine pentoxide method. 85% showed 50 p. p. m. or less, 63% 30 p. p. m. or less. The av. for the city was 31 p. p. m., in the downtown area ("Loop") 53 p. p. m., in the densely populated district around this 21-30 p. p. m. and in less thickly populated districts 15-18 p. p. m. The amt. increases according to the number of automobiles passing in 5 min. from 10 p. p. m. to 64 p. p. m., the latter with 400-1000 cars. Ten p. p. m. is considered a residual amt. and above it the amt. varies approx. as the logarithm of the no. of automobiles passing in 5 min. In residential and industrial streets the av. concn. is 12.5 p. p. m., on traffic streets 25 p. p. m. and on boulevards 47.6 p. p. m. A table of percentage of samples in each range of 10 p. p. m. for each class is given. On boulevards hourly fluctuations occur with maxima at 8-9 A. M., 11-12 A. M., 1-2 P. M. and 5-6 P. M. On a 2-level street, Wacker Drive, open to a river on one side, the av. was 62 p. p. m., the max. 133 p. p. m. and only one sample was under 33 p. p. m. The Dept. of Health does not permit use of this level as a source of air supply for adjoining buildings. It was concluded that in general CO in the air of city streets other than boulevards does not constitute a serious health hazard. At times automobile boulevards and the lower level of double-decked streets contain enough CO to menace the health of those exposed for several hrs and this air should not be used for habitable rooms. Recommendations for consideration are mech. ventilation of double-decked streets, reduction of idling of motors and studies of the effect of CO in amts. below 100 p. p. m. on susceptible age groups or individuals. FOSTER DEE SNELL.

The bacterial examination of water in public swimming baths. G. K. BOWEN. *J. State Med.* 36, 521-45(1928); *U. S. Public Health Eng. Abstracts* E-676d(1928). B reviews the literature of transmission of disease by swimming baths and of bacterial standards. Practically all of the standards considered are of U. S. origin. Exptl. results obtained from a number of places in England during the yrs. 1925-26 are given. These data include bacterial results, methods of operating the bathing pools, no. of persons using baths and effects of temp. B. concludes in part that: (1) Pollution is less in cold weather than in warm, regardless of methods; (2) continuous filtration is superior to occasional emptying and filling with fresh water; (3) the standard adopted should be as stringent as that of drinking water (U. S. Treasury); and (4) it is not possible to maintain this standard without continuous disinfection with some agent such as Cl. J. A. KENNEDY.

Purifying water. R. E. HALL. *Brit.* 291,970, June 28, 1927. For filtering boiler water or other hot alk. waters free from oil or oily substances silicates are used such as granulated slag from Cu smelting, forsterite, or other members of the olivine group of minerals, or some members of the pyroxene and amphibole group, ilmenite or chromite. An app. is described.

Filter construction suitable for municipal water filtration plants. WALTER WAGNER (to General Zeolite Co.). U. S. 1,698,079, Jan. 8.

Purifying boiler feed water. LEOPOLD SCHINDL. Austrian 110,070, Feb. 15, 1928. The water passes through a container in which it is first treated with steam, for removal of gases, and then filtered through successive gratings of increasing fineness.

Device (associated with the smoke box) for heating and purification by steam treatment of feed water for locomotive boilers. JOHANN STUMPF. U. S. 1,699,965, Jan. 22.

Prevention of boiler incrustation by electrical means. LEOPOLD FRÄNZL. Austrian 109,792, Jan. 15, 1928. The system includes a charged elec. condenser, the surface to be protected against incrustation corresponding to a plate of the condenser.

A compound for removing boiler scale. M. I. GLIBOV. Russ. 4829, Mar. 31, 1928. A concd. soln. of NaOH is mixed with an aq. ext. from oak bark and moss, a mixt. of tanning ext. and linseed-oil foots with the addn. oft annin, marshmallow

root and viscous salep roots until the liquid so obtained has a viscosity range of 34–44° Bé.

Extracting tannates from boiler scale. HERMANN MENZ, KURT TREUBENER AND WALTER FAHDT. Ger. 467,021, July 29, 1924. A device for the lixiviation of boiler scale to ext. the tannates is fitted with an internal sieve which retains solid matter.

Apparatus for softening water with base-exchange substances. CHESTER T. MCGILL (to Reiter Co.). U. S. 1,697,835, Jan. 1. Structural features.

Apparatus for softening water by treatment with base-exchange materials. CHAS. P. EISENHAEUER (to Duro Co.). U. S. 1,699,836, Jan. 22.

Apparatus for softening water by treatment with base-exchange material. EDWARD T. TURNER. U. S. 1,697,095, Jan. 1.

Filtration apparatus adapted for softening water with base-exchange silicates. CHESTER T. MCGILL (to Reiter Co.). U. S. 1,698,890, Jan. 15. Structural features.

Forming screen plates for water softener filters, etc. CHARLES P. EISENHAEUER (to Duro Co.). U. S. 1,699,693, Jan. 22. Mech. features.

Artificial zeolite. ORDEIG, SOCIEDAD LIMITADA. Fr. 641,755, Oct. 3, 1927. A colloidal ppt. is obtained by the action of an alkali aluminate on a colloidal soln. of a metallic salt with Na_2SiO_3 . The mother liquors are extd. by pressure, dried and fractioned in water giving a fine sand of artificial zeolite for *water purification*.

Decreasing the hardness of water used for treating fibrous material. G. S. PETROV and N. A. ALEKSEEV. Russ. 4630, Feb. 29, 1928. H_2SO_4 sludges obtained from treatment of crude oil, shale and brown-coal distillates, peat tars, hydrogenated aromatic hydrocarbons, terpenes or sulfonic acids obtained from sulfination of aromatic hydrocarbons or phenols with fats or fatty acids are used to soften water in a proportion to obtain a slightly acid reaction followed by a neutralization with soda.

Apparatus for treatment of distillery slop or other organic wastes. GUSTAVE T. REICH. U. S. 1,698,171, Jan. 8. An app. is specified suitable for heating in retorts to obtain a *fertilizer* and various structural details are described.

Incinerator for garbage, etc. WILLIAM C. EPSTEIN (to Duo-Tor Mfg. Co.). U. S. 1,697,524, Jan. 1.

Retorts and associated apparatus for drying and incinerating garbage and rubbish. JOHN SCHAAF. U. S. 1,698,454, Jan. 8. Structural features.

Incinerator for household garbage and refuse. LEE O. HABER (to Buffalo Co-operative Stove Co.). U. S. 1,699,531, Jan. 22. Structural features.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

Soil experiments. O. LIEHR. *Z. Pflanzenernahr. Dungung.* 7B, 201–6(1928).—Nutrient values of a large number of soils were detd. by the Neubauer seedling method and by that of Lemmermann and König. No general relationship existed between these values and the soil reaction. A general lack of phosphate in German soils is indicated. B. C. A.

Soil analyses and their limitations. W. N. C. BELGRAVE. *Malayan Agr. J.* 16, 289–3(1928). The older well-known standard methods are very briefly reviewed and the limitations to the usefulness of such methods and recent modifications are discussed and lastly an explanation of the present sphere of usefulness of soil analyses is given. While mech. analyses are useful, chem. analyses in themselves cannot be recommended. Chem. analysis can be of use for comparing a soil with another of the same type and in the same habitat of which the reaction to fertilizers for the crop under consideration has been ascertained, either by long planting experience or by field expts. when and only when this basic information is available can use be made of chem. analysis. E. F. SNYDER

The theory of the soil substance rule. A. V. BUZAGH. *Kolloid Z.* 46, 178–85 (1928). The adsorption theory of soil substance is discussed with the conclusion that factors other than adsorption are of importance. This conclusion was then substantiated with exptl. data. It was shown that the principle is applicable to non-peptized coarse dispersed systems with the conclusion that the soil substance effect enters into the production of colloidal solns. by the solvent interchange method. It was shown that degree of peptization depends not only upon sp. adsorption but also on the concn. of the gel suspension independently of whether a peptization, in the narrow sense, had taken place, or whether only a suspension occurred. L. F. MARK

Colloids and soil fertility. A. DEMOLON. Lab. du ministère de l'agr. *Rev. gén. sci.* 39, 604-12(1928).—This is a brief review, in the light of recent work, of the importance of colloids in some problems of chem. agriculture. The constitution and properties of mineral and humic colloids, the complex clay and humic colloids, colloids and H_2O , the absorbing power of colloids and colloids and soil reaction are discussed. There is another subject which appears outlined and which perhaps is no less suggestive. It is that which concerns the relation of the plants to the colloidal complexes. Perhaps it is not too fanciful to hope that this same path will lead shortly to a satisfactory detn. of the elements of the soil at the disposition of the plant. At this moment, the study of the soil appears as the most solid basis of agronomy. E. F. S.

Colloidal behavior of soils and soil fertility. V. The distribution of soluble and colloidal iron and aluminum in soils. J. S. JOFFE AND H. C. MCLEAN. *N. J. Agr. Expt. Sta. Soil Sci.* 26, 317-25(1928); cf. *C. A.* 22, 4701.—It was found that colloidal Fe and Al sols of various degrees of dispersion may exist, especially in the presence of the NO_3 anion and at moments of the relative absence of the SO_4 and PO_4 anions. Dialysis expts. on samples of surface and subsoil from soil fertility plots prove that only extreme conditions of acidity may bring about Fe and Al in the mol. state. Water exts. of the dialyzed soils should contain the Fe and Al which may be present in the sol state, and in expts. with a large no. of soils it was found that very little of the sol state exists. Fertilizer treatments of the soils investigated do not seem to show marked effects on the state of aggregation of the Fe and Al. The mineral fertilizers tend to coagulate the colloids. The bulk of the Fe and Al split off from the mineral complexes in the process of weathering exist in the soil as the gel, and, as such, are distributed throughout the soil profile. $BaCl_2$ exts. of the same soils which were used in the dialysis expts. give large quantities (as high as 370 p. p. m) of Fe and Al. This is due to the soly. effects of the acid produced by the release of H ions in the process of replacement with the Ba ion. HCl thus formed reacts with the gels, bringing them in soln. The relation of the acid formed by the base exchange reactions to the quantities of Fe and Al going in soln. is discussed. It is shown that the Fe and Al going in soln. do not represent the total quantity of gel present in the soil. A certain correlation may be found between the amt. of titrable acidity of the acid produced by replacement and the amt. of Fe and Al in soln. J. J. SKINNER

Exchangeable bases in soil. V. NOVÁK AND B. MALÁČ. *Bull. Czechoslov. Acad. Agr.* 1927, No. 5; *Proc. Intern. Soc. Soil Sci.* 3, 73-4(1927-8).—Carbonate-free soils. The methods of Hissink, Gedroiz, and Kelley for detg. exchangeable bases in soils give comparable results. By the Kelley method the sum of the individual bases agrees with the amt. of NH_3 absorbed from NH_4Cl . In podsol profiles Fe and Al must be included in the calcn. of exchangeable bases. The Gedroiz (0.05 N HCl) method in many cases involves some decompn. of the absorbing complex, and in neutral soils the liberation of detectable amts. of Fe and Al. During the operation of all methods (Hissink not examd.) considerable amts. of silica may be rendered sol. In degraded chernosem profiles, where the A_1 and A_1' horizons are carbonate-free and the C horizon contains much chalk, only Na, K, Mg, and Ca were found among the absorbed bases. Fe and Al only appeared when the Gedroiz method was adopted. Ca was usually present in greatest amts., and Na and K were present only to a small extent. Podsol profiles with acid reaction differ from tchernosem in having only a small content of total exchangeable bases and by the presence among these of Fe and Al. In horizons A and A_1 the sum of replaceable Fe and Al represents 60-70% of the total replaceable bases, whereas in horizons B and C_1 Ca and Mg are predominant, and the Fe and Al content falls to 5-9%. With soils contg. carbonates the Hissink and Kelley methods diverge considerably, the former giving values averaging twice those of the latter. Bobko-Askinasi's method agrees with Hissink's. Gedroiz' method using 0.05 N NH_4Cl yields irregular results. With N NH_4Cl the Gedroiz method gives values double those by Hissink's. Generally speaking, for carbonate-free soils, the Gedroiz simplified method (0.05 N NH_4Cl) is recommended for speed and ease of working. For detg. total bases without individual identification, Kelley's method is better. None of the processes examd. gives a reliable and satisfactory result for soils contg. carbonate. B. C. A

The identification and composition of the soil aluminosilicate active in base exchange and soil acidity. H. W. KERR. Univ. of Wis. *Soil Science* 26, 385-98(1928); cf. *C. A.* 22, 2021.—The base-exchange material of soils is confined largely to the clay fraction and seems to be so intimately mixed with other colloidal material that it is impossible to sep. it by sp. gr. methods. Sepn. by the use of solvents is complicated, because of the soln. of other materials which obscure the results. By employing the contents derived according to the base-exchange equil. theory, as developed by K.,

it was possible to identify active aluminosilicates from different sources. The equil. const. seems to be characteristic of each compd. involved in base exchange. The soil from which the active org. matter had been completely removed by gentle ignition gave a value for K agreeing very closely with samples of a clay material (bentonite) and differing markedly from the values found for the true zeolites tested. This suggests that the inorg. compds. involved in base exchange of soils and bentonite are identical. Bentonite is a mixt. of at least 2 minerals, which are very difficultly sepd. by mech. means, because of the colloidal properties of the substance. It was found possible to decompose the active material of bentonite by boiling for 18 hrs. with *N* HCl. The liberated silicic acid was then extd. with a 10% soln. of Na_2CO_3 . The analyses of these exts. showed that the ratio of Al_2O_3 to SiO_2 was almost 1 to 6. By further consideration of the base-exchange reaction for cations of different valence, it was shown that the active aluminosilicic acid was monobasic, and when due allowance was made for the unsatn. of the compd., the analyses calcd. from the free acid agreed fairly well with the formula: $\text{H}_2\text{O}(\text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2) \cdot 8\text{H}_2\text{O}$. By leaching a sample of bentonite with 0.1 *N* HCl and washing the sample with H_2O , the free acid was prepd. This acid suspended in H_2O gave a p_{H} of 2.73. It is suggested that the compd. described is of widespread occurrence in soils and, for those which are non-alk., is possibly the predominant if not the only mineral in their inorg. exchange complex. E. F. SNYDER

Distribution of nitrates in three layers of fallow soil. JOHN B. SMITH. Rhode Island Agr. Expt. Sta. *Soil Science* 26, 347-50(1928).—The distribution of NO_3 among 3 layers of fallow soil was studied in the summer season of 1926. A fertilizer analyzing 6% NH_3 , 8% P_2O_5 and 6% K_2O was mixed with the surface 7 in. of Merrimac silt loam. For the entire season, there was little actual loss of easily nitrifiable N from the upper 2 ft. of a fallow plat but vicissitudes of weather and activities of microorganisms caused decided temporary disappearances of nitrates. Proportionate disappearances of NO_3 under growing crops might well constitute critical deficiencies of available N. Nitrates moving downward after leaching rains were often retained in the subsoil layers, and at such times the quantities there present were in excess of those remaining in the surface layers. Under midsummer conditions, nitrates leached from the upper soil layers were returned by the upward movement of soil water to replace that lost from the surface by evapn. J. J. SKINNER

Methods for determining "available" soil calcium. H. D. CHAPMAN. Univ. Calif., Citrus Expt. Sta., Riverside. *J. Am. Soc. Agron.* 21, 92-106(1929).—All the methods show in general a higher Ca extn. from soils growing good alfalfa than from those growing poor alfalfa. The exceptions are probably due to the influence of other fertility conditions. The total quantities of Ca leached out by carbonated H_2O were found to approximate closely the exchange Ca in the soils. While the detn. of such total amts. is important in indicating something as to the potential supply of usable Ca a soil may contain, it does not furnish evidence as to that portion which must be available to enable a plant to maintain normal growth. The Ca leached out by the first liter of satd. carbonated H_2O shows something as to potential supply, represents the more easily sol. Ca and shows considerable correlation to field results with alfalfa. Leaching with satd. carbonated H_2O in a closed system is more accurate than shaking given quantities of soil and 0.04 *N* H_2CO_3 and detg. the Ca dissolved. The former procedure approaches more nearly to the hypothecated mechanism of plant feeding and possesses, therefore, more significance as a method for detg. so-called available Ca. The extn. of Ca by means of plant seedlings offers interesting possibilities in detg. the relative amt. of easily sol. constituents in a soil. Used in conjunction with chem. methods, it enhances their significance in detg. that portion of an element which is available. Not as wide a range of Ca could be removed from the soil by buckwheat seedlings as by carbonated H_2O , but the results obtained were in somewhat the same order and quantities. F. F. SNYDER

Complete dissociation of silicates by carbonic acid and humic acid and side reactions. R. GUILLIN. *Compt. rend.* 187, 673 5(1928); cf. *C. A.* 22, 835.—Whatever may be the nature of humified soils, whether they are calcareous or not, carbonic acid and humic acids are able to cause the complete dissocn. of the rocks with elimination at first of K and Na, then of lime and magnesia and finally of alumina which remains solely fixed to the humic acids, iron oxide being eliminated by reduction. E. F. S.

The buffer method and the determination of exchangeable hydrogen for estimating the amounts of lime required to bring soils to definite p_{H} values. W. H. PIERRE AND S. L. WORLEY. Alabama Agr. Expt. Sta. *Soil Science* 26, 363-75(1928).—The buffer capacity of soils toward base can be detd. in the lab. by means of the "dialysis-colorimetric" method. A 3-day period of contact between the soil and $\text{Ba}(\text{OH})_2$ was sufficient

for establishment of equil. The H-ion concn. of soils after being treated with base in the lab., according to the buffer method, was lower than that of the soils treated with equiv. amts. of lime in greenhouse pots. The relation between the amts. of base required in the lab. and the amts. of lime required in the field or greenhouse to bring soils to similar p_H values is called the "liming factor." The "liming factor" of 77 soils of widely different texture and acidity was found to be noticeably uniform and to average about 1.50. Liming of soils in accordance with their content of exchangeable H brought the soils to p_H values of about 6.5. The detn. of the buffer action of soils toward base and the detn. of the exchangeable H of soils are recommended as methods of detg. the amts. of lime required to bring soils to definite p_H values. The advantages of these methods are briefly discussed. The reason why soils to which have been added amts. of lime equiv. to their content of exchangeable H do not reach a p_H of 7.0 but only of about 6.5, is believed to be because the lime reacts with other than the exchangeable H of soils. The non-exchangeable soil complex is also believed to be responsible for the presence of the "liming factor."

E. F. SNYDER

The biochemical factors in sulfur and swamp soils in Latvia. J. KUPZIS. Univ. zu Riga. *Centr. Bakt. Parasitenk.*, II Abt., 76, 48-65(1928).— H_2S in hot springs usually arises by the splitting of sulfides by steam. In cold water it is usually due to the reduction of sulfates by microorganisms. $CaSO_4$ in the boggy soils in the region about Riga is reduced by anaerobic bacteria, particularly *Spirillum desulfuricans*, thus producing H_2S and Ca humate. The reaction continues as the water percolates over the gypsum and dolomite strata as long as food is available and O is absent. Food in the water is derived from vegetation in the swamps. The presence of aerobic bacteria favors the reaction using up available O. The action of CO_2 coming from dolomite yields free S which is found in the soil. The S waters of this region contain not only H_2S but also mineral salts, sol. material from the bogs, and products of bacterial metabolism.

JOHN T. MYERS

Microbiological investigations of strongly acid swamp soils. K. DREWES. Univ. Kiel. *Centr. Bakt. Parasitenk.*, II Abt., 76, 114-20(1928).—The p_H of certain swamp soils ranged from 2.4 to 5.2. At a p_H below 3.5, no vegetative bacterial cells except the S bacteria were found. In the upper humus contg. layers of soil, only mycelial forms and bacterial spores were present. The lower humus layers were sterile. The number of cells and the intensity of microbiological processes are related to the reaction of the soil. At a p_H of 2.4, there was practically no biological action, as protein or cellulose cleavage, nitrification or denitrification. In the production of acid, *Thio bacillus thiooxidans* was most important, by producing H_2SO_4 .

JOHN T. MYERS

Certain abundant non-spore-forming bacteria in soil. H. J. CONN. N. Y. State Agr. Expt. Sta. Geneva, N. Y. *Centr. Bakt. Parasitenk.*, II Abt., 76, 65-88(1928)

A non-spore-forming bacterium, which produces punctiform colonies on agar or gelatin, is abundant in the soil. There are 2 morphological groups, one consisting of typical short rods and the other growing in the lab. for a day or two as rods and then going over to a form resembling micrococci. It is named *Bact. globiformis*. It is capable of utilizing various amino acids, ammonium salts and nitrates, as well as complex compds. like peptone. It can derive its C from polyhydric alcs., carbohydrates and org. acids, even such a simple one as acetic. In spite of this it will not grow in certain poor soils as Volusia silt loam and Hoosick coarse sandy loam, unless furnished with C and N in an available form. These soils have a low crop productivity. It is not suggested that the organism is necessary for the growth of plants but that plants do not thrive in a soil deficient in substances required for the nutrition of *Bact. globiformis*. The presence of such compds. cannot be detected in such small amts. by chem. means. Hence the ability of a soil to support this organism might serve as a rapid means for their detection. One soil, Dunkirk fine sand, will support this organism and yet does not have a good crop-producing capacity. There is a long bibliography. J. T. M.

A preliminary study of the potential fertility of Oklahoma soils. HORACE J. HARPER AND HENRY F. MURPHY. Oklahoma Agr. Expt. Sta. *Proc. Oklahoma Acad. Sci., Univ. Oklahoma Bull.*, N. S. No. 409, 7, 138-41(1928).—A preliminary study of the total N, total P and the acidity was made on 106 samples of soil from various parts of the Expt. Sta. Farm at Stillwater, Okla. There was a wide variation in the total N and total P content, varying from 6940 to 325 lbs. per acre in the case of total N and 2040 to 220 lbs. per acre in the case of the total P. The av. total N content was 2057 lb. and the av. total P content was 601 lb. per acre. These data would indicate that Oklahoma soils on the av. contain only about $1/3$ as much total N and P as should be present in good fertile soil. About 30% of the soils tested should be limed in order to correct the soil acidity which is an important factor in obtaining the best growth

of crops like alfalfa and sweet clover. It was also found that there was a gradual decrease in the N content of the soils in the central part of the U. S. beginning from North Dakota and going south to Texas. Climatic conditions are apparently the cause of this condition. The total P content of the northern states studied was also higher than that of Oklahoma, Arkansas and Texas. The cause of this condition can only be explained on the basis that the original soil-forming materials were higher in those regions. Indications are that the soils in western Oklahoma are not as heavy in texture as the soils in eastern Oklahoma.

E. F. SNYDER

The nitrogen contents of weeds and their relation to soil fertility. HORACE J. HARPER AND HENRY F. MURPHY. Oklahoma Agr. Expt. Sta. *Proc. Oklahoma Acad. Sci., Univ. Oklahoma Bull.* 1928, New Series No. 410, Studies series 30, 73-7.—The growing of legumes is not the right method for building up poor soils, because it is expensive and increases the content of N and org. matter to only a moderate extent. It is known from old that by allowing weeds to grow on poor land, the fertility of the soil rises. This is due to the fact that the weeds transfer to the soil large amts. of org. and nitrogenous substances, the latter being derived from compds. that are originated through the activity of non-symbiotic bacteria capable of assimilating atm. N (*Azotobacter*). The N contents of many plants were examd. including sunflower, ragweeds, osin weed, coreopsis, wild lettuce, cocklebur, crab grass, black-eyed Susan, water hemp, Russian thistle, Bermuda grass, oat and wheat straw, soy beans, peas, hairy vetch, sweet clover, cotton burrs, sesbanis and rye. The hairy vetch samples had the highest N content (2.67-4.1%); next came peas (2.36-3.24%). The lowest amt. was found in straw, the av. of 25 samples being 0.519%. The N values of the majority of the plants examd. ranged between about 1.0 and 2.5%. The question whether weeds should be used as a means of maintaining the fertility of the soil needs serious consideration.

GUENTHER SCHWOCH

The constitution of the soils of the Swiss Romande. RABATÉ AND L. DESHUSSES. *Compt. rend. acad. agr. France* 14, 1207-12(1928).—The soils studied may be put in the category of brown soils. They are delimited to a variable depth, 80 cm. at most. They are relatively not very acid, sometimes neutral and do not require liming, for the reason notably that the roots of the cultivated plants are able to reach the zone of accumulation of lime. The carrying away of the bases goes beyond the first phase of the simple decalcification. The carrying away of the sesquioxides, although not being very rapid, is none the less evident and one is able to note the formation of a layer of accumulation where the humus concs. itself. The soils are therefore finally brown weakly podsolized soils.

E. F. SNYDER

Action of soil acids on cultivated plants. H. FORKERT. *Diss., Hamburg* 1925.—The exchange acidity plays a prominent part in the effect of soil acids on plant growth. In water cultures, nutrient solns. having a p_H value below 5 are injurious. In ranges of less acidity crop increases are obtained. Corresponding effects are observed in soil. Among plants examd. in the seedling stage, oats are the most sensitive to acidity, followed in order by barley, rye and wheat. Peas, flax and sugar beet are but slightly affected by soil acids. Among cereals, acidity brings little change in straw yields, and the relative grain yield is affected only when the total acidity is above 10 cc. No morphological differences are noted.

B. C. A.

Desirable soil-nitrate levels for certain market-garden crops. JOHN B. SMITH. Rhode Island Expt. Sta. *Soil Science* 26, 265-79(1928).—The following quantities of NH_4 are designated as desirable to maintain in soil throughout the season: celery, lettuce and beets, 10 p. p. m.; cabbage, 15 p. p. m.; tomatoes and squash, 20 p. p. m. NH_4 resulting from the decomposition of oats, rye and timothy green manures were correlated with the percentages of N in the crop decompd.

J. J. SKINNER

The influence of the reaction of the soil on the development of *Hevea brasiliensis*. A. KORTLANDT. *Arch. Rubbercultuur* 12, 605-15(1928)(In English 617-27)(Appendix on calculated data 629-58).—The relation between the soil acidity and the growth of *Hevea brasiliensis* was studied by analyzing 1200 samples of soil from various estates in Sumatra and correlating the results with the growth on the various estates. In the majority of cases there was not the slightest relationship evident between the acidity of the soil and the development of *Hevea brasiliensis*. Only when p_H was over 8 was there good evidence that growth was adversely affected (cf. Bobiliov, *C. A.* 19, 3036). Excellent growth prevailed where the acidity was as high as p_H 3.13. In general the soil of the east coast of Sumatra has a high acidity, and only in a few cases was an alkali above p_H 8 found. From a practical point of view, *Hevea brasiliensis* is insensitive to a strongly acid soil, and the degree of acidity is only one of many factors which are of importance for the satisfactory growth of *Hevea brasiliensis*. $(NH_4)_2SO_4$ produces

an acid soil, and consequently should be used to counteract excessive alkali. The results of various fertilizing expts. indicate that no fear need be attached to the regular use of this fertilizer.

C. C. DAVIS

Soil survey of Wales. Progress report, 1925-1927. G. W. ROBINSON, J. O. JONES AND D. O. HUGHES. Univ. Coll., Bangor. *Welsh J. Agr.* 4, 303-21(1928).—Data are given on the soils of the Glamorgan and Monmouth, Eastern Anglesey and East Denbighshire areas of Wales.

K. D. JACOB

Adsorption of potassium from different sources and nitrification studies with Norfolk sandy loam. G. V. C. HOUGHLAND. Univ. of Maryland. *Soil Science* 26, 329-43(1928).—Samples of Norfolk sandy loam soil adsorbed considerable amts. of K when leached with 0.1 N solns. of K salts. The addn. of NaCl to a soln. of KCl, in the proportions found in fertilizer salts, did not reduce the amt. of K adsorbed by the soil. K_2SO_4 was adsorbed to a slightly greater degree than KCl. The K adsorbed from a soln. of KCl was replaced by dil. acid more rapidly than the K adsorbed from a K_2SO_4 soln. The addn. of NaCl did not effect the replacement of the K adsorbed from KCl. The nitrification of dried ground fish, packing house tankage and $(NH_4)_2SO_4$ was inhibited when fertilizer salts were used as the only source of K in complete fertilizer mixt. A slight stimulating effect on nitrification was obtained when K_2SO_4 was used. In general nitrification decreased as the concn. of the K materials increased, but the decrease was greatest where fertilizer salts were used.

J. J. SKINNER

Rhode Island soils in different parts of the state. BURT L. HARTWELL AND JOHN B. SMITH. Rhode Island Agr. Expt. Sta. *Bull.* 214, 24 pp.(1928).—This bulletin includes work of all the field and chem. tests which have been made at the Rhode Island Expt. Sta. on soil from various parts of the state. The ingredients dissolved from the soils by HCl (d. 1.115) on the whole were not related to the immediate needs of the soils. Field tests with corn on unlimed soils showed that the needs are in the decreasing order, P, N and K. After liming one of the soils, P was not then the principal deficiency as was the case before liming. Aside from swamp, meadow, tidal marsh and coastal beach, the soils of the entire state were classified in 1904 by the U. S. Bureau of Soils into 6 types. For beets, a high-lime-response crop, practically all the soils were benefited by liming, and the proportion of timothy to redtop was increased. The early chem. methods of measuring soil acidity proved less useful than one which consisted in digesting the soil with dil. ammonia and titrating the excess alkali with dil. HCl. Field tests, with turnips, on soils after liming showed that P and N are the principal deficiencies in about an equal number of cases. Four cords of cow-stable manure usually did not supply sufficient N. Spring wheat missed the K more than it did the N. The percentage of P_2O_5 in turnips bore an inverse relation in a general way to the increased growth caused by adding P_2O_5 to the soil, and thus furnished useful information concerning the relative need for P. In only three of 38 field tests did the effect of the equiv. of 2.5 tons of limestone fail to improve the growth of alfalfa. The av. yield on the limed sections was 4.13 tons of alfalfa hay. Heretofore unpublished chem. data on surface soil taken in 1925 from 12 different areas representing about 2000 acres of land, not generally in a high state of cultivation, showed that acid soil conditions were high in about two-thirds, and medium in one-third, of the samples. The worst of each factor was represented by pH 4.8, relative active acidity 160, CaO absorption 4.320 p. p. m. and active Al 869 p. p. m. The N ranged from 0.138 to 0.559% and the P_2O_5 sol. in 2 N acetic acid from 14 to 78 p. p. m.

J. J. SKINNER

Utilization of nitrogen by grass land in the North Sea marshlands. F. TRILLING. *Z. Pflanzenernähr. Düngung* 7B, 226-34(1928).—Considerable variation in the efficiency of nitrogenous manures in marshes is recorded. Newer soils respond more markedly to treatment with $(NH_4)_2SO_4$ than do older ones. Increases in hay yields following nitrogenous fertilization are greater in soils having little clover in the herbage. Botanical examn. shows this increase is largely in the proportion of meadow grass, with a diminution in that of dogstail. The relatively small effect of $(NH_4)_2SO_4$ on rich clover land is ascribed to the influence of the different type of herbage on the phys. and chem. properties of the soil.

B. C. A.

Growth of seedlings of conifers in crude humus. I. Transformation of nitrogen in crude humus. H. HESSELMANN. *Rept. Swedish Inst. Exptl. Forestry* 23, 337-432 (1927).—The growth of conifer seedlings in sand contg. crude humus showed the latter to contain N in a form capable of rapid conversion into nitrate on exposure. Artificial inoculation with the requisite organisms was important. Crude humus from birch forests proved better than that from pines. There was a very definite connection between the rate of nitrification of the crude humus, the development of seedlings and the growth of assocd. mycorrhiza. The last-named varied with the nature of the humus.

II. Formation of mycorrhiza in connection with seedlings of *Pinus sylvestris* in different kinds of crude humus. E. MELIN. *Ibid* 433-94.—The general parallelism between the growth of pine seedlings in humus and the production of mycorrhiza is a direct consequence of the nitrification of the humus, and the rate at which this occurs tends to regulate the symbiotic relationship.

B. C. A.

Tea in northeast India. P. H. CARPENTER. Indian Tea Assoc. *Agr. J. India* 23, 256-66(1928).—Mech. and chem. analyses of various types of *Indian tea soils* are tabulated, the compn. varying rather widely with soils from different localities. Most of the tea soils of northeast India are classed as new alluvium and vary in type from sandstones and heavy clays to peats. Soils with an acidity as high as 3000 parts CaO per million, as detd. by the Hopkin's method, and a p_H value as low as 3.8 grow good tea. Soils showing practically no acidity by the Hopkin's method but with a p_H value of about 6.5 may be successful as tea soils. Tea cannot be successfully grown on neutral soils of p_H 7.0. The *tannin content of the various tea leaves and stalk* is as follows: bud 27.9, first leaf 27.9, second leaf 21.3, third leaf 17.8, fourth leaf 14.5, upper stalk (bud to second leaf) 11.7 and lower stalk (second to fourth leaf) 6.4%.

K. D. JACOB

An analytical study of the putting greens of Rhode Island golf courses. BASIL E. GILBERT. R. I. Agr. Expt. Sta. *Bull.* 212, 15 pp.(1928).—This bulletin reports certain analytical studies made of green-keeping practices, and chem. analyses of soils of putting greens of 22 R. I. golf courses. The seed mixtures in use, fertilizer practices, nurseries, water at greens, brown patch and worms are discussed in the light of prevailing practices. The use of $(NH_4)_2SO_4$ was found to be common, and relations between its use, the discouragement of weeds, and the acidity of the soil were found to exist. Where consistent use had been made of this fertilizer, high-acidity conditions were found. In some cases definite indications were obtained to show that weeds were prevented from growing. Mech. analyses of the soils were made. No positive correlation was found to exist between fineness of soil and good turf. Measurements were made of soil acidity and active Al. Indications are given to show that the practice of top-dressing with sand causes diln. of the soils with the result that the active Al content was affected. An inverse correlation between the finer portions of the soil and the active Al was found. Total N and calcd. humus are given. The courses which had the best turf on their greens were highest in total N and, therefore, also in humus.

J. J. SKINNER

Some factors involved in studying the fixation of phosphorus by soils. A. G. WEIDEMANN. Michigan State College. *Soil Science* 26, 281-90(1928).—Very acid mucks show indications of negative fixation of P when treated with a highly concd. soln. of $CaH_4(PO_4)_2$. This phenomenon is due to the fact that the mucks cannot fix as much P from a concd. soln. as there is in the water that is rendered unfree, and some of this P is liberated and goes to concentrate the remaining soln. Mucks with a relatively high p_H value do not show any indications of negative fixation of P regardless of the concn. of the soln. with which they are treated. This is, no doubt, due to the fact that the P reacts chemically with the lime to form an insol. compd. Very acid mucks show no indications of negative fixation of P from solns. of any concn., provided they are treated with lime before the fixation studies are made. In this case again the P reacts with the lime to form an insol. compd. When high-lime mucks are treated with acid their ability to fix P from soln. is considerably lessened. When mucks that show an indication of negative fixation are treated with as much H_2O as they can render unfree the P fixation results will be positive regardless of the concn. of the P soln. with which they are treated.

J. J. SKINNER

Researches on the composition of spinach. LOUIS FONDARD AND LOUIS MARGAILLAN. Faculté des Sciences de Marseille. *Compt. rend. acad. agr. France* 14, 1265-70(1928).—The detn. of the needs of spinach has been given in previous researches, the considerable need of this plant for N, and in addn. perhaps K. The study of its common and its various stages of development confirm this first conclusion, in showing that K exercises a marked influence during the entire duration of the growth of the vegetable, and N more particularly at the beginning. Phosphoric acid intervenes, at the period of prepn. of fructification, in favoring the absorption of K. The results for 1926 show that the influence of K employed alone does not appear decisive, upon the formation of the elementary principles. The general explanation still holds in the absence of phosphoric acid, of which the tests for 1925 have shown the necessity for favoring the action of K. This action from the sole point of view of yield has nevertheless been considerable.

E. F. SNYDER

Utilization of waste water from sugar factories. M. GREVEMEYER. *Z. Ver. deut. Zucker-Ind.* 1928, 135-9.—Pots contg. the following materials were shown with

mustard: (a) loamy soil, (b) similar soil saturated with waste water, (c) soil with lime sludge, (d) soil with N as $(\text{NH}_4)_2\text{SO}_4$ and lime as chalk to correspond with sludge, and (e) completely manured soil. The fresh weights of the crops (in g.) were (a) 128.5, (b) plants all died down, (c) 132.1, (d) 224.5, (e) 265.2. Oats sowed subsequently in the same pots yielded 38, 252.5, 45, 45.5, and 46 g. as fresh plant weight, resp. The failure of mustard in (b) is attributed to the possible presence of harmful salts and the slimy condition of the soil. In the case of oats, soil (b) was less exhausted by the previous crop, and nitrogenous substances may have broken down to a more available form. To other series of pots soil which had been irrigated by waste water was applied as manure at a rate corresponding to 10 tons/acre. The materials used, when extd. with 10% HCl, yielded 0.109–0.299% K_2O , 0.305–0.484% N, 0.038–0.332% P_2O_5 , 0.70–0.84% CaO, 0.054–0.123% MgO, and with barley gave increased yields of about 10%. With mustard the increase was less marked. B. C. A.

Influence of neutral salts and fertilizers on soil reaction. F. TERLIKOWSKI AND B. KURYLOWICZ. *Rocz. nauk. lesnych* 13, 622(1925).—The effect of chlorides and sulfates of K, Mg, Ca and NH_4 , and of some neutral fertilizer salts, on the reaction of soil suspensions and the reduction in buffer capacity are recorded. There is a definite individuality among the different horizons of a soil profile in respect to the action of neutral salts. The effect is most marked in the A_1 horizons, when salts of bivalent metals are used, whereas salts of univalent metals are most active on podsol eluvials. The action of neutral salts is greater on loams than on podsoles or sandy podsoles. Changes in reaction values of soils following neutral salt treatment are proportionally greatest for the smallest quantities of salt added. In quantities such as are used in common practice neutral salts have little or no effect on soil reaction. B. C. A.

Chemical and microbiological principles underlying the decomposition of green manures in the soil. SELMAN A. WAKSMAN. N. J. Agr. Expt. Sta. *J. Am. Soc. Agron.* 21, 1–18(1929).—The problem of the decompn. of green manures, involving a knowledge of the rapidity of liberation of the N in an available form and of the amt. of undecompd. or only very slowly decompd. residues which goes to increase the soil org. matter, resolves itself into a problem of the chem. compn. of the plants which make up the green manure, a problem of decompn. of the various org. complexes in the plant by the different groups of soil organisms, as well as a knowledge of the metabolism of these organisms. E. F. SNYDER

Fertilization of soils poor in lime. Comparative tests of different carbonates. GUSTAVE RIVIÈRE AND GEORGES PICHARD. *Compt. rend.* 187, 1068–70(1928).—All of the carbonates, namely Ca, Mg, Na and K, which were employed have increased the yields, sometimes very considerably, by comparison with the checks, but it is the Na_2CO_3 which in all of the cases shows itself the most active. The authors are not able to affirm that its action is limited, the same as that of the other carbonates, in favoring nitrification by modifying the reaction of these too weakly alk. soils as the other carbonates should act as effectively, it being given that the no. of basic ions contributed has been the same in all of the plots. They are therefore lead to accept Na in this instance as an actual fertilizer. The increase in yield is probably due to the very easy nitrification of the reserve N contained in the soil and to the needs for Na of the plants tried. E. F. SNYDER

Influence of soil and manuring on the quality and growth of barley 1926. E. J. RUSSELL. Rothamsted Expt. Sta. *J. Inst. Brewing* 34, 307–20(1928); cf. C. A. 22, 1010.—Expts. in 1925 showed generally that neither phosphates nor potassic fertilizers increased the yield of barley. Sulfate and particularly NH_4Cl gave increased yields. The growing period of the 1926 barley was characterized by its sunlessness and the data obtained unexpectedly showed no great yield increases and suggest that under wet, sunless conditions nitrogenous fertilizers may have a harmful effect. However, the diastatic power of the malts made from the barleys was higher where the barley received $(\text{NH}_4)_2\text{SO}_4$ and indications are that increased diastatic power follows with an increase of N in the barley. The 1926 barleys were very similar in N content to the barleys of previous years. This season proved as before that NH_4Cl is superior to the sulfate as a fertilizer. Tabulated analytical data on the barley and malts made therefrom are given of the several growing plots, which show the results from untreated and fertilized soils. In the appendix are given observations on the plots of ground used in growing the barleys. PETER J. F. WEBER

The chemical effect of gypsum, sulfur, iron sulfate and alum on alkali soil. W. P. KELLEY AND ALEXANDER ARANY. Calif. Agr. Expt. Sta., Berkeley. *Hilgardia* 3, 393–420(1928).—The application of gypsum, S, FeSO_4 and alum produced important chem. changes in the black-alkali soil near Fresno, Calif. With each of these materials

the chem. reactions involved the sol. carbonate and the exchange complex of the soil. Gypsum pptd. the sol. carbonate as CaCO_3 in accordance with theory, while the other materials either decomposed carbonate or else converted it into bicarbonate. Simultaneously with the effect on sol. carbonate, the exchange complex was affected. The effect of gypsum depends on its sol. Ca, while S, FeSO_4 , and alum are effective because of the H ions that are formed. The acid formed by the oxidation of S, or the hydrolysis of FeSO_4 and alum, dissolves CaCO_3 and possibly other minerals, and thus brings Ca into soln. As a result, the Na content of the exchange complex is decreased and the Ca content is increased. In consequence of these chem. transformations the phys. conditions of the soil have been markedly improved and the growth of crops has been pronouncedly stimulated. The theoretical and practical aspects of the black-alkali soil problem are discussed. Twenty-one references are appended. C. R. F.

Manufacture of manure from straw and calcium cyanamide. F. ZUCKER. *Z. Pflanzenernähr Düngung* 7B, 206-15(1928).— CaCN_2 was used successfully in making artificial farmyard manure from straw. The best results were obtained when the heaps of straw were about 90 cm. in height. Careful control of moisture conditions was necessary to ensure complete rotting through the stack with min. losses in dry wt. of expts. served to show the value of the manure, but, in general, this was somewhat low that of ordinary yard manure. B. C. A.

Liquid manure, urine and drainage water. STIEHR AND M. BERGOLD. *Z. Pflanzenernähr Düngung* 7B, 216-26(1928).—The addn. to cattle urine of H_2SO_4 or H_3PO_4 in mts. corresponding to its total N content reduces N losses by checking fermentation. The loss of N during the fermentation of liquid manure is traced almost entirely to be volatilization of NH_3 , no free N being liberated. Drainage from "hot fermented" manure (Krantz) differs from ordinary liquid manure in that a large proportion of its total N is in org. combination. It is also richer in potash and phosphate, the latter existing mainly in colloidal suspension. B. C. A.

Comparative biological and chemical investigations on stable manures. IV. G. REICHMANN. *Inst. für Gärungsgewebe, Berlin. Centr. Bakt. Parasitenk.* II Abt., 75, 66-26(1928).—Only a small number of species of the microflora are active in the incense destructive processes of heating horse manure. The degree of heating, age and compactness has little relation to the rate of ammonification. After manure is well rotted, nitrification and denitrification are slow; hence the sp. organisms are scarce in this stage. As manure ripens, humus forms, but this is a late manifestation, being followed by the early rapid oxidative processes; many biol. data are included in this article. There is a bibliography of 68 titles. JOHN T. MYERS

A preliminary note on the effect of fertilizer constituents on the quality of sugar-cane juice and gur. P. B. SANYAL. *Agr. J. India* 23, 277-86(1928).—Sugar cane fertilized with superphosphate alone produced juice contg. the highest % of sucrose and lowest % of glucose and highest coeff. of purity, while fertilization with $(\text{NH}_4)_2\text{SO}_4$ alone produced the opposite effect. CaCN_2 and mustard cake gave results closely paralleling those obtained with $(\text{NH}_4)_2\text{SO}_4$. K_2SO_4 alone gave results intermediate between those obtained with the N fertilizers and superphosphate but more nearly approaching those obtained with the latter. Gurs (unrefined raw sugar) obtained from cane fertilized with superphosphate and with K_2SO_4 alone were also of much higher quality than those from cane receiving N fertilizers alone. Gur prepd. by the *Honn. super defecation method* was distinctly superior to that prepd. by the ordinary boiling process. K. D. JACOB

Fertilizer experiments with sweet potatoes. G. V. C. HOUGHLAND. Univ. of Maryland. *Soil Science* 26, 291-304(1928).—From a comparison of different forms of N in a 3-8-8 fertilizer used for sweet potatoes, the sol. materials such as urea, NaNO_3 , and $(\text{NH}_4)_2\text{SO}_4$ produced the highest av. yields of prime potatoes. Of the inorg.-org. combinations the 60%-40% ratio gave the highest av. yield of prime potatoes. It was suggested that a sol. N material in the fertilizer mixt. helped to establish the sweet potato sprout in the field. The results on one year's work with Leuna saltpeter indicated that it was a very suitable N material for sweet potatoes, when used in conjunction with organics. In this respect, it compared favorably with NaNO_3 and $(\text{NH}_4)_2\text{SO}_4$. J. J. SKINNER

The barley experiments of 1926. H. M. LANCASTER AND H. LLOYD HIND. *J. Inst. Brewing* 34, 321-33(1928).—This paper gives the fertilizer treatment of the plots of barley of 1926 expts. in tabulated form with analytical data of the barleys, and malts made from the barleys by the "stocking" and bulk malting process, together with market valuation. The report also gives the valuation and analytical data of various varieties of barleys and malts made therefrom by the "stocking" method,

on barleys from the National Institute of Agricultural Botany, Cambridge.

PETER J. F. WEBER

The degree of response of different crops to various phosphorus carriers. B. L. HARTWELL AND S. C. DAMON. Rhode Island Agr. Expt. Sta., *Bull.* 209, 19 pp. (1927).—As a result of several years' experimentation, beets, cabbages, rape and turnips are classed as high-P response crops. Cereals, millet, potatoes, tomatoes and spring wheat are low-P response crops, and soy beans, corn and oats are intermediate.

J. J. SKINNER

The mineral content of feeds, soils and waters of South Carolina. J. H. MITCHELL, J. D. WARNER AND K. S. MORROW. So. Carolina Agr. Expt. Sta., *Bull.* 252, 31 pp. (1928).—Detailed analyses are given of various crops used for feed, and grown under different conditions together with the analyses of soils and water from various sources.

J. J. SKINNER

The influence of fertilizer treatments on the content of exchangeable cations in Hagerstown silt loam. F. G. MERKLE. Penn. Agr. Expt. Sta. *Soil Science* 26, 377-8; (1928).—Soils repeatedly fertilized with chem. fertilizers or with org. manures undergo significant changes in the quantity and proportion of replaceable cations. Liming tends to saturate the absorption complex with Ca. A part of the K applied in chem. fertilizers is retained in the acidoid complex. NH_4 from soils may be retained and constitute a large percentage of the total absorbed cations.

J. J. SKINNER

Fluosilicates; their use as insecticides. J. FRERE. *Rev. prod. chim.* 31, 880-4 (1928).—A review of these products with reference to their value as insecticides. Their manuf. is briefly described.

P. THOMASSET

Some phases of the Japanese beetle insecticide investigations. E. R. LEEUWEN, O. G. ANDERSON AND P. A. VAN DER MEULEN. U. S. Bur. of Entomology. *J. Econ. Entomol.* 21, 805-13 (1928); cf. *C. A.* 22, 1011.—Measures for the protection of plants from injury by the Japanese beetle (*Popillia japonica*) are discussed. With the exception of early peaches and the bloom of certain flowering plants, fruit and shade trees, shrubs, grape vines and garden plants may be adequately protected from beetle injury by means of sprays. The beetles are so strongly attracted to early peaches that even a heavy coating of As fails to protect them. Highly toxic compds. are more or less repellent to the beetles. Even such inert substances as China clay and chalk are highly repellent, indicating that toxicity is not the only factor concerned in repellence from sprayed foliage. Beetles do not approach or alight upon sprayed trees so readily as upon unsprayed trees. Tests bear out the value of a spray of PbHAsO_4 coated with Pb oleate. As only 30% (av.) of the beetles on the tree at the time of spraying with PbHAsO_4 are killed by the spray, the protection afforded is largely due to the repellent action. When geraniol, an attractant for the beetle, is emulsified and mixed with PbHAsO_4 the efficiency of the mixt. is not greatly increased. Geraniol cannot be relied upon to attract beetles under all conditions. Foliage sprayed with PbHAsO_4 and sucrose soln. is readily eaten and has given the highest % kill of any mixt. yet used in the field. The use of traps is described.

C. H. R.

Soil insecticides for the Japanese beetle. WALTER E. FLEMING. U. S. Bureau of Entomology. *J. Econ. Entomol.* 21, 813-8 (1928); cf. *C. A.* 22, 1647.—This paper treats the most effective compds. which have been found to kill the soil-infesting stages of the Japanese beetle, *Popillia japonica*. Although a no. of compds. were more toxic than CS_2 in air at 70% relative humidity, this compd. only could be depended upon to permeate the soil and destroy the insects within 24 hrs. Other compds. penetrated only the surface layer, dissolved in the soil water near the surface, reacted with soil constituents or had such low vapor pressures that they penetrated soil very slowly. CS_2 is used in the form of a dild. emulsion. A group of org. compds., solid under ordinary conditions, has been intimately mixed with soil containing larvae of the Japanese beetle. A table is given showing the min. concn. and min. time necessary to kill the larvae for the 47 compds. tested. Hydroquinone and naphthalene are the most effective, β -naphthyl benzoate and tolidine among the least. The insecticidal treatment of soil is discussed.

C. H. R.

Deterioration of soap-nicotine preparation. II. C. C. McDONNELL AND J. J. T. GRAHAM. U. S. Dept. Agr. *Ind. Eng. Chem.* 21, 70-3 (1929).—Soap-nicotine preps. ordinarily found on the market decrease in nicotine content on storage. Hard soda soaps lose nicotine more rapidly on exposure to the air than potash soaps. The loss of nicotine from soap-nicotine preps. made with drying oils and packed without exclusion of air is due mainly to oxidation. When made from non-drying oils and stored without air being excluded the loss of nicotine is due to volatilization of nicotine. Hard and soft soaps, whether made from drying or non-drying oils, when packed with

complete protection from air, suffered no loss in nicotine content during 2 years' storage.

E. F. SNYDER

Talc and mica dusts as a control for lepidopterous larvae. BYRLEY F. DRIGGERS. N. J. Agr. Expt. Sta. *J. Econ. Entomol.* 21, 938-9(1928).—These dusts proved highly effective against larvae of the Oriental fruit moth (*Laspeyresia molesta*). The effect is phys. rather than chem.

C. H. RICHARDSON

Effect of early summer and late summer white oil and nicotine sulfate sprays on the number of eggs of the European red mite overwintering on peach trees. BYRLEY F. DRIGGERS. N. J. Agr. Expt. Sta. *J. Econ. Entomol.* 21, 878-82(1928).—Five applications of nicotine sulfate (1-800) and white petroleum oil emulsion (1%) on peaches in May and June failed to prevent the European red mite (*Paratetranychus pilosus*) from depositing large nos. of eggs. Ground tobacco dust and nicotine sulfate spray (1-800) did not greatly reduce the no. of eggs. Four applications of white petroleum oil emulsion in August killed nearly all the eggs. Peach trees sprayed with white petroleum oil emulsion in May and June suffered a slight yellowing of the foliage and a noticeable dropping of young fruit. A single tree sprayed in August with the oil emulsion shed some foliage, the older leaves appearing to be most sensitive to the oil.

C. H. RICHARDSON

Influence of spray practices on arsenical residues. HARRY C. McLEAN AND ALBERT L. WEBER. N. J. Agr. Expt. Sta. *J. Econ. Entomol.* 21, 921-8(1928).—Expts. conducted in N. J. during a season in which the rainfall was above normal show that heavy applications of $PbHASO_4$ may be made on fall and winter varieties of apples without exceeding the spray residue tolerance for 1928 of 0.01 grain As_2O_3 per lb. fruit. If sprayed heavily in June no further applications can be made without exceeding this tolerance. Fruit dusted with $PbHASO_4$ showed only a trace of As residue when picked. Apples sprayed up to July 1, followed by dusting later in the season, held low As residues at harvest. The greatest residues were found on fruit from the lower section of the tree.

C. H. RICHARDSON

The use of arsenites in the control of Mormon crickets. F. T. COWAN. U. S. Bureau of Entomology. *J. Econ. Entomol.* 21, 928-32(1928).—The Mormon cricket (*Leptoglossus simplex*) is not satisfactorily controlled by a poisoned bran bait. Dust mixts. of Na arsenite 1 part, $Ca(OH)_2$ 4 parts and of Ca arsenite 1 part, $Ca(OH)_2$ 3 parts were very effective. The Na arsenite-lime dust is applied at the rate of 5 lbs. per acre, the Ca arsenite-lime dust at 8 lbs. per acre. No serious injury from the dusts to growing grain or alfalfa was observed.

C. H. RICHARDSON

A method of volatilizing carbon disulfide for soil fumigation. H. K. RILEY. Purdue Univ. Agr. Expt. Sta. *J. Econ. Entomol.* 21, 932-3(1928).—A method of volatilizing CS_2 with steam under pressure for the control of the greenhouse centipede (*Scolopendrella immaculata*) is described. The app. is figured.

C. H. RICHARDSON

An economic discussion of the nitrogen situation with regard to its future development (BEAR) 13. Solid solutions of lime and arsenic acid (CLIFFORD, CAMERON) 6. Arica soil conditions in two districts of the Philippine Islands and their relation to fiber production (SHERMAN) 25. Responses of insects to smell and taste and their value in control (McINDOO) 111. The determination of nitrates and nitrogen (EMMERT) 7. Treatment of fish (Can. pat. 285,632) 27. Working up stable manure, rancid fodder and other fermentable substances (Austrian pat. 110,536) 16. Fertilizer and food for animals from vegetable refuse (Brit. pat. 291,514) 12. Apparatus for treatment of distillery slop or other org. wastes (U. S. pat. 1,698,171) 14. Improving basic slag (Ger. pat. 469,000) 9. Recovering glycerol from materials containing proteins (Ger. pat. 467,350) 26.

Agricultural Research in 1927. Royal Agr. Soc. of England. London: John Murray. 190 pp. 1s. 3d., post free. Reviewed in *Chem. News* 137, 399(1928).

Fertilizers. ANTALDO ANTALDI. Fr. 641,253, Aug. 24, 1927. Fertilizing substances are recovered from smoke by drawing it successfully through an acid and an alkali.

Fertilizers. ADOLF BAUMANN. Austrian 110,254, Mar. 15, 1928. Stable mixts. of fertilizers are prepd. by dissolving or suspending one of the ingredients in water, absorbing the soln. or suspension in an absorbent such as peat, drying, and finally mixing in the other ingredient. Stable mixts. of CaO and superphosphate may be so prepd.

Fertilizer. BAPTISTIN BODRERO. Can. 285,789, Dec. 25, 1928. Fertilizer is manufd. by heating and stirring $\text{Ca}_3(\text{PO}_4)_2$ in a mixing app. and injecting into the plastic mass S vapors, whereby the S is sublimed into the mass and a homogeneous complex product ("sulfo-calcium phosphate") is obtained.

Fertilizer. WILHELM GAUS, ROBERT GRIESSBACH and OTTO SCHLIEPHAKE (to I. G. Farbenind. A.-G.). U. S. 1,699,234, Jan. 15. K fluosilicate obtained from KCl is decomposed with aq. NH_3 into a soln. of KF and NH_4F and this is treated with a soln. contg. $\text{Ca}(\text{NO}_3)_2$ to produce a composite fertilizer.

Fertilizer. HEINRICH HEIMANN (to I. G. Farbenind. A.-G.). U. S. 1,698,793, Jan. 15. A hot concd. aq. soln. of NH_4NO_3 is mixed with inorg. fertilizing salts such as heated KCl, K_2SO_4 or $(\text{NH}_4)_2\text{SO}_4$ and the mixed salts in solid phase are obtained by evapg. water by the heat contained in the mixt.

Fertilizers. FRITZ FLOTHE and HANS BRENEK (to Rhenania Kunheim Chemischer Fabriken A.-G.). U. S. 1,696,975, Jan. 1. Mineral phosphorites are mixed with alkali metal chlorides and alkali metal sulfates and the mixt. is treated with steam and heated to 900° or higher, with such proportioning of the materials that the mixt. to be heated contains for each mol. of P_2O_5 about 1 mol. of alkali metal oxide and at least 1 mol. of SiO_2 with such a proportion of CaO that in addn. to an alkali Ca phosphate, orthosilicate also may be formed.

Fertilizer. ERNST SCHWARZ (to I. G. Farbenind. A.-G.) U. S. 1,699,254, Jan. 15. A mixed fertilizer is prepd. contg. urea, di-Ca phosphate and a fertilizing K salt such as KNO_3 or K_2SO_4 . NH_4 phosphate also may be used.

Fertilizers. PHOSPHATES ET SUPERPHOSPHATES DE TEBBAKA. Fr. 640,888, Feb. 25, 1927. Natural phosphates ground to pass through a sieve having a mesh of at least 180 per sq. cm. is used as a fertilizer.

Fertilizers. SOCIÉTÉ ANON. DES MANUFACTURES DES GLACES ET PRODUITS CHIMIQUES DE SAINT-GOBAIN, CHAUNY ET CIREY. Fr. 641,199, Mar. 2, 1927. A phospho-ammonium-potassium fertilizer is obtained by decomposing KCl and NH_4Cl by a soln. of phosphoric acid at a temp. not above 130° , with agitation, and saturating the free phosphoric acid in the product by NH_3 or $(\text{NH}_4)_2\text{HPO}_4$.

Use of free nitric acid as a weed destroyer and fertilizer. E. J. BURBAN. Brit. 291,461, June 2, 1927.

Treatment of bones. GELATINES HASSELT & VILVORDE SOC. ANON. Ger. 469,211, Aug. 26, 1926. See Fr. 634,361 (C. A. 22, 3748).

Increasing the germinating power of seeds. IGNAZ KREIDL. Austrian 110,553, Apr. 15, 1928. The seeds are mixed dry with one or more insol. or sparingly sol. compds. of Mn, Mg or Ce, or with radioactive materials; sparingly sol. basic salts may be added also.

Treating cotton plants. WILLIAM EGGERT, JR. U. S. 1,698,539, Jan. 8. Seed-producing cotton plants have supplied to their roots during the blossoming period a fermented soln. prepd. from cotton plant leaves and blossoms together with a saccharine compd. such as sugar or molasses and an ext. of sassafras leaves, for the purpose of repelling attacks of insects, etc.

Fungicide. GEORGE E. SANDERS. Can. 285,659, Dec. 18, 1928. A fungicide is produced by bringing together quick lime, water and polyhydrated CuSO_4 in crystal form, the CuSO_4 being added while the lime is hydrating and the amt. of water being controlled to cause the CuSO_4 to be brought to the monohydrated form by the action of the hydrating lime and producing the product in a dry powd. form. Salts of Ni, Al, Co, Zn, Ag, etc., may be substituted for the Cu and copper carbonate or other copper salt may be substituted for the sulfate.

Combined fungicide and insecticide in dry form. GEO. E. SANDERS. Can. 285,660, Dec. 18, 1928. Equal parts of hydrated lime and white arsenic are mixed with water to form an imperfect arsenite of lime. An excess of CuSO_4 is added to react completely with the arsenical salt; a paste is formed, which is allowed to stand 24 hrs. to permit a complete reaction to take place. Enough quicklime is then added to the paste so that in hydrating it takes up all of the excess moisture and a dry powder results, suitable for dusting on plants.

Insecticide. MICHEL-JOSEPH POUÉY. Fr. 641,062, Sept. 17, 1927. Residual juices from the manuf. of nicotine or from waste tobacco stalks are dried and powdered to form an insecticide.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

New meters for the brewing industry. J. OELSCHLÄGER. *Wochschr. Brau.* 45, 272-5(1928).—A description is given of a power meter, Geiger's Pi-meter and Torsio-graph, and Thyssen's vibration indicator. A. SCHULTZ

Analytical data on raw materials and brewery by-products for March, April and May, 1928. F. ANCKER. *Wochschr. Brau.* 45, 326-7(1928). A. SCHULTZ

The determination of the fusel oil content of alcoholic solutions containing a large amount of fusel oil. W. KILP AND B. LAMPE. *Z. angew. Chem.* 41, 1163-4(1928).—The Röse method has been modified to give the percentage of amyl alc. in solns. rich in fusel oil. The following formula gives accurate results in grams fusel oil per 100 cc.: $Z 0.5428 V/a$, in which Z = vol. increase of CHCl_3 , V = total vol. of soln., a = aliquot of original soln. 0.5428, detd. by Röse, is g. amyl alc. corresponding to increase of 1 cc. in vol. of CHCl_3 . C. N. FREY

The analysis of hops. A. STÁDNÍK. *Chem. Obzor.* 3, 142-5, 176-80(1928) (English summary).—After a review of recent chem. literature on hops a new acidimetric method for sepg. lupulone from humulone is described. It consists in shaking and neutralizing the ether soln. of hops with NaHCO_3 and titrating the remaining acid portion of lupulone. The lupulone portion can be calcd. from the difference of the acid portion of lupulone and the titrimetric value of the original unshaken soln. By means of this method the aging process of hops can be ascertained in the course of which humulone is changed into neutral derivs. much more rapidly than lupulone whose acidity decreases slowly. A new method of I no. detn. and detn. of tannin exts. on an iodometric basis has been worked out; this enables one to evaluate the efficiency of hops. JAROSLAV KUČERA

The antiseptic power of hops. M. FRYS. *Bull. assoc. élèves inst. sup. fermentations* 29, 403-10, 429-34(1928).—A detailed account is given of an investigation carried out by Chapman's biol. method. **Conclusions:** (1) The quality of hops can be partly judged by their antiseptic power. (2) The antiseptic power is not proportional to the quantity of hops added; up to a certain quantity, all the antiseptic substances go into soln., but above that point some of them remain undissolved. (3) During cooling there is a loss of antiseptic power, which varies with the methods of cooling, being greater in presence of air than in its absence; this loss is due to the oxidation of the hop resins during cooling. (4) There is quite an appreciable loss in antiseptic power during fermentation. Up to about 200 g. of hops per hl. of wort, there is little or no loss, but above this proportion the loss increases rapidly with increase in the amt. of hops. The antiseptic power tends to a limiting value of about 33.3 in the finished beer, irrespective of the amt. of hops used. (5) Alc. content, ext. and acidity of the wort do not affect the antiseptic power. (6) Quite a no. of so-called hop exts. which are sold have but little antiseptic power. A. PAPINEAU-COUTURE

The Gutzeit test. A. D. COMBRIE AND T. J. WARD. *J. Inst. Brewing* 34, 530-3 (1928).—The method and app. used in the Gutzeit test for arsenic in the authors' lab are described. The evolved gases pass through a definite area of HgCl_2 paper. The procedure employed in testing malts, hops, grains, sugars and liquids contg. org. matter is given, together with tests of reagents employed in the test. In the brewing of beer any arsenic present in the malt or hops is very largely eliminated during the brewing processes. PETER J. F. WEBER

Note on standards for Gutzeit test. A. T. HENLEY. *J. Inst. Brewing* 34, 608-9 (1928).—H. describes his preparation of permanent standards from artists water colors, "Chrome Lemon" and "Chrome Deep." PETER J. F. WEBER

Critical analysis of malt. A. T. HENLEY. *J. Inst. Brewing* 34, 223-5(1928).—H. elaborates upon the "sinker" test by making a sepn. of the malt into fractions using liquids of varying sp. gravities. PETER J. F. WEBER

The seasons' malts of 1928 (made from 1927 barleys). F. W. COOKE, G. HADLEY AND H. LLOYD HIND. *J. Inst. Brewing* 34, 595-607(1928).—The av. malts showed an av. ext., slightly low N, with correspondingly lower sol. N and a diastatic power almost up to the av. PETER J. F. WEBER

Defective wines. E. HUGUES. *Station Oenologique de Montpellier. Ann.* 21, 519-32(1928); cf. C. A. 22, 1822.—A review of the causes of defective wines and their effects on the chem. compn. of the wines, together with tables giving the compn. of such wines. A. PAPINEAU-COUTURE

Testing beers for May and June, 1928. F. ANCKER. *Wochschr. Brau.* 45, 357-8

(1928).—For this period, 125 beers were examd. Of 7 top fermentation beers, 4 contained sweetening agents. The p_H of light beers was 4.21–4.98. A. SCHULTZ

Finings. H. W. HARMAN, J. H. OLIVER AND PHYLLIS WOODHOUSE. *J. Inst. Brewing* 34, 203–13(1929).—The analysis of the beer, and finings as normally used in the brewery, shows that an appreciable amount of the finings remains in the beer, and can help in stabilizing the colloidal condition of the beer. Finings from different sources cut under the same conditions gave differences in fining properties when used on beers of different p_H values. Penang isinglass had the widest range, making it applicable to nearly all classes of beer. Saigon and Indian are suitable for the more alk. beers brewed from hard waters. Russian isinglass was also satisfactory for the latter class of beers. Brazil and China isinglasses worked well on acid beers only. Where Irish moss had been used in the boiling of the wort, finings gave an increased amount of precipitated isinglass protein. Other factors also influence the finings such as alkalinity and CaSO_4 content of the brewing water; whether beer worts were made from all malt, or malt and raw cereal or sugar; temp. of conversion; break while boiling wort; character of fermentation; separation of hop resins in a hop back and presence of metal, particularly iron. PETER J. F. WEBER

Notes on the washing of yeasts. R. VAN DAELE. *Bull. assoc. élèves inst. sup. fermentations Gand* 29, 421–9(1928).—A discussion of the possibilities of washing more or less contaminated yeasts (particularly top fermentation yeasts) with a view to rendering them utilizable without danger of infection: the various possible antiseptics are mentioned, together with their method of use, permissible doses and effects.

A. PAPINEAU-COUTURE

The substitution of malt sprouts by ammonium salts in the manufacture of yeast. H. CLAASSEN. *Z. angew. Chem.* 41, 1161–3(1928); cf. *C. A.* 22, 1209, 3485.—Duclaux and later Ehrlich had shown that yeast utilizes ammonium salts. Wohl and Scherdel's work is not accurate. The ratios of org. to NH_4N are based on the assumption that all the N of malt exts. is available to the yeast, but only 65% is available. When the optimum amt. of org. N is present, replacement of 40% of this N by NH_4N does not affect the yield or the N content of the yeast. Replacing more than 40% causes the yield to decrease and the N content of the yeast to increase. In a medium contg 3 times the optimum N content in the form of NH_4N , the yeast yield is decreased and the N content increased. Some irregularities in these results were obtained. The addn. of excessive amts. of NH_4 salts caused the baking strength of the yeast to decline

C. N. FREY

Dufton distilling column for the preparation of absolute alcohol (NOYES) 1. The barley experiments of 1926 (LANCASTER, HIND) 15. Glycerol. VEREINIGTE CHEMISCHE WERKE A.-G. Fr. 642,083, Oct. 7, 1927. See Brit. 278,703 (*C. A.* 22, 2636).

Glycerol by fermentation. KARL LÜDECKE and NELLY LÜDECKE. U. S. 1,698,800, Jan. 15. See Fr. 636,121 (*C. A.* 23, 235).

Non-alcoholic beverages. WILLIBALD WINKLER, GUSTAV WINKLER and HERMANN FRIEDRICH HIRSCHLER. Austrian 110,543, Apr. 15, 1928. Non-alcoholic beverages with a wine- or beer-like taste are made by subjecting sweetened decoctions of plants or their roots, fruits, seeds or leaves to 3 consecutive fermentations. The first fermentation is suitably effected at 25–30° in open vessels with organisms of the group *B. xylinum* symbiotically associated with yeasts of the groups *Mycoderma* and *Saccharomyces*. The second is suitably effected in closed vessels at 20° with yeasts of the groups *Saccharomyces*, *Torula*, *Tychia* and *Willia*. The third proceeds at 8–15° during the storage of the products. Suitable initial materials are plants or plant-parts of medicinal value, except those having undesired sp. effects.

Brewing. LUDWIG FISCHER. Ger. 469,120, May 13, 1925. A fermenting funnel has a filling of glass wool, glycerol and SO_2 -evolving material.

Working up stable manure, rancid fodder and other fermentable substances. HERMANN KASERER. Austrian 110,536, Apr. 15, 1928. The subdivided org. substances

are mixed with suitable liquids and freed from excess of liquid by pressing to a convenient degree.

Yeast. ARNE BOYE. Fr. 642,019, Oct. 6, 1927. Wort contg. yeast is passed in a continuous manner through a no. of compartments, and the nutrient substances are brought in a continuous manner to the different compartments in such a manner as to obtain the most favorable concn. for the state of fermentation in any particular compartment.

Yeast. H. BÜCHER. Brit. 291,146, Feb. 24, 1927. A continuous process for yeast production comprises causing a sugar soln. together with nutrient inorg. salts to flow in a stream with the seed yeast and new growth, while aerating the materials, and supplying additional inorg. nutrients and preferably also additional sugar or other org. nutrients to the stream; yeast is sepd. and liquor returned to the process. An app. is described. Alc. and acetaldehyde may be recovered from the discharged air by treatment with a counter-current absorbent stream or with solvents.

Yeast. K. A. JACOBSEN. Brit. 291,770, June 8, 1927. In the manuf. of yeast with continuous addition of nutrient soln. and continuous discharge of yeast-contg. soln., the supply of carbohydrate nutrient is periodically varied in such a manner in relation to the alternating budding and ripening periods of the yeast that an increased quantity of nutrient soln. is added at the times when the budding tendency of the yeast tends to decrease, so that the ripening periods which tend to intervene are prevented from occurring and the yeast is kept in a budding condition until withdrawn to a sep. container for ripening. Various details and modifications are described.

Yeast. H. C. JANSEN and J. P. H. JANSEN. Brit. 291,127, May 3, 1927. Nutrient substances such as NH_3 are added to the vats during yeast propagation by use of the gas current used for aeration as a carrier.

Yeast. W. SCORR. Brit. 291,135, Feb. 22, 1927. Yeast after use in fermentation is reconditioned by circulating beer or other suitable liquor over it at a controlled temp. in an enclosed vessel, with or without an addnl. air supply. An app. is described.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Ethereal oil of Siberian fir (*Abies sibirica*). YU. S. ZALKIND AND S. ZABOEY. *J. Russ. Phys. Chem. Soc.* 60, 553-9 (1928).—The ethereal oil obtained from the needles of the Siberian fir contains *l*-pinene, camphene, phellandrene, traces of santene, possibly nopinene and *l*-bornyl acetate. The bark contains *l*-pinene, camphene, phellandrene and *l*-bornyl acetate. B. C. A.

Evaluation of mercury oxycyanide and mercury cyanide tablets. E. SCHULEK and A. STASIAK. Hygien. Inst., Budapest. *Arch. Pharm.* 266, 638-41 (1929).—Prep. a 0.1% soln. of the finely powdered sample (if necessary by the addn. of a few drops dil. H_2SO_4), transfer an aliquot of 10 cc. to a 100-cc. flask, add 5 cc. 20% H_3PO_4 and 1 cc. satd. $\text{Br-H}_2\text{O}$. After 5 mins. add 1 g. KBr or NaCl, and after a further 5-10 min., 3 cc. H_2O and 1 to 2 cc. 5% PhOH soln. in order to remove the excess of Br, shake thoroughly and add 0.5 g. KI. After 10-15 mins. titrate the sepd. I with 0.01 N thio-sulfate (1 cc. of which = 0.000013005 g. CN). W. O. E.

Decomposition of morphine in aqueous solution, especially during sterilization. R. DIRIZEL AND W. HUSS. Univ. Munchen. *Arch. Pharm.* 266, 641-6 (1929).—The purpose of this investigation was to clarify the chem. changes which take place in aq. solns. of morphine on heating and in storage, to det. the degree of such decompn. and from the resulting data to develop a suitable method of sterilization. The stability of morphine in aq. soln. depends largely on the p_{H} . Alk. morphine solns. change markedly at room temp.; nearly neutral solns. also, especially at elevated temp., are relatively unstable; acid solns. are more stable. With a $p_{\text{H}} \leq 5.5$, heating at the temp. of boiling water for 60 mins. is followed by no further spectral displacement, from which it is concluded that no change takes place from the chem.-constitutional standpoint. The changes taking place in aq. soln. are oxidative in character. W. O. E.

Alkaloid of *Carnegiea gigantea* (Engelm.) Britt. and Rose. GEORG HEYL. Tech. Hochschule Darmstadt. *Arch. Pharm.* 266, 668-73 (1928).—An alkaloid, *carnegine*, $\text{C}_{19}\text{H}_{19}\text{NO}_2$, was isolated in the form of a thick sirup, which apparently decomposed on standing, *HCl* salt, $\text{C}_{19}\text{H}_{19}\text{NO}_2 \cdot \text{HCl} \cdot \text{H}_2\text{O}$, m. 207°; *HBr* salt, $\text{C}_{19}\text{H}_{19}\text{NO}_2 \cdot \text{HBr}$, m. 228°; *chloroaurate*, $\text{C}_{19}\text{H}_{19}\text{NO}_2 \cdot \text{AuCl}_3 \cdot \text{HCl}$; *chloroplatinate* $(\text{C}_{19}\text{H}_{19}\text{NO}_2)_2 \cdot \text{PtCl}_4 \cdot 2\text{HCl}$. W. O. E.

Animal drugs in the materia medica. P. MANICKE. Univ. Leipzig. *Pharm. Ztg.* 73, 1427-9(1928).—An address giving an account of the numerous preps. from animal sources employed in ancient and modern times. W. O. E.

Simple evaluation of spiritus aetheris. F. WRATSCHKO. *Pharm. Presse* 33, 384-6 (1928).—Into a 25-cc. glass-stoppered measuring cylinder graduated in 0.1 cc. introduce 10 cc. of the sample, 10 cc. H_2O and 5 cc. petr. ether. Shake vigorously, and after sepn. of the liquid into layers read off accurately the lower (k). Calc. the % of alc. (x) and Et_2O (y) from the expressions: $y = 72(20 - k)/d$ and $x = p - 5y/4$, in which d = sp. gr. of the sample, p = alc. vol. % of the alc.- H_2O mixt. having the same d . as that of spir. aether. The method is carried out at 15° , if at higher or lower temps. a suitable correction is made by use of the expression: $y = 10d_1(20 - k)/d_2$, in which d_1 and d_2 = the d . of Et_2O and spir. aether. at the examg. temp., resp. The value p is obtained by reference to the customary alc. tables for the temp. $15^\circ/15^\circ$. W. O. E.

Euphorbium resin. K. H. BAUER AND P. SCHENKEL. Univ. Leipzig. *Arch. Pharm.* 266, 633-8(1928).—Euphorbon, obtained from the resin, m. $67-8^\circ$ and $115-6^\circ$ when crystd. from petr. ether and MeOH, resp., is a composite substance; on fractional crystn. from MeOH it yields the unsatd. alc. *euphorbol*, $C_{28}H_{48}O$, m. 122° , susceptible of hydrogenation to either a di- or a tetrahydro deriv., the latter giving with $AcCl$ the deriv., $C_{28}H_{47}OCOCH_3$, needles, m. 129° . W. O. E.

An attempt to prepare mercury compounds of triphenylmethane dyes. FREDERICK R. GREENBAUM. *Am. J. Pharm.* 101, 34-46(1929).—Brilliant green, malachite green, gentian violet, night blue and basic fuchsin were mercurated. Not all these dyes gave definite mono- or di-Hg compds.; the mercuration usually resulted in mixts. of various Hg compds. The very slight soly. of the compds. makes them less useful from a pharmaceutical point of view. The soly. was no higher than 0.3% in alc.; the alc. soln. can be dild. with H_2O without pptn. For practical purposes and for therapeutic investigations it was necessary to obtain H_2O - or alkali-sol. Hg compds. of triphenylmethane dyes. The condensation of phenolbenzotrichloride and of resorcinolbenzotrichloride resulted in alkali-sol. triphenylmethane dyes, which on mercuration furnished di-Hg compds. easily sol. in alkalies. Therefore, further investigation will be necessary along the line of alkali-sol. triphenylmethane dyes and their mercuration. A short bibliography is appended. W. G. GAESSLER

Testing some common antiseptics. EDWARD S. ROSE. *Am. J. Pharm.* 101, 52-5 (1929).—R. examd. some 20 so-called antiseptic proprietary preps. Very few were antiseptic in accordance with the Government's interpretation. Briefly, the procedure of examn. is to inoculate the sample or allow it to come in contact with a specially prepd. culture of *Staph. aureus*, either in liquid or solid form as the case requires. Five mins. is the time allowed to kill in most instances. However, in a few cases, 10- and 15-min. periods are permitted. In the case of inhibition it should show after a period of incubation. R. also examd. a no. of common articles sold in the drug store and generally considered by the laity to have antiseptic properties. The following were found to be antiseptic: Ointments (mercurial 30%; ammoniated Hg 10%; I U. S. P.; thymol iodide 10%; yellow oxide Hg 2%; calomel 30%); soaps (germicidal 1%); liquids ($AgNO_3$ 5-10%; neosilvol 5-10%; solargentum 5-10%; argyrol 5-10%); spirit of camphor U. S. P.; alc. 70%; bay rum; Al_2Cl_3 soln. 25%; tincture of I, U. S. P.; tincture of I, colorless N. F.; Lugol's soln. U. S. P.; soln. of H_2O_2 U. S. P.; turpentine; phenol 1-70; mercurochrome 2% in acetone 10, alc. 55, H_2O 35; above mixt. without mercurochrome; antiseptic soln. N. F.; zonite; flexible collodion). The following are either not antiseptic at all or only very weakly antiseptic: Ointments (ZnO U. S. P.; S U. S. P.; ichthyol 10%; compd. resorcinol N. F.; tar U. S. P.; Lassar Zn paste N. F.); soaps (castile; Pear's glycerin); liquids (distd. ext. of witch-hazel; satd. soln. of H_3BO_3 ; satd. soln. of $MgSO_4$; mercurochrome 2% aq.; mercurochrome 3% aq.; alkaline aromatic soln. N. F.; Dobell's soln. U. S. P.). W. G. GAESSLER

New medicaments. ZERNIK. *Deut. med. Wochschr.* 54, 20-1, 61-2, 101, 148-9, 233-4, 275-6, 480-1, 657-8, 1091-2, 1173-4, 1472, 1811, 2071(1928); cf. C. A. 22, 665.—A summarized description of the compn., dosage and uses of the new preps. introduced into medicine, with references to the literature. ARTHUR GROLLMAN

The determination of morphine. A. K. BALLS AND WILLIAM A. WOLFF. Univ. of Pa., Philadelphia. *J. Biol. Chem.* 80, 379-402(1928).—In the existing methods of detg. morphine, several errors were encountered. The pptn. of impurities usually results in the retention of some morphine by the ppt. Evaph. of morphine solns. results in decompn. Methods are, therefore, proposed for estg. morphine which avoid

the above errors. They are suitable for amts. of morphine greater than 20 mg. per 100 g. of material.

ARTHUR GROLLMAN

Chemico-pharmaceutical control of the sterilized dose solutions in ampoules. D. N. POPOV. *Trans. Sci. Chem.-Pharm. Inst.* (Moscow) No. 9, 45-63(1924).—P. presents control analyses on novocaine 1-2% with 1:10000 adrenaline and camphor oil. The standard methods of analysis are described in detail and the advantages and disadvantages of some of these are discussed.

J. S. JOFFE

Digitalis preparations, their standardization and their standard titers. O. A. STEPPUN. *Trans. Sci. Chem.-Pharm. Inst.* (Moscow) No. 13, 80-98(1926).—S. reviews the development of the chemistry of digitalis and describes his method of prepg. gitalin.

J. S. JOFFE

The standardization of preparations of *Secale cornutum* and some physiological observations on the properties of *Secale* and histamine. S. I. CHECHULIN. *Trans. Sci. Chem.-Pharm. Inst.* (Moscow) No. 13, 110-31(1926); cf. *C. A.* 20, 2706.—C. presents exptl. data on the effect of the drugs on guinea-pig uterus. For calcg. the standard the following formula is suggested: $V = 0.02 \times D\beta \cdot 100/Ds$, where V = the value sought, $D\beta$ = dose of histamine in cc., Ds = dose of *Secale*, 0.02 = no. of mg. of active histamine in 1 cc. of a standard soln. and 100 = cc. of the test prepn.

J. S. JOFFE

Biological methods of determining the value of some drugs. O. A. STEPPUN. *Trans. Sci. Chem.-Pharm. Inst.* (Moscow) No. 13, 99-105(1926).—A discussion of the principles underlying the methods of detg. the value of drugs.

J. S. JOFFE

The biological value of some cardiac drugs. O. A. STEPPUN. *Trans. Sci. Chem.-Pharm. Inst.* (Moscow) No. 13, 106-9(1926).—A discussion of the principle of the method of Fokke on the value of cardiac drugs.

J. S. JOFFE

The determination of the total geraniol content of Java citronella oil and the analytical examination of the latter in general. A. RECLAIRE AND D. B. SPOELSTRA. *Ber. Aldeel Handelsmuseum Ver. Koloniaal Inst.* No. 36, 3-11(1928); cf. *C. A.* 22, 2237.—Comparative tests showed that the method of Radcliffe and Chadderton is much more accurate than that of Schimmel & Co. It has been suggested to add to the analysis of citronella oil a detn. of distn. residue, namely, the substances boiling over 250° . It was found that so many factors in connection with the distn. influenced the results, that this detn. was of little value for the evaluation of screeh oil.

J. C. JURRJENS
